REMINGTON'S
PRACTICE OF PHARMACY

A TREATISE

ON THE MAKING, STANDARDIZING, AND DISPENSING, OF OFFICIAL, UNOFFICIAL, AND EXTEMPORANEOUS PHARMACEUTICAL PREPARATIONS, WITH DESCRIPTIONS OF MEDICINAL SUBSTANCES, THEIR PROPERTIES, USES, AND DOSES, AND SUCH OTHER PROFESSIONAL SERVICE IN CONNECTION WITH COMMUNITY HEALTH AS THE PHARMACIST MAY BE CALLED UPON TO RENDER

INTENDED

FOR THE USE OF PHARMACISTS AND PHYSICIANS

AND

AS A TEXTBOOK FOR STUDENTS

OVER EIGHT HUNDRED ILLUSTRATIONS

SEVENTH EDITION

BY

E. FULLERTON COOK, P.D., PH.M.

CHAIRMAN OF THE COMMITTEE OF REVISION OF THE PHARMACOPŒIA OF THE UNITED STATES OF AMERICA; PROFESSOR OF OPERATIVE PHARMACY, AND DIRECTOR OF THE PHARMACEUTICAL LABORATORIES, AND DIRECTOR OF THE BUSINESS ADMINISTRATION COURSES OF THE PHILADELPHIA COLLEGE OF PHARMACY AND SCIENCE; MEMBER OF THE COMMITTEE OF REVISION OF THE N. F.; MEMBER OF THE COMMITTEE ON GALENICALS OF THE SECOND INTERNATIONAL CONFERENCE FOR THE UNIFICATION OF POTENT REMEDIES (BRUSSELS, 1925), ETC.

AND

CHARLES H. LAWALL, PH.M., PHARM.D., SC.D., F.R.S.A.

DEAN OF PHARMACY, AND PROFESSOR OF THEORY AND PRACTICE OF PHARMACY OF THE PHILADELPHIA COLLEGE OF PHARMACY AND SCIENCE; MEMBER OF THE GENERAL COMMITTEE OF REVISION; MEMBER OF THE EXECUTIVE COMMITTEE OF REVISION, AND CHAIRMAN OF THE SUBCOMMITTEE ON CHEMICAL REAGENTS OF THE PHARMACOPŒIA OF THE UNITED STATES OF AMERICA; MEMBER OF THE COMMITTEE OF REVISION OF THE N. F.; PHARMACEUTICAL EDITOR OF THE UNITED STATES DISPENSATORY, ETC.

The use in this volume of certain portions of the text of the United States Pharmacopœia, Tenth Revision, is by virtue of permission received from the Board of Trustees of the United States Pharmacopœial Convention. The said Board of Trustees is not responsible for any inaccuracy of quotation nor for any errors in the statements of quantities or percentage strengths.

Permission to use for comment parts of the text of the National Formulary, Fifth Edition, in this volume has been granted by the Committee on Publication by authority of the Council of the American Pharmaceutical Association.

Authority to use the New and Non-Official Remedies, 1925 Edition, has been granted by the American Medical Association.

AUTHORS' PREFACE TO THE SEVENTH EDITION

THE authors of the Seventh Edition of "Remington's Practice of Pharmacy" became associated with its editorial staff in 1901, when Joseph P. Remington started work on the Fourth Edition. Both E. Fullerton Cook and Charles H. LaWall had, only a few months before (August, 1900), been appointed assistants to Dean Remington in the faculty of the Philadelphia College of Pharmacy.

In April, 1901, E. Fullerton Cook became the personal and intimate assistant of Joseph P. Remington who was at that time the editor of the Practice of Pharmacy, the pharmaceutical editor of the U. S. Dispensatory, and a few weeks later, following the death of Dr. Charles Rice, the Chairman of the Revision Committee of the Pharmacopœia of the United States. These and many other activities of Professor Remington made his office and laboratory the center of intense pharmaceutical activity, which continued up to the time of his death in 1918. During all of this same period, Charles H. LaWall was also constantly collaborating with Professor Remington in various phases of literary and educational work and it may be rightly said that over almost two decades both Cook and LaWall served a continuous apprenticeship in preparation for this Seventh Edition.

In the past quarter of a century the practice of pharmacy and pharmaceutical education have undergone revolutionary changes. Fortunately both authors have been intimately familiar with every pharmaceutical development of this period and especially active in the remarkable growth in pharmaceutical education, and consequently they feel themselves in a position to present a summary and guide to modern pharmaceutical services and activities, which in their opinion fully justifies the claim of pharmacy to professional recognition. The properly trained and professionally active pharmacist is an important factor in the community in the protection and maintenance of public health and in the care of disease, when he is fully coöperating with the physicians of the neighborhood in their application of scientific medicine.

When the summary was published a year ago of a study made by American pharmacists for the Commonwealth Fund, dealing with the needs of pharmaceutical education, a research conducted under the direction of Dr. W. W. Charters of the University of Chicago (see page 2), it was indeed gratifying to learn that the outline of the "New Remington", as it had already been planned, met most completely the ideals there expressed.

It was therefore with stimulated confidence in the rather ambitious plan which had been outlined that the revision was undertaken.

The authors had long recognized the futility of attempting so extensive a presentation without calling to their assistance specialists in many departments, and with the adoption of that policy no effort was spared to secure the help of experts wherever it was needed. Thirty-nine collaborators are listed on the title page, but the authors are indebted to innumerable other sources of information for valuable suggestions or facts and here gratefully acknowledge the contributions from friends and associates who have freely discussed many problems and thus added to the completeness of the text.

The inclusion of much information concerning the characteristics and therapeutics of the newer materia medica, from the 1925 edition of the New and Non-Official Remedies, was authorized by the American Medical Association and will be most acceptable information for many professional pharmacists.

The United States Pharmacopœia, Tenth Revision (U. S. P. X), the National Formulary, Fifth Edition (N. F. V), and the 1925 edition of the New and Non-Official Remedies (N. N. R.), have been made the basis for this edition, although other important therapeutic agents and unofficial preparations have been included. A glance at the contents of the Seventh Edition will reveal something of the greatly enlarged scope. The opportunities of the pharmacist as a chemist and analyst have been recognized; the continual call upon him for information relative to community health and welfare, including the control of pests and the use of disinfectants, has been made a feature; the necessity has been met for having at hand correct and very complete knowledge concerning the handling of surgical supplies and modern biological products, a chapter on antidotes to poisons was added that this might be available in emergency, and also other technical and professional information.

An addition which meets a definite need is the Chapter on "The Responsibility of the Pharmacist Under the Law", and the Chapters on Scientific Business Methods and Control, will, it is hoped, render an important service to the practicing pharmacist, even though his activities may be largely professional.

A more specific reference to the collaborators who have so earnestly and loyally assisted in the revision is necessary here. For many months it was possible for a small group to meet weekly to discuss every phase of the revision as it developed. These conferences will long be remembered, because of the earnestness and unanimity of purpose of each, their value in settling the many questions which came up, and their stimulation of new ideas. In these regular conferences were always found the authors, with Ivor Griffith, Adley B. Nichols and Edward J. Hughes. Others were frequently called into special sessions.

In Part I, Charles H. LaWall prepared the historical section and those parts which place before the student and pharmacist his obligations under the professional codes which are as old as the medical profession. It was felt that the beginner should immediately be initiated into the seriousness of the duties and responsibilities of pharmacy and be thus prepared to assume the correct attitude toward the technical operations which follow.

A chapter on pharmaceutical arithmetic has been added to Part II by Ivor Griffith. This represents practical experience in the needs of the pharmacist and many years of teaching the subject to pharmacy students. While elementary in many details it is exactly what is needed by the student, and frequently also by the dispensing and manufacturing pharmacist. Part II has been completely rewritten in the light of modern apparatus and processes, and the illustrations only present that which the authors personally know to be up-to-date and practicable.

Part III contains all formulas official in the U. S. P. X and N. F. V, with alternative weights and measures. This latter feature was continued at the earnest request of many users of the book and only after a careful survey of the conditions in American pharmacy. Many formerly official or otherwise useful formulas have been included under each class of preparations, the "Formulary" of earlier editions being omitted.

A notable feature of this section is a list of titles of classes of official and unofficial pharmaceutical preparations. This was compiled by Charles H. LaWall and presents, it is believed, a more complete list of titles of pharmaceutical preparations, together with their definitions, than is found in any other pharmaceutical textbook.

In Parts IV and V, Professor LaWall presents a discussion of the theory of inorganic and organic chemistry in a condensed and simple form, which will be greatly appreciated by many pharmacy students. In these sections the official chemicals, those recognized by the N. N. R., and many others, are discussed from the standpoint of their standards, manufacture, and use. Prof. Edward J. Hughes has contributed much to the information presented here, especially with reference to reactions, general chemical statements, and manufacturing processes.

The statements throughout the book concerning the therapeutic uses of drugs, preparations, and chemicals have been prepared by Dr. Horatio C. Wood, Jr.

No attempt has been made in Part VI to include an extensive treatise on the perfumery art, but it is believed that what has been included will be found of value to many who are interested in this fascinating subject. The material presented has been used in a brief course in perfumery and cosmetics at the Philadelphia College of Pharmacy and Science, and the authors are indebted to Philip E. Chaleyer, director of the perfumery laboratories of the Burton T. Bush Company of New York, for many other helpful suggestions.

In preparing the material for Part VI on the responsibility of the pharmacist under the Law, the services of a number of experts have been enlisted. The discussion on commercial law has been prepared by Howard Kirk, a member of the Philadelphia Bar, who has lectured on law before the students of the Philadelphia College of Pharmacy and Science for a number of years, and in consequence has studied and advised on practically every legal problem the pharmacist encounters.

It was not considered practicable to present the state law of any one commonwealth, because of its limited application, but the model pharmacy law, prepared a few years ago by a committee of the A. Ph. A., has been included with the hope that it may be more readily available as a model when new legislation is proposed in any state. Henry C. Christensen, Secretary of the National Association of Boards of Pharmacy has supplied information for the presentation of this material. The aid of governmental departments has been secured in connection with the several Federal Laws which require records and which constantly raise questions in the minds of pharmacists, namely, the Harrison Narcotic Act and the Volstead Prohibition Act.

The section dealing with the Narcotic Act was prepared by Levi G. Nutt. Colonel Nutt is a registered pharmacist, and has had about twenty-five years of experience in the Internal Revenue Service. He is now head of the Narcotic Division, Bureau of Internal Revenue, Washington, D.C., is in charge of the enforcement of the Harrison Act and Secretary of the Federal Narcotic Control Board, so that his discussion is authoritative and should be helpful to all pharmacists who operate under a narcotic permit.

The section dealing with the National Prohibition Act was prepared jointly by Dr. J. M. Doran, Head of the Industrial Alcohol and Chemical Division, Prohibition Unit, Bureau of Internal Revenue, Washington, D.C., and Dr. Clifton E. Young, Assistant Head of the same Division. This presentation is based upon the general principles underlying the Act, omitting detailed regulations, as these are subject to frequent revision.

A statement was also prepared by the Bureau of Chemistry on the requirements of the Food and Drugs Act. A brief discussion on the question of patents and trademarks is included, Dr. F. E. Stewart, internationally known as an expert on trademarks, having collaborated with Mr. Kirk on this section.

No apologies are necessary in this day of scientific business efficiency for the inclusion of Part VIII. The result of more than twenty-five years of study of business methods as applied to pharmacy, in the business administration department of the Philadelphia College of Pharmacy and Science, was made the basis for these chapters.

The assistance of Dr. R. P. Fischelis was secured in the compilation of the vast amount of material available. The authors are greatly indebted to Doctor Fischelis for its excellent presentation and for much added material, especially in that section dealing with merchandising, including advertising and selling. Doctor Fischelis was for a number of years in charge of the business courses of the Medico-Chirurgical College of Pharmacy and more recently and at the present time, Special Lecturer in Business Pharmacy and Pharmaceutical Journalism at the Philadelphia College of Pharmacy and Science.

The many contributions and the critical review of this entire section by Paul. C. Olsen, Instructor in Merchandising, Wharton School of Finance and Commerce of the University of Pennsylvania, and Lecturer on Business Administration at the Philadelphia College of Pharmacy and Science, and also by

Edwin P. McLean, President of the W. B. McLean Manufacturing Company, and student of merchandising economics and business analysis, have added greatly to the business administration section. In the accounting chapter the advice and practical illustrations in bookkeeping received from Harold J. LaWall, accounting expert and statistician, will be found helpful by many who face the necessity of keeping business records.

The analysis and value of accounts for the control of business has been especially presented. Especially valuable help in this has been received from Mr. McLean, who has constructively analysed more than five hundred drug stores within the last few years, and by Mr. Olsen, who is constantly handling drug store accounts and analysing the drug business from the standpoint of business efficiency.

Special acknowledgment is made to Dr. H. A. B. Dunning and also to the officers of the Liggett Corporation for placing at the disposal of the authors many facts and valuable methods used successfully by their organizations.

In Part IX, the student of pharmacy and the professional pharmacist who has the opportunity to enter the analytical field will find a presentation of valuable information. Each section has been prepared by an individual who is engaged in practical analytical work and who is convinced of the commercial practicability of such work for the pharmacist.

Professor LaWall, who for many years has conducted a successful analytical laboratory and who has been the official chemist of the Bureau of Foods of the Pennsylvania Department of Agriculture for more than twenty years, has written the introductory chapter; Prof. Ivor Griffith, after handling thousands of urine samples, has not only written the chapter on urinalysis in his inimitable style but has illustrated it with his own original drawings. Edward J. Hughes, Assistant Professor of Chemistry at the Philadelphia College of Pharmacy and Science has explained the chemical assays of the U. S. P. and N. F.; Jos. W. E. Harrisson, analytical chemist of large experience, associated with Professor LaWall and an assistant chemist of the Pennsylvania Bureau of Chemistry and Foods, has explained the official Proximate Assays, and Dr. Paul S. Pittinger, Instructor in Biologic Assaying at the Philadelphia College of Pharmacy and Science and member of the Bio-Assay Subcommittee of the U. S. P. Committee of Revision has prepared the Chapter on Biological Standardization.

Part X deals with large manufacturing operations in pharmacy. The presentation here considers chiefly the control methods required for large scale processes and has been prepared by Prof. Charles E. Vanderkleed, Lecturer on Chemical Control in the Philadelphia College of Pharmacy and Science. Professor Vanderkleed has had more than thirty years of experience as the director of large manufacturing pharmaceutical laboratories.

Many valuable suggestions in detailed manufacturing operations found elsewhere in the book, such as percolation, distillation, tablet making, tablet and pill coating, ointment manufacture, etc., have been contributed by

Charles S. Herron, graduate pharmacist and manufacturing pharmacist of large experience, L. T. Andrews of New York, manufacturing pharmacist and chemist with extensive training and many original ideas, and Mr. Francis J. Stokes, manufacturer and operator of manufacturing machinery and equipment. The section on drug milling was completely rewritten by A. John Schwarz, pharmacognocist and botanist, from his large experience in controlling the crude drug supplies of a large pharmaceutical manufacturer.

Recognizing that the prescription pharmacist, in the final analysis, contributes the most important professional service offered by pharmacy, probably more effort has been concentrated on Part XI than on any other section of the book. Especial emphasis has been placed upon the ethical basis which must inspire this service if it is to be acceptable and efficient.

To insure the inclusion of the latest and more efficient dispensing methods, a number of professional pharmacists were invited to collaborate. Among these are names so well known to most American pharmacists that they need no comment: William L. Cliffe, Philadelphia, Pa., Samuel L. Hilton, Washington, D.C., Ambrose Hunsberger, Philadelphia, Pa., J. Lewis Nebinger, (special instructor in Dispensing at the Philadelphia College of Pharmacy and Science and director of a retail prescription department in Philadelphia where from four to five hundred prescriptions are compounded daily), Leonard A. Seltzer, and William Alanson Hall, well-known professional pharmacists of Detroit, Michigan, and Prof. Adley B. Nichols, Assistant Professor of Operative Pharmacy at the Philadelphia College of Pharmacy and Science. As has already been indicated many other prescription pharmacists have been consulted and their ideas included, but only a general acknowledgment can be made. Years of accumulated information from hundreds of sources are represented and are acknowledged in the text whenever their origin is definitely known.

The section on sterilization and sterile products presents the methods of the N. F. V, but much added material is given through the coöperation of Samuel L. Hilton and Gilbert L. Harvey, each of whom has had extensive experience in the preparation of sterile solutions.

Part XII on Homeopathic Pharmacy has been prepared by John A. Borneman, who is an authority in this field, being Professor of Pharmacy at Hahnemann Medical College in Philadelphia and a manufacturer of homeopathic products for many years.

It is hoped that Part XIII will aid the pharmacist in answering many of the questions concerning the elimination of such household parts as fleas, rats, flies, etc. Accurate information is also included on the use of disinfectants and the proper treatment of infectious material in cases of contagious disease. This material is abstracted or quoted from popular bulletins on these subjects as issued by the Public Health Service of the United States or by the Bureau of Chemistry, Washington, D.C. Permission was granted for the use of this material.

In Part XIV is presented a systematic consideration of those biological products which have received the approval and are manufactured under the control of the Hygienic Laboratory of the U. S. Public Health Service.

Dr. F. M. Huntoon, Medical Director of H. K. Mulford Company and in charge of research in immunology and bacteriology in that laboratory, and Robt. H. Hutchinson, Director of the Professional Service Bureau of the H. K. Mulford Company have collaborated in this section. The information is sufficiently detailed and illustrated to provide a comprehensive knowledge of those biological products which have received general approval and which are being largely used by the medical profession. The pharmacist with this information available, can intelligently handle and discuss with physicians these important modern therapeutic agents.

Dr. Horatio C. Wood, Jr., Professor of Pharmacology and Therapeutics in the University of Pennsylvania and Professor of Materia Medica at the Philadelphia College of Pharmacy and Science, has prepared Part XV on Toxicology and Antidotes. It is recognized that the pharmacist is called upon to give only first aid treatment in cases of poisoning and that is the viewpoint from which this Chapter is prepared. It, however, places much valuable information at the ready disposal of the pharmacist for such emergency conditions as may at any time arise.

The outline of a laboratory course in manufacturing pharmacy represents the experience of Professor Cook in teaching this subject and is offered with the hope that it may aid in standardizing the teaching in this branch. The Pharmaceutical Syllabus is taken as a basis but with further extensions and details.

Two glossaries are appended. The one including unusual pharmaceutical terms has long been a valuable feature of the book and has been further elaborated. The glossary of medical terms was added to aid the student in his study of the therapeutic uses of drugs, where the meaning of a medical term used in this book is not understood and a dictionary is not available.

In conclusion the authors wish to gratefully acknowledge the assistance of a number of others who have rendered special aid in various parts of the revision. Prof. Eugene G. Eberle, Professor of Pharmacy for many years in Baylor University, College of Pharmacy, and a nationally known pharmacist and writer, read all proofs and offered many helpful suggestions, especially of an editorial character; Ralph L. Calvert, Instructor in Pharmaceutical Latin at the Philadelphia College of Pharmacy and Science, has carefully checked all statements concerning the use of Latin in prescription filling. Dr. Arthur D. Holmes, Director of Research in the E. L. Patch Company, has prepared the statements concerning cod liver oil and its assay. The very complete sections on plasters, surgical dressings, first aid outfits, and sutures and ligatures have been prepared by Dr. Fred B. Kilmer, the director of the Scientific Departments of Johnson and Johnson. Millicent R. LaWall, Marguerite S. Cook and Beulah H. Tullar have assisted editorially through the book in many capacities such as in the compilation of information and the

reading of proof, and to Mrs. Tullar has fallen the task of preparing the extensive index upon which the value of the book so largely depends.

The authors are indebted to Mr. Arthur H. Thomas, to Whitall Tatum Company, and a number of other manufacturers for the use of illustrations. The line drawings which have been added were made by Mr. B. C. Kolb.

In a work so comprehensive and involving so large an amount of labor many other associates have aided and to these the authors wish to express their appreciation, and finally present this volume as a contribution to the profession of pharmacy, with the hope that it may serve its day and meet the needs of this generation as fully as did the first volume when presented by its illustrious author, Joseph P. Remington, in 1885.

PHILADELPHIA, MAY 1, 1926.

PREFACE TO THE FIRST EDITION

THE rapid and substantial progress made in Pharmacy within the last decade has created a necessity for a work treating of the improved apparatus, the revised processes, and the recently introduced preparations of the age.

The vast advances made in theoretical and applied chemistry and physics have much to do with the development of pharmaceutical science, and these have been reflected in all the revised editions of the Pharmacopœias which have been recently published. When the author was elected in 1874 to the chair of Theory and Practice of Pharmacy in the Philadelphia College of Pharmacy, the outlines of study which had been so carefully prepared for the classes by his eminent predecessors, Professor William Procter, Jr., and Professor Edward Parrish, were found to be not strictly in accord, either in their arrangement of the subjects or in their method of treatment. Desiring to preserve the distinctive characteristics of each, an effort was at once made to frame a system which should embody their valuable features, embrace new subjects, and still retain that harmony of plan and proper sequence which are absolutely essential to the success of any system.

The strictly alphabetical classification of subjects which is now universally adopted by pharmacopœias and dispensatories, although admirable in works of reference, presents an effectual stumblingblock to the acquisition of pharmaceutical knowledge through systematic study; the vast accumulation of facts collected under each head being arranged lexically, they necessarily have no connection with one another, and thus the saving of labor effected by considering similar groups together, and the value of the association of kindred subjects, are lost to the student. In the method of grouping the subjects which is herein adopted, the constant aim has been to arrange the latter in such a manner that the reader shall be gradually led from the consideration of elementary subjects to those which involve more advanced knowledge, whilst the groups themselves are so placed as to follow one another in a natural sequence.

The work is divided into six parts. Part I is devoted to detailed descriptions of apparatus and definitions and comments on general pharmaceutical processes.

The Officinal Preparations alone are considered in Part II. Due weight and prominence are thus given to the Pharmacopœia, the National authority, which is now so thoroughly recognized.

In order to suit the convenience of pharmacists who prefer to *weigh solids* and *measure liquids*, the officinal formulas are expressed, in addition to parts by weight, in *avoirdupois weight* and *apothecaries' measure*. These equivalents are printed in *bold type*, near the margin, and arranged so as to fit them for quick and accurate reference.

Part III treats of Inorganic Chemical Substances. Precedence is of course given to officinal preparations in these. The descriptions, solubilities, and tests for identity and impurities of each substance are systematically tabulated under its proper title. It is confidently believed that by this method of arrangement the valuable descriptive features of the Pharmacopœia will be

more prominently developed, ready reference facilitated, and close study of the details rendered easy. Each chemical operation is accompanied by equations, whilst the reaction is, in addition, explained in words.

The Carbon Compounds, or Organic Chemical Substances, are considered in Part IV. These are naturally grouped according to the physical and medical properties of their principal constituents, beginning with simple bodies like cellulin, gum, etc., and progressing to the most highly organized alkaloids, etc.

Part V is devoted to Extemporaneous Pharmacy. Care has been taken to treat of the practice which would be best adapted for the needs of the many pharmacists who conduct operations upon a moderate scale, rather than for those of the few who manage very large establishments. In this, as well as in other parts of the work, operations are illustrated which are conducted by manufacturing pharmacists.

Part VI contains a formulary of Pharmaceutical Preparations which have not been recognized by the Pharmacopœia. The recipes selected are chiefly those which have been heretofore rather difficult of access to most pharmacists, yet such as are likely to be in request. Many private formulas are embraced in the collection; and such of the preparations of the old Pharmacopœias as have not been included in the new edition, but are still in use, have been inserted.

In conclusion, the author ventures to express the hope that the work will prove an efficient help to the pharmaceutical student as well as to the pharmacist and the physician. Although the labor has been mainly performed amidst the harassing cares of active professional duties, and perfection is known to be unattainable, no pains has been spared to discover and correct errors and omissions in the text. The author's warmest acknowledgments are tendered to Mr. A. B. Taylor, Mr. Joseph McCreery, and Mr. George M. Smith for their valuable assistance in revising the proof sheets, and to the latter especially for his work on the index. The outline illustrations, by Mr. John Collins, were drawn either from the actual objects or from photographs taken by the author.

J. P. R.

136.	Glass evaporating dish	125
137.	Enameled cast iron dishes	125
138.	Agate ware evaporating dish	125
139.	Glass-lined open crystallizing pan	125
140.	Stirrers	126
141.	Small vacuum still	126
142.	Vacuum still	126
143.	Apparatus for recovering alcohol from exhausted drugs	127
144.	Vacuum dryer	127
145.	Evaporating sulphuric acid	128
146.	Flask evaporation	128
147.	Drying closet	128
148.	Drying closet with trays on portable frames	129
149.	Graduated evaporating dish	129
150.	Measuring evaporation	129
151.	Hood	130
152.	Fume closet	130
153.	Grommet	130
154.	Alembic	131
155.	Japanese lambik	131
156.	Plain retort	132
157.	Tubulated retort	132
158.	Distilling flask	132
159.	Soxhlet apparatus	133
160.	Special form of glass condenser	133
160*a*.	Trap bulb	134
161.	Tube properly bent	134
162.	Tube unequally heated	134
163.	Tube hastily bent	134
164.	Holding the tube	134
165.	Well drawn tube	135
166.	Tube unevenly heated	135
167.	Tube carelessly drawn	135
168.	Cork borers	135
169.	Rat tail file	135
170.	Rasp and file	135
171.	Bladder joint	136
172.	Bladder joint	136
173.	Rubber joint	136
174.	Plain receiver	137
175.	Tubulated receiver	137
176.	Tubulated and quilled receiver	137
177.	Mode of using quilled receiver	137
178.	Adapters	137
179.	Use of adapter	137
180.	Funnel tubes	138
181.	Improvised funnel tube	138
182.	Charging a plain retort	138
183.	Safety tube	138
184.	Retort stand	138
185.	Retort ring clamp	138
186.	Portable retort stand	139
186*a*.	Funnel stand	139
187.	Ring with split sections of rubber tubing	139
188.	Clamp extension	139
189.	Clamp holder	139
190.	Various forms of Leibig condensers	140
191.	Flask distillate	140
192.	Tube condenser in use	140
193.	Pinchcock	140
194.	Pinchcock	140
195.	Metallic worm condenser	141
196.	Glass worm condenser	141
197.	Remington still	141
198.	Stokes' automatic water still	142
199.	Barnstead water still	142
200.	Receiving distilled water from an automatic still	143
201.	Regnault still	143
202.	Redistilling outfit with rectifying column	144
203.	Effect of vacuum and pressure	144

REMINGTON'S PRACTICE OF PHARMACY

PART I

INTRODUCTION, HISTORY, PHARMACOPŒIAS, FORMULARIES, AND OTHER STANDARD BOOKS

CHAPTER I

SCOPE AND HISTORY OF PHARMACY

PHARMACY is the science which treats of medicinal substances. It embraces not only a knowledge of medicines and the art of preparing and dispensing them, but also their identification, selection, preservation, combination, analysis, and standardization. The discovery of new medicinal drugs and the synthesis of organic compounds of therapeutic value are important functions of scientific pharmacy.

The word Pharmacy is also used to designate the place where medicines are sold.

Compounding consists of the skilful blending of two or more ingredients. In *dispensing* the pharmacist transfers from one container to another. These acts legally distinguish the practice of pharmacy from mere merchandising, there being drug stores which are not legally classed as pharmacies.

For convenience in study, Pharmacy may be divided into two major classes: *Theoretical Pharmacy* and *Practical Pharmacy*.

Theoretical Pharmacy—Inasmuch as all Nature, animate and inanimate, has been laid under contribution to provide remedies for the alleviation of disease, it follows that those sciences which embrace a knowledge of substances obtained from the vegetable, mineral, and animal kingdoms, as well as those which treat of the laws governing them, are called upon to supply important facts which form the basis of the science of Pharmacy.

Botany, the science of plants, *Mineralogy*, that of inorganic substances found in or on the earth, *Biology*, the science which treats of life, and *Zoölogy*, the science which treats of animals, are, however, less important than *Chemistry* and *Physics;* for upon these two Pharmacy is most dependent for its greatest development and its highest degree of usefulness.

Physics or *Natural Philosophy* is that branch of science which describes and explains the changes produced in bodies, by which their specific identity is not destroyed, while *Chemistry* treats of those changes which affect the specific identity of the bodies.

Materia Medica (medicinal materials) is a term applied to designate the substances which are used in the cure of disease; it is most intimately connected with *Pharmacognosy*, the science which treats of crude drugs. The specific definition of Pharmacy limits the latter to the consideration of the preparations made from drugs.

In schools and colleges of pharmacy, it is usual to divide General Pharmacy into three departments—Chemistry, Botany and Materia Medica, and Theory and Practice of Pharmacy.

Toxicology, the science of poisons, *Microscopy*, the science requiring optical instruments called microscopes, *Bacteriology*, a natural science which treats of micro-organisms, and *Serology*, dealing with serum products, form valuable collateral and special subjects of study. *Biological Assay* or *Physiological Standardization*, formerly known as *Pharmacodynamics*, deals with the action of drugs upon healthy animal organs. *Posology* is the science of doses for medicinal substances.

Pharmacology is broadly defined as the science of drugs. Unfortunately the name has also been used by specialists to indicate the action of drugs on living organisms and is employed synonymously with pharmacodynamics.

Practical Pharmacy is that branch of Pharmacy which treats of the operations, processes, and methods used in applying the principles of theoretical pharmacy. It is sometimes known as *Operative Pharmacy*.

During 1924 and 1925 the Educational Research Committee of the Commonwealth Fund, under the direction of W. W. Charters, conducted a study of pharmacy to determine the educational and training requirements for one who is to become a competent professional pharmacist. The conclusion of this portion of their report presents such a comprehensive view of pharmaceutical service that it is copied in full.

"In conclusion, then, we present this picture of the typical pharmacist which the college of pharmacy is to train. He is a man with interests and obligations outside of his profession; his personality and character should be of a high degree of competence. In his profession he buys and sells a wide variety of products, he fills prescriptions and manufactures those products which it is advisable not to purchase. He assists in the control of insects, fungi, and germs. He is a valuable source of information on public and private health and on other scientific matters. As a pharmacist he intelligently reads the authoritative treatises of his profession; he endeavors to understand and obey the laws of his country and he continually labors to keep abreast of his profession."

This guide book for the pharmacist endeavors to provide technical assistance in all of the varied activities and services recognized in the Commonwealth study.

HISTORICAL INTRODUCTION

Pharmacy, the art of identifying, selecting, preserving, and combining drugs of animal, plant or mineral origin, and medicine, the art of restoring or preserving health by the administration of these substances, are closely related professions, which are indistinguishable in their early history because of the fact that their practice was combined in one and the same individual who was frequently the priest or religious leader as well.

The beginnings of both medicine and pharmacy are so closely interwoven with superstition and fable that it is difficult to separate the real from the mythical. Disease was at first believed to be caused by evil spirits, hence incantations, noises, and odors were as frequently employed as remedies of a more material and efficacious character.

Isis and Osiris of Egypt are among the earliest of the mythical personages to whom have been attributed the origin of the healing arts. The Egyptian Thoth, also called Hermes, appears in this connection, although more particularly with relation to the beginning of alchemy or chemistry. Bacchus, Apollo, and Ammon of the Greeks, and Zoroaster of the Persians, claimed a share in these traditions. The most prominent of all of these mythical personages was Æsculapius (Fig. 1), the son of Apollo and pupil of

Chiron. It is he whose emblem, the *caduceus* (the serpents twining on a staff) originally carried by Hermes, is still seen in connection with medical insignia. His untimely end by a thunderbolt from Jove for having presumed to develop his art so far as to raise the dead to life, led to an interesting series of complications which are entertainingly described in any work on mythology. Æsculapius is credited with having had a number of children of whom the most notable was Hygeia, representing health, and Panacea, representing medicine.

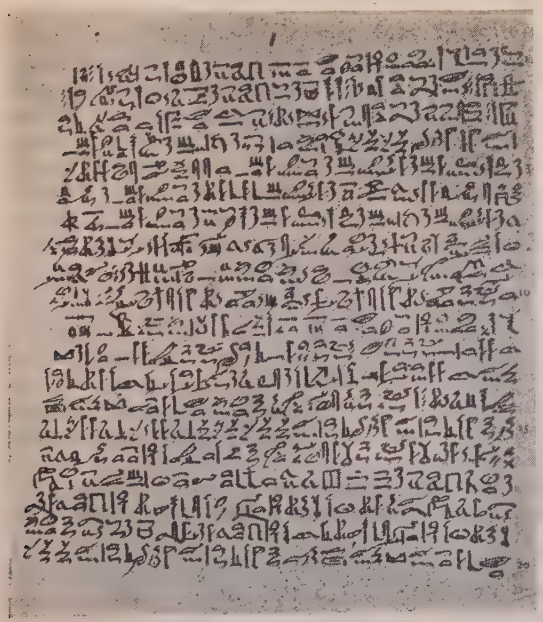
Fig. 1

ÆSCULAPIUS
(A statue at Naples)

Cosmas and Damien, who are still regarded with veneration as patron saints of Pharmacy in some European countries, were not mythological characters, but their history is such a jumble of fact and fancy that they properly belong to the mythology rather than to the history of the profession. They were victims of the Diocletian persecution in the fourth century and for centuries their tomb at Cyrus in Syria was worshiped as a shrine. Churches have been built in their honor in Constantinople and also in Rome, and their memory has been celebrated for many centuries by physicians and pharmacists of Catholic Europe on September 27th of each year.

The first real manuscript or literature pertaining to pharmacy and medicine is the papyrus, or scroll, called the *Papyrus Ebers* (Fig. 2), because it was discovered and partly translated by the noted Egyptologist of that name. It is a continuous roll of manuscript about 12 inches wide and over 250 feet in length and dates from about the sixteenth century before Christ, which is shortly prior to the time of Moses. It contains chapters not only on remedial agents and their methods for compounding, but also on means of conjuring away diseases. Many of the drugs enumerated are in common use today.

Fig. 2

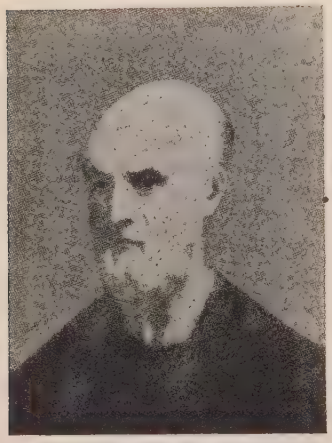


FIRST PAGE OF EBER'S PAPYRUS
(From The Evolution of Modern Medicine, by Sir William Osler)

Polypharmacy, or the prescribing of a multiplicity of ingredients in one compound seems to have been the practice of that early day. Some of the formulas contain as many as thirty-five ingredients. The writing of the Papyrus is in black ink, but the chapter heads and weights and measures are written in red ink. Evidence that the formulas were used is found in the fact that opposite many of them some commentator, or possibly an ancient apothecary, has written on the margin, "good".

Scientific pharmacy and medicine, until separated from mythology, really began with Hippocrates (Fig. 3), who was born on the Island of Cos in 460 B. C. Hippocrates was a keen observer, accurate thinker, and a clear and concise writer. He said among many other wise things, "Life is short, opportunity fleeting, judgment difficult, treatment easy, but treatment after thought is proper and profitable." In the writings of Hippocrates nearly 400 drugs are named as medicines and a large number of these are still used. He directed and employed preparations belonging to the classes of poultices, gargles, pills, ointments, collyria, and inhalations. He is best known as the author of that noble and idealistic code called the "Hippocratic Oath", which is the foundation of medical ethics and which is still administered in many medical colleges. The *Hippocratic Oath* is as follows:

FIG. 3



HIPPOCRATES
(Painting in the College of Physicians and Surgeons, Philadelphia, by Fanny Darrach)

"I swear by Apollo, the physician, and Æsculapius, and Hygeia, and Panacea, and all the gods and all the goddesses—and I make them my judges—that this mine oath and this my written engagement I will fulfil as far as power and discernment shall be mine.

"Him who taught me this art I will esteem even as I do my parents; He shall partake of my livelihood, and, if in want, shall share my goods. I will regard his issue as my brothers and will teach them this art without fee or written engagement if they shall wish to learn it.

"I will give instruction by precept, by discourse, and in all other ways to my own sons, to those of him who taught me, to disciples bound by written engagements and sworn according to medical law, and to no other person. So far as power and discernment shall be mine, I will carry out regimen for the sick and will keep them from harm and wrong. To none will I give a deadly drug, even if solicited, nor offer counsel to such an end; likewise to no women will I give a destructive suppository; but guiltless and hallowed will I keep my life and mine art. I will cut no one whatever for the stone, but will give way to those who work at this practice.

"Into whatsoever houses I shall enter I shall go for the benefit of the sick, holding aloof from all voluntary wrong and corruption, including venereal acts upon the bodies of females and males, whether free or slaves. Whatsoever in my practice or not in my practice I shall see or hear amid the lives of men which ought not be noised abroad—as to this I will keep silence, holding such things unfitting to be spoken.

"And now if I shall fulfil this oath and break it not, may the fruits of life and art be mine, may I be honored of all men for all time; the opposite if I shall transgress or be forsworn."

There was much experimentation along empirical lines in those early times and no opportunity for a systematic training except under a preceptor or master of an art or profession.

At the beginning of the Christian Era there were several Greeks and Romans whose names stood out prominently. Celsus, a Roman, was really a compiler of an encyclopedic collection of knowledge rather than a practitioner. Dioscorides, a physician, was especially noted for his work on Materia

Medica, and was the recognized authority in that subject for over 1600 years. Pliny, a Roman physician, whose specialty was natural history, was also the author of an encyclopedic work including medicine and pharmacy. Galen (Fig. 4) was a Greek who attained to Roman citizenship and made his reputation under the Cæsars. He was both a pharmacist and a physician. He originated so many preparations of vegetable drugs that such preparations are called "galenicals" or "galenical preparations" even at the present time. One of the commonly used articles originated by him and which has come down to us almost unchanged for nearly 2000 years, is the toilet preparation known as "cold cream".

FIG. 4

GALEN
(From Les Collections Artistiques de la Medecine de Paris)

The first six centuries of the Christian Era are what are known as the Dark Ages because of the lack of progress of civilization and all that pertains to it during this long period. There are really no names up to the twelfth or thirteenth centuries, except those of Arabic origin, which have anything to do with the development of medicine or pharmacy. The Arabs, who had attained the zenith of their success during this period, utilized works of Hippocrates, Galen, Dioscorides, and others, to the fullest extent.

Pharmacies, as separate places where drugs were compounded and sold, were first instituted during this Arabic period. The Arabians who attained the greatest fame in medicine, pharmacy, and alchemy were Geber and Mesue, of the eighth century, and Rhazes and Avicenna of the ninth century. The most famous of the Arabic figures in medicine and pharmacy, however, was Maimonides, who was the author of another contribution having an influence upon pharmaceutical ethics. It is known as the *Oath and Prayer of Maimonides* and is as follows:

"Thy Eternal Providence has appointed me to watch over the life and health of Thy creatures. May the love for my art actuate me at all times; may neither avarice, nor miserliness, nor thirst for glory, or for a great reputation engage my mind; for the enemies of Truth and Philanthropy could easily deceive me and make me forgetful of my lofty aim of doing good to Thy children.

"May I never see in the patient anything but a fellow creature in pain.

"Grant me strength, time and opportunity always to correct what I have acquired, always to extend its domain; for knowledge is immense and the spirit of man can extend infinitely to enrich itself daily with new requirements. Today he can discover his errors of yesterday and tomorrow he may obtain a new light on what he thinks himself sure of today.

"O God, Thou hast appointed me to watch over the life and death of Thy creatures; here am I ready for my vocation.

"And now I turn unto my calling:"

O stand by me, my God, in this truly important task;
Grant me success! For—
Without Thy loving counsel and support,
Man can avail but naught.
Inspire me with true love for this my art
And for Thy creatures,
O, grant—

That neither greed for gain, nor thirst for fame, nor vain ambition,
May interfere with my activity.
For these I know are enemies of truth and love of men.
And might beguile one in profession,
From furthering the welfare of Thy creatures.
O strengthen me.
Grant energy unto both body and the soul
That I might e'er unhindered ready be
To mitigate the woes,
Sustain and help
The rich and poor, the good and bad, enemy and friend,
O let me e'er behold in the afflicted and the suffering,
Only the human being.

In the eleventh century the period of the Crusades began, and this had a stimulating influence upon all scientific and professional knowledge. During the period of the Arabic domination, great schools of learning had been established at Salerno, Cordova, Seville, and Toledo. These were followed by others at Montpelier, Padua, and Leyden. In these schools pharmacy was taught as a part of the study of medicine. The first undoubted record of the separation of medicine and pharmacy is found in a decree of the Emperor Frederick II of Sicily, who in 1233, just after the close of the Crusades, issued an edict regulating the practice of pharmacy in his kingdom. This law mentions the "apotheca" as being the warehouses where drugs and medicines were stored. The compounders were called *confectionarii* while the sellers of simple medicines were called *stationarii* and the shops were called *stationes*. Physicians were neither permitted to conduct pharmacies nor to derive any profit from the sale of medicine by clandestine arrangements with any confectionarius. The confectionarii in their turn, were required to take an oath to prepare all medicines according to the formulary of the Salernian School. The prices which they were permitted to charge were regulated by law and were so graduated as to permit greater proportional profits upon those substances which were less frequently called for.

Pharmacies were permitted only in the principal cities and then under restrictions as to management and responsibility. This undoubtedly was the origin of the restriction of the practice of pharmacy. This restriction is still maintained in many European countries.

At this time the physician used no other drugs than those recommended by the ancients. As most of these came from far off lands, they were both rare and costly. Many herbs and plants were required to be gathered when the sun and planets were in certain constellations and certificates of their proper origin were needed. All this was impossible without a distinct employment of those who dealt in drugs and compounded them and it was found convenient to permit the dealers in drugs gradually to acquire monopolies.

The preparation of medicines was becoming more difficult and expensive. The invention by the Arabs of distillation, sublimation, and other chemical processes necessitated laboratories, furnaces, and costly apparatus, so it was thought proper that those who devoted themselves to pharmacy, which also included the practice of chemistry or alchemy, as it was then called, should have indemnification by an exclusive trade and thus they could be kept under close and effective supervision. Pharmacists were also allowed at that time to deal in sweetmeats and confections, which were then great luxuries.

The first organized body of pharmacists originated in Bruges, Belgium, in 1297. It was in the nature of a secret society and possessed a hall, constitution and by-laws, and an official seal. This was the period at which guilds, as professional and trade organizations were called, were very common. Other guilds

or organized bodies of apothecaries were soon formed in different parts of Europe and were the prototypes of the pharmaceutical organizations of the present time.

The word "apothecary" is derived from the Latin root "apothec" meaning a warehouse for drugs and medicines. The apothecary was originally a wholesaler. The word "apothecary" as translated in the Bible, should, in all probability, be translated "perfumer" as there is no clear record of the practice of the art of the apothecary as such among the early Hebrews, nor are there references to the administration of internal remedies in Biblical literature.

The perfumer, on the other hand, was intimately associated with religious practices, in that the preparation of the incense and of the anointing oils required a person skilled in compounding such ingredients.

The word "pharmacy" comes to us from the Greek root "*pharmakon*" which originally meant to mix and later meant a drug, medicine, or poison. The words drug and druggist are of more modern origin; the latter originally signified one who dealt in dry herbs.

Chemistry, through alchemy, is a word of Arabic origin, the original name being "Khem", the ancient name of Egypt. The prefix "al" is the common Arabic prefix meaning "the". Alchemy, however, originally referred to the practices of the Egyptians who were skilled as metal workers and in the art of glass making and other industries which have chemical knowledge as a basis.

From the 15th to 17th centuries, pharmacy probably reached the zenith of its success as a mysterious art. The rarity and cost of the raw materials, the many difficult and tedious operations which had to be undertaken to prepare even the simplest medicines, all combined to make the pharmacist a person not only of great technical skill but one who was absolutely indispensable to the success of the physician. In some countries, during the 17th century, particularly in England and France, the pharmacists were allied with the grocers, final separation of the groups being effected by the establishment of guilds of apothecaries under royal sanction.

As pharmacy and medicine were intimately associated during the earlier period, so pharmacy and alchemy, likewise were associated during the later period immediately preceding the birth of chemistry as an exact science. In this period lived a character who had a greater influence upon pharmacy and medicine than any individual since the beginning of the Christian Era. His real name was Philipus Aureolus Theophrastus Bombastus von Hohenheim, but he called himself Paracelsus, and by that name he is best known.

The early history of chemistry or alchemy had been influenced by the futile search for two mythical or imaginary substances,—the *Philosopher's Stone* and the *Elixir of Life*. The former was credited with the power of changing baser metals into gold, and the latter with conferring upon its possessor and user perpetual youth. Many fruitless years were spent by the wisest and the greatest of investigators in this futile quest, the by-products of the investigations being the discovery of many substances useful to mankind and the establishing of certain fundamental principles which led to the development of chemistry as a true science instead of an empiric and mysterious art.

Paracelsus condemned the uselessness of the search for these non-existent substances and was the founder of what came to be known as the iatrochemical school of medicine, in which chemical salts came for the first time to be used internally in the treatment of disease. Paracelsus, after having made some revolutionary changes in scientific thought, died in 1541. One of his successors, J. B. Van Helmont, who discovered carbon dioxide and who coined the word "gas", and Johann Rudolph Glauber, a German pharmacist and chemist, who

originated and studied the properties of the substance still known as Glauber's salt applied themselves particularly to the adaptations of chemistry to pharmacy and medicine.

Carl Wilhelm Scheele was a distinguished pharmacist of the eighteenth century. Scheele is credited with having made more important discoveries covering a wider range of subjects than any other investigator before or since. Trommsdorf of Germany and Dover and Fowler of England were prominent pharmacists of the eighteenth century. The names of Dover and Fowler are attached to pharmaceutical preparations still widely used in prescription practice.

For the guidance of physicians and pharmacists, books called pharmacopœias, or dispensatories, had appeared. One of the earliest of these was originated by Valerus Cordus, in 1524. The Pharmacopœia of Augsberg, known as the Pharmacopœia Augustana, which was issued in 1601 was probably the first book of standards given official authority by a city or community. Following close after that was the first London Pharmacopœia of 1618, which was largely based upon the older formularies of the Arabians and of Galen. The first Paris Pharmacopœia was issued in 1639. Pharmacopœias were at that time not nationally issued but were sponsored by communities or cities. The pharmacopœias of London, of Edinburgh, of Dublin, of Paris, of Nuremberg, and of many other European cities were often conflicting in the formulas for similiar preparations.

The first national pharmacopœia was that of France, known as the French Codex (*Codex Medicamentarius Gallicus*), which was issued in 1818. The second of the national pharmacopœias to appear was the United States Pharmacopœia, which was first issued in 1821. The first British Pharmacopœia did not replace the Pharmacopœias of London, Edinburgh, and Dublin until 1864, and the first German Pharmacopœia appeared in 1872.

Pharmaceutical education had developed in Europe to a considerable extent before any college appeared in America. The Philadelphia College of Pharmacy, now the Philadelphia College of Pharmacy and Science, was the first college of pharmacy instituted in the United States.[1] This was followed soon after by colleges in New York, Massachusetts, and Baltimore, and at present there are upwards of fifty colleges of pharmacy in the United States, many of which are departments of state universities and the majority of which are in agreement as to entrance requirements, curricula, and degrees.

The practice of pharmacy so far as its external appearance is concerned has changed markedly during the historic periods so briefly described, especially in the past few decades. It is, however, primarily concerned with the compounding, dispensing, and sale of remedial agents, and registration in the various states is based upon evidence of scientific and professional ability.

The development of pharmacy during the nineteenth century was along more scientific lines. The discovery of the alkaloids brought into prominence many names, among which were Vauquelin, Sequin, Derosne, Serturner, Pelletier, and Caventou. The origin and development of percolation added the names of Real, Robiquet, and Boullay. Now for the first time American names begin to appear in the scientific and educational literature of the profession. Parrish, Procter, Maisch, Remington, Wilbert, Daniel B. Smith, Alfred B. Taylor, and Kraemer of Philadelphia; Bedford, Rice, Squibb, Coghall, and Milhau of New York; William J. M. Gordon of Cincinnati; Grahame, Hancock, and Charles E. Dohme, of Baltimore; George W. Sloan, Eli Lilly, and Eliel of Indiana; Frederick Stearns of Detroit; Prescott and

[1] See "The First Century of the Philadelphia College of Pharmacy".

Schlotterbeck of Ann Arbor; Sheppard and Markoe of Boston; Hallberg, Oldberg, and Ebert of Chicago; Enno Sanders and Good of St. Louis; Scheffer and Diehl of Louisville; William S. Thompson of Washington; Searby of California; William Simpson of North Carolina; and William Saunders of Ontario, are but a few of the illustrious names of those who worked unceasingly for the advancement of pharmacy during the period immediately preceding the present era.

The successive revisions of the United States Pharmacopœia, each one an advance in scientific knowledge over its predecessor, the development of pharmacy laws in the various states, and the passage of the Federal Food and Drugs Act in 1906, have combined to increase the importance of the professional side of pharmacy.

The pharmacist has great responsibilities under the law, and toward the public. He is held accountable for his scientific knowledge and his registration is dependent upon proof of this fact. He is given certain privileges in return for his acceptance of these responsibilities and the sum total of his duties, responsibilities, and privileges, as is similarly true of other professions, is embodied in the ethical codes which have been adopted from time to time by various organized bodies of pharmacists.

Since 1921 a unified code of ethics has been adopted by the various national pharmaceutical organizations and by the colleges of pharmacy. This code of ethics gives the best insight into the professional responsibilities of the pharmacist that can be furnished, and it is quoted here in full:—

Principles of Pharmaceutical Ethics

I

The Duties of the Pharmacist in Connection with his Services to the Public

Pharmacy has for its primary object the service which it can render to the public in safeguarding the handling, sale, compounding, and dispensing of medicinal substances.

The practice of pharmacy demands knowledge, skill, and integrity on the part of those engaged in it. Pharmacists are required to pass certain educational tests in order to qualify under the laws of our States. The States thus restrict the practice of pharmacy to those persons who, by reason of special training and qualifications, are able to qualify under regulatory requirements, and grant to them privileges necessarily denied to others.

In return the States expect the pharmacist to recognize his responsibility to the community and to fulfil his professional obligations honorably and with due regard for the physical and moral well being of society.

The pharmacist should uphold the approved legal standards of the United States Pharmacopœia and of the National Formulary for articles which are official in either of these works, and should, as far as possible, encourage the use of these official drugs and preparations and discourage the use of objectionable nostrums. He should sell and dispense only drugs of the best quality for medicinal use and for filling prescriptions.

He should neither buy, sell, nor use substandard drugs for uses which are in any way connected with medicinal purposes.

The pharmacist should be properly remunerated by the public for his knowledge and skill when used in its behalf in compounding prescriptions, and his fee for such personal work should take into account the time consumed and the great responsibility involved as well as the cost of the ingredients.

The pharmacist should not sell or dispense powerful drugs and poisons to

persons not properly qualified to administer or use them, and should use every proper precaution to safeguard the public from poisons and from all habit-forming medicines.

The pharmacist, being legally entrusted with the dispensing and sale of narcotic drugs and alcoholic liquors, should merit this responsibility by upholding and conforming to the laws and regulations governing the distribution of these substances.

The pharmacist should seek to enlist and merit the confidence of his patrons and when this confidence is won it should be jealously guarded and never abused by extortion or misrepresentation or in any other manner.

The pharmacist should consider the knowledge which he gains of the ailments of his patrons and their confidences regarding these matters as entrusted to his honor, and he should never divulge such facts unless compelled to do so by law.

The pharmacist should hold the health and safety of his patrons to be of first consideration; he should make no attempt to prescribe or treat diseases or strive to sell drugs or remedies of any kind simply for the sake of profit.

He should keep his pharmacy clean, neat, and sanitary in all its departments and should be well supplied with accurate measuring and weighing devices and other suitable apparatus for the proper performance of his professional duties.

It is considered inimical to public welfare for the pharmacist to have any clandestine arrangement with any physician in which fees are divided or in which secret prescriptions are concerned.

The pharmacist should primarily be a good citizen, and should uphold and defend the laws of the state and nation. He should inform himself concerning the laws, particularly those relating to food and drug adulteration and those pertaining to health and sanitation, and should always be ready to coöperate with the proper authorities having charge of the enforcement of the laws.

The pharmacist should be willing to join any constructive effort to promote the public welfare and he should regulate his public and private conduct and deeds so as to entitle him to the respect and confidence of the community in which he practices.

II

The Duties of the Pharmacist in His Relations to the Physician

The pharmacist, even when urgently requested so to do, should always refuse to prescribe or attempt diagnoses. He should under such circumstances, refer applicants for medical aid to a reputable, legally qualified physician. In cases of extreme emergency, as in accident or sudden illness on the street in which persons are brought to him pending the arrival of a physician, such prompt action should be taken to prevent suffering as is dictated by humanitarian impulses and guided by scientific knowledge and common sense.

The pharmacist should not, under any circumstances, substitute one article for another, or one make of an article for another in a prescription, without the consent of the physician who wrote it. No change should be made in a physician's prescription, except such as is essentially warranted by correct pharmaceutical procedure, nor any that will interfere with the obvious intent of the prescriber, as regards therapeutic action.

He should follow the physician's directions explicitly in the matter of refilling prescriptions, copying the formula upon the label, or giving a copy of the prescription to the patient. He should not add any extra directions or

caution or poison labels without due regard for the wishes of the prescriber, providing the safety of the patient is not jeopardized.

Whenever there is doubt as to the interpretation of the physician's prescription or directions, he should invariably confer with the physician in order to avoid a possible mistake or an unpleasant situation.

He should never discuss the therapeutic effect of a physician's prescription with a patron nor disclose details of composition which the physician has withheld, suggesting to the patient that such details can be properly discussed with the prescriber only.

Where an obvious error or omission in a prescription is detected by the pharmacist, he should protect the interests of his patron and also the reputation of the physician by conferring confidentially upon the subject, using the utmost caution and delicacy in handling such an important matter.

III

The Duties of Pharmacists to Each Other and to the Profession at Large

The pharmacist should strive to perfect and enlarge his professional knowledge. He should contribute his share toward the scientific progress of his profession and encourage and participate in research, investigation, and study.

He should associate himself with pharmaceutical organizations whose aims are compatible with this code of ethics and to whose membership he may be eligible. He should contribute his share of time, energy, and expense to carry on the work of these organizations and promote their welfare. He should keep himself informed upon professional matters by reading current pharmaceutical and medical literature.

He should perform no act, nor should he be a party to any transaction which will bring discredit to himself or to his profession or in any way bring criticism upon it, nor should he unwarrantedly criticise a fellow pharmacist or do anything to diminish the trust reposed in the practitioners of pharmacy.

The pharmacist should expose any corrupt or dishonest conduct of any member of his profession which comes to his certain knowledge through those accredited processes provided by the civil laws or the rules and regulations of pharmaceutical organizations, and should aid in driving the unworthy out of the calling.

He should not accept agencies for objectionable nostrums nor allow his name to be used in connection with advertisements or correspondence for furthering their sale.

He should courteously aid a fellow pharmacist who may request advice or professional information or who, in an emergency, needs supplies.

He should not aid any person to evade legal requirements regarding character, time, or practical experience by carelessly or improperly endorsing or approving statements relating thereto.

He should not imitate the labels of his competitors nor take any other unfair advantage of merited professional or commercial success. When a bottle or package of a medicine is brought to him to be refilled, he should remove all other labels and place his own thereon unless the patron requests otherwise.

He should not fill orders which come to him by mistake, being originally intended for a competitor.

He should deal fairly with manufacturers and wholesale druggists from whom he purchases his supplies; all goods received in error or excess and all undercharges should be as promptly reported as are shortages and overcharges.

He should earnestly strive to follow all proper trade regulations and

rules, promptly meet all obligations, and closely adhere to all contracts and agreements.

In the fourth paragraph in the Principles of Pharmaceutical Ethics the words "objectionable nostrums" appear. An objectionable nostrum is considered to be one which does not comply with the minimum requirements for such preparations as drafted by a committee of the American Pharmaceutical Association.

Extract from the Report for the Committee of the A. Ph. A. on Proprietary Remedies[1]

Minimum Requirements with which Proprietary Remedies Should Comply in Order to Render Them Safe for Direct Sale to the General Public

The following declarations are provisional and subject to repeal, modification, or expansion, as the Commission may later decide.

1. Prescription Fakes, Concealment of Proprietary Character—The preparation must not be named or advertised in such a way as to conceal its proprietary character and lead the purchaser to believe that it is a simple chemical or vegetable drug ordinarily purchasable in small quantities instead of a proprietary mixture or substance.

2. Methods of Marketing—The preparation must be one which is regularly offered to the public through the usual trade channels, *i.e.*, through regular wholesale and retail dealers in ready-made medicines, and thus subject to inspection by the authorities charged with the enforcement of state food and drug laws.

3. Alcohol Content—If the preparation contains alcohol, it must be sufficiently medicated to prevent its use as an intoxicating beverage and in addition to this requirement, the proportion of alcohol present must not be greater than is properly necessary to hold in solution in permanently active condition the essential constituents of the preparation, and to protect the preparation against freezing, fermentation, or other deleterious change.

4. Content of Habit-forming Narcotic Drugs—If the preparation is one which is capable of being used internally, whether recommended for internal use or not, it must not contain cocaine, nor shall it contain opium or any of its alkaloids or their derivatives, in greater proportions than those specified in Section Six of the Federal Law commonly known as the Harrison Act, and it shall also contain other active drugs in such proportion that the use of the preparation will not be likely to create a drug habit, nor satisfy such a habit when previously existing.

5. Remedies for Children's Use—If intended for administration to infants or children, the preparation must not contain cocaine, or opium or its alkaloids, or their derivatives in any proportion whatever.

6. Activity of the Preparation, Cautions Against Misuse—The preparation must be of such character that it will not be liable to endanger life or health when used in accordance with the accompanying instructions, and if the preparation is one which is liable to occasion injury when improperly used or when used to excess, the accompanying literature must bear instructions tending to guard against such improper or excessive use.

7. Immoral or Illegal Purposes—The preparation must not be intended for use as an abortifacient nor for use for any other immoral or illegal purpose, nor must it be advertised or recommended either directly or indirectly as an abortifacient or for any immoral or illegal purposes.

---

[1] Journal of the A. Ph. A. 1915.

8. Incurable and Contagious Diseases—The preparation must not be advertised or recommended as a cure for diseases or conditions which are generally recognised as incurable by the simple administration of drugs, or for the cure of contagious or acute diseases the treatment of which properly requires the supervision of a qualified medical attendant.

9. Conformity to the Federal Food and Drugs Act—Neither the label on the package nor any of the accompanying literature shall bear or contain any statement in conflict with the misbranding provisions of the Federal Food and Drugs Act.

10. Advertising Not Accompanying the Package—Advertising not accompanying the package shall conform substantially to the statements on the label, carton, or in the accompanying circulars as to the origin, composition or character of the preparation, or concerning its curative or remedial value.

The foregoing outline, brief though it is, will serve to acquaint the prospective student in pharmacy with the high lights in the history of the profession. The student who wishes to pursue this interesting subject further may find profitable and entertaining reading in any of the following books, which deal more specifically with the history of Pharmacy: Wooton's *Chronicles of Pharmacy*, Peters' *Pictorial History of Pharmacy*, Bolton's *Follies of Science*, Schelenz' *Geschichte der Pharmacy*, and Berendes' *Das Apothekenwesen*, all of which will be found in any well equipped pharmaceutical library. The Proceedings and the Year Books of the American Pharmaceutical Association contain much material bearing upon the history of pharmacy, and current pharmaceutical literature also contributes to this phase of the study of pharmacy.

CHAPTER II

PHARMACOPŒIAS AND OTHER STANDARD BOOKS ON PHARMACY

A *pharmacopœia* (from the Greek *pharmakon*, "a drug medicine", and *poieo*, "make"), in the modern acceptation of the word, is a book containing a list of medicinal substances, with descriptions, tests, and formulas for preparing the same, selected by some recognized authority. The historical development of pharmacopœias is described on page 8. The necessity for legalized standards to define the character, establish the purity, and regulate the strength of medicines is recognized by all civilized nations; and although all of the nations of the globe have not yet formally adopted national standards, in nearly every case where this has not been done it will be found that the standards of some other country are in use. The most important pharmacopœias, with the dates of their latest issues, are as follows:

Official Pharmacopœias

Nation	Date of Issue	Title
1. United States	1926	Pharmacopœia of the United States of America, Tenth Decennial Revision[1]
Spanish Edition	1926	
Chinese Edition (U.S.P.IX)	1923	
2. Great Britain and Ireland and Colonies	1914	British Pharmacopœia combining the Indian and Colonial Addendum
3. Germany	1910	Arzneibuch fur das Deutsche Reich (Pharmacopœa Germanica, editio V)
4. France	1908	Codex Medicamentarius Gallicus (Pharmacopée Française)
Supplement—April 1, 1920		
Additions and Modifications—April 5, 1922		
Additions and Modifications—Sept. 24, 1923		
Additions and Modifications—May 13, 1925		
5. Austria	1906	Pharmacopœia Austriaca, editio octava
6. Belgium	1906	Pharmacopœa Belgica, editio tertia
7. Chile	1886	Farmacopea Chilena
8. Croatia-Slavonia	1888	Pharmacopœa Croatico-Slavonica
9. Denmark	1907	Pharmacopœa Danica
10. Greece	1924	Ἑλληνικὴ Φαρμακοποιΐα (Second Edition)
11. Hungary	1909	Pharmacopœa Hungarica, editio tertia
12. Italy	1920	Farmacopea ufficiale del regno d'Italia, quarta edizione
13. Japan	1921	Pharmacopœa Japonica (Fourth Edition)
14. Mexico	1904	Nueva Farmacopea Mexicana, cuarta edicion
15. Netherlands	1905	Pharmacopœa Nederlandica, editio quarta
First Supplement—1910		
Second Supplement—1914		
Third Supplement—1918		
16. Norway	1913	Pharmacopœa Norvegica, edito quarta
17. Portugal	1876	Pharmacopœa Portugueza
18. Roumania	1893	Pharmacopœa Romana, editio tertia
19. Russia	1910	Pharmacopœa Rossica, sixth edition.
20. Servia	1908	Pharmakopœa Serbica, editio secunda
21. Spain	1905	Farmacopea oficial Española, septima edicion
22. Sweden (Tenth Edition)	1926	Pharmacopœa Svecica (Svenska Farmakopén)
23. Switzerland	1907	Pharmacopœa Helvitica, editio quarta
24. Venezuela	1898	Farmacopœa Venezolana, I
25. Argentina	1898	Ph. Arg. I, Farmacopea Nacional Argentina, primera edicion
26. Finland	1914	Ph. Fenn. V, Pharmacopœa Fennica, editio quinta

[1] In quoting this title, it is customary to abbreviate it to "U.S.P. X." It is advisable to adhere to this form so as to preserve uniformity. The "tenth revision" means, of course, the same as "eleventh edition". Formerly it was customary to use the year in which the Decennial Convention met to designate the Pharmacopœias, thus "U.S.P. 1890"; much confusion resulted from this practice because it now requires three or four years to revise such an authority and hence the "U.S.P. 1890" would have been more appropriately termed the "U.S.P. 1893". In the last two revisions this was corrected by omitting a date upon the back of the book and using the words "Ninth Decennial Revision" and "Tenth Decennial Revision".

The U. S. Pharmacopœia is now used officially in Porto Rico and the Philippine Islands and has been recognized as the official Pharmacopœia of Cuba, every drug store in Cuba since 1910 having been compelled by law to have a copy. A Spanish Edition of the U. S. P. VIII was issued in 1909, the Spanish Edition of the U. S. P. IX appeared in 1919, and the Spanish Translation of the U. S. P. X will be issued early in 1926.

A Chinese Edition of the U. S. P. IX was published in 1923 by the Chun Hwa Book Co., Shanghai, China. This was entirely a private enterprise but its appearance was welcomed by the many European and American trained physicians and pharmacists of China.

The official pharmacopœias are all issued under the authority of the respective governments, with the exception of the United States Pharmacopœia, which has, however, been accepted by the government and the individual states through the national and state food and drugs acts. Efforts are being constantly put forth to secure the adoption of an International Pharmacopœia. If these efforts should prove successful a great advance will be made in bringing about a uniformity in the strength of preparations; yet it may well be doubted whether such a work would be as generally useful as the present pharmacopœias, which have been proved by long experience to be best adapted to the varying needs of the different nations. A practical plan of securing the chief advantages possessed by an International Pharmacopœia has been inaugurated by the establishment of the "International Conference for the Unification of Potent Remedies", which first met in the city of Brussels in September, 1902, and for a second time in September, 1925. This body in the final *protocol* of 1902 agreed upon standards of strength for potent preparations which they requested the various pharmacopœias of the world to adopt. In 1906, representatives from nineteen governments met at Brussels and, with certain reservations, formally signed the agreements drawn up in 1902 and also formulated details for further unification. The United States Pharmacopœia (Eighth Revision) was the first national pharmacopœia to adopt some of these recommendations. The U. S. P. IX and the U. S. P. X have inserted the Latin title adopted by the International Conference followed by the letters "P. I.", below the official title of those preparations which conform to the standards of the protocol. The letters P. I. mean "Protocol Internationale".

The Pharmacopœia of the United States, Tenth Decennial Revision, was prepared by a committee appointed by the National Convention for revising the Pharmacopœia, which met in Washington, D. C., May 11, 1920. Thirty-eight medical bodies, seventy-seven incorporated pharmaceutical organizations and the Medical Departments of the Army and Navy, the U. S. Public Health Service, the U. S. Department of Agriculture, the U. S. Treasury (Customs Service), the American Medical Association, the American Pharmaceutical Association, the American Chemical Society, the National Dental Association, the Association of American Dairy, Food and Drug Officials, the National Wholesale Druggists' Association, the National Association of Boards of Pharmacy, the National Association of Retail Druggists, and the American Drug Manufacturers' Association, sent delegates to this Convention, which selected from those present fifty members, with the President of the Convention a member *ex-officio*, making the total fifty-one. These were designated as the "General Committee of Revision of the Pharmacopœia of the United States of America". Of this number twenty-one were physicians, twenty were pharmacists and chemists, six were chemists, and four botanists and pharmacognosists. At the Eighth Decennial Convention, in 1900, several important

changes in the plan of the work were made. The business portion was separated from that of actual revision by creating a Board of Trustees whose duty it was to make contracts, attend to the finances, and place the book on sale. The Convention was also incorporated at that time, and it now carries on its work under a charter issued at Washington under the laws of the District of Columbia. The Convention of 1910 changed the number of members on the Committee of Revision from twenty-six to fifty-one and also authorized the formation of an Executive Committee. The Convention of 1920 made no change in the organization of the Committee of Revision, and the General Committee, as soon after its election as possible, met, elected officers, and the chairman organized the work of revision, appointing fifteen Sub-committees to report upon the several divisions of the work. These Sub-committees were: 1. Scope (Admissions and Deletions). 2. Therapeutics and Pharmacodynamics (Posology). 3. Biological Assays. 4. Biological Products and Diagnostical Tests. 5. Botany and Pharmacognosy. 6. Proximate Assays. 7. Inorganic Chemicals. 8. Organic Chemicals. 9. Reagents and Test Solutions. 10. Volatile Oils. 11. Extracts, Fluidextracts, and Tinctures. 12. Waters, Solutions, Spirits, Syrups, and Elixirs. 13. Cerates, Ointments, and Miscellaneous Galenicals. 14. Tables, Weights, and Measures. 15. Nomenclature.

When these appointments were ratified by the General Committee of Revision and the Board of Trustees, each Sub-committee organized and elected its own Chairman.

These Sub-committee Chairmen, through appointment by the General Chairman and election by the General Committee and Board of Trustees, formed the Executive Committee of Revision, with the Chairman of the General Committee also as Chairman of the Executive Committee, and the actual work of revision began. According to the By-laws of the Convention, the "Executive Committee shall execute such orders or resolutions as have been assigned to it by the Convention, the General Committee of Revision, or the Board of Trustees, and have entire charge of the preparation of the manuscript and reading of proof for the revised Pharmacopœia". The General Committee of Revision represents geographically various parts of the United States, and it is necessary to conduct the revision largely by mail. During the Tenth Revision two meetings of the entire General Committee were held and also a number of Sub-committee conferences. The Board and Committee remain in office until the next decennial convention, or until their successors are appointed.

Permission to use the text of the Pharmacopœia is granted upon application to the Chairman of the Board of Trustees under certain regulations which are necessary to guard the copyright. As the U. S. Pharmacopœia will be largely quoted in this treatise, its plan and the outlines of its main features should be thoroughly understood at the outset.

Six hundred and thirty substances, including chemicals, crude drugs, and preparations have been deemed of sufficient importance to merit a place in the U. S. Pharmacopœia. A number of these substances are not in themselves of therapeutic value but have been admitted as pharmaceutic necessities, being employed in manufacturing other official products. The Pharmacopœia provides standards for all ingredients used in formulas.

Under the Federal Food and Drugs Act, the United States Pharmacopœia and the National Formulary establish the standards for medicines in the United States and its provinces and violations are punishable by fine or other penalty.

Nomenclature

The names of the various substances are indicated—1. By the OFFICIAL LATIN TITLE, which is always in the Latin language. 2. By the OFFICIAL ENGLISH TITLE. 3. By the ABBREVIATED TITLE. 4. By the SYNONYM. 5. By the BOTANICAL NAME (in the case of plants). 6. By the SYMBOLIC FORMULA (in the case of chemicals). Each of these names has a special use.

The following extracts from the Pharmacopœia are given in illustration:

CANTHARIS	[Official Latin title]	**UNGUENTUM PHENOLIS**
Cantharides	[Official English title]	**Ointment of Phenol**
Canthar.	[Official Abbreviated title]	**Ung. Phenol.**
[SPANISH FLIES, RUSSIAN FLIES]	[Synonym]	[OINTMENT OF CARBOLIC ACID]
POTASSII BITARTRAS	[Official Latin title]	**SPIRITUS ÆTHYLIS NITRITIS**
Potassium Bitartrate	[Official English title]	**Spirit of Ethyl Nitrite**
Pot. Bitart.	[Official Abbreviated title]	**Sp. Æth. Nitrit.**
[CREAM OF TARTAR, POTASSIUM ACID TARTRATE]	[Synonym]	[SWEET SPIRIT OF NITRE]
$KHC_4H_4O_6$	[Symbolic formula]	$C_2H_5NO_2$

1. The Official Latin Title—Example, **LIQUOR AMMONII ACETATIS.** The official Latin title is thoroughly distinctive, and is intended to be used in designating the drug or preparation where precision is required, and is used, mostly in its abbreviated form, in writing prescriptions, in labelling store furniture, specimens, etc. Latin is selected for the official title because it is universally used and understood as the language of science, and is not liable to change, as is the case of a living tongue. Although the official titles are usually abbreviated in practice, the proper terminations and full titles should be known and observed carefully, and the habit of using the Latin abbreviations in English conversation should be strictly guarded against as not only inelegant, but vulgar.[1] A vast amount of careful consideration, extending over many years, has been expended in perfecting a system of pharmacopœial nomenclature which is at once brief, simple, expressive, distinctive, and convenient. The following may be cited as models: Acacia, Camphora, Opium, Rheum, Sapo, etc., the full pharmacopœial definition of these titles being, respectively, **Acacia.** "Acacia is the dried gummy exudation from the stems and branches of *Acacia Senegal* Willdenow, or of some other species of *Acacia* (Fam. *Leguminosæ*)." **Camphora.** "A dextrorotatory ketone [$C_9H_{16}CO$] obtained from *Cinnamomum Camphora* (Linné) Nees et Ebermaier (Fam. *Lauraceæ*)." **Opium.** "Opium is the air-dried, milky exudation obtained by incising the unripe capsules of *Papaver somniferum* Linné or its variety *album* De Candolle (Fam. *Papaveraceæ*). Opium in its normal, moist condition yields not less than 9.5 per cent of anhydrous morphine." **Rheum.** "Rhubarb consists of the dried rhizome and roots of *Rheum officinale* Baillon or of *Rheum palmatum* Linné, and the var. *tanguticum* Maximowicz (Fam. *Polygonaceæ*), and probably other species of *Rheum* grown in China and Thibet, deprived of most of the bark tissues and carefully dried." **Sapo.** "Soap prepared from olive oil and sodium hydroxide." The *generic*, or genus name (the first part of the botanical name), was generally chosen for the official Latin title, as, **Krameria**, for "the dried root of *Krameria Triandra*" (botanical name). In the case of some old and very well known drugs, this rule could not be adopted with-

[1] Example of what should be avoided in conversation: "I mixed the *Pulv. Pip. Nig.* with the *Pot. Carb.* and the *Muc. Trag.*, but could not form a mass."

out causing confusion and the *specific* or species name (the second part of the botanical name) was retained, as **Ipecacuanha,** the official Latin title for "the dried rhizome and root of *Cephaëlis Ipecacuanha*". The official Latin title obviously cannot retain the simplicity of a single word where two parts of the same plant are official. Thus, for example, the leaves and root of Belladonna both must be defined by affixing the Latin name of the particular part of the plant intended, as *Belladonnæ Folia* for Belladonna Leaves; and *Belladonnæ Radix* for Belladonna Root; nor can a single word be chosen for either official title where the specific names of two or more plants of the same genus differ. The generic name of the two official mints is Mentha, and to distinguish them it is necessary to use the full botanical name for each one. Thus, *Mentha piperita* (Peppermint), *Mentha Viridis* (Spearmint).

There are a very few exceptions to the above principles of nomenclature, as in the case of *Kino* and *Prunus Virginiana*, derived, according to the most recent and reliable authorities, respectively from *Pterocarpus Marsupium* and *Prunus serotina*. These drugs are largely used and the old names have become so well established that it would lead to confusing and possibly embarrassing mistakes to change them now. In the case of compound medicines, such official titles were selected as would usually express the composition of the preparations as fully as possible, indicating the principal ingredients without sacrificing the important consideration of brevity and convenience in abbreviation, as *Mistura Cretæ*, *Pulvis Ipecacuanhæ et Opii*, and *Tinctura Opii Camphorata*. In some cases it is desirable to indicate in the title the medical properties or use of the preparation, as in *Antitoxinum Diphthericum* and *Antitoxinum Tetanicum*, but titles indicating therapeutic use have been generally discarded in official books because of their tendency to induce self-medication. Where the number of important ingredients in a preparation is too great to admit of a selection, the participial adjective *compositus* (meaning compound) is added, the feminine (*composita*) or neuter (*compositum*) termination being used respectively where the noun is feminine or neuter, as Spirit*us* Aurantii Composit*us* (masc.), Tinctur*a* Lavandulæ Composit*a* (fem.), Extract*um* Colocynthidis Composit*um* (neut.).

2. The Official English Title—Example, **Solution of Ammonium Acetate.** The English title should be used when a drug or preparation is mentioned in ordinary conversation, in commercial transactions, in writing orders for supplies, and in all cases where the use of the Latin official title could be justly criticized as an ostentatious display of erudition. In the U. S. Pharmacopœia, 1880, a large number of English titles used in former Pharmacopœias were changed, the old vernacular names being either dropped altogether or inserted as synonyms. This advanced step was rendered necessary by the increase in articles used in the materia medica and by a desire for greater accuracy and better methods in nomenclature. The confusion which always exists in different localities concerning the common names of drugs is also avoided, as the anglicized Latin name is distinctive. Such English names as *Bloodroot*, *Calabar Bean*, *Male Fern*, and *Yellow Jasmine*, for instance, were replaced by *Sanguinaria*, *Physostigma*, *Aspidium*, and *Gelsemium*.

On the other hand, some of the common English names were so fixed by usage that it was not deemed judicious to alter them; besides, a change would often have necessitated the use of a longer and less convenient word. The retention of the English names *Clove*, *Mustard*, and *Ginger* sufficiently illustrates this.

In the U. S. Pharmacopœia, 1890, a very important change was made in the English names of the chemical substances, the basylous or metallic

component being given the first place; for instance, *potassium citrate*, *ammonium bromide*, and *zinc sulphate*, replace the former names *citrate of potassium*, *bromide of ammonium*, and *sulphate of zinc*. This change required many alterations in nomenclature. In the U. S. P. of 1890, the salts of iron and mercury were for the first time differentiated by the use of the terms *ous* and *ic*, respectively, to designate lower and higher states of oxidation; for example, ferr*ous* sulphate and ferr*ic* sulphate, mercur*ous* iodide and mercur*ic* iodide, replaced the names sulphate of iron and iodide of mercury; the compounds of mercury, on account of the differences in dose existing among them, were further distinguished by the use of the adjectives "corrosive", "mild", "red", "yellow". For the scale salts of iron, which are of complex composition and not true chemical salts, notwithstanding the fact that the metallic component exists in them in the ferric state, the term "iron" was used in order to emphasize the fact of their defective chemical construction for they are not definite double salts. This nomenclature is retained in the Tenth Decennial Revision of the Pharmacopœia.

The Pharmacopœial names of chemical substances do not always represent their chemical composition. The enormous multiplication of synthetic remedies, and the length of the systematic names of these bodies, have compelled the use of shorter terms which are more conveniently employed in prescriptions and in commercial transactions. Thus, "metadihydroxybenzene" is a more cumbersome word than "resorcinol", phenyldimethylpyrazolon" than "antipyrine". If we turn to unofficial substances, a better example is afforded by the use of "analgen", which is dignified by the systematic name of "orthoethyloxyanamonobenzoylamidochinoline". In recent revisions of the Pharmacopœia it has been desirable to introduce a number of synthetic remedies having long scientific names, and trade or proprietary names could not be used as titles in a standard book of this character unless permission was obtained from the owners, hence the long names had to be shortened, and "diaminodihydroxyarsenobenzene hydrochloride" became "Arsphenamine", "2-phenylquinoline 4 carboxylic acid" became "Cinchophen", and "Quaternary oxymethyl oxymethelene dihydro-isoquinoline chloride" became "Cotarnine Chloride". The value of a long chemical name lies in the fact that the name indicates its composition, but some of the most useful modern remedies are very complex in their chemical composition, hence the inconvenience. The custom of abbreviating the official Latin titles in writing prescriptions is universal among physicians, and the new official names, which are long, will not cause great inconvenience in practice. Thus "Phenobarbitalum" has been abbreviated to "Phenobarb".

3. Abbreviations—The U. S. Pharmacopœial Convention of 1910 recommended that there should be inserted after each article used by physicians in prescriptions a carefully considered abbreviated name. These were to be known as the official abbreviations, in order that uniformity might be established throughout the country, with the object of preventing mistakes in reading and compounding prescriptions, and further, to serve as authorized abbreviations in labelling the store furniture of the pharmacist. Such abbreviated titles were also adopted by the N. F. IV, and the British Pharmacopœia (1914) and have been continued in the U. S. P. X and N. F. V.

4. The Synonym—Example, [Basham's Mixture]. In the Pharmacopœia the definition of the term synonym is restricted to an equivalent name in common use, which is usually antiquated and derived from an unscientific source, and which should really be abandoned, but which common custom and long usage demand shall not be entirely ignored. The synonyms should be rarely

or never used by pharmacist, yet it is necessary to be familiar with them in order to recognize their equivalent official Latin or English names when they are used by customers. Common names, as snakeroot, dock, Indian hemp, balm, etc., have varying and often opposite meanings in different localities, and confusion and even loss of life have resulted from the unfortunate use of these common names. In the U. S. P. X synonyms are placed below the official English title in smaller type. After the passage of the Food and Drugs Act, the increased importance of synonyms, which were sometimes used to evade the standards, led the Conventions of 1910 and 1920 to recommend that all important synonyms be printed in the text of the Pharmacopœia immediately after the English name of the substance. The Committee of Revision also passed the following resolution which had been adopted by the Convention: "Substances labelled with an official synonym must comply with the same standards, tests, and requirements as are demanded for the official article under the official title."

5. The Botanical Name—By this is meant the systematic name recognized by botanists for plants, which serves in pharmacopœial nomenclature as the basis of the official name. The botanical name usually consists of two Latin words, the first indicating the genus and the second the species to which the plant belongs. *Capsicum frutescens* is the botanical name for the particular variety of capsicum or Cayenne pepper which the Pharmacopœia designates. Here the generic, or first name, is chosen for the official title, and if no description followed the title it would be inferred that any part of any plant in the genus "Capsicum" could be officially used for making preparations; but the specific name, "frutescens", limits the use of this species, while the description which follows shows the *part* of the plant which must be employed: "the dried, ripe *fruit* of *Capsicum frutescens* Linné (Fam. *Solanaceæ*), grown in Africa". Now, *Capsicum baccatum* and *Capsicum annuum* are different species and are active members of the genus, but their claims are unrecognized and the fruit from these species is not official. The specific name does not begin with a capital letter, except when it has been at some previous time itself a generic name, as in *Atropa Belladonna*, or when it is derived from the name of a person, as in *Garcinia Hanburii*, or when the word is indeclinable, as in *Theobroma Cacao*, or when it is a combination of a noun and an adjective, as in *Xanthoxylum Clava-Herculis*. The name of the author follows the botanical name, as, *Capsicum frutescens* Linné, and after this the Family to which the plant belongs is indicated in italics, and the whole enclosed in parenthesis, as (Fam. *Solanaceæ*). The term Natural Order (Nat. Ord.) was replaced in the U. S. P. VIII by the word Family (Fam.), to accord with modern usage among botanical authorities. It must be apparent that the botanical name need not be employed either in writing or in speaking in ordinary pharmaceutical work, but its use is absolutely necessary in establishing the identity of any drug authorized by the Pharmacopœia, and hence it is important to know the botanical names.

6. The Symbolic Formula—The use of certain arbitrary symbols to represent chemical elements provides a most convenient and useful method of expressing the composition of a chemical with the utmost brevity and exactness. *Plumbi Oxidum* and *Lead Oxide* are both much longer terms than "PbO" and not so definite. *Sodium Sulphate* does not always contain the same proportion of water of crystallization, and if the symbolic formula, Na_2SO_4. $10H_2O$, were not appended to the official title there might be doubt as to which sulphate was intended; the added $10H_2O$, however, accurately defines it. In the Molecular Weight Table will be found figures following the symbolic formulas. These indicate the *molecular weight* (the sum of the

weight of the atoms) of the chemical. Thus, in $MgSO_4 . 7H_2O = 246.49$, the atomic weight of Magnesium, Mg. 24.32, is the first factor; this added to Sulphur, S, 32.06, makes 56.38; Oxygen, O, 16.00, multiplied by 4, gives 64.00; then hydrogen having the atomic weight of 1.008, if multiplied by 2 and this by 7, gives 14.112, and seven times O (16.00) is 112.00; then $56.38+64.00+14.112+112.00=246.492$, the molecular weight of magnesium sulphate.

The Official Definition—In order that no question shall arise as to the exact meaning of the official Latin title, or any other name by which an official substance is known, it is necessary to state explicitly what kind or variety of the substance should be used. In the case of drugs this has been already noted (see page 17); for chemicals an illustration may be given in Creosote, which is defined as "A mixture of phenols, principally guaiacol [$C_6H_4(OH)(OCH_3)$ 1: 2] and creosol [$C_6H_3(CH_3)(OH)(OCH_3)$ 1: 2: 3] obtained from wood tar". Again, *Sevum Preparatum*, Prepared Suet, is officially defined as "The internal fat of the abdomen of the sheep, *Ovis aries* Linné (Fam. *Bovidæ*), purified by melting and straining". This excludes beef suet and all other kinds of suet, and states the method of purification.

The Purity Rubric—This was first introduced into the U. S. P. VIII to limit the quantity of innocuous impurities in chemicals, by stating in terms of percentage the amount of pure substance that must be present. It has been continued and extended to drugs and many other articles in the U. S. P. X. Thus, under *Potassii Iodidum*, Potassium Iodide, will be found the "purity rubric" as follows: "Potassium Iodide, when dried to constant weight at 100° C. contains not less than 99 per cent of KI". It might appear at first sight, that a medicinal chemical should always contain one hundred per cent of the pure product, but practical experience shows that absolute purity is not attainable, and that the presence of minute quantities of impurities (provided they are harmless) does not affect the medicinal value of a chemical. Under the pharmacopœias formerly in use, prosecutions were often instituted, convictions obtained, and penalties imposed by the authorities, because there was no purity rubric, no allowance for the absorption of moisture, or for the presence of traces of substances which were innocuous. The purity rubric remedies this defect by definitely stating the amount of permissible impurities. In the case of most vegetable drugs a limit has been fixed for the allowable percentage of foreign matter. In some instances this applies to other portions of the same plant but usually it is intended to exclude the presence or admixture of foreign substances.

The Official Description—Immediately following the official definition of the substances there will be noticed in the Pharmacopœia, in smaller type, what has been termed the *official description*; this consists usually, for drugs, of a concise statement of their physical characteristics, when entire, and also, in most instances, the structure of the same drug when sectioned or powdered. In the chemicals the official definition usually includes the symbolic formula, the purity rubric, and the official description, which are printed in smaller type, exactly as in the case of the vegetable drugs. To the descriptions of the chemical drugs are usually added the solubility statements.

Tests for Identity and Purity—In the U. S. P. X the tests which establish the identity of a chemical and those which insure the pharmacopœial degree of purity are grouped under appropriate headings. Ash limits, to restrict the amount of soil and sand adhering to roots and plants, an occasional identity test, and other means of determining purity or the presence of adulterants have also been appended to vegetable drugs. It is not to be understood that the tests under the caption "Tests for purity" are the final and exclusive indication of quality. The monographs are divided and sub-heads used only for

convenience of reference and an article to be official must meet every requirement of the text.

Assay Processes—The assaying of many chemicals, drugs, oils, and preparations is necessary to fix their value definitely as medicinal agents, and many such assays have been introduced into the U. S. P. and N. F. This work requires skill, knowledge, and experience, and each process requires careful study.

A chapter has been added to this edition in which will be found detailed explanations of all assay methods, and the advanced student is referred to this chapter for information.

The majority of assay methods are chemical, involving either *gravimetric*, *volumetric*, or *electrolytic* processes. For vegetable drugs containing definite active principles *proximate assays* or *biological assays* have been adopted whenever practicable.

Doses—An innovation was adopted by the U. S. P. VIII by the insertion of the average dose for most articles; this has been continued in the U. S. P. X. The dose of a medicine can never be a fixed and unvarying quantity; the age and condition of the patient, the severity of the disease, the idiosyncrasy and tolerance for medicines, become factors in determining the dose and the physician must give all of these facts consideration. For these reasons, an "average dose" was used in order to furnish a guide to pharmacists and physicians. The following quotation from the preface of the Pharmacopœia is appended:

"The Convention instructed the Committee 'to state the average approximate (but neither a minimum nor a maximum) dose for adults, and, where deemed advisable, also for children. The metric system is to be used, and the approximate equivalent in apothecary weights or measures inserted in parenthesis,' and the Committee was further directed to make the following distinct declaration *'that neither this Convention nor the Committee of Revision created by it intends to have these doses regarded as obligatory on the physician or as forbidding him to exceed the doses given whenever, in his judgment, this may seem advisable'.*"

Pharmacopœial Illustrations—The following examples are selected from the U. S. P. X and are given in condensed form.

CINCHONA
Cinchona
Cinch.

[Official Latin title]
[Official English title]
[Official Abbreviation]
[Synonyms]

PERUVIAN BARK

Cinchona is the dried bark of *Cinchona Succirubra* Pavon.....or of *Cinchona Ledgeriana Moens* .....(Fam. *Rubiaceæ*). Cinchona yields not less than 5 per cent of the alkaloids of Cinchona.

[Official definition and Purity Rubric]

Description and physical properties.

Unground Cinchona—In quills or curved pieces or in broken fragments; bark from ..... taste astringent and very bitter.

Structure—Cork, frequently bearing dense masses of lichen tissue on its outer surface .... small groups between the medullary rays.

Powdered Cinchona—Brown; bast-fibers, frequently whole, spindle-shaped ..... sphenoidal microcrystals very minute.

[Official description]

Assay—Heat 5 Gm. of Cinchona, in fine powder, for one hour, in a 500 cc. flask.....Use chloroform for the final extraction.

[Assay]

Preparations—Fluidextractum Cinchonæ, etc.

AVERAGE DOSE—Metric, 1Gm.—Apothecaries, 15 grains.

SODII HYDROXIDUM
Sodium Hydroxide
Sod. Hydrox.

CAUSTIC SODA

[Symbolic formula and Purity Rubric]

Sodium Hydroxide contains not less than 90 per cent of NaOH.

Caution.—Great care is necessary in handling it, as it rapidly destroys organic tissues.

Description and physical properties.

Dry, white, or nearly white, fused masses, or sticks,.....becoming covered with.....carbonate.

One Gm. of Sodium Hydroxide is soluble in 0.9 cc. of water at 25° C. .....very soluble in alcohol.

Tests for identity—An aqueous solution.....responds to the reactions for sodium.

Tests for purity—An aqueous solution. . . (1 in 50) . . . . meets the requirements of the test for *heavy metals*.

Assay—Place about 10 Gm. of Sodium Hydroxide in a glass-stoppered weighing bottle, and weigh accurately. Transfer. . . and titrate 100 cc. of the filtrate with normal hydrochloric acid.

Preserve in well-closed containers.

Preparation—Liquor Sodii Hydroxidi.

The Preparations of the Pharmacopœia

Although these will be considered in detail in the body of this work, a few general remarks will be appropriate here. The "parts by weight" plan adopted by the U. S. Pharmacopœia, 1880, was dropped in the 1890 revision, and the "solids by weight, liquids by measure" principle accepted. This is more in accord with the methods used in English speaking countries and harmonizes with the established practice of medicine, *i.e.*, giving doses of liquids by volume. A great advance was made by the adoption of the metric system for expressing the quantities, which were thus also made definite. Every pharmacist should employ the metric system exclusively in making preparations; but for the convenience of those who prefer the older system, corresponding quantities are given in the working formulas in this book, based on the old system of avoirdupois weight and apothecaries measure. The latter will be found much less convenient than the metric quantities, especially if the operator has procured a set of metric weights and measures and has learned to use them.

The U. S. P. official text is printed in this book by authority from the Board of Trustees of the United States Pharmacopœial Convention. When alternative quantities are given, the latter are enclosed in brackets in the text, and are printed in smaller type in the list of ingredients. The object of this arrangement is to indicate that the alternative quantities are not used in the Pharmacopœia.

The alternative quantities are not intended to be equivalents of the metric quantities and the two systems are not interchangeable; either the metric or the alternative formula may be used but in no case part of one and part of the other; different type distinguishes one from the other.

National Formulary

The Third Edition of the N. F. was made a standard under the Pure Food and Drugs Act, June 30, 1906, and the Fifth Edition, published in 1926, has been printed in this book, authority being granted by the Council of the American Pharmaceutical Association, as the National Formulary is the property of that organization although the profits arising from its sale are not used for the benefit of the Association, but are devoted to the work of the next succeeding revision. Its origin dates from 1882 when Charles Rice, Ph.D., organized a Committee from New York and Brooklyn to frame a book of formulas for unofficial preparations. The New York and Brooklyn Formulary was subsequently enlarged and the joint Committee presented it to the American Pharmaceutical Association in 1885 as the nucleus for the construction of the National Formulary. The book has gone through five editions and is quoted in national and state laws as of equal authority with the Pharmacopœia.

The National Formulary V has been carefully revised (1926) and its standards are in harmony with those of the U. S. P. X. Its position is secondary and follows the lead of the Pharmacopœia. Some of the preparations of the Pharmacopœia which were deleted are now found in the National Formulary, because physicians continue to use such preparations.

In the National Formulary the standards of the U. S. P. X are used; thus, where alcohol, glycerin, syrup, iodine, tincture of opium, cinchona, and other U. S. P. drugs and preparations are directed, it means that they must conform in strength and tests to the standards of the U. S. P. X.

It is important to remember that if a drug or preparation is sold under or

by a name recognized in the U. S. Pharmacopœia or National Formulary it must not differ from the standard of strength, quality, and purity determined by the tests laid down in either of these books official at the time of investigation. A drug or preparation is not deemed to be adulterated if it differs from the official standards, provided such standards are plainly stated upon the bottle, box, or container.

This position of the National Formulary made it desirable that its standards should be used in this book so that the student would become familiar with the preparations of both books and recognize the fact that they are of equal force before the law, and the N. F. texts are printed in this book by authority from the American Pharmaceutical Association.

In both the U. S. P. and N. F., the standards are intended solely to apply to substances which are used for medicinal purposes and when professedly bought, sold, or dispensed as such.

New and Non-official Remedies (N. N. R.)

The American Medical Association for a number of years, through its Council on Pharmacy and Chemistry, has issued an annual publication under the above title. In this are listed such unofficial representatives of the newer materia medica, chiefly synthetic or biological, as have been accepted under the rules of the Council. Many of these are proprietary, that is, they are chemicals, drugs, or similar preparations, used in the treatment of diseases, but protected against free competition, as to name, product, composition, or process of manufacture by secrecy, patent, copyright, or by any other means.

To be accepted by the Council, the composition of products must be known, suitable tests for identification must be available, no unwarranted therapeutic or false claims may be made, and other requirements must be complied with which insure the ethical character of the product.

The book also provides descriptions and tests, therapeutic uses, and doses, and is a valuable reference book in the pharmacist's library. Many articles accepted by the N. N. R. are included in this book in the lists of unofficial substances, with permission.

Dispensatories

A dispensatory is a commentary on a pharmacopœia. Like the textbooks on pharmacy, the various dispensatories are privately owned and are revised more frequently than are the Pharmacopœia and the National Formulary. The U. S. Pharmacopœia describes the drugs and chemical substances of the materia medica, establishes the degree of purity of many of them, and defines the strength of the preparations. The dispensatories comment on the substances, giving their physical, medical, and pharmaceutical history, with their doses and uses. The number of substances noted in the Pharmacopœia is limited. On the other hand, the dispensatories present, in addition, information about those substances which are official in our own and other pharmacopœias, and those which are of occasional or rare use. There are two dispensatories which comment especially upon the materia medica and preparations of the U. S. Pharmacopœia,—the United States Dispensatory, which was first published in 1833, and the National Dispensatory, which was first issued in 1879. King's American Dispensatory, adopted by the National Eclectic Medical Association in 1879 as its standard authority, is especially designed for the use of eclectic practitioners. The plans of these works are similar. The text

of the Pharmacopœia is first inserted and immediately following are appended the comments of authors and editors. The arrangement of the subjects is strictly alphabetical, the United States Dispensatory dividing them, however, into two classes, distinguished by type of two sizes. The principal portion of the work, that in the larger type, is devoted to a commentary on the preparations of the United States and other Pharmacopœias; the unofficial and less important subjects are to be found in the second part. In the National Dispensatory the unofficial substances are considered either in the body of the book or under sub-divisions as allied drugs. The possession of a reliable commentary upon the Pharmacopœia is a necessity which is fully realized by pharmacists.

PART II

TECHNICAL OPERATIONS IN PHARMACY

CHAPTER III

METROLOGY

Weight and Measure

METROLOGY in its modern significance comprises the study of the art of weighing and measuring, and the accumulation of facts with regard to units of weight and measure which are now or have formerly been in use. In pharmacy the definition includes the measure of the gravitating force of bodies, which always bears a direct ratio to their mass, and is commonly called *weight;* the determination of the bulk or extent of the body, its *measure;* and the relation which measure bears to weight when compared with a standard, known as *specific gravity.*

Weight cannot be annihilated and is modified only by altitude and that but slightly. Temperature and barometric pressure have no practical effect upon it. *Volume,* however, is easily influenced by temperature which must be taken into account in making preparations accurately and in the determination of specific gravity.

Weight

A knowledge of the systems of weights and measures in use must necessarily command the early attention of the student, and a short account of the origin of the present systems may be of service in fixing in the mind the essential distinctions between them. The sense of the weight of a body cannot be conveyed intelligibly to the mind unless a means of comparison is chosen. As weight is the measure of the gravitating force of a body, so this force is expressed as related to a standard of resistance, which is exactly that which would balance the body and keep it in equilibrium, when used with a mechanical device constructed for this specific purpose. Such standards are termed *weights* and the mechanical devices are called *balances* or *scales.*

The standards which have been chosen by various nations are arbitrary, and instances are common where different standards are in use at the same time in the same country. Many of the ancient standards are clearly referable to variable parts of the human body, as nail, foot, span, pace, cubit (length of the forearm), fathom or orgyia (stretch of the arms). In the history of metrology three periods may be traced: 1. The *Ancient,* during which the old classical standards originated, and which terminated with the decline of the Roman Empire. It is interesting to note that the unit of distance used at the present day by all nations in maritime measurements is the *nautical* or *meridian mile* or one-sixtieth of a degree of the earth's equatorial circumference, and that this is exactly equal to 1000 Egyptian fathoms or 4000 Egyptian cubits.

These Egyptian measurements which have persisted for more than 4000 years were based upon astronomical or meridian measurements which were imperishably recorded in the great Pyramid of Ghizeh, whose perimeter is exactly 500 of these fathoms, or one-half of a nautical mile. 2. The *Mediæval,* extending to the sixteenth century. In this period the old standards were lost, but their names were preserved, and European nations adopted various independent standards. 3. The *Modern.* Since the seventeenth century the efforts of most enlightened nations have been directed toward scientific accuracy and simplicity, and during the present century toward international uniformity.

Historical metrology is also referred to as *Documentary Metrology* which is concerned with the study of monuments and records of ancient periods, and *Inductive Metrology*, which is concerned with the accumulation of data concerning the measurement of large numbers of objects which have been referred to as standards but which have no exact measure except by statutory regulation.

A history of the development of standard weights and measures is appended.[1]

---

[1] *The Development of Modern Weights and Measures*—In Great Britain, in the year 1266, the 51st act of the reign of Henry III declares "that by the consent of the whole realm of England the measure of the King was made,—that is to say, that an English silver penny called the sterling, round and without clipping, shall weigh *thirty-two grains of wheat*, well dried and gathered out of the middle of the ear; and twenty pence (penny-weights) do make an ounce and twelve ounces a pound, and eight pounds do make a gallon of wine, and eight wine gallons do make a bushel, which is the eighth of a quarter".

The sixteen-ounce pound (avoirdupois) was derived from a more ancient source, and was undoubtedly of Roman origin, and introduced at the time of the first civilization of the British island. The word "haberdepois", according to Gray, was, however, first used in English laws in 1303.

A statute of Edward I (A. D. 1304) states "that every *pound* of money or of *medicines* is of *twenty* shillings *weight*, but the pound of all other things is *twenty-five shillings weight*. The *ounce* of *medicines* consists of *twenty pence*, and the *pound* contains *twelve* ounces (the Troy Pound), but in other things the pound contains *fifteen* ounces, in both cases the ounce weighing twenty pence".

These laws unfold the theory of the ancient weights and measures of Great Britain, and reveal the standard,—*i.e.*, a natural object, grains of wheat; a difference existed then between the troy and the avoirdupois pound, but the weights now in use are one-sixteenth heavier than those of Edward I, owing to the change made in the value of the coin by the sovereign subsequently; in addition to this, the true penny-weight standard was lost, and in the next revision of the weights and measures the present troy and avoirdupois standards were adopted. The troy weight is of still earlier origin. The great fairs of the eighth and ninth centuries were held at several French cities, including *Troyes*, and the gathering places of traders from all countries. Coins were frequently so mutilated that they were sold by weight, and the standard weight of Troyes for selling coin was adopted for precious metals and medicines in all parts of Europe. The troy ounce and the avoirdupois ounce were originally intended to have the same weight, but after the revision it was found that the avoirdupois ounce was lighter by forty-two and a half grains than the troy ounce.

The subsequent adoption of troy weight by the London College of Physicians in 1618, on the recommendation of Sir Theodore Turquet de la Mayerne, who compiled their first Pharmacopœia, has entailed upon all apothecaries who are governed by British customs, to this day, the very great inconvenience of buying and selling medicines by one system of weights (the *avoirdupois*) and compounding them by another (the *apothecaries* or *troy*).

In the next century efforts were made toward reforming the standards, and the Royal Society, in 1736, began the work, which ended in the preparation, under the direction of the House of Commons, by Mr. Bird, of the standard "yard" and standard "pound" troy in 1760. Copies of these have been made, no intentional deviation has been made since, and they are still the standards used most largely in the United States. In 1816, on account of the growing popularity of the French metrical system, and in view of the desirability of securing a standard which could easily be recovered in case of loss or destruction and which should be commensurable with a simple unit, steps were taken in England to secure these advantages. The labors of English scientists led to the adoption of the *Imperial* measures and standards, which were legalized January 1, 1826, and are now in general use in Great Britain, thus introducing another element of confusion into an already complicated subject.

In this system the *yard* is equivalent to 36 inches, and its length was determined by comparison with a pendulum beating seconds of mean time, in a vacuum, at the temperature of 62° F. at the level of the sea in the latitude of London, which length was found to be 39.1393 inches. The *pound troy* (containing 5760 grains) was determined by comparison with a given measure of distilled water under certain conditions. Thus, a cubic inch of distilled water was weighed with brass weights in air at 62° F. the barometer at 30 inches, and it weighed 252.458 grains. The standard for measures of capacity in Great Britain (either dry or liquid) is the *Imperial gallon*, and this contains 10 pounds avoirdupois (each 7000 grains) of distilled water weighed in air at 62° F. the barometer standing at 30 inches, the *bushel* containing 8 such gallons. Washington, in his first annual message to Congress, Jan. 1790, recommended the establishment of uniformity in currency, weights and measures, action was taken with reference to the currency and recommendations were made by Jefferson, then Secretary of State, for the adoption of either of the currently used English systems or a decimal system. However, nothing was accomplished until in 1819-20 when efforts were again made in the United States to secure uniformity in the standards which were in use by the several States. Finally, after a lengthy investigation, the Secretary of the Treasury, on June 14, 1836, was directed by Congress to furnish each State in the Union with a complete set of the revised standards, and thus we have the *troy pound* (5760 grains), the *avoirdupois pound* (7000 grains), and the *yard* (36 inches) all identical with the British standards; but the United States *gallon* is quite different, the old wine gallon of 231 cubic inches, containing 58372.2 grains of distilled water at its maximum density, weighed in air of the temperature of 62° F. the barometer standing at 30 inches, being retained, while the bushel contained 77.274 pounds of water under the same conditions, thus making the dry quart about 16 per cent greater in volume than the liquid quart.

In 1864 the use of the metric measures was legalized in Great Britain, but not made compulsory, and in 1866 the United States followed the same course.

By the United States law of July 28,1866, all lengths, areas, and cubic measures are derived from the international meter equivalent to 39.37 inches. Since 1893 the United States Office of Standard Weights and Measures has been authorized to derive the yard from the meter, 1 yard equals $\frac{3600}{3937}$ meter, and the customary weights are referred to the kilogram by Executive order approved April 5, 1893. All capacities are based on the equivalent 1 cubic decimeter equals 1 liter, the decimeter being equal to 3.937 inches. The gallon still remains at 231 cubic inches and the bushel contains 2150.42 cubic inches. This makes the liquid quart equal to 0.946 liters and the dry quart 1.1013 liters, while the Imperial quart is 1.1359 liters. The customary weights are derived from the international kilogram, based on the value that 1 avoirdupois pound=453.5924277 grams and that $\frac{5760}{7000}$ avoirdupois pound equals 1 troy pound. See History of Standard Weights and Measures of the United States, by L. A. Fischer, U. S. Bureau of Standards.

The British Pharmacopœia of 1898, while giving alternative equivalents in the metric system, adopted avoirdupois weight (termed Imperial weight) for expressing quantities which were to be weighed. Avoirdupois weight is also in general use in the United States for commercial purposes, including the buying and selling of drugs on the large scale. The British Pharmacopœia of 1914, however, adopted the metric system exclusively for its processes and tests.

The following systems of weights and measures are now in use in the United States and the pharmacist must have a practical knowledge of all of them:

Weights

Avoirdupois Weight

Pound		Ounces		Grains
℔ 1	=	16	=	7000
		oz. 1	=	437.5

Apothecaries Weight (also called Troy Weight)

Pound		Troy Ounces		Drachms		Scruples		Grains
1	=	12	=	96	=	288	=	5760
		℥ 1	=	8	=	24	=	480
				ʒ 1	=	3	=	60
						℈ 1	=	gr. 20

It will be observed that the troy ounce contains 42½ grains *more* than the avoirdupois ounce, while the troy pound contains 1240 grains *less* than the avoirdupois pound. Fortunately, one unit common to troy, or apothecaries, and avoirdupois weight has been saved,—namely, *the grain*. The abbreviations of the denominations of apothecaries weight are represented by the signs ℥, ounce; ʒ, drachm; ℈, scruple; and *gr.*, grain; these have long been in use, but may possibly be mistaken for one another in rapid or careless writing. The abbreviations or signs of avoirdupois weight differ from those of troy weight, and care should be used not to confound them; they are ℔., pound; oz., ounce; gr., grain. The avoirdupois "dram" is sometimes although rarely referred to. It is the sixteenth part of the avoirdupois ounce or $27\frac{11}{32}$ grains. It has no legal status in the United States.

Volumes

Apothecaries or Wine Measure, U. S.

Gallon		Pints		Fluidounces		Fluidrachms		Minims
Cong. 1	=	8	=	128	=	1024	=	61440
		O. 1	=	16	=	128	=	7680
				f ℥ 1	=	8	=	480
						f ʒ 1	=	♏ 60

Imperial Measure, Br.

(Used in Great Britain)

Gallon		Pints		Fluidounces		Fluidrachms		Minims
C. 1	=	8	=	160	=	1280	=	76800
		O. 1	=	20	=	160	=	9600
				fl. oz. 1	=	8	=	480
						fl. dr. 1	=	min. 60

Note. The Imperial gallon, pint, fluidounce, and minim are all different from the corresponding quantities in the apothecaries or United States wine measure.

When the subject of the weights and measures in ordinary use is studied, the lack of simplicity and close relation is clearly apparent. The pint of distilled water at 25° C. (77° F.) (the temperature adopted for taking specific gravities and solubilities by the U. S. P. X), weighs 7273.1 (7273.125) grains and the fluidounce 454.6 grains, or, more accurately, 454.5703 grains. We have thus three ounces in use of different values,—troy ounce, 480 grains; avoirdupois ounce, (and also the Imperial fluidounce), 437.5 grains; and fluidounce, 454.6 grains.

The U. S. gallon of water weighs 8.33 avoirdupois pounds, and the pint weighs 1.0416 avoirdupois pounds; the pound therefore equals 0.9601 pints and calculations assuming the equivalence of the pint and the pound are obviously incorrect.

The Imperial measure differs from our wine measure principally in having twenty fluidounces in the pint instead of sixteen; the fluidounce, however, is appreciably smaller than the apothecaries' fluidounce. A convenient relation exists, however, between measure and weight in the *Imperial gallon, which contains ten avoirdupois pounds of water* at 15.6° C. (60° F.).

The Imperial fluidounce contains the same number of grains as the avoirdupois ounce (437.5). This is a serious objection to the use of the English graduated measures in the United States, because they indicate Imperial fluidounces instead of U. S. fluidounces, a factor which must be taken into account when compounding formulas of British origin. *It is also improper and inaccurate to use measures graduated in the U. S. system in measuring quantities directed in English formulas where the Imperial measure is intended.* The error amounts to nearly two pints in the gallon.

Approximate Measures

In apportioning doses for a patient, the practitioner is usually compelled to order the liquid medicine to be administered in certain quantities that have been established by custom, and estimated as follows:

	Alternative	Metric
A tumblerful	f ℥ viii	240 cc.
A teacupful	f ℥ iv	120 cc.
A wineglassful	f ℥ ii	60 cc.
A tablespoonful	f ℥ iv	15 cc.
A dessertspoonful	f ℥ ii	8 cc.
A teaspoonful	f ℥ i	4 cc.

A drop, through a popular error, is considered to be 1 minim.

The equivalents given above for the teaspoonful, dessertspoonful, and tablespoonful are authorized by the U. S. P. X.

In almost all cases the modern teacups, tablespoons, dessertspoons, and teaspoons, after careful tests by many authorities, were found to average 25 per cent greater capacity than the theoretical quantities given above, and the use of accurately graduated medicine glasses, which may be had now at a trifling cost, should be insisted upon (see Fig. 5).

Fig. 5

Graduated medicine glass

The Metric System—The idea of adopting a scientific standard for the basis of metrology, which could be accurately reverified, was suggested by a number of individuals after the Renaissance. Jean Picard, the French astronomer in the 17th century proposed to take as a unit the length of a pendulum beating one second of time at sea level, at a latitude of 45°.

James Watt, the English inventor in 1783, first suggested the application of decimal notation, and the commensurability of weight, length, and volume. The French National Assembly in 1790 appointed a committee to decide the preferability of the pendulum standard or a terrestrial measure of some kind. The committee reported in 1791 in favor of the latter and commissions were appointed to measure an arc of meridian and to perfect the details of the commensurability of the units and of nomenclature.

The unit decided upon was the *meter*, which was the one-millionth part of a quadrant of longitude running through Paris. This makes the *meter*, the one forty-millionth part of the earth's polar circumference. In 1799 the commissions reported in detail upon the system and defined the *liter* as the volume of the cube of one-tenth of a *meter*, and the *gram* as the weight of 1/1000 liter of distilled water at its maximum density of 4° C. The new system became compulsory in France in 1801, and found rapid favor among scientific workers in all civilized countries.

National jealousies and the natural antipathy to changing established customs interfered greatly with its adoption during the early part of the 19th century. At present the metric system is in use in every great country of the world excepting the United States and Great Britain and in these two countries it is legalized for reference to and definition of other standards, and is in exclusive use by scientific workers. In the United States the metric system was legalized in 1866, but not made compulsory, and in the same year the international prototype meter and kilogram were adopted as fundamental standards.

The United States silver coinage is based upon the metric system, the half dollar being exactly 12½ grams and the quarter and the dime being of the proper proportionate weights.

Since 1875 there has been established and maintained an International Bureau of Weights and Measures, with headquarters at Paris, which is managed by an International Committee, upon which all civilized countries are represented, the object of the committee being to make and provide prototypes of the meter and kilogram for the subscribing nations.

The United States prototype standards, constructed of a platinum-iridium alloy, were brought from Paris in 1890 and are now in the custody of the Bureau of Standards at Washington, D. C. They have been reproduced and distributed by our own government to the various states having bureaus needing such replicas. The original United States prototype meter was taken back to Paris some years later for reverification and was found to have altered less that one fifty-thousandth of an inch after fifteen years of use.

The name Metric System is very appropriate, as *each unit is derived from the meter;* it is also known as the *Decimal System*, because in obtaining the multiples and sub-divisions the number ten (*decem*) is used solely. The prefixes, which indicate *multiplication*, are of Greek derivation,—deka, 10; hecto, 100; kilo, 1000. Myria, meaning 10,000, was a term used in the original system but is not employed in practice. The *division* of the units is expressed by Latin prefixes,—deci, $\frac{1}{10}$; centi, $\frac{1}{100}$; milli, $\frac{1}{1000}$.

The following table will indicate to the student the basis of the metric system. The full table with abbreviations follows:

Prefixes		Meaning		Units
milli-	= *one-thousandth*	$\frac{1}{1000}$	.001	**"meter"** *for length*
centi-	= *one-hundreth*	$\frac{1}{100}$	.01	
deci-	= *one-tenth*	$\frac{1}{10}$	.1	**"gram"** *for weight or mass*
Unit	= *one*	1	1	
Deka-	= *ten*	$\frac{10}{1}$	10	
Hecto-	= *one hundred*	$\frac{100}{1}$	100	**"liter"** *for capacity*
Kilo-	= *one thousand*	$\frac{1000}{1}$	1000	

Abbreviation	Meter	Abbreviation	Liter	Abbreviation	Gram
1 milli- meter, mm. =	.001	1 milli- liter, ml. or mil =	.001	1 milli- gram, mg. =	.001
1 centi- meter, cm. =	.01	1 centi- liter, cl. =	.01	1 centi- gram, cg. =	.01
1 deci- meter, dm. =	.1	1 deci- liter, dl. =	.1	1 deci- gram, dg. =	.1
Meter, M.	**1.**	**Liter, L.**	**1.**	**Gram, Gm.**	**1.**
1 Deka- meter, Dm. =	10.	1 Deka- liter, Dl. =	10.	1 Deka- gram, Dg. =	10.
1 Hecto-meter, Hm. =	100.	1 Hecto-liter, Hl. =	100.	1 Hecto-gram, Hg. =	100.
1 Kilo- meter, Km. =	1000.	1 Kilo- liter, Kl. =	1000.	1 Kilo- gram, Kg. =	1000.

Note—These terms are used without the hyphens, which are inserted here for emphasis in teaching the use of the prefixes.

In pharmaceutical practice a number of the above measures are rarely if ever used. Of the measures of length, the *millimeter* (mm.) and *centimeter* (cm.) are employed in the U. S. Pharmacopœia in the descriptions of drugs. In microscopy *micromillimeter* (mkm.) or preferably, *micron* (μ), signifies the thousandth part of a millimeter, and is often used, but the Pharmacopœia has adopted the decimal part of a millimeter instead of the micron, under powdered drugs, thus, under cimicifuga the starch grains are described as being "from 0.003 to 0.015 mm. in diameter". Measurements pertaining to the size of colloidal particles are termed micro-micromillimeter ($\mu\,\mu$), meaning the millionth part of a millimeter. In measures of capacity, the term *milliliter* was, for many years, generally replaced by the term *cubic centimeter* (cc.) in chemical and pharmaceutical practice. The more accurate term *milliliter*, or its abbreviated form *mil* or *ml.*, was adopted by the Ninth Revision of the United States Pharmacopœia and the N. F. IV, but it proved so unpopular in practice that the U. S. P. X and the N. F. V have returned to the older term *cubic centimeter* (cc.). For all practical purposes the two terms have the same value, 1 mil being equivalent to 1.000027 cubic centimeters. The difference amounts to only 1½ minims in a gallon and may be disregarded. The cc. and the liter have been chosen as the most convenient units for measure.

In weight, the *milligram*, *centigram*, *gram*, and *kilogram* are selected; the latter, the commercial unit for larger quantities of drugs, is called the *kilo*. This habit of appropriating only certain of the most convenient denominations for practical work has an analogy in the disuse of the theoretical terms of the system of United States coinage. Thus, the double eagle, eagle, and dime are ignored, while dollars and cents are preferred as units. The principal merits of the metric system are: 1. That every weight and measure bears a simple relation to the initial unit, the meter. 2. That every unit is multiplied or divided by the same number (*i.e.*, 10) to obtain the various denominations, and increase or decrease is expressed by simply moving the decimal point. 3. The commensurability of units of weight, length, and volume. 4. Its almost universal adoption makes it an international system.

Length—*Meter.* Each side of the square (Fig. 6) measures 1 decimeter; one is graduated into tenths (*centimeters*), and these into tenths (*millimeters*) (the scale beneath shows the comparison with inches): 10 decimeters = 1 METER = 39.3700 in. (remember three threes, 3 ft., 3 in., and ⅜ of an inch).

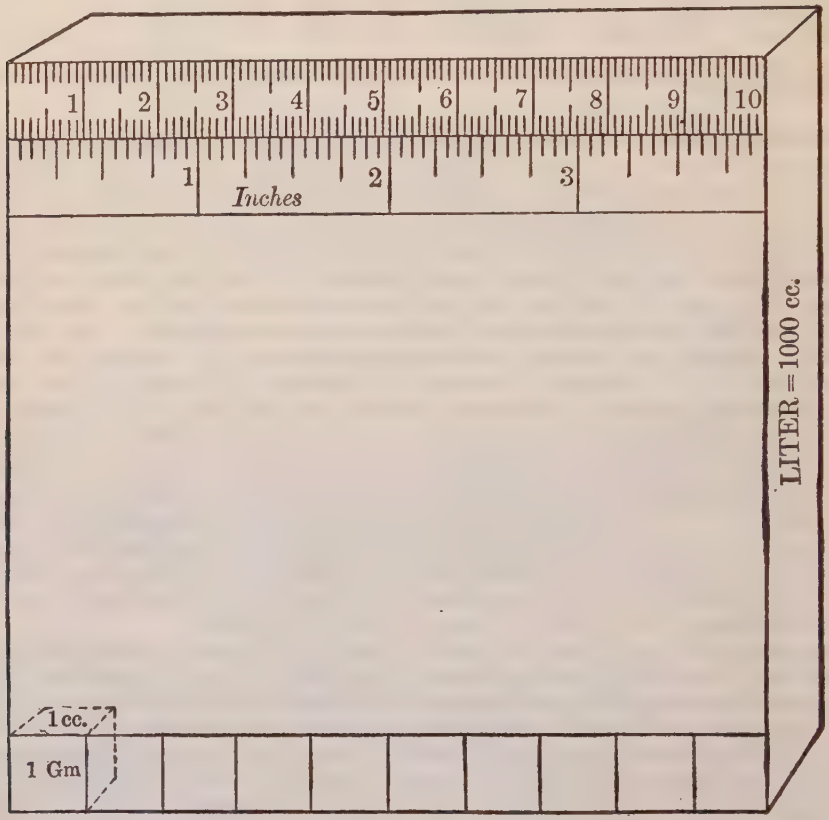
Capacity—*Liter.* A hollow cube having each side of the same size as the square would hold a LITER = 1000 mils, usually spoken of as cc. = 2.11342 pints.

Weight—*Gram.* The weight of distilled water at 4° C. (39.2° F.) contained in a cube of the $\frac{1}{1000}$ of a liter is equal to a GRAM = 15.432 grains, and measures 1 *milliliter* (see Fig. 6).

The advantages of the metric system have become more and more apparent

upon examination, and its simplicity, brevity, and adaptability to everyday needs are now universally conceded. The progress which it had made in this country up to 1890 fully warranted its exclusive adoption in the U. S. Pharmacopœia; hence definite quantities were given and metric weights and measures alone employed.

FIG. 6



Metric diagram

The use of the metric weights and measures in the text of the U. S. Pharmacopœia makes it necessary for every pharmacist to become familiar with them, and therefore an easy method of remembering their relations to each other and their equivalents in other systems is desirable. The tables of equivalents which follow are taken from the Pharmacopœia, and were prepared by the U. S. Bureau of Standards.

Equivalents of Weights and Measures

Metric, Avoirdupois and Apothecaries

NOTE—The values given for the relation of weight to measure and *vice versa*, are for water at the temperature of 4° C. (39.2° F.) *in vacuo*. For ordinary, practical purposes these values may be used without correction.

Weights						Metric Weight and Measure	Measures		
Grains	Apothecaries		Avoirdupois				Fluid		Fluidounce and fractions
	oz.	grains	lbs.	oz.	grains	Gm. or cc.*	ounces	minims

Orthography, Pronunciation, and Reading

Orthography—There are two methods of orthography of the metric units in use in the United States; in one of these, the original French, the units are spelled mètre, litre, gramme; in the other, proposed by the American Metric Bureau, the units are spelled meter, liter, gram. In the U. S. Pharmacopœias for three decades, ever since the original adoption of the metric system, the French gramme was used and meter and liter adopted, but the U. S. P. X has adopted the spelling gram.

Pronunciation—Meter is pronounced *mee'ter*, liter, *lee'ter*, either gram or gramme is pronounced *gram*, not, in two syllables, as sometimes heard, *gram'me;* centimeter should be pronounced sen'tee-mee-ter, not son'tee-mee-ter. The latter faulty pronunciation is quite common, and is due to confounding the French pronunciation with the English. Either son-tee-ma'tr (French) or sen'tee-mee-ter (English) would be correct, but to use half of the French and half of the English is obviously improper, and, as the metric system is now Anglicized, the simple English pronunciation is more appropriate.

Reading—Some difficulty is usually experienced by those unfamiliar with the metric system in reading the quantities. In the linear measures in pharmacy, centimeters and millimeters are almost exclusively used; thus, 0.05 M. would not be read five hundredths of a meter, but 5 centimeters (5 cm.); if the millimeter column contains a unit, as in 0.055 M. it is read fifty-five millimeters (55 mm.), in preference to fifty-five thousandths of a meter.

Fractions of a millimeter must be read decimally, as, 0.0555 mm., fifty-five and five-tenths millimeters. In measures of capacity, cubic centimeters, cc. are exclusively used for quantities of less than a liter, the terms half liter, quarter liter, deciliter, centiliter, milliliter are replaced by 500 cc. 250 cc. 100 cc. 10 cc. 1 cc.; with water the cc. is considered equivalent to a gram. In weight, when the quantity is relatively large, and in commercial transactions, the (kilogram) is abbreviated to kilo, pronounced kee-lo; when less than a (kilogram), and not less than a gram, the quantity is read with the gram for the unit; 2000 Gm. would be read either as two thousand grams or as two kilos, and 543 Gm. would be read five hundred and forty-three grams, while 2543 Gm. is sometimes read two kilos and five hundred and forty-three grams, although twenty-five hundred and forty-three grams is usually preferred. For quantities below the gram, decigrams are not used, but centigrams and milligrams are regarded as the most convenient units; they are read in the same way as centimeters and millimeters.

WEIGHING AND MEASURING

Among the first operations that the student is called upon to perform are the very important ones of *weighing* and *measuring*. The former process requires the use of the *balance*, or, as more frequently but less preferably termed, *scales*. As the successful performance of many of the operations in pharmacy depends upon a thorough knowledge of the principles of the balance and a correct understanding of its care and use, it has been selected as one of the first subjects for consideration.

There is a relativity of accuracy in weighing (or measuring) which must not be overlooked, and which may be illustrated by giving consideration to the following graded list: coal, ice, salt, sugar, epsom salt, morphine, strychnine, aconitine, and radium. One of the most important things for the pharmacist to

learn is the degree of tolerance or error permissible in weighing or measuring any particular ingredient.

The empiric methods of the kitchen embodied in such quantities as a handful or pinch, have no place in pharmacy. Accurate work can be accomplished only by means of suitable apparatus.

It is obviously unnecessary to discuss such weighing devices as platform scales, steelyards, crane scales, spring balances, computing scales or any of the specialized or unusual types not commonly used in retail or in manufacturing pharmacy.

The *balance* may be defined as an instrument for determining the relative weights of substances, and should be *correctly constructed, skilfully used,* and *carefully protected from injury,* if accurate results are to be obtained.

Construction of the Balance—For systematic consideration pharmaceutical balances, which all belong to the general class known as counter balances, may be classified as follows: 1. *Single beam, equal arms.* 2. *Single beam, unequal arms.* 3. *Double beam, unequal arms.* 4. *Compound lever balances.* 5. *Torsion balances.*

1. The Single Beam, Equal Arm Balance—This instrument which still maintains its supremacy, notwithstanding many attempts to supplant it, is the *single beam, equal arm balance,* which may be described as consisting of a metallic lever or beam, divided into two equal arms at the center by a knife edge, upon which it is supported. At exactly equal distances from this point of support, and situated in the same plane, are placed the end knife edges; these suspend the pans which carry the substances to be weighed. The principles used in the construction of this balance have been in continuous use from the earliest periods of antiquity. A properly constructed balance should possess the following requirements:

1. *When the beam is in a horizontal position, the center of gravity should be slightly below the point of support, or central knife edge, and perpendicular to it.*

The relative sensitiveness of the balance depends upon the fulfilment of this principle, which may be roughly illustrated by forcing a pin through the center of a circular piece of pasteboard; if the edge of the pasteboard is touched slightly, it does not oscillate at all, but revolves around the center to a degree corresponding to the impulse given it. In this position it illustrates neutral equilibrium. If the pin is removed and inserted at a very short distance above the center, and the edge of the pasteboard touched as before, it will oscillate slowly, corresponding to a very sensitive beam, the point of support being slightly above the center of gravity; if the pin is again removed and inserted far above the center, and the same impulse imparted to the edge, it will oscillate quickly, illustrating stable equilibrium characteristic of a beam which comes to rest quickly and is not particularly sensitive. Unstable equilibrium may be illustrated by balancing the disk so that the point of support is below the center. The slightest touch then causes it to reverse its position completely and finally come to rest with the center of gravity below the point of support.

2. *The end knife edges must be at exactly equal distances from the central knife edge; they must all be in the same plane, and the edges absolutely parallel to each other.*

It is very apparent that the conditions of a good prescription balance cannot be satisfied if there is inequality in the length of the arms of the beam. In Fig. 7 the distance from the central knife edge to the one on the left must be exactly the same as the distance from the central knife edge to the one on the right, otherwise unequal weights would be required to establish equilibrium.

If the central knife edge is placed either above or below a line drawn so that it connects the end knife edges, the loading of the pans will either cause the beam to cease oscillating, or will diminish the sensitiveness in proportion to the load. If the knife edges are not parallel, the weight of a body would not be constant upon every part of the pan, but would be greater if placed near the edge on one side, and correspondingly less at a point directly opposite.

Fig. 7

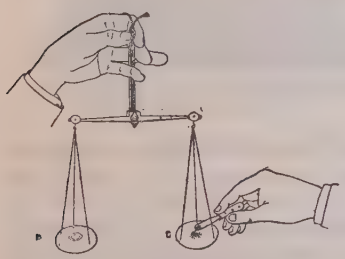
Position of knife edges

3. *The beam should be inflexible, but as light in weight as possible, and the knife edges in fine balances should bear upon agate planes.*

Rigidity of the beam is necessary, because any serious deflection caused by a loading of the pans would lower the end knife edges, and thus accuracy in weighing would be impossible. The beam should not be heavier than necessary, because the sensitiveness of the balance would be thereby lessened, and to diminish friction which constantly increases with the age and use of a balance, the bearings of the knife edges should be agate planes, which are polished flat pieces of the very hard mineral called agate.

The Tests of a Balance—Having stated the essential points in the construction of the balance, the tests, which are always applied by manufacturers before approving a balance, will now be described. These tests may be applied by any intelligent and careful person to satisfy himself with regard to the construction and character of a balance, the origin, history, or condition of which are in doubt. The prescription balance, being one of the most delicate and important of the instruments in use by the pharmacist, is selected for illustration. 1. A suitable counter or table having been secured, the balance is placed in a level position. This is accomplished by means of levels and adjusting screws which are now a part of the equipment of every first class balance. The beam is then elevated so that it is free to oscillate, and when the oscillations have ceased, the smallest weight to which the balance is sensitive is placed upon the right hand pan,—it should at once respond to the weight; this tests its sensitiveness with unloaded pans. 2. Both pans are now loaded with the full weight that the balance is designed to carry, and then the smallest weight is placed upon the right hand pan,—the oscillation, although slower than in the first test, ought to be as decided; this shows its sensitiveness when loaded. 3. The pans should now be loaded to half the capacity of the balance, and perfect equilibrium attained. The weights on the right hand pan must now be exchanged for those on the left hand pan, and *vice versa;* if equilibrium is still maintained, the arms of the beam are equal. 4. The pans should be moderately loaded and balanced, and one of the larger weights shifted in different positions upon each of the pans in turn, and any variation in equilibrium carefully noted. This variation, as previously mentioned, indicates a lack of parallelism in the knife edges.

Fig. 8



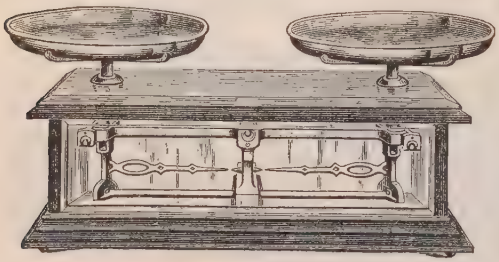
Manner of holding scales

Hand Scales—The commonest form in which this principle is utilized in pharmacy is seen in the cheap hand scales now almost entirely out of use. In those usually seen the beam is of brass, with a steel central knife edge, having a perforation in each end of the beam for the insertion of two wire hooks, to which are attached silken cords for supporting the

pans. The manner of holding these scales is shown in Fig. 8. They are now rarely employed and do not comply with the legal requirements for prescription balances.

Prescription Balances—The advantage of substituting a rigid metallic column for the usually unsteady human arm as a support to the beam is easily apparent, for, in addition to the increased stability which is gained both hands are left free to perform the weighing; more time can usually be devoted to secure equilibrium and the oscillations can be more accurately observed.

FIG. 9



Counter scales in "glass box"

Prescription balances are now available in many forms (See Figs. 13 and 14). The "take down" type commonly used in teaching institutions is not suitable for continuous and daily use in a pharmacy. Illustrations are given of a number of different types of prescription balances, some of which belong to the simpler form of single beam, equal arm balance, and others to the type known as box scales, in which the mechanical parts are enclosed and protected from injury. Most careful pharmacists have two balances for use in the prescription department. These are described by some legal authorities, pertaining to weights and measures, as Class A and Class B balances.

The Class A balance is the balance of greatest sensitiveness and should be used in weighing quantities of ten grains or less. The Class B balance, which need not be so expensive nor so sensitive, should be used in weighing quantities above ten grains.

FIG. 10

Scale with graduated parallel beam and sliding weight

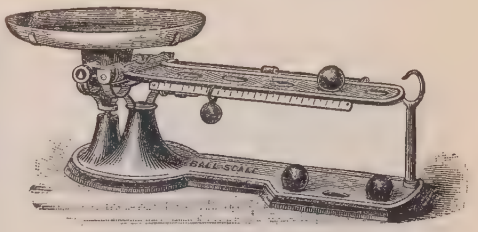
The tolerances established by the United States Bureau of Standards for these two classes of balances provides for a variation of one-fifth of a grain when the load on the balance is one-half ounce in a Class A balance, and a variation of one-half grain for the same load in a Class B balance. Smaller or larger loads are permitted to have the same proportionate error or variation.

The finest prescription balances are now provided with solid nickel or solid silver pans and gold-plated beams. As the pans are subjected to more wear and tear than any other part of the balance, it is economical to use *solid* rather than *plated* pans, for constant friction wears off the plating, and the additional cost for replating soon absorbs the difference in price. Equipped in this way, and with agate bearings, a prescription balance is durable and really cheap, because it will remain for a long time fully equal to the most exacting demands. The most expensive, most sensitive, and most accurate type of single beam equal arm balance is the *analytical balance.* This is fully discussed in the Chapter on "The Pharmacist as an Analyst", Part IX.

Counter Scales—For counter and dispensing purposes, the single beam, equal arm principle was formerly exclusively used. This type of balance occupied so much valuable counter space that it has been entirely replaced by one of the other types of scales, usually the compound lever type with the working parts enclosed (See Fig. 9). A very convenient form of dispensing scale for smaller quantities, made by Troemner, is shown in Fig. 10. The beam is provided with a horizontal, graduated bar, upon which a poise slides backward and forward; the beam is graduated so that apothecaries' or metric weight may be used, and a projecting shelf attached to the base forms a convenient receptacle for the weights.

2. Forms of Single Beam, Unequal Arm Balances—This type of balance is preferred for laboratory work when larger amounts are to be weighed. The principle upon which these very practical weighing machines are founded is based on the following law of physics, "*The power is to the weight or resistance in the inverse ratio of the length of the arms of the lever*". The inequality in the length of the arms of this beam permits of the convenient use of one movable weight upon the graduated longer arm of the beam, thus dispensing with the use of small weights, which are liable to be lost.

FIG. 11

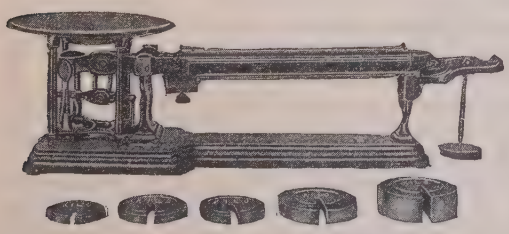


Ball scale

Troemner furnishes a convenient scale of this type for pharmacists' use. It is termed the "ball scale" (see Fig. 11). The beam is flat and perforated with five holes, which are about four inches apart; an iron ball is placed in one of these holes when a substance is to be weighed; the distance from the fulcrum of course determines the weight. It will weigh from ¼ oz. av. up to 16 pounds, and is furnished with an extra "sliding poise", to use in taring or balancing bottles when liquids are to be weighed. The purchaser of this scale need not buy a set of avoirdupois weights.

3. Double Beam, Unequal Arm Balances—This scale (see Fig. 12) is of great advantage in laboratory or manufacturing work because it is particularly adapted for weighing liquids, the weight on the one beam being used to tare the bottle or jar, while the other weight is left free so that it can be adjusted at once to the weight of the liquid desired. These are now to be had with the scale graduated either in the avoirdupois or in the metric system.

FIG. 12



Manufacturing laboratory scale

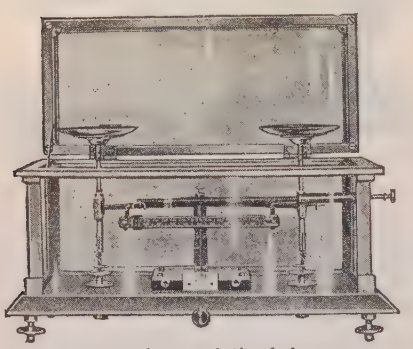
4. Compound Lever Balances—The principle of the compound lever was first applied in the construction of balances by Robervahl, of Paris, about A. D. 1660. It has been skilfully adopted for both prescription balances and the general counter and platform scales. The principal objection to this type of balance, when compared with single beam balances, consists in the multiplicity of points of contact and suspension, thus necessarily increasing friction and the liability to disarrangement; but

their general convenience and improvements in construction have brought them into favor. The principle of the Robervahl compound lever balance, with the arrangement of the levers, is shown in the box scale in Fig. 9.

One of the practical advantages possessed by this form of balance is the small amount of polished metal to keep in order, and, as the working parts are enclosed in a tight box of glass, wood, or marble, dust and corrosive vapors are largely excluded; as they are made to occupy as little space as possible, the pans are conveniently low and unobstructed.

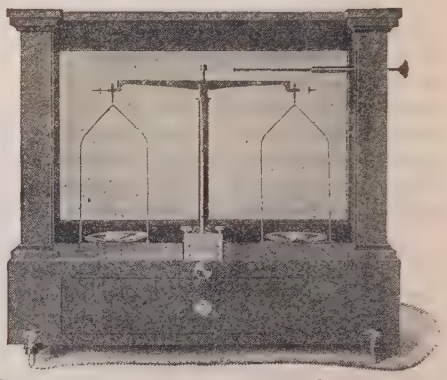
Box prescription scales, on the compound lever principle, have come into extensive use, and they are the most convenient scales for weighing moderately small quantities. The Troemner scale (Fig. 13), a Class A balance, is enclosed in bevel plate glass, the bearings are agate and the scale is provided with a side beam graduated from $\frac{1}{10}$ grain to 15 grains. Their strongest recommendation is the ease with which they may be cleaned and kept in order;

FIG. 13



Troemner's prescription balance

FIG. 14



Troemner's prescription balance

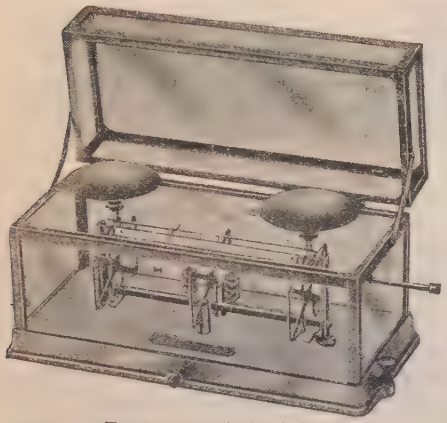
the only polished metal liable to be affected by corrosive vapors is found in the pans, and these are of solid nickel; a hinged glass cover effectually excludes dust and vapors when the balance is not in use. If a pharmacist has a delicate, single beam balance for weighing alkaloids and powerful poisons (see Fig. 14), and a box prescription scale for weighing ordinary quantities, he is well equipped for compounding prescriptions.

Torsion Balances—A simple illustration of the principle of torsion is afforded by tying a stout piece of cord to a firm support and inserting a lead pencil in the middle of the cord between the strands, at right angles to it. If the free end of the cord is tightly stretched, and the effort is made to turn the lead pencil over, it will be at once noticed that resistance is offered, and if the pencil is released, it at once flies back to its original position.

Torsion is the term applied to this method of twisting. The principle of supporting the beam of a balance upon a tightly stretched wire, with the view of doing away with knife edges and diminishing friction, occupied the attention of inventors for years. In 1882 Prof. Roeder and Dr. Springer contrived an ingenious torsion balance which gave promise of valuable results. Two illustrations of this original balance are shown on page 54 of the first edition of the "PRACTICE OF PHARMACY". Recent improvements have greatly increased its efficiency; the most important difficulty in applying the principle—that of torsional resistance—was overcome by the device of placing a weight just above the center of gravity, torsional resistance having the ten-

dency to keep the beam in a horizontal position, while the elevation of a weight above the center of gravity, by its tendency to produce unstable equilibrium (see page 42), exercises an opposite effect—that of inclining the beam to be top heavy, and therefore to tip on either side. If now the weight is made adjustable, by mounting it upon a perpendicular screw, so that it can be raised or lowered, it is possible to arrange these opposite forces so that one exactly neutralizes the other. In this manner sensitiveness is obtained.

Fig. 15



Torsion prescription balance

Fig. 16

Frame

Fig. 17

Frame with wire

In the torsion prescription balance (see Fig. 15) two beams are used, supported upon three frames, each of the latter having a flattened metallic band stretched tightly over its edge. Fig. 16 shows one of these frames, and Fig. 17 shows a frame with the wire stretched upon it. The form of the prescription balance is that of the box scale, enclosed in a glass case; a rider beam graduated upon the upper edge from $\frac{1}{8}$ of a grain to 10 grains and on its lower edge from 0.01 Gm. to 0.65 Gm., furnishes a very convenient means of weighing small quantities without having to use small weights. A base upon which the torsion balance may be placed, containing a drawer, is very convenient for holding weights, powder papers, etc.

The torsion principle has also been applied to analytical balances and scales designed to carry heavier loads, as well as counter scales.

Care of Balances—The necessity for protecting the delicate mechanism of a balance is frequently overlooked, notwithstanding the possibility of having a fine apparatus irretrievably ruined by lack of care in using or cleaning it or in protecting it while at rest. The position chosen for the balance or scales should be upon a level and firm counter, desk, or table, where it will be subjected to little risk of injury from dampness, dust, or corrosive vapors, and where the knife edges will not be liable to become dulled by jarring or other vibration.

In the finer class of balances, protection is afforded by enclosing them in glass cases having sash doors in the front and sometimes in the back. They are protected against injury from vibration by the use of a lever for elevating or locking the beam, so that the knife edges are not in contact with any surface whatever. To prevent injury from jarring while the balance is in use, by a weight falling on the pan, or other accident, the finest balances are provided with pan supports, which break the fall and serve the additional purpose of quickly arresting the beam, thus saving time while weighing.

In using a fine prescription balance neither the weights nor the substance that is to be weighed should be placed on the scale pans while the beam is free to oscillate. The desired weight should be placed upon one scale pan (usually the one on the right hand side) and an amount of the substance to be weighed, approximately the desired weight, placed upon the opposite pan. The beam

should then be released by means of the lever and if the substance is in excess, the beam should be locked and a small portion removed and the beam again released and the oscillations observed. This procedure should be repeated until the correct amount is obtained. In case of a deficiency of the substance to be weighed the reverse procedure is followed until the correct amount is obtained. With practice this can be very deftly and very quickly done and the sensitiveness of the balance retained for years.

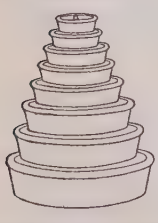
Such balances are often protected against injury from corrosive vapors by having some quicklime (unslaked lime), and some sulphuric acid in separate, open but properly protected, containers within the balance case. This protects from acid and alkaline vapors and also produces dehydration of the air in the case to a certain extent. The quicklime and acid must be frequently renewed to be effective.

Substances which act on metals, like iodine, corrosive sublimate, etc., and those which are adhesive, like the extracts, should not be weighed directly upon the scale pans, but upon counterpoised watch crystals, or, if these are not at hand, upon highly glazed paper, care being taken to balance the papers before weighing the substance. In cleaning the scales, great care should be exercised; polishing powders should be used sparingly; a portion is very apt to find its way into crevices and elude detection until an attempt is made to adjust the scales, when the increased weight of one of the sides of the beam leads to its discovery. Frequent cleaning with soft leather is generally sufficient to keep a balance in good order; but if through neglect it becomes necessary to use more active measures, some simple polishing powder for the silver and brass work, with soapsuds for nickel plate, and simple brushing for the lacquered brass, is all that is necessary.

Metallic Weights used in Pharmacy

The weights used by the pharmacist are a very important part of his outfit, and care in their selection and examination is necessary. False economy is particularly to be avoided, as the use of cheap, inaccurate weights must lead ultimately to serious consequences. Prescription weights have been found in use in drug stores by official inspectors so worn that the characters on their faces had disappeared, and, on the contrary, weights have been found with bits of hardened extract and dirt almost entirely obscuring their characters. An unused set of standard weights should be kept on hand, so that at least once a year the weights in daily use can be tested and adjusted or rejected if necessary.

FIG. 18

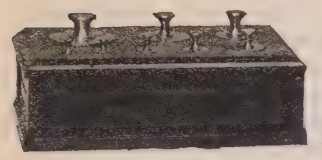


Common avoirdupois weights

Common avoirdupois weights are usually made of iron, and are of the flat, circular form (see Fig. 18), japanned to prevent rusting; these form a pyramidal pile, and range from half an ounce to four pounds; they may be adjusted if found to be incorrect by adding to or diminishing the amount of lead which is hammered into a depression in the base of each. These weights are sometimes made of brass in this form, and sometimes of zinc; the latter, however, are brittle and unserviceable. When used for general retail sales, the cylindrical weights, known technically as "block weights", are preferable (see Fig. 19). If the block is made of two kinds of wood glued together, so as to avoid shrinkage, they are very desirable, particularly if each cylindrical hole in the block has been made large enough to hold easily each weight. The advantages of block weights are, that the gaps left by missing weights are readily noticed, and that the greater surface of the weight is protected from

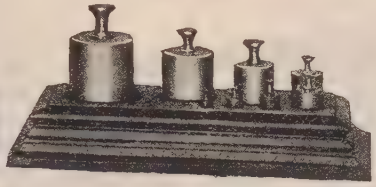
the action of corrosive vapors when not in use. When the weights are nickel plated, a more imposing appearance is produced by arranging them on an ebonized block in recesses (see Fig. 20). The disadvantage of this form is that the surfaces are not protected from oxidation, and they need cleaning more frequently.

Fig. 19



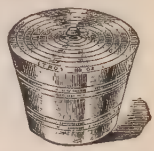
Block weights

Fig. 20



Cylindrical weights

Fig. 21

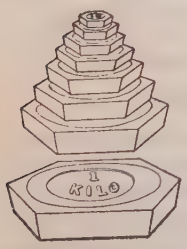


Cup troy weights

Troy weights may be had either as "block weights" or "cup weights"; the latter are to be preferred, particularly if the block avoirdupois weights are in use, for they are then easily distinguished from each other. The cup troy weights range from ¼ ounce to 32 ounces, and have many conveniences (see Fig. 21). When the outside weight is separated, it will be found to have the exact weight of all the rest; if one of the weights is missing, its absence is at once noticed in the incomplete nest, and their compact form is a great recommendation. Weights cannot well be made to occupy less space than these, while all the inside weights are protected from abrasion and corrosion.

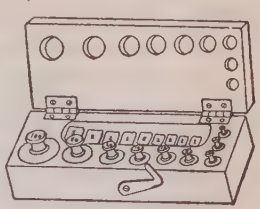
Metric weights may be procured of iron (japanned) for weighing larger quantities, when they are preferably hexagonal and flat in shape, to distinguish them from the ordinary round avoirdupois weights (see Fig. 22). The most useful form for the pharmacist's purposes are undoubtedly the brass weights. They are also supplied in the form of block weights, plainly marked to distinguish them from the avoirdupois weights of similar style. These usually range from 1000 grams to 10 grams. A small set made by Becker, and contained in a solid block, ranging from 0.01 gram to 100 grams, as shown in Fig. 23, is very reliable and convenient.

Fig. 22



Metric weights (iron)

Fig. 23



Metric weights (block)

For prescription purposes, a very inexpensive yet accurate set is made by Troemner, by which 50 grams may be weighed by using all the brass weights, while ample provision is made for weighing the fractional parts of a gram.

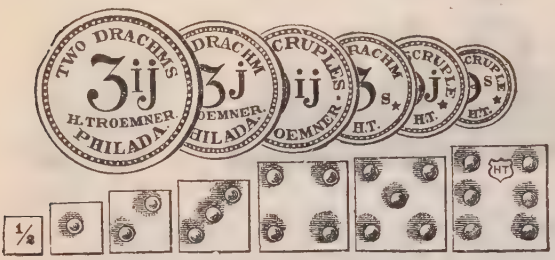
For analytical purposes, metric weights are almost exclusively used; usually the highest weight is 100 grams, the lowest 0.001 gram or 1 milligram. The weights, from one gram upward, are of brass, finely lacquered; the smaller weights are made of squares of platinum foil, with one corner turned up, to permit of their being easily handled with the forceps. Fractions of a milligram are weighed by means of the rider upon the graduated beam of the balance.

In analytical work and in using the Class A balance in prescription work, the weights should never be handled with the fingers but always with the forceps which accompany a fine and accurate set of weights. In the more expensive sets of weights the forceps are tipped with bone or ivory to prevent

the wearing away of the weights during handling. With proper care the accuracy of a fine set of weights may be maintained for years.

Prescription weights.—Too much care can hardly be exercised in the selection of weights to be used in compounding prescriptions. The cost of accurate weights is trifling, yet weights have been found by inspectors in this line of investigation which are disgracefully inaccurate. The round, flat, brass "drachm" weights, which have the denomination stamped distinctly on their faces in raised characters, are most generally used (see Fig. 24). These range from 10 grains to 120 grains in weight. Brass weights of similar shape ranged according to units of the decimal system are also available, and are frequently used. The old fashioned square brass "drachm" weights have passed out of use. The brass foil grain weights are very unsatisfactory, and should not be employed, because of their liability to corrosion. Undoubtedly the best grain weights are the aluminum wire weights. These are more easily and quickly distinguished from one another

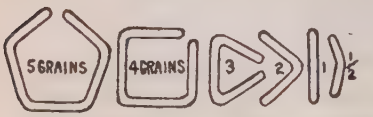
Fig. 24



Troy prescription weights

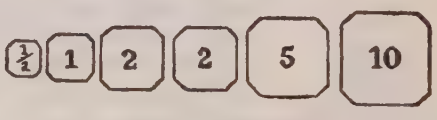
than any other form, and there is less likelihood of dangerous mistakes than from the flat weights, where the denomination is stamped upon the face, often faintly, and is liable to be obliterated by constant use or by corrosive contact. The number of sides in the wire weights at once gives the denomination (see Fig. 25). The shapes of these wire weights are so distinctive, and they are so easily handled, that they should be invariably used. The aluminum grain weights, cut out of aluminum plates, are to be preferred to the flat, brass grain weights, because they are less liable to corrosive action. They are usually more accurately adjusted; the corners of the weights are clipped, and each weight is usually pressed into a curved form, so that it may be easily picked up (see Fig. 26).

Fig. 25



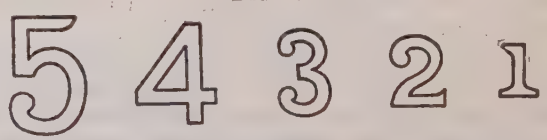
Aluminum wire weights

Fig. 26



Aluminum grain weights

Fig. 27



Aluminum grain weights

In still another form of aluminum grain weights the outlines of the arabic numerals themselves are stamped from sheet aluminum (see Fig. 27).

Measuring Liquids—Tinned iron measures nearly cylindrical in shape, but slightly wider at the bottom, are generally used for measuring liquids when the quantity is over a pint. A set of these measures usually consists of five (gallon, half-gallon, quart, pint, and half-pint). Those made of tinned iron, or of the

enameled sheet iron called agate ware, are greatly inferior to those made of *tinned copper*. Tinned iron measures soon become rusty, and although a protection is afforded if enameled, particles of the enamel chip off, and the exposed iron soon contaminates the liquids measured in them. The first cost of copper measures is greater than tinned iron, but they are far more durable. Care must be taken to protect them from blows which will cause dents, as these may be serious enough to detract from the accuracy of the measures. Fig. 28 shows copper measures of the usual form. Cylindrical metric measures having a diameter just half their height, of tinned copper or brass, in sets of ten, including dekaliter, half-dekaliter, double liter, liter, half-liter, double deciliter, deciliter, half-deciliter, double centiliter, and centiliter are obtainable (see Fig. 29). Copper measures of unusual design are made by H. Sherman, of Philadelphia (see Fig. 30). These have the merit of being less liable to error in measuring and less likely to spill than those of ordinary shape, because of the contracted surface at the top, also alcoholic liquids evaporate less from these than from other types of measures.

Fig. 28

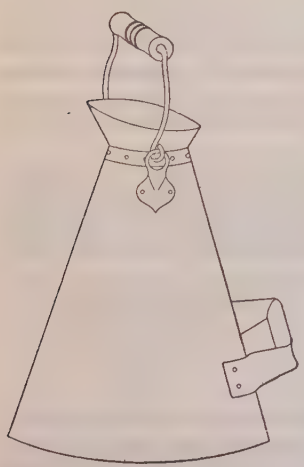
Copper measures

Fig. 29

Metric measures

Fig. 31 illustrates a form of copper measure much used in measuring oils. The flexible outlet tube permits the delivery of the liquid without danger of spilling.

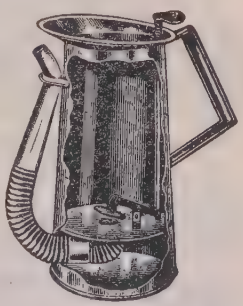
Fig. 30



Special copper measure

Glass measures are preferred for relatively small quantities of liquids, for, although always subject to loss from breakage, they can be more accurately adjusted to indicate the measure. On account of the transparency of glass, the level of the liquid at any height may be seen through the measure, while it is possible to measure accurately with opaque vessels only when they are completely filled.

Fig. 31



Copper measure with outlet

Glass graduated measures are almost exclusively used for quantities of one pint or less, and are of two forms—*conical* and *cylindrical*. The conical graduate is preferred in practical work because of the greater ease with which it can be cleaned, but cylindrical measures are more accurate because of their uniform and smaller average diameter. Thus, if a conical graduated measure has at the 3 fl. oz. mark a diameter of 3 inches (see Figs. 32 and 33), and the cylindrical graduate (see Fig. 34) a diameter at the same mark of

1 inch, it follows that a trifling error in reading the quantity in the cylindrical graduate, either slightly above or below the line, would be increased if similarly made in the conical graduate by exactly the number of times that the surface of the liquid in the conical graduate exceeds that in the cylindrical graduate at the given point. Graduates for prescription use are now always

FIG. 32

Conical metric graduate

FIG. 33

Conical apothecaries graduate

FIG. 34

Cylindrical graduate

graduated by hand, the former moulded graduates not meeting the specifications of the Bureau of Standards.

Bureau of Standards—*Specifications for Glass Graduates.* 1. Graduates shall be made to contain or to deliver the indicated volume at 20° C. (68° F). They shall be legibly, conspicuously, and permanently marked to indicate whether they are graduated to contain or to deliver.

2. Graduates shall be either cylindrical or conical in shape. In the case of all cylindrical graduates the ratio of length of the graduated scale to the internal diameter shall not be less than five to one. In the case of conical graduates the ratio of length of the graduated scale to the internal diameter at the highest graduation shall not be less than two to one, and at one-fourth of the total capacity this ratio shall not be less than one to one.

3. Graduates shall be made of good quality glass, thoroughly annealed, clear, transparent, of uniform but not excessive thickness, and free from bubbles and streaks.

4. Graduates shall be provided with a base at right angles to the axis and of such a diameter that the graduate will stand when placed on a surface making an angle of 25 per cent, or approximately 15°, with the horizontal.

5. All graduates shall be provided with pouring lips.

6. The graduation marks shall be perpendicular to the axis, and parallel to the base and to each other.

7. The graduation marks shall be varied in length in such a manner that they may be conveniently read, but in no case shall any graduation mark extend less than one-fourth of the distance around the graduate. The main graduation marks shall extend at least one-half of the distance around the graduate, provided, however, that on duplex, or double-scale, graduates a clear space shall be left between the ends of the main graduation marks on the two scales, and this space, measured parallel to the graduation marks, shall conform to the following values:

Circumference of graduate at the graduation marks	Distance between ends of graduation marks
	Inch
Up to 5 inches	1/3
From 5 to 10 inches, inclusive	1/4
More than 10 inches	3/8

8. Graduation marks shall be clear and distinct and uniform in character. They shall be etched or engraved, and shall not exceed 0.015 inch (0.38 mm.) in width. Blown or pressed graduation marks shall not be allowed.

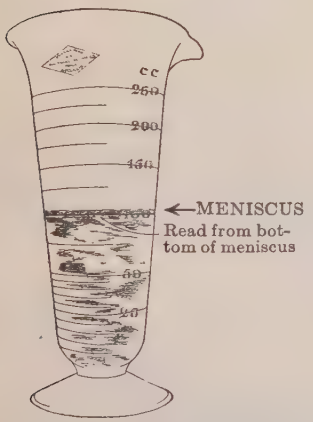
9. The clear interval between the graduation marks shall not be less than 0.04 inch (1 mm.).

10. The value of the main graduation marks shall be plainly designated, each number being placed either directly upon or immediately above the graduation mark to which it refers, but the position of the numbers shall be consistent throughout the graduated scale. If placed upon the graduation marks, the numbers shall be placed from the ends a sufficient distance to allow the ends to be used in making a setting. Intermediate graduation marks shall not be numbered.

11. On all single-scale graduates, where the main graduation marks do not completely encircle the graduate, the middle points of the main graduation marks shall be directly opposite the lip. On duplex, or double-scale, graduates the center of the clear spaces between the ends of the main graduation marks, provided for in specification 7, shall be approximately 90° from the lip.

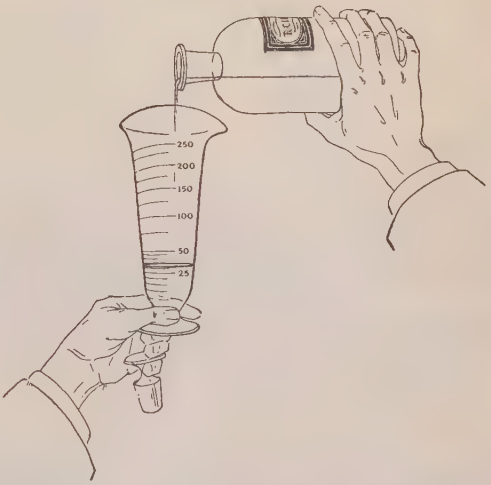
Moulded graduates are sometimes seen for use in preparing solutions for photographic purposes but are not accurate. At this time all graduates made by reliable firms bear a guarantee of accuracy and the name of the manufacturer. Graduation in both the apothecaries and the metric system on opposite sides of a graduate, at one time frequently seen, is no longer permitted by some laws governing weights and measures. When an aqueous or alcoholic liquid is poured into a graduate, which has the form of a cylinder, capillary

Fig. 35



Reading meniscus

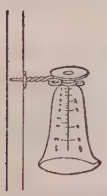
Fig. 35a



Measuring in a graduate

attraction causes its surface to become concave, *i.e.*, that portion in contact with the vessel is drawn upward. This phenomenon is known as the formation of a *meniscus* (See Fig. 35), and in determining the volume of a liquid *the reading must be made at the bottom of this meniscus.* This regulation has been established by the U. S. Bureau of Standards and all glass measuring vessels are graduated upon this basis.

Fig. 36



Graduate hook

When pouring into a graduate from a stock bottle the graduate should be taken in the left hand, as illustrated in Fig. 35a. The shelf bottle is then grasped with the right hand with the label in such a position that after pouring, any excess of liquid will not soil the label should it run down the side of the bottle.

The stopper is now removed with the free fingers of the left hand, while still holding the graduate; the graduate is raised and held so that the graduation point to be read is on a level with the eye, and the liquid then measured.

Fig. 37

Minim pipette

The next move replaces the stopper, and the bottle may then be returned to the counter or shelf. Finally the liquid is poured into the bottle or mortar, for dispensing or compounding. Notice that the graduations are etched upon the glass measure in such a position that the entire operation, including measuring and pouring from the graduate, may be conducted without taking the graduate from the left hand, only tilting it.

Glass measuring vessels, larger than 1 pint or 500 cc., are usually in the form of a jar (see Fig. 414).

Fig. 36 shows a simple method of supporting a graduate after cleaning it. A brass hook is screwed into an upright, preferably over the sink; the prongs are so adjusted that they easily catch the graduate base. An excellent form of graduate rack is illustrated in Part XI, under "the sink".

The extension of the graduating mark into a circle which passes entirely around the graduate is an improvement which obviates the necessity of placing the graduate upon a level place, as the corresponding mark upon the opposite side may be seen through the glass, and the graduate easily leveled even when held in the hand. For measuring smaller quantities of liquids, graduated glass tubes of much less diameter should be used. Minim pipettes are more accurate and convenient than conical minim graduates, and the operation is more cleanly. The graduations on the minim measure are necessarily in the narrowest and lowest portion of a comparatively tall measure. Now, if it is desired to measure 10 minims of a volatile oil the surface which the oil must traverse when this measure is inverted is so great that probably 20 per cent of the oil will be left adhering to the measure. In those instances of liquid preparations where the smaller liquid is miscible with the larger quantity of diluting liquid, the minim graduate may be rinsed and this loss recovered, but inconveniences are largely overcome and greater accuracy secured by the use of a minim pipette (see Fig. 37).

In administering small quantities of liquids, the very convenient *drop* is almost always used. The impression that a drop is equivalent to a minim, and that sixty drops of any fluid are equivalent to a fluidrachm, is widespread. This impression doubtless arose from the fact that sixty ordinary drops of *water* are about equal to a fluidrachm; but many circumstances cause variations in the relative size of drops. Thick viscous liquids, like the mucilages and the syrups, necessarily produce large drops, because the drop adheres to the surface of the glass so long as its weight does not overcome its power of adhesion, while bromine and chloroform, heavy, mobile liquids, having very little adhesion to the dropping surface, produce very small drops, only one-fifth the size of the drop of syrup of acacia. The shape and surface of the vessel from which the liquid is dropped also have an influence in determining the size of the drop. The greater the extent of surface to which the drop adheres, the larger, proportionally, will be the drop.

A "normal" or "standard" drop measure was recommended by the Brussels Conference of 1902 for International adoption. The external diameter of the outlet tube of this *normal dropper* shall be exactly 3 millimeters and so adjusted that at a temperature of 15° C., it shall yield 20 drops of distilled water, weighing 1 Gm.

In the opinion of the Committee of Revision of the Pharmacopœia such a dropper did not seem to be practicable or necessary and was not adopted.

It is believed that the measurement of small volumes of liquids through the use of graduated pipettes (see Fig. 339), is more reliable, when accuracy is required, than through the use of even a standard dropper. This is evidently the opinion of the majority of pharmacists and chemists since a standard dropper has never gained popularity in the United States.

If drops are specified on a prescription, the usual custom is to employ an "eye dropper" shaped much like the minim pipette in Fig. 37.

CHAPTER IV

SPECIFIC GRAVITY

Specific gravity is the ratio of the weight of a given substance to the weight of an equal bulk of a standard substance.

The substance taken as a standard is *water* for solids or liquids, and *air* for hydrogen or gases.

The weights of bodies being obviously in proportion to their masses, the specific gravity of a substance is equivalent to its relative density, and the term *density* has replaced the term *specific gravity* in many scientific works. Density is sometimes briefly defined as "mass per unit volume." The terms density, usually abbreviated "D", and specific gravity, usually abbreviated "Sp. Gr." may be considered as synonymous.

If great accuracy is required, corrections must be made for differences in temperature and for the buoyancy of the air. The latter variation, being slight, is usually disregarded, but temperature is so important that a statement of the fact is usually included in the definition, as follows: *Specific gravity is the weight (or mass) of one body compared with the weight (or mass) of an equal bulk or volume of another body selected as the standard, both bodies having the same temperature, or the temperature of each being definitely known.*

Absolute specific gravity, for solids or liquids, is taken or calculated at the temperature of 4° C. (39.2° F.), which is the temperature of the maximum density of water. *Apparent specific gravity,* as it is called, is the kind of specific gravity that is ordinarily taken in scientific work, and may be taken at any other temperature, but the temperature should always be stated. Sometimes for purposes of convenience specific gravities are taken in which the instrument is not standardized at the same temperature as that of the substance at the time the specific gravity is being taken. Such facts are recorded in a definite manner as illustrated by the following:

Specific gravity at 4°/4° means absolute specific gravity.
Specific gravity at 25°/25° means specific gravity at 25° C.
Specific gravity at 25°/4° means that the specific gravity has been taken at 25° C. but that the pycnometer or hydrometer has been standardized at 4° C. Other similar combinations may be interpreted in the light of the above explanations.

The official temperature for taking specific gravities in pharmacy is 25° C., the official temperature recognized by the U. S. Pharmacopœia for most chemical and physical operations. There is one important exception to this in the case of alcoholic liquids, in which the temperature is 15.56° C., (60° F.), as this temperature was legally adopted many years ago by the United States Government for determining alcoholic strengths for excise purposes, and has never been changed.

Specific gravities are always expressed decimally. Thus, if a certain volume of water is weighed and then the same volume of chloroform, the latter is found to be nearly half again as heavy as the former and it is expressed as a decimal unit and fraction thus: 1.475, meaning that it is one and four hundred and seventy-five thousandths times as heavy as water. Taking a lighter substance for an example, it is found that oil of turpentine is not nearly as heavy as water and the specific gravity of a specimen of this substance is expressed as 0.860, which means that it is only eight hundred and sixty thousandths as heavy as water.

The heaviest metal known has a specific gravity of 22.48; it is the rare metal osmium. To give a comparative idea of some commoner metals, ordinarily recognized as being heavy, it is found that gold has a specific gravity of 19.32 and lead has a specific gravity of 11.34.

The lightest metal known has a specific gravity of 0.534; it is the rare element lithium. Somewhere between these two extremes will be found the specific gravities of the thousands of substances, both liquid and solid, which are of importance in pharmacy.

The specific gravities of liquids concern the pharmacist much more than the specific gravities of solids.

The principle of taking specific gravities of either liquids or solids is precisely the same. The object sought is the weight of a bulk or volume of water equal to that of a convenient quantity of the body of which the specific gravity is to be taken.

This may be expressed by a simple algebraic formula made up of factors as follows:

W = Weight of object
W^1 = Weight of equal bulk of water.
Sp. Gr. = Specific gravity.

The formula exemplifying the underlying principles discussed above is:

$$\text{Sp. Gr.} = \frac{W}{W^1}$$

From this may be deduced the following:

$$W = \text{Sp. Gr.} \times W^1$$

$$W^1 = \frac{W}{\text{Sp. Gr.}}$$

From these three equations all specific gravity calculations may be simply and easily made.

The principal difficulty with specific gravity calculations and the reason why some students find them hard to comprehend is found in the fact that, except when metric system units are used, there are complicated preliminary calculations usually necessary, because of the lack of commensurability of the units previously mentioned under the theory of weights and measures.

If the principles of specific gravity are once thoroughly learned in connection with calculations in the metric system, little difficulty will be experienced later in making any application of them desired if the other systems of weights and measures are accurately known, and their relations to each other perfectly understood.

Take for example a substance in which 100 cc. weighs exactly 150 Gm.; the preceding equation can be applied:

$$\text{Sp. Gr.} = \frac{W}{W^1} \text{ or Sp. Gr.} = \frac{150}{100} \text{ or } 1.50$$

The specific gravity is found to be 1.50, but if a substance is taken of which one fluidounce weighs one and one-half ounces avoirdupois, no simple method of calculation is possible, for each factor must be reduced to the only common unit, the grain, and the equation is much more complicated, as shown by the following:

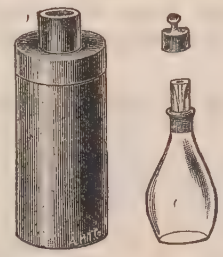
$$\text{Sp. Gr.} = \frac{W}{W^1} \text{ or Sp. Gr.} = \frac{437.5 \times 1.5}{454.6} \text{ or } 1.44+$$

The temperature directed in the U. S. P. is 25° C. (77° F.). When not specified, it is understood to mean 25° C. (77° F.); but in many investigations, particularly those conducted in Europe, the temperature selected is that of the maximum density of water, 4° C. (39.2° F.). For practical purposes the temperature adopted by the Pharmacopœia is most useful in the latitude of the United States.

Specific Gravity of Liquids

The *specific gravity bottle* (*pycnometer* or *pyknometer*) is the most accurate instrument for taking the specific gravity of liquids. Figs. 38 and 39 show several types commonly used. Some of these are provided with counterpoise weights which exactly balance the empty bottle. In most cases, however, the actual weight of the bottle (called the "*tare*") must be previously ascertained, and this weight subtracted each time a specific gravity is taken. For very accurate work, and especially in the determination of alcoholic strength, the pycnometer is equipped with a thermometer, so that the weighing may be quickly accomplished when the exact temperature is reached at which the specific gravity is to be taken. Any ordinary flask or bottle may be used for taking the specific gravity of a liquid if it can be accurately weighed and if it has been standardized by ascertaining the weight of water contained at the standard temperature, when filled to a mark previously made on the neck of the container.

Fig. 38



Specific gravity bottle with tare

Fig. 39

Specific gravity bottle with thermometer

It is usually found advisable to employ pycnometers which at the standard temperature hold some simple unit volume of water as 100 Gm., 50 Gm., 25 Gm., 10 Gm., or 5 Gm., or 1000 grains or 100 grains if the metric system is not used.

This simplifies calculating very much as will be seen by an example. A pycnometer or bottle, weighing 20.613 Gm. when empty, holds exactly 25 Gm. of water at 25° C. When filled with simple syrup, the official strength of which is under question, it weighs 51.863 Gm. Subtracting the tare of the bottle, 20.613 Gm., we find the weight of the syrup to be 31.250 Gm., and dividing this by 25, the weight of water which the bottle holds, the specific gravity is found to be 1.25 and the syrup is therefore below standard, for its specific gravity should not be below 1.313. (See also page 76 and Part XVI.)

Hydrometers

A *hydrometer* is a floating instrument which is used to indicate the specific gravity of a liquid by sinking to a depth corresponding to the density of the liquid. Its principle of action was probably first made known by Archimedes, and depends upon the fact that when a solid body is placed in a liquid in which it is capable of floating, it sinks to a certain point, and this floating point is reached when the body has displaced a volume of liquid exactly equal to its own weight. Hydrometers may be divided into two classes for convenience of study: 1. Those in which the weight is constant, but the depth of immersion subject to change. 2. Those in which the depth of immersion is constant, but the weight subject to change. To the first class belong nearly all the hydrometers especially useful to pharmacists, and of these, two kinds are generally used, one for liquids heavier, the other for those lighter, than water. The best hydrometers now in use are constructed so as to indicate directly the specific gravity when used at the proper temperature. The earliest hydrometers were devised for use in manufacturing operations conducted by unskilled and uneducated workmen who could not be depended upon to remember decimal fractions or observe distinctions based on small decimal differences,

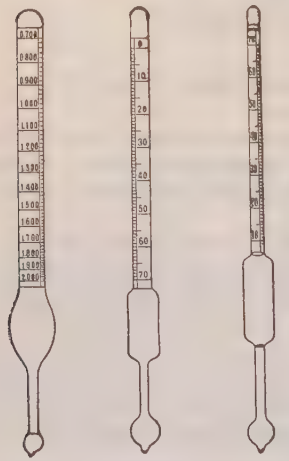
but who could be taught to use hydrometers in which an arbitrary scale consisting of whole numbers was employed.

Many such arbitrary scale hydrometers have been in use. The most important one is Baumé's. Several of lesser importance are Twaddell's and Gay-Lussac's and Brix's. To the second class belong the hydrometers which are intended to sink, by the addition of weights, to a given mark on the stem, and thus displace a constant volume, like Fahrenheit's, Nicholson's, Guyton de Morveau's, etc. These are seldom seen except in physical laboratories or in lecture counter experiments, to illustrate a principle.

1. Hydrometers in which the weight is constant, but the depth of immersion subject to change.

Specific Gravity Hydrometers—This form of hydrometer (see Fig. 40) is coming into more frequent use. It is capable of registering specific gravity accurately to the third decimal place. A series of instruments is needed to cover the entire practical working range which is from 0.700 to 2.000.

FIG. 40 FIG. 41 FIG. 42



Specific gravity hydrometer | Baumé's hydrometer for heavy liquids | Baumé's hydrometer for light liquids

Baumé's Hydrometers—This form was the first one of its class to come into general use, having been originally described by Baumé in his "*Éléments de Pharmacie.*" Two instruments were used by Baumé, one for liquids heavier than water, the other for liquids lighter than water. This type of hydrometer, as now made, consists of a glass tube loaded at the bottom with mercury or small shot, having a bulb blown in it just above the loaded end.

A cylindrical tube, loaded so as to cause it to assume an upright position in a liquid, may be used as a hydrometer. The only advantage gained in expanding the lower portion into bulbs is one of convenience, that of increasing the volume of the hydrometer, and thus permitting the use of shorter instruments. The graduations upon the stem of Baumé's hydrometer are called degrees. They are entirely arbitrary, and were made in the following manner:

For the hydrometer to be used for *liquids heavier than water* (See Fig. 41), sufficient mercury was added to the lower bulb to cause it to sink in water to a convenient point near the top of the stem; this was marked 0. The instrument was then placed in a solution containing 15 per cent by weight of common salt, and the point at which it rested was marked 15. The space between these two points was divided into fifteen equal parts, and the scale below was extended by marking off similar spaces. *For liquids lighter than water* (see Fig. 42), the instrument was placed in a 10 per cent by weight solution of common salt, and loaded so that it floated at a point just above the bulb; this was marked 0. The hydrometer was then transferred to water, the point at which it rested was marked 10, the space between was divided into ten equal parts, and the scale above was extended by marking off similar spaces.

Formulas are available for converting Baumé's degrees into specific gravity by a simple calculation. The following is the formula of the U. S. Bureau of Standards for calculating degrees Baumé from specific gravity.

For liquids heavier than water:

$$°B. = 145 - \frac{145}{\text{Sp. Gr.} \times \frac{60°}{60°}\text{F.}}$$

For liquids lighter than water:

$$°B. = \frac{140}{\text{Sp. Gr.} \times \frac{60°}{60°}\text{F.}} - 130$$

A close approximation, in which temperature is disregarded, may be obtained from the following formulas for calculating specific gravities from degrees Baumé, taken from *Moerk's Analytical Chemistry*.

For liquids heavier than water:

$$\text{Sp. gr.} = 145 \div 145 - °B.$$

For liquids lighter than water:

$$\text{Sp. gr.} = 140 \div 130 + °B.$$

The Bureau of Standards has coöperated with the American Petroleum Institute to standardize a slightly different scale for liquids lighter than water. This scale is based upon the following formula:

$$\text{Degrees A. P. I.} = \frac{141.5}{\text{Sp. Gr.} \times \frac{60°}{60°}\text{F.}} - 131.5$$

Specific gravities at $\frac{60°}{60°}$ F. $\left(\frac{15°.56}{15°.56}\text{ C.}\right)$ corresponding to degrees Baumé for liquids heavier than water.

[Calculated from the formula, specific gravity $\frac{60°}{60°}$ F. $= \frac{145}{145 - \text{Deg. Baumé}}$]

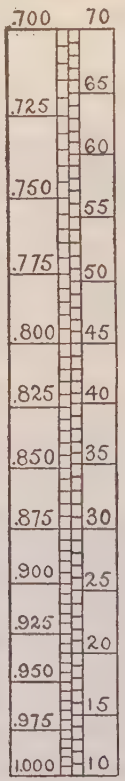
32.5	0.8616	55.5	0.7547	78.5	0.6715		

It must be borne in mind, however, that the hydrometer cannot be as accurate an instrument for taking specific gravity as the pycnometer or specific gravity bottle. The adhesion of air bubbles when in use and the consequent buoyant and error-producing effect, the liability to variation in the diameter of the stem, the inaccuracies in the scale, and the difficulties of adjusting it to give correct readings are the principal disadvantages of hydrometers.

FIG. 43

FIG. 44



Scales of specific gravity hydrometer

In the illustrations shown in Figs. 43 and 44, the arbitrary scale of Baumé, made up of equal spaces, is shown immediately in contact with a specific gravity scale. The spaces of the latter gradually increase in size from below upward, and the highest space is nearly four times the size of the lowest. Before any hydrometer is accepted for use, it should be tested by floating it in water at the temperature indicated on the hydrometer, and, the specific gravity of several liquids having been ascertained carefully by the specific gravity bottle, the hydrometer should be floated in the same liquids, and any deviation carefully noted. A hydrometer which registers uniformly one or two points too low or too high need not be rejected, because the error can be added or subtracted each time and the constant error marked on the box for a memorandum; but if an error of any magnitude must be added to one part of the scale, and another subtracted from another part, it is economy to reject the instrument at once. Hydrometers are usually floated in tall, cylindrical, glass jars (see Fig. 45), and it is frequently necessary to cool the liquid by placing the jar in ice water after inserting a thermometer, and, after the temperature has been lowered to the desired degree, observing the point to which the hydrometer sinks in the liquid. The U. S. Bureau of Standards has established a definite reading point for hydrometers. This is described as follows in circular No. 16. *The Testing of Hydrometers.* "In reading the hydrometer scale the eye is placed slightly below the plane of the surface of the test liquid; it is raised slowly until the surface, seen as an ellipse, becomes a straight line. The point where this line cuts the hydrometer scale should be taken as the reading of the hydrometer". It is usually best to cool the liquid below the standard temperature adopted for the hydrometer, and then, after wiping the jar, the correct higher temperature may be gradually obtained by holding the jar in the hands until the temperature rises to the desired point. A hydrometer having an elongated bulb with cylindrical sides, as shown in Fig. 46, is more likely to give a false indication if permitted to touch the sides of the jar than one having an oval or globular

FIG. 46

Hydrometer with elongated bulb

FIG. 45

Hydrometer jar

bulb (see Fig. 40); the latter can touch the jar at only one point, and hence can move freely up and down, while the former may have one side touching the side of the jar for its entire length. To obviate this, Doctor Squibb suggested the use of a jar with four perpendicular indentations in it, and a hydrometer having an oval bulb (see Fig. 47). The points of contact between the urinometer bulb and the indentations in the jar are best shown in the transverse sectional view immediately below the cut of the urinometer.

Fig. 47

Urinometer and jar (Squibb)

The *urinometer* (see Fig. 47) is one of the most useful special applications of the hydrometer; as its name indicates, it is used to take the specific gravity of urine (see Chapter on Urinalysis); a special scale, which is easily understood, is sometimes used. The very delicate stem, which hardly permits of the use of specific gravity figures, is divided into sixty spaces, numbered 10 to 60; by adding 1000 to each of these numbers, and pointing off three decimal places from the right, the true specific gravity is shown. In Doctor Squibb's urinometer the specific gravity is indicated without abbreviation, the number uppermost on the scale being 1.000, the lowest 1.060, the intervening figures being 1.010, 1.020, 1.030, 1.040, and 1.050.

The *saccharometer* is intended to take the specific gravity of syrups. The scale is sometimes graduated so as to indicate the percentage of sugar in solution, rarely the actual specific gravity; sometimes Baumé's scale (*pèse-sirop*) is used as is also the hydrometer of Brix. The *eleometer*, a very delicate instrument, is used to take the specific gravity of fixed oil. The *lactometer* is employed in detecting the adulteration of milk with water; it has a limited application and is mainly used in connection with the fat content of milk, previously estimated, for the calculation of the total milk solids.

Special hydrometers are often made for taking the specific gravity of liquids, like petroleum benzin, ether, petroleum, vinegar, wine, beer, solutions of silver nitrate, sea water, etc.; probably the most useful to the pharmacist of all those having special applications is the one made for testing alcohol.

Alcoholometers may be purchased which combine the thermometer with the hydrometer, as shown in Fig. 48, the scale frequently having the percentage, by volume, of absolute alcohol or degrees proof marked opposite the corresponding specific gravity. This instrument is capable of very accurate use in a limited field of work and in the hands of an experienced person. It cannot be used in determining the alcoholic strength of any liquid containing more than traces of substances other than alcohol and water. For instance, the alcoholic strength of distilled extract of witchhazel, or of hydro-alcoholic distillates of any kind may be accurately determined, but not the alcoholic strength of wines or flavoring extracts by its direct application or use.

Fig. 48

Alcoholometer

Tralles' hydrometer is an alcoholometer having a centesimal scale. It has been used by the United States government in gauging spirits, and at one time was in general use by distillers. Each division of the scale corresponds to a given percentage of pure alcohol, by volume, in the liquor.

Cartier's hydrometer, largely used in France, is merely a modification of Baumé's *pèse-esprit*, or hydrometer for liquids lighter than water; the zero of the scale is the same as Baumé's (10°), but the degrees are not of the same value, 32° of Baumé's scale being equal to 30° Cartier. Dorvault gives the following approximate rule for conversion: Cartier's degrees may be converted into Baumé's by subtracting 10, multiplying the remainder by 0.08, and adding the product to Cartier's degree.

Baumé's degrees may be converted into Cartier's by subtracting 10, multiplying the remainder by 0.08, and subtracting the product from Baumé's degree.

Gay-Lussac's centesimal alcoholometer has a scale divided into 100 unequal degrees. The zero corresponds to pure water at 15° C. (59° F.) and the 100 mark to absolute alcohol. The advantage of this method is that every intermediate degree expresses the percentage of pure alcohol by measure contained in the spirit. Thus, when the instrument stands at the 50 mark in an alcoholic liquid, it indicates that 100 measures of the liquid contain 50 of pure alcohol.

Brix's hydrometer is used in the sugar industry and registers the amount of dissolved sugar in weak saccharine liquids, such as fruit juices, etc.

Sikes' hydrometer is used in Great Britain in the collection of the excise revenue. It is a brass instrument having a spherical bulb, with a weight at the bottom to make it float upright; the stem is divided into 20 parts, and every other division numbered, from 0 to 10. A series of nine weights are furnished with the instrument, numbered from 10 to 90; these are to be added to the weight at the bottom to cause the hydrometer to sink, so that a reading may be had on the graduated scale; this reading, added to the number on the weight employed, gives a figure which indicates the strength of the spirit by referring to a table which accompanies the instrument.

Jones' hydrometer is similar to Sikes', but by many is regarded as an improvement on it.

Dica's hydrometer belongs to the same class.

Twaddell's hydrometer is frequently employed in the industries and technical works often quote the degrees of this scale. It is used for liquids heavier than water, and is graduated so that the number of the degree, multiplied by 5 and added to 1000, and subsequently divided by 1000, gives the specific gravity. Thus, 20° Twaddell indicates the specific gravity of 1.100; 50° Twaddell, 1.250.

Beck's hydrometer is rarely used or referred to. In this scale 0 corresponds to the specific gravity 1.00, and 30 to that of 0.850; the scale is extended equally above and below 0. For tables, see some of the older reference works. *Bayley's Chemist's Pocket Book*, p. 178.

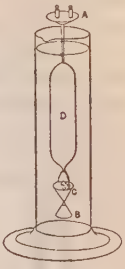
Zanetti's hydrometers have a scale which requires the addition of a cipher to the number of the degree to show the specific gravity.

2. Hydrometers in which the depth of the immersion is constant, but the weight subject to change.

Fahrenheit's hydrometer was one of the first instruments of this class to come into general use. Robert Boyle described, however, in 1675, his "New Essay Instrument", and Fahrenheit's hydrometer was very similar to it in principle. It had but a single mark on the stem, which was surmounted by a small scale pan and weights were placed on the pan to cause the hydrometer to sink to the mark. As this mark indicated the point at which the instrument would float in water at a given temperature when certain weights were placed on the pan, it follows that when it was immersed in a liquid of different specific gravity the weights would have to be changed to float the instrument to the fixed mark; the ratio which this weight bore to the weight used for water gave the specific gravity.

Nicholson's hydrometer is similar in principle to Fahrenheit's, but is modified so that it can be used for taking the specific gravity of heavy or light solids. Fig. 49 is an illustration of one of the most convenient forms of the instrument; it is usually made of brass; there is a single mark on the stem and a scale pan on the summit. To the lower extremity of the hydrometer two conical cups are attached; their apexes are joined so as to resemble an hour glass; the lowest cone has several apertures at the top, to permit of the escape of air when the instrument is immersed. The weight of the hydrometer is usually so adjusted that a 1000 grain weight is needed on the scale pan to float it to the mark on the stem. The specific gravity of solid substances is obtained by weighing them first in air, on the upper platform, and then submerged, in the upper cup, and making the necessary calculations from the factors obtained. The lower cup is used for taking the specific gravity of bodies lighter than water, and is very convenient, the weight of the hydrometer keeping the light body submerged when the lower cup is placed over it. The specific gravity is obtained in the same manner as in the case of bodies heavier than water. One of the advantages of Nicholson's hydrometer is that it can be used in place of a balance for weighing small quantities, as shown above.

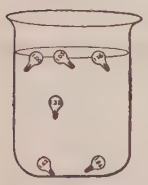
FIG. 49



Nicholson's hydrometer

Lovi's beads, or *specific gravity beads*, are sometimes used for taking the specific gravity of liquids; they are especially useful in large scale manufacturing operations which are conducted by unskilled workmen, and in such cases as where a boiling liquid is to be evaporated until it has a given specific gravity, or in mixing liquids of different densities. They are balloon shaped, hollow globes of glass, of different sizes and weights, having specific gravity figures scratched upon their sides. These figures indicate the specific gravity of a liquid in which the beads swim indifferently; that is, they neither rise nor sink, if the specific gravities of the bead and liquid are the same and the temperature is constant and at the same degree as that at which the beads were standardized. The illustration, Fig. 50, shows their method of use, those heavier than the liquid sinking, those lighter floating, while the one supported indifferently (1.25) indicates the specific gravity of the liquid. Lovi's beads may be defined as hydrometers which indicate but one specific gravity.

FIG. 50

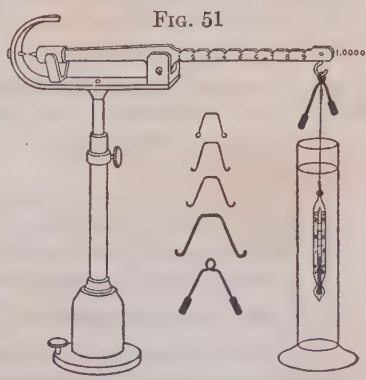


Lovi's beads

Methods of taking the Specific Gravity of Small Quantities of Liquids

Westphal Specific Gravity Balance—This balance is a very convenient device for taking the specific gravities of liquids (see Fig. 51). Sliding weights on the beam give the specific gravity as a direct reading after the temperature has been adjusted, the equilibrium attained, and the sum of the weights determined.

FIG. 51



Westphal specific gravity balance

Gannal's Method—Gannal suggested a very convenient modification of this method of taking the specific gravity of a liquid. A piece of glass, "*densi-*

mètre hydrostatique", having the shape of an olive, has a volume of 10 cc. This is suspended from the hook at the end of the beam of a balance by a horsehair (see Fig. 51), and weights are added to the opposite scale pan until the balance is restored; it is then immersed in the liquid, and the metric weight required to restore the equilibrium gives the specific gravity without a calculation.

Specific Gravity Pipette—Grauer recommends the use of a small pipette having a fine orifice at the lower end, and at the upper end a short piece of rubber tube closed by a pinchcock; a mark is scratched on the pipette to show a point to which a convenient weight of water rises (1 Gm.); enough of the liquid to be tested is drawn by the mouth through the tube to rise to the mark, and it is then closed; the weight of the liquid indicates its specific gravity.

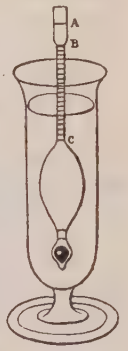
Fig. 52

Nicol's specific gravity tube

A very accurate tube form, known as *Nicol's Specific Gravity Bottle*, is shown in Fig. 52.

Rousseau's Densimeter—This ingenious instrument is constructed upon the plan of a hydrometer (see Fig. 53). The stem from B to C is divided into 20 equal parts; the cup-shaped tube upon the summit of the stem holds exactly 1 cc. When the densimeter is floated in water at the proper temperature, it sinks to the point C at the bottom of the stem; when the cup is filled with water to the cc. mark, it causes the instrument to sink to the point B; this space, B C, being divided into 20 equal parts, it follows that each division corresponds to $\frac{1}{20}$ of a Gm., or 0.05 Gm. If one cc. of oil of rose is placed in the cup, it will sink the densimeter to 17.2 divisions of the scale; then $17.2 \times 0.05 = 0.860$, the specific gravity of the oil of rose.

Fig. 53



Rousseau's densimeter

Specific Gravity of Solids

As has been stated, the taking of the specific gravity of a solid is of comparatively rare occurrence in pharmacy. The same principle obtains that has been so thoroughly discussed and illustrated in connection with the specific gravity of liquids and may be taken in a number of different ways.

The rule for solids is as follows:

Rule.—Divide the weight of the body by the weight of water displaced (loss of weight in water); the quotient will be the specific gravity.

The taking of the specific gravity of solids will be considered under the following heads:

1. Solids insoluble in, and heavier than water.
2. Solids soluble in, and heavier than water.
3. Solids insoluble in, and lighter than water.
4. Solids soluble in, and lighter than water.

1. To take the specific gravity of a solid insoluble in, and heavier than water.

a. With the Balance—It is customary to recommend a special balance for taking the specific gravity of solids, known technically as the hydrostatic balance; but a good prescription or analytical balance will answer perfectly for practical purposes. The substance, preferably in one piece, is first weighed accurately and the weight noted; a horse hair or piece of fine, waterproofed silk thread is then tied around it with a slip knot, and a tight loop at the other end is made, which is attached to the hook at the end of the scale beam; a

small wooden bench made for the purpose, or extemporized by taking out the bottom and one of the sides of a small wooden or stiff pasteboard box, is now arranged over the scale pan so that it does not touch it or interfere with its free movement; upon this a small beaker or wide mouthed jar is placed, and two-thirds filled with distilled water (see Fig. 54). The suspending thread must be adjusted to such length that it will permit of the complete immersion of the substance in the water. Upon weighing the immersed substance, after freeing it from attached air bubbles, it will be at once noticed that it has lost weight, and all that remains to be done is to apply the rule—divide the weight of the body by its loss of weight in water.

Fig. 54

Taking the specific gravity of a solid

For example, 805.5 grains of copper lose by immersion in water 90 grains; then 805.5 divided by 90 gives 8.95, the specific gravity of the copper. See also Nicholson's hydrometer, Fig. 49.

b. With the Specific Gravity Bottle—The specific gravity bottle or pycnometer (see Figs. 38 and 39) has already been described. It is particularly adapted to taking specific gravities of solid substances which are in small fragments or even in a much finer state of subdivision. To use the instrument for a solid substance, the previously weighed body is dropped into the bottle, which is then filled with water at the temperature of 25° C. (77° F.), the exterior of the bottle is carefully dried, and after the counterpoise (the exact weight of the empty bottle), has been placed upon the opposite scale pan, it is weighed. To obtain the *loss of weight* in water of the substance, it is only necessary to deduct the weight of the contents of the bottle (*i.e.*, that of the water and the immersed body) from the weight of the body in air, plus that of the water which the bottle holds when full,—*i.e.*, 100 Gm.; the rule is then to be applied—divide the weight of the body by its loss of weight in water.

Fig. 55

Graduated specific gravity tube

Example—A piece of aluminum wire weighs 10 Gm.; when dropped into a 100 Gm. bottle, and the bottle filled with water at the proper temperature, the weight of both is 106.2 Gm. As the bottle when filled with water alone held 100 Gm., and as the weight of the aluminum in air is 10 Gm., both together weigh 110 Gm.; hence 110 Gm., less 106.2 Gm., gives 3.8 Gm., the loss of weight of the aluminum in water. *Apply the rule*, $\frac{10.}{3.8} = 2.63$, sp. gr.

The specific gravity of any insoluble powder, like calomel, litharge, etc., may be taken in exactly the same way, but care must be observed to agitate the powder with a small quantity of water in the bottle, before adding the rest, to eliminate the possibility of adherent bubbles of air, which would be the cause of error.

c. With the Graduated Tube—A graduated tube is provided in which each space indicates a Gm. (cc.) of water (or better if graduated in smaller subdivisions); the zero mark should be somewhat above the bottom of the tube, as shown in Fig. 55. Now, if water is poured into the tube exactly up to the zero mark, and a weighed solid body dropped into it, the water will rise in the tube and indicate the weight of a bulk of water equal to that of the substance; this is equivalent to the loss in water. *Then apply the rule*—divide the weight of the body by its loss of weight in water. Any cylindrical graduated measure may be used if the volume of the water is accurately noted before and after

the immersion of the previously weighed substance. It is evident that this method cannot be as accurate as either of those above mentioned, as small differences are more clearly indicated by a good balance than by tube reading.

d. By immersing the Solid in a transparent Liquid of the Same Density—This method may be applied where the body is small, is not very heavy specifically, and is insoluble in the liquid. This method is used in the U. S. P. X to take the specific gravity of beeswax (see Part V). Small globules or blocks of the wax are immersed in a mixture of alcohol and water which is then adjusted by the addition of one or the other as needed until the globules or masses of wax float indifferently in the liquid and neither sink nor rise. The specific gravity of the solid will of course be the same as that of the liquid, which may be ascertained after the removal of the wax by straining or filtration, using a specific gravity bottle. (See page 57.)

2. To take the specific gravity of a solid soluble in, and heavier than water.

A liquid must be selected in which the solid is insoluble, like olive oil, petroleum benzin, or oil of turpentine. The specific gravity of the oil or other liquid having been ascertained, it is used just as if it were water, the object being to find out the apparent loss of weight of the substance when immersed in the oil; this having been obtained, a simple proportion must be made as follows: as the specific gravity of the oil is to the specific gravity of water, so is the loss of weight in the oil to the loss of weight in water. *Then apply the rule*—divide the weight of the body by its loss of weight in water.

Example—The loss in weight of 20 Gm. of citric acid, by immersion in oil, is 11.5 Gm. then, as

Sp. gr. of oil		Sp. gr. of water		Loss of weight in oil		Loss of weight in water
0.920	:	1.000	::	11.5	: × or 12.5, then	$\frac{20.0}{12.5} = 1.6$, sp. gr. of citric acid.

It is obvious that either the balance, specific gravity bottle, or graduated tube can be used in this case; but it is possible in some cases to coat the soluble substance with varnish and treat it then as an insoluble substance, and thus avoid the use of an oily liquid. A pill of blue mass may be coated with shellac varnish, and then treated as an insoluble substance as in 1, *b*. The practical difficulty, however, is to secure a thin coating which shall be impervious to water.

3. To take the specific gravity of a solid insoluble in, and lighter than water.

The solution of this problem requires the aid of a heavy insoluble body, which is to be attached to the light body, so as to secure the immersion of both. It is plain that if the loss of weight in water of the heavy substance is deducted from the loss of weight in water of both the heavy and the light body, the result must give the loss of weight in water of the light body alone. *Then apply the rule*—divide the weight of the body by its loss of weight in water.

Example—A piece of paraffin weighs 17.4 Gm., a piece of brass loses by immersion in water 0.6 Gm.; when the brass is attached to the paraffin, both together lose by immersion in water 20.6 Gm.; by deducting 0.6 Gm. (the loss in water of the brass) from 20.6 Gm. (the loss in water of both) the loss in water of the paraffin alone is found, *i. e.*, 20 Gm.; then $\frac{17.4}{20.0} = 0.870$, sp. gr. of paraffin. See also Nicholson's hydrometer, Fig. 49.

4. To take the specific gravity of a solid soluble in, and lighter than water.

The use of the specific gravity bottle is recommended in cases of this kind, and the process is the same as in 2. The selection of a suitable liquid lighter

than the body, and in which it is insoluble is, however, usually attended with difficulty. The proportion would be, as the specific gravity of the light liquid is to the specific gravity of water, so is the loss of weight in the light liquid to the loss of weight in water. *Then the rule must be applied*—divide the weight of the body by the loss of weight in water.

Specific Volume

Specific volume in pharmacy may be defined *as the volume of one body compared with the volume of an equal weight of another body selected as the standard, both bodies having the same temperature.* It is directly the opposite of specific gravity. The temperature chosen is usually 25° C. (77° F.). 1. *To obtain the specific volume of a liquid*—**Rule:** Divide the volume of the given weight of the liquid by the volume of an equal weight of water, or divide the specific gravity of water (1.000) by the specific gravity of the liquid. *Ex.*—1403 Gm. of nitric acid measure 1000 cc. and 1403 Gm. of water measure 1403 cc.; then $\frac{1000}{1403} =$ 0.7127, sp. vol. of nitric acid. 2. *To obtain the volume of a given weight of a liquid*—**Rule:** Multiply the vol. of an equal weight of water by the sp. vol. of the liquid. *Ex.*—How many fl. oz. are there in 100 oz. av. of nitric acid? 100 oz. av. of water measure 96.21 fl. oz.; then $96.21 \times 0.7127 = 68.56 +$ fl. oz. of nitric acid.

Very early in the tyro's experience the fact is recognized that pound bottles designed for different liquids vary in size, a pint bottle, for instance (which may be regarded as a rough standard), holding about a pound avoirdupois of water; the same bottle, however, would only be four-fifths full if a pound of glycerin were poured into it, and two-thirds full if chloroform were used, while a pound of petroleum benzin would fill the pint bottle, and there would be almost enough to spare to fill another pint bottle. A bottle which would hold a pound of ether would hold two pounds of chloroform, and a pint bottle holding one pound of water holds fourteen pounds of mercury. These facts are, of course, capable of the explanation that the specific volumes of liquids lighter than water are greater than that of water, while those of liquids heavier than water are less. An instructive and useful bottle may be made by selecting a flask with a long and not very narrow neck (see Fig. 56), the bulb of which would hold about 100 cc. of water at 4°C.; if the neck would hold about 50 cc. of the same liquid at the same temperature, and a mark was made at the 100 cc. point and the tube graduated from 100 cc. to 150 cc., it would follow that in order to find the specific volume of any lighter liquid within the capacity of the bottle, all that would be necessary would be to pour into the flask 100 Gm. of such liquid at the proper temperature and read off the point to which the liquid rises. A bottle to be used for heavy liquids would have the 100 cc. mark at the top of the neck and the cc. graduations below decrease in value. A bottle of limited range may be constructed having the 100 cc. mark half way between the top of the bulb and the top of the neck. That specific volume is the antithesis of specific gravity is shown by the fact that in order to obtain the specific volume of a liquid the measure of a given weight of the liquid is divided by the measure of an equal weight of water, and (as has been shown heretofore) specific gravity is obtained by dividing the weight of a given measure of the liquid by the weight of an equal measure of water; therefore it follows that when the specific volume of a liquid is multiplied by its specific gravity the product must be 1, or the specific gravity of water.

CHAPTER V

THE ARITHMETIC OF PHARMACY

In no wise does the arithmetic of pharmacy differ from any other arithmetic in so far as its first principles are concerned. The rules of addition, subtraction, division, and multiplication apply here exactly as they apply in any other practical application of arithmetic. The decimal point observes the same laws of conduct; the numerator in the fraction sits astride the denominator; the quotient cannot be had until the division is completed—all of these things are in the arithmetic of pharmacy precisely as they are in the arithmetic of commerce, of chemistry, of engineering, or of any other business, trade, or profession.

Let the foregoing be clearly understood. The student who undertakes a study of the arithmetic of pharmacy does so in order to become familiar with the solving of those distinct problems which occur in the practice of professional duties. No student in pharmacy who was able to manipulate the fundamental problems of the elementary school arithmetic, need have any fear of finding unusually intricate problems in the work of the pharmacy school, or in daily practice.

He need have no *fear* but he must have a wholesome *respect*. That respect must be for *accuracy*.

It is readily appreciated that the pharmacist must have, besides all of his other qualifications, a sense of the accurate. An incorrect calculation on paper, if put into practice, might cause great disaster and interminable worry. It is obvious when dealing with such substances as aconitine and strychnine, where the dose is a small fraction of a grain, and an error may mean the difference between life and death, that all calculations must be handled with absolute accuracy.

The arithmetical principles governing the solution of a problem in compound interest may be exactly the same as those governing the solution of a problem in prescription compounding, but the issues involved are vastly different. One deals with money which may be restored when lost; the other deals with human life which when lost is gone forever.

It is hardly necessary to point out that in presenting this chapter it is pre-supposed that those who study it are familiar with the fundamentals of arithmetic. Yet it is known from experience that many entrants into the courses in pharmacy, although graduates from high schools, commence their professional training sadly deficient in a knowledge of the simplest processes of arithmetic.

The advice to students who appreciate their weakness in this respect is to acquire an elementary text book on the subject and carefully study its contents. The two main weaknesses in the arithmetic of the novitiate in pharmacy are in handling fractions and in the placing of the decimal point.

"What is one-half of one-fortieth?"

This question tendered to hundreds of aspirants to college matriculation has always brought more than fifty per cent of incorrect responses. The arithmetic of pharmacy demands much better ground work than is reflected by such a result.

Weights and Measures

The chapter on Metrology (page 26), deals so comprehensively with the theory of weights and measures that it would be superfluous to introduce here anything beyond a few questions and answers to afford practice in handling the units of the several systems, and the conversion of one system into the other.

The Metric System

Remember Its Special Advantages

(a) Commensurability of the units.

Thus: 10 cc. of water weighs 10 Gm.
25 cc. of water weighs 25 Gm.
1000 cc. (1 liter) of water weighs 1000 Gm. (1 kilo).

(b) It is the system of decimal progression, like the system of coinage. Ten of the low unit make one of the next higher unit.

$$\$3.95 = \begin{cases} 3 \text{ dollars} \\ 9 \text{ dimes} \\ 5 \text{ cents} \end{cases}$$

$$3.95 \text{ Gm.} = \begin{cases} 3 \text{ grams} \\ 9 \text{ decigrams} \\ 5 \text{ centigrams} \end{cases}$$

Addition—1. Add: 3 Kgm., 33 Gm., 3 cgm., 433 mgm.

Note: The gram is the unit of weight, therefore the answer should be in terms of grams and fractions thereof.

Solution:

3 Kgm.	=	3 × 1000	=	3000.	Gm.
33 Gm.	=			33.	Gm.
3 cgm.	=	3 ÷ 100	=	.03	Gm.
433 mgm.	=	433 ÷ 1000	=	.433	Gm.
				3033.463	Gm.

Subtraction—2. Subtract: 285 cc. from 5 liters.

Note: In volume measure the cubic centimeter, or cc., is the unit generally used, hence the answer should be given in cc.

5 liters = 5000 cc. and
5000 cc. − 285 cc. = 4715 cc.

Multiplication:

Note: The product is always of the same denomination as the multiplicand, thus:

20 Gm. × 4 = 80 Gm. . . . not 80 cc. or 80 anything else.

Therefore if the multiplicand should be composed of several units it should be resolved to one unit before multiplying.

Thus: (9 Dgm. 9 cm. 9 cgm.) × 25 is equivalent to
99.09 Gm. × 25 = 2477.25. Gm.

3. What will be the total weight of the ingredients in a prescription for 25 powders, each powder containing 4 dgm. of chalk, 10 cgm. of bismuth subnitrate, and 1 mgm. of cocaine.

4 dgm. + 10 cgm. + 1 mgm. × 25 = 0.4 + 0.10 + .001 Gm. × 25 = 0.501 × 25 = 12.525 Gm.

Division.

Note: The quotient is always of the same denomination as the dividend, thus: 20 Gm. ÷ 4 = 5 Gm. not 5 cc. or 5 anything else.

4. Divide 3 liters by 25
3 liters = 3000 cc. ÷ 25 = 120 cc.

Problems

5. Add together 25 mgm., 25 cgm., 25 Gm., 25 Dgm., 25 dgm.
6. What is the total weight of the following shipment of belladonna leaves:

(1) 2 Kgm. 30 Gm.
(2) 225 Gm. 45 cgm.
(3) 855.6 Gm.
(4) 3 Hgm. 3 Dgm.
(5) 454 Gm.

7. How much is left in a 5 liter flask after the removal of three portions totalling 895 cc.?
8. Subtract the total in No. 5 from a Kilogram.
9. Multiply 48.5 cc. by 3.246.
10. A certain preparation is to contain 0.0325 Gm. of quinine in each cc. How much must be weighed out for 5 liters of the preparation?
11. How many 65 mgm. pills of aloe can be made from a 50 Gm. package of the drug?

The English Systems

Weight

There are two systems of weight measurement in use in the U. S. in the handling of medicines. This is unfortunate and causes much confusion. They are the Avoirdupois and Apothecaries systems.

a. *Avoirdupois*: This is the system of weight by which the pharmacist buys his material. It is also the system which he uses in bulk selling "over the counter"—such goods as Epsom salt, whiting, tar camphor, etc.

The Avoirdupois system is *not* the system used at the prescription counter in dispensing medicines, or in compounding formulas for medicine.

b. *Apothecaries* (Troy): This is the system of weight which is used at the prescription counter, and frequently in compounding medicines. (The United States Pharmacopœia and National Formulary use the metric system exclusively.)

These two systems differ thus:

1 pound Avoirdupois = 7000 grains
1 pound Apothecaries = 5760 grains

The *grain* Avoirdupois is exactly the same as the *grain* Apothecaries. The difference in weight between the two pounds is therefore very great (7000 − 5760 = 1240 grs.), the Avoirdupois pound being the heavier.

1 ounce Avoirdupois = 437.5 grains
1 ounce Apothecaries = 480 grains

The Apothecaries ounce is 480 − 437.5 or 42.5 grains heavier than the Avoirdupois ounce. This is because

1 pound Avoirdupois = 16 ounces
1 pound Apothecaries = 12 ounces

13. A druggist buys a 5 ounce tin of quinine sulphate. How many 5 grain capsules can be made from the contents?

The druggist purchases by the Avoirdupois system *always*.

Therefore: 5 ounces converted to grains is

437.5 × 5 or
2187.5 grains

Assuming no loss during filling, there may be made of 5 grain capsules from this lot:

2187.5 ÷ 5 or 437 capsules

Addition: 14. Add the following volumes:

4 gallons, 5 gallons, 3 pints, 2 fluid ounces, 2 pints, 4 fluid drachms, and 55 minims.

Note: Write out in proper sequence the names of the units in the system thus:

Gallons pints fl. ounces fl. drachms minims.

Now arrange the numbers in the question under each other in their proper place, starting with the first number and continuing to the end.

gallons	pints	fl. oz.	fl. dr.	min.
4				
5	3	2		
	2		4	55
Now add:	9 gal.	5 pt.	2 fl. oz.	4 fl. dr. 55 min.

Had the sum, let us say of pints, exceeded the equivalent of the next higher unit, it would have been necessary to reduce to that unit, entering the remainder, of course, under the pint unit.

Thus:

gallons	pints
2	6
	4
	5
	3 gals. 7 pints

Subtraction: 15. Subtract 1 pint, 4 fl. oz., 6 fl. dr. and 33 minims from 2 gallons.

Note: Start out as under addition.

Thus:

gallons	pints	fl. oz.	fl. dr.	min.
2	0	0	0	0
	1	4	6	33
	1 gal.	6 pt.	11 fl. oz.	1 fl. dr. 27 min.

But a far more apparent method is to partition one gallon into its component parts, thus:

	2 gallons =				
	1 gallon	7 pints	15 fl. oz.	7 fl. dr.	60 minims
now subtract		1	4	6	33
	1 gal.	6 pt.	11 fl. oz.	1 fl. dr.	27 min.

Had the minuend been 5 gallons instead of 2, the arrangement would have been:

4 gallons 7 pts. 15 fl. oz. 7 fl. dr. 60 minims

(When these are added they constitute 5 gallons. Try it.)

Volume

Volumes of liquids are recorded only in terms of the Apothecaries fluid measure system.[1] There is no Avoirdupois fluid measure.

Table A.

60 minims (min.)	=	1 fluid drachm
8 fluid drachms (fl. dr.)	=	1 fluid ounce
16 fluid ounces (fl. oz.)	=	1 pint
8 pints (O.)	=	1 gallon (Cong.)

O. is the abbreviation for the Latin word *Octarius*; Cong., for the Latin word *Congius*.

Table B.

gallon		pints		fl. oz.		fl. dr.		min.
1	=	8	=	128	=	1024	=	61,440
		1	=	16	=	128	=	7,680
				1	=	8	=	480
						1	=	60

The gill, which is ¼ pint, is obsolete, but is occasionally met with in old family recipes.

Division: 16. Divide 10 gallons, 3 pints and 4 fl. oz. by 8.

Note: In dividing proceed from left to right, beginning with the high unit. Should there be a remainder, change this to the next unit and add to the number of that unit before dividing it.

Thus:

	gal.	pt.	fl. oz.
8)	10	3	8
	1 gal.	2 pt.	7 fl. oz.

Multiplication: 17. Multiply 4 pints, 7 fl. oz. and 3 fl. dr. by 4.

Note: Begin with the smallest unit, working from right to left. When it becomes necessary, change the product to the next higher unit, writing only the remainder, if there is any, under the unit multiplied as follows:

gal.	pt.	fl. oz.	fl. dr.
0	4	7	3
			4
2 gal.	1 pt.	13 fl. oz.	4 fl. dr.

[1] The Imperial System is the fluid measure of the British Empire. Because of the proximity of Canada it becomes necessary for those who practice on the border states to learn this system. It is thoroughly discussed in the chapter on Metrology, page 29.

Problems

18. The inventory card shows that the following stocks of syrup are in the store-room.

Three one gallon bottles, 2 pints, 8 fl. oz. and 5½ gallons, 22 pints, 19 fl. oz. How much will this be altogether?

19. How many 15 min. capsules can be filled from 5 fl. oz. and 3 fl. dr. of cod liver oil?

20. How much cod liver oil is necessary to make 2500 capsules each containing 15 min.? (Give the answer in higher units).

21. A barrel supposed to have contained 50 gallons of oil of turpentine leaks slowly. It is found upon measuring that it contains only 33 gallons, 5 pints, and 2 fl. dr. How much was lost?

Relationship of Weights and Measures

Commit to memory the following equivalents, which are given with practical accuracy.

LINEAR MEASURE

1 meter = 39.37 inches
1 inch = 25 millimeters
(0.025 meter)

FLUID MEASURE

1 cc. = 16.23 minims
1 fl. oz. = 29.57 cc.

(Other equivalents may be calculated from these. Thus a pint is equal to 29.57 × 16 or approximately 473 cc.).

WEIGHT

Avoirdupois and Metric

1 ounce = 28.35 Gm.
1 pound = 454 Gm.
1 Kilogram = 2.2 pounds

Apothecaries and Metric

1 grain = 65 mgm. or 0.065 Gm.
1 gram = 15.4 grains

Problems

22. Convert 2 fl. oz., 5 fl. dr. and 33 minims into cubic centimeters.

23. Convert (a) 6.5 grains into milligrams
(b) $\frac{3}{10}$ grain into milligrams
(c) 3½ apothecary ounces into grams
(d) 3½ avoirdupois ounces into grams

24. Convert (a) 550 Gm. into avoirdupois ounces
(b) 550 Gm. into apothecaries ounces

25. Convert the following doses into metric weights:

(a) atropine sulphate, $\frac{1}{100}$ grain to $\frac{1}{60}$th grain
(b) aconitine, $\frac{1}{320}$ grain to $\frac{1}{200}$ grain
(c) codeine, $\frac{1}{6}$ grain to $\frac{1}{2}$ grain
(d) salol, 3 grains to $7\frac{1}{2}$ grains
(e) Epsom salt, 30 grains to 2 drachms

26. Change the following prescription into metric units:

℞ Arsen. Triox. gr. $\frac{1}{2}$
Hydrarg. Chlor. Corr. gr. $\frac{1}{3}$
Phenolphthal. gr. X
Mass. Ferr. Carb. ℥iss

Specific Gravity

Remember—Specific gravity is the term used to express the relative weight of a body as compared to the weight of an equal volume of water, or with some other chosen standard.

When we say that the specific gravity of mercury is 13.25, we mean that a given volume of mercury, let us say a pint, is 13.25 times as heavy as a pint of water.

Variations in temperature cause a variation in volume so that temperature must always be taken into consideration.

Liquids

In practice the specific gravity of *liquids* can be arrived at by using the following formula:

Rule:
$$\text{Sp. Gr. (of a liquid)} = \frac{\text{weight of the liquid}}{\text{weight of an equal volume of water}}$$

Solids

This is described under the chapter on Specific Gravity, page 55. While the principle remains the same, a slight change is made from the above formula, because of a deviation in the method of practically obtaining the specific gravity of a solid.

Rule:
$$\text{Sp. Gr. (of a solid)} = \frac{\text{weight of the solid in air}}{\text{loss of its weight in water}}$$

27. A certain bottle holds 320 Gm. of water, and 280 Gm. of an oil. What is the specific gravity of the oil?

$$\text{Sp. Gr.} = \frac{\text{weight of substance}}{\text{weight of an equal volume of water}}$$

$$= \frac{280}{320} = 0.875 = \text{The specific gravity of the oil}$$

Note: Specific gravity is an abstract figure, that is, it is never given in terms of grams or ounces or in any other unit.

Simply the plain figure, thus: Glycerin, Sp. Gr. 1.25
Chloroform, Sp. Gr. 1.48

Note also that, with the exception of mercury and a few other fluid substances, the specific gravity of liquids generally lies within the range between 0.5 to 2.0, and that the specific gravity of terrestrial solids rarely exceeds 20.

(Notwithstanding these facts students *do* manage to find answers to specific gravity problems that run into figures more appropriate to astronomical distances or microscopic measurements.)

28. 100 cc. of a certain liquid weighs 92 Gm. What is its specific gravity?

$$\text{Sp. Gr.} = \frac{\text{weight of substance}}{\text{weight of an equal volume of water}} = \frac{92}{?}$$

The equal volume of water must, of course, be 100 cc. and the weight of 100 cc. of water is 100 Gm.

Therefore: $$\text{Sp. Gr.} = \frac{92}{100} = 0.920$$

29. A piece of iron weighs 6.6 Gm. in air. Suspended in water it weighs 5.2 Gm. What is the Sp. Gr. of the metal?

$$\text{Sp. Gr. (of a solid)} = \frac{\text{weight of the solid in air}}{\text{loss of its weight in water}} = \frac{6.6}{?}$$

Loss of weight in water is: 6.6 Gm. − 5.2 Gm. or 1.4 Gm.

Therefore: $$\text{Sp. Gr.} = \frac{6.6}{1.4} = 4.714$$

Note: (Always work a specific gravity answer to at least the third decimal place.)

Substances which are soluble in water, copper sulphate crystals for instance, are weighed in a liquid in which they are insoluble, such as oil of turpentine, and the specific gravity of this liquid is applied as a correction factor.

The calculation is done, exactly as if water has been used and the apparent answer thus obtained, is multiplied by the specific gravity of the special liquid used, to obtain the true answer.

30. A crystal of copper sulphate weighs 5.760 Gm. in air. Suspended in oil of turpentine, having a Sp. Gr. of 0.860 it weighs 3.080. What is the specific gravity of the crystal?

Weight of the crystal in air	= 5.760
Weight of the crystal in oil of turpentine	= 3.080
Loss in weight	= 2.680

Assuming that this loss occurred with water:

$$\text{Sp. Gr.} = \frac{\text{weight of the solid in air}}{\text{loss of weight in water}} = \frac{5.760}{2.680} = 2.150$$

Applying the correction factor for oil of turpentine:

$$2.150 \times 0.860 = 1.849$$

Problems

31. An iron bottle holds 75 lbs. of mercury but only 5.533 lbs. of water. What is the Sp. Gr. of the mercury?

32. A pycnometer (Sp. Gr. bottle) holds 50 Gm. of water; of chloroform it holds 74.25 Gm. What is the Sp. Gr. of the chloroform?

33. A certain bottle weighs 31.44 Gm.; filled with water it weighs 80.92 Gm.; filled with glycerin it weighs 93.40 Gm. What is the Sp. Gr. of the glycerin?

34. What is the Sp. Gr. of an oil, an avoirdupois ounce of which measures exactly one fluid ounce?

35. A piece of metal weighs 5.44 Gm. in air; suspended in water it weighs 4.304 Gm. What is the Sp. Gr. of the metal?

36. A crystal of alum weighs 5.736 Gm. in air and 2.850 Gm. when suspended in oil of turpentine, having a specific gravity of 0.855. What is the Sp. Gr. of the alum crystal?

37. The weight of 10 cc. of a certain liquid is 195 grains. What is its specific gravity?

Specific Volume

Specific volume expresses exactly the reverse of specific gravity. It is the volume of a body compared to the volume of an equal weight of water. It is useful because, by its determination, the space which will be occupied by a certain weight of a liquid, can be readily calculated.

Remember the following formula:

$$\text{Sp. Vol.} = \frac{\text{volume of a body}}{\text{volume of an equal weight of water}}$$

Note: Because of the relation between specific gravity and specific volume, the one may be easily converted into the other.

$$\text{Thus: Sp. Gr.} = \frac{1}{\text{sp. vol.}}$$

$$\text{Sp. Vol.} = \frac{1}{\text{sp. gr.}}$$

Problems

38. A certain weight of oil measures 75 cc. The same weight of water measures 55 cc. What is the specific volume of the oil?

39. Chloroform has a specific gravity of 1.48. What is its specific volume?

40. Glycerin has a Sp. Gr. of 1.25. What is its specific volume?

41. Sulphuric acid has a Sp. Vol. of 0.554. What is its specific gravity?

42. Glycerin has a Sp. Vol. of 0.802. What is its specific gravity?

Practical Applications of Specific Gravity

(a). *Reducing volume to weight.*

METRIC

1 cc. of water weighs 1 Gm.
1 cc. of any liquid with the Sp. Gr. 1 weighs 1 Gm.
1 cc. of a liquid with the Sp. Gr. 2 weighs 1×2 or 2 Gm.
1 cc. of a liquid with the Sp. Gr. 1.5 weighs 1×1.5 or 1.5 Gm.
Thus: *The number of cc.* $\times$ *Sp. Gr.* = *Weight in grams.*

43. What is the weight in Gm. of 1 liter of chloroform having a Sp. Gr. of 1.48?

No. of cc. $\times$ Sp. Gr. = weight in grams
1000×1.48 = 1480 Gm.

APOTHECARIES' FLUID MEASURE

There is no commensurability of the units between this system and avoirdupois or troy weight.

1 fl. oz. of water does NOT weigh 1 ounce.
1 minim of water does NOT weigh 1 grain.

But it is known that:
1 fl. oz. of water weighs 454.6 grains, and that
1 minim of water weighs $\frac{454.6}{480}$ or 0.95 grain.
1 fl. oz. of water weighs 454.6 gr.
1 fl. oz. of any liquid having a Sp. Gr. of 1 weighs 454.6 gr.
1 fl. oz. of a liquid having a Sp. Gr. of 2 weighs 454.6 × 2 or 909.2 gr.

Therefore the weight in grains of a fluid ounce of any liquid is:

$$454.6 \times \text{Sp. Gr.}$$

Further, any volume in fluid ounces may be changed to grains (and thence to higher units) according to this formula.

454.6 × Sp. Gr. × number of fl. oz. = wt. in grains.

44. Calculate the weight in grains of 1 pint, 1 fl. oz. and 4 dr. of sulphuric acid, Sp. Gr. 1.8.

454.6 × Sp. Gr. × number of fl. oz. = wt. in grains.
1 pt. 1 fl. oz. 4 fl. dr. = 17.5 fl. oz.
454.6 × 1.8 × 17.5 = 14319.9 grains.

(The answer may be resolved into higher units if desired. Since the avoirdupois grain and the apothecaries are identical, either system may be calculated from the above answer.)

Since 1 minim weighs 0.95 grain, the weight in grains of a number of minims may be had according to the following formula:

0.95 gr. × Sp. Gr. × number of minims = weight in grains.

Problems

45. What is the weight in Gm. of 725 cc. of alcohol (Sp. Gr. 0.816)?
46. What is the weight in Gm. of 1 liter of ether (Sp. Gr. 0.718)?
47. What is the weight in grains of 12.5 fl. oz. of mercury (Sp. Gr. 13.5)?
48. Calculate the weight in avoirdupois pounds of 50 gallons of alcohol (Sp. Gr. 0.816)?
49. What is the weight in grains of 1 pint of gasoline (Sp. Gr. 0.684)?
50. Calculate the weight in Gm. of 5 pints of ammonia water (Sp. Gr. 0.955).
51. What is the weight in grains of 240 minims of chloroform (Sp. Gr. 1.48)?
52. What is the weight in Gm. of 900 minims of ether (Sp. Gr. 0.718)?

Proportion

Example:
100 Gm. of quinine cost $1.80. What will be the cost of 25 Gm.?
The line of reasoning followed to solve a problem of this kind is as follows:

100 Gm. costs $1.80
Therefore 1 Gm. costs 1.8¢
And 25 Gm. costs 1.8¢ × 25 or 45¢ or $0.45.

But there is another way which, though seemingly more complex, may be used very simply to solve much more abstruse problems than the above.

If the three quantities in the problem, namely 100 Gm., $1.80 and 25 Gm. be considered in connection with the answer $0.45, it will be readily seen that

100 bears the same relation to 25 as 1.80 does to 0.45. In other words the quantities and prices are in proportion. Knowing the answer, of course, it was easy to make this comparison. But the comparison may be made without knowing the answer, providing we substitute for the answer the letter x, thus:

100 is to 25 as 1.80 is to x

That constitutes a proportional statement which may be written in the conventional way:

1	2		3	4
100	: 25	: :	$1.80	: x
	is to	as		is to

There are three known terms in the statement and x the unknown. Terms are numbered, first, second, etc., from left to right. The two end terms (1 and 4) are the *extremes*, and the two middle terms (2 and 3) are the *means*. Arithmetically the product of the means must equal the product of the extremes. Therefore, if one of the *extremes* be unknown it may be had by dividing the product of the *means* by the known extreme.

100 : 25 : : $1.80 : x

means

extremes

$$x = \frac{25 \times 1.80}{100} = \$0.45$$

Certain rules must be remembered in working with proportion. They are:

(1) Let "x" always be the fourth term.

(2) Let the third term be that number in the question which expresses the same kind of value as is expected in the answer.

(3) Decide whether the answer sought will be greater or less than the third term. If greater, the larger of the two remaining terms belongs in the second place—if smaller, the lesser of the remaining terms belongs in second place.

(4) The remaining term goes in the first place.

Again:

If 100 Gm. of quinine cost $1.80 what will be the cost of 25 Gm.?

First proceed with the proportional skeleton statement:

1	2	3	4
	: :	:	x

Next ask the question: In what terms will the answer be expressed? Money, of course!

The money term . . . $1.80 then goes in the third place, as 180 cents or $1.80, since *the answer will always be in the same unit as the third term.*

1	2	3	4
:	: :	180¢	: x

Next: Is the answer to be greater or less than $1.80?

Manifestly it will be smaller, since 25 Gm. will certainly cost less than 100 Gm.

The lesser of the two remaining terms, then, goes in the second place, and the lone remaining term in the first place.

$$\begin{array}{cccccccc} 1 & & 2 & & 3 & & 4 \\ 100 & : & 25 & :: & 180¢ & : & x \end{array}$$

$$x = \frac{\text{Product of means}}{\text{Known extreme}} = \frac{180 \times 25}{100} = 45¢$$

These rules will always work correctly if properly applied.

Problems

53. If homatropine costs $3.00 a Gm., how much would 65 mgm. cost?
54. How much would 3 grains of the homatropine cost?
55. If strong silver protein costs $0.90 an ounce, how much can be bought for $5.00?
56. Mercury costs $2.80 per Kilogram. Its Sp. Gr. is 13.5: (a) How much would 100 cc. cost? (b) What would be the cost of a pound (avoir.)? (c) How much would 4 fl. oz. cost?
57. Alcohol costs $4.20 per gallon. Its Sp. Gr. is 0.816. What is the cost per pound?
58. Five pound avoirdupois of nitric acid costs at the rate of 38¢ a pound. Its Sp. Gr. is 1.412. What is the cost per liter?

Percentage Problems

Percentage, abbreviated per cent, and symbolized %, indicates parts in 100 parts.

10 per cent means 10 parts in 100 parts.

Opium, containing 10% of morphine, contains 10 parts of the alkaloid and 90 parts of other constituents, or 10 parts of the alkaloid in 100 parts of the drug

The strength of a solution, the amount of an active principle in a drug, or of an ingredient in a mixture—all may be conveniently stated in percentages, and the per cent symbol is constantly met with in the practice of pharmacy. There is not in all the arithmetic of pharmacy, so diversified a series of problems as those involving the use of the percentage idea. Nor is there in any field as prolific a source of argument as in this.

Percentage truly refers to parts per one hundred parts. It is obvious that the statement involves parts of the same kind and value. It is in connection with percentage solutions that it is often difficult to convince the student the true interpretation of the per cent values.

A 10 per cent silver nitrate solution properly means 10 parts of the silver salt in 100 parts of the finished solution. But since the salt can only be estimated in terms of weight, and the finished solution may be estimated in terms of volume or in terms of weight, it becomes necessary to qualify this statement further, thus:

Ten parts of silver nitrate, by weight, in 100 parts, by weight, of the finished solution.

When the doctor requests:

Two fluidounces of a 5% solution of cocaine hydrochloride, the correct interpretation of his order would be thus:

Two fluidounces of a solution of cocaine hydrochloride containing 5 per cent, by weight, of the alkaloidal salt.

But the quantity is given in volume (2 fl. oz.) and consequently it must be changed into units of weight before proceeding further with the calculation.

Rules for converting from volume into weight and vice versa, have been already studied; and these rules involve the use of the specific gravity factor.

Commonly in the drug store it is customary to overlook the negligible error which occurs when the specific gravity factor is overlooked, that is, then the assumption is made that the specific gravity of the finished solution is 1. But in the interest of "accuracy all the time"—a permissible inaccuracy is detrimental, particularly so since the error increases as the percentage strength increases.

If *exactly* calculated quantities are required, it is possible to obtain them by a method, which while considered by some as impractical, is nevertheless, the only accurate method available. It is as follows:

In calculating the percentage solution use as great a volume of solvent (water usually) as the quantity of solution called for. Base the calculation of the amount of ingredient upon the weight of this volume of solvent.

When this is done the finished liquid will actually measure more than the desired volume, but the definite quantity may be measured out and the excess saved or rejected according to its value, stability, etc.

59. Write a formula for 2 fluidounces of a 15 per cent solution of mild silver-protein.

Two fluidounces of water weigh $454.6 \times 2 = 909.2$ grains.

A 15% solution is:

15% ingredient
85% solvent = 909.2 grains
100% solution

The question now is:

If 85% = 909.2 grains what will 15% be?

This may be solved by proportion:

85 : 15 : : 909.2 : x (= 160.4 grains).

Thus by measuring out 2 fluidounces of water and dissolving in it 160.4 grains of mild silver-protein, there is produced a little over 2 fluidounces of an *exactly* 15 per cent solution.

The use of this exact method is suggested for all calculations involving 5 per cent and over.

Under 5 per cent the error is so negligible that the "drug store method" may be safely used.

60. Example: 2 fl. oz. of a 2.5 per cent solution of silver nitrate.

$$2 \text{ fl. oz.} = 454.6 \times 2 = 909.2 \text{ grains.}$$

$$2.5 \text{ per cent} = \frac{2.5}{100} = 0.025$$

Now if 909.2 is multiplied by this figure, the weight of the silver nitrate will be obtained. $909.2 \times 0.025 = 22.73$.

Therefore, 22.73 grains of silver nitrate dissolved in water to measure 2 fluid ounces is the answer.

Problems in Percentage

61. How much morphine is present in 280 Gm. of 11.5% opium?

62. How much resin is present in 24 avoirdupois pounds of podophyllum, which assays 2.8% resin?

63. If a certain opium has a morphine content of 11.5%, how much of the opium would contain just 9 Gm. of morphine?

64. What is the per cent of soluble matter in a certain drug, 600 Gm. of which yield 45 Gm. of soluble-extractive matter?

65. Diluted hydrocyanic acid contains 2% of absolute HCN, the rest being water. How much absolute HCN is present in 650 Gm. of diluted acid?

66. How many Gm. of 5% caustic potash solution may be made from 280 Gm. of potash?

67. What is the per cent strength of a liquid made by dissolving 16 Gm. of potassium chlorate in 1 fluidounce of water?

68. Boric acid requires 18 parts of water for solution. What is the per cent strength of a saturated solution?

69. What is the percentage of sugar in a syrup made by dissolving 5 pounds of sugar in 8 pounds of water? (Always remember that a solution is the sum of the solute (ingredient) and the solvent.)

70. Write formulas for the following solutions using the exact method:

(a) 500 cc. of a 15% aqueous solution of sodium bromide.
(b) 4 fl. oz. of a 12.5% aqueous solution of sodium bromide.
(c) 250 cc. of a 25% aqueous solution of sodium bromide.
(d) 6 fl. oz. of a 10% aqueous solution of sodium bromide.

71. Write formulas for the following solutions using any method.

(a) 4 fl. oz. of a 1% aqueous solution of silver nitrate.
(b) 1 Liter of a 2.5% aqueous solution of silver nitrate.
(c) 2 fl. oz. of a 4% solution of salicylic acid in alcohol (Sp. Gr. 0.81).

Explanation of " c ": $454.6 \times 2 = 909.2 \times 0.81 = 736.4$.
$736.4 \times 0.04 = 29.45$ grains dissolved in 2 fl. oz. of alcohol.

72. Write a formula for a quart of a 1-1000 aqueous solution of silver nitrate.

Explanation: 1 quart $= 454.6 \times 32 = 14547.2$ grains.

$$1/1000 = \frac{1}{1000} \times \frac{14547.2}{1} = 14.5 \text{ grains.}$$

14.5 grains dissolved in a quart of water.

73. Write a formula for a liter of a 1—2500 solution of silver nitrate in water.

74. U. S. P. solution of formaldehyde contains 37% of absolute formaldehyde. Write a formula for a pint of an aqueous solution containing 2.5% of absolute formaldehyde.

75. Write a formula for 4 fl. oz. of a concentrated solution of potassium permanganate of such a strength that 1 fl. dr. diluted with water to make a pint, constitutes a 1—1000 solution.

76. Write a formula for 250 cc. of a solution of silver nitrate of such a strength that 5 cc. diluted to a liter, constitutes a 1—2500 solution.

Explanation: The only clue to a solution of the problem lies in the last part of the sentence.

" 5 cc. diluted to a liter = a 1—2500 solution."

Therefore what is contained in a liter of a 1—2500 solution must be contained in the 5 cc. of the stronger solution.

$$1 \text{ liter of water} = 1000 \text{ cc.} = 1000 \text{ Gm.}$$

$$1-2500 = \frac{1}{2500} \times 1000 = 0.4 \text{ Gm.}$$

$$5 \text{ cc.} = 0.4 \text{ Gm.}$$

$$\text{Therefore: } 250 \text{ cc.} = 0.4 \times 50 = 20 \text{ Gm.}$$

Answer: 20 Gm. of silver nitrate and water sufficient to make 250 cc.

77. What is the % strength of a salt solution, obtained by diluting 200 Gm. of a 10% solution to 300 Gm.?

Explanation: The answer will be in terms of percentage.

Hence: : : : 10% : x

After dilution the strength will be less, therefore the lesser remaining term goes in the second place and the larger in the first. (The converse is true in a problem involving concentration.)

$$300 : 200 :: 10\% : x$$

$$x = \frac{10 \times 200}{300} = 6.66\%$$

78. To what weight should 5 kilograms of alcohol (95%) be diluted to make an alcohol of 50%?

79. How many pounds of 67 % nitric acid are required to make 40 pounds of 10% nitric acid?

80. To how many fluidounces must a liter of alcohol (Sp. Gr. 0.835; strength 85 per cent by weight) be diluted in order to make 62% alcohol having a Sp. Gr. of 0.89?

Note: Convert liter into Gm. Find weight of diluted product by proportion. This will be in Gm. Convert this to cc. (with Sp. Gr.); then to fl. oz.

Alligation*

Alligation Medial

81. Example: A druggist mixes together 5 pounds of 11% powdered opium, 4 pounds of 12.5% powdered opium, and 10 pounds of 9% powdered opium. What is the percentage strength of the mixture?

Explanation:	5 lb. of 11% opium	=	55 lb. of 1% opium
	4 lb. of 12.5% opium	=	50 lb. of 1% opium
	10 lb. of 9% opium	=	90 lb. of 1% opium
Totalling	19 lb. which is equivalent to		195 lb. of 1% opium

Nineteen lb. contains as much as 195 lb. of 1% opium, and the strength of the mixture must be as many times 1 per cent as 19 lb. is contained in 195

$$\text{or } \frac{195}{19} = 10.26\%.$$

82. What is the per cent of resin content in the following mixture?

25 lb. of 3 % podophyllum
5 Kilos 2.5% podophyllum
12 lb. 4.2% podophyllum
(Resolve into pounds)

* (The word alligation comes from the Latin *alligare*—to bind, referring to the binding together of value in these problems.)

83. What is the strength of the mixture produced by combining the following lots of alcohol?

2 liters of 95% alcohol
2 gallons of 50% alcohol
7 pints of 60% alcohol

(Resolve all quantities into liters)

Medial alligation may also be applied to Sp. Gr. The amounts, however, must always be in volume because Sp. Gr. expresses the weight of a given *volume*.

84. What would be the Sp. Gr. of a mixture of 150 Gm. of ether, Sp. Gr. 0.710 and 250 Gm. of chloroform Sp. Gr. 1.480?

Note: (Reduce Gm. to cc. then proceed by alligation medial).

85. What would be the Sp. Gr. of a mixture of 1 pint of glycerin (Sp. Gr. 1.248) and 1 lb. of water?

86. What would be the Sp. Gr. of a mixture of 1 gallon of alcohol of Sp. Gr. 0.816 and 1 gallon of alcohol of Sp. Gr. 0.920?

Alligation Alternate

87. Problem: In what proportion must opium containing 10.0% of morphine be mixed with 15% opium to produce opium of 12% morphine strength?

The weaker opium is 2% too weak. The stronger opium is 3% too strong. Therefore the excess in strength of 3 parts of the stronger will just balance the deficiency of 2 parts of the weaker drug.

For $3 \times 2 = 2 \times 3$.

Proceed with the solution of the problem thus:

Desired per cent, 12% $\begin{cases} 10\% = 3 \text{ parts.} \\ 15\% = 2 \text{ parts.} \end{cases}$

The figure obtained by subtracting 10% from 12% is placed against the 15%, and that obtained by subtracting the 12% from 15% placed against the 12%.

88. In what proportion must 30% alcohol, 45% alcohol, 60% alcohol, and 95% alcohol be mixed to make alcohol of 50% strength?

Desired percentage 50% $\begin{cases} \left.\begin{matrix} 30\% \\ 60\% \end{matrix}\right] = 10 \text{ parts of } 30\% \text{ alcohol.} \\ \left.\begin{matrix} 45\% \\ 95\% \end{matrix}\right] = 20 \text{ parts of } 60\% \text{ alcohol.} \\ \left.\begin{matrix} 45\% \\ 95\% \end{matrix}\right] = 45 \text{ parts of } 45\% \text{ alcohol.} \\ \left.\begin{matrix} 45\% \\ 95\% \end{matrix}\right] = 5 \text{ parts of } 95\% \text{ alcohol.} \end{cases}$

Rule: *Always link together a quantity which is less, with one which is greater than the desired percentage, otherwise the answer will be wrong.*

89. Prove the correctness of the above answer by medial alligation. Thus:

What will be the per cent strength of the following mixture?

10 parts of 30% alcohol
20 parts of 60% alcohol
45 parts of 45% alcohol
5 parts of 95% alcohol

Note: More than one correct answer may be had to certain problems in alternate alligation, depending on how the units are linked together.

90. How must the following batches of powdered opium be mixed in order to secure a 12% product, five lots containing respectively 7.5%, 9%, 10%, 14%, and 15% of morphine?

91. In what proportion should 95% alcohol, 50% alcohol, and water be mixed to make an alcohol of 35% strength?

Note: (The water may be considered as 0% alcohol.)

92. In what proportion should powdered opium, containing 12% of morphine, and powdered opium of 15% strength, and lactose, be mixed to make a 12.5% opium?

93. In what proportion must mineral oil (Sp. Gr. 0.812) be mixed with mineral oil (Sp. Gr. 0.845) to make a product having a Sp. Gr. of 0.825?

The problems heretofore solved referred only to indeterminate quantities (parts). The value of alligation alternate may be extended to problems where definite quantities are included, such as:

94. Example: How much opium containing 12% of morphine and how much of 14% strength, and how much lactose must be added to 250 Gm. of opium of 9% strength to have a product containing 10% of morphine?

Solution:

$$10\% \begin{cases} 12 \\ 0 \end{cases} = 10 \text{ parts} = ?$$
$$\begin{cases} 12 \\ 0 \end{cases} = 2 \text{ parts} = ?$$
$$\begin{cases} 9 \\ 14 \end{cases} = 4 \text{ parts} = 250 \text{ Gm.}$$
$$\begin{cases} 9 \\ 14 \end{cases} = 1 \text{ part} = ?$$

Then proceed by proportion:

$$4 : 10 :: 250 : x = 625 \text{ Gm.}$$
$$4 : 2 :: 250 : x = 125 \text{ Gm.}$$
$$4 : 1 :: 250 : x = 65.6 \text{ Gm.}$$

95. Example: How much opium of 12% morphine strength, and how much opium of 16% strength, must be used to make 25 lbs. of a product having a morphine content of 12.5%?

$$12.5 \begin{cases} 16 = 0.5 \text{ or } 5 \text{ parts} \\ 12 = 3.5 \text{ or } 35 \text{ parts} \end{cases}$$

Totalling..... .40 parts or 25 lbs.

By proportion:

$$40 : 5 :: 25 : x = 3\tfrac{1}{8} \text{ lbs.}$$
$$40 : 35 :: 25 : x = 21\tfrac{7}{8} \text{ lbs.}$$

96. How many Gm. of 28% ammonia water should be added to a Kilogram of 10% ammonia water to produce a 15% ammonia water?

97. The following lots of solution of ammonium chloride are mixed together: 200 Gm. of a 5% solution, 500 Gm. of a 1.5% solution and, 250 Gm. of a 4% solution. How much of the salt (100%), must be dissolved in the above mixture to increase its strength to 6%?

98. Three lots of powdered kola of the following alkaloidal content are mixed together: 1.28%, 1.45%, and 2%. How much of each need be used to produce 10 lb. of the finished mixture?

99. How many Gm. of nitric acid of 68% strength must be added to a Kilogram of dilute acid (10%) to make a 40% product?

Formulas and Prescriptions

100. Calculate a formula for a gallon of the following liquid:

Glycerin	3 fl. dr.
Phenol	1 fl. dr.
Water, sufficient to make	4 fl. oz.

The formula as written calls for 4 fluid ounces. The quantity wanted is a gallon, or 128 fluidounces. The ratio between 128 and 4 is 32 to 1. Thus if each quantity is multiplied by 32, the problem will be solved:

Glycerin	3 fl. dr.	× 32	=	96 fl. dr. or 12 fl. oz.
Phenol	1 fl. dr.	× 32	=	32 fl. dr. or 4 fl. oz.
Water, sufficient to make	4 fl. oz.	or		1 gallon

101. Calculate a formula for 100 Gm. of antiseptic powder prepared as follows:

Phenol	2 Gm.
Thymol	1 Gm.
Sod. benzoate	7 Gm.
Sod. salicylate	25 Gm.
Alum	115 Gm.
Totalling	150 Gm.

Now 100 Gm. is $\frac{100}{150}$ or $\frac{2}{3}$ of 150 Gm.

Each ingredient must be multiplied by $\frac{2}{3}$ so that there will be 100 Gm. of finished product instead of 150 Gm.

Phenol	2 Gm.	× $\frac{2}{3}$	=	$1\frac{1}{3}$ Gm.
Thymol	1 Gm.	× $\frac{2}{3}$	=	$\frac{2}{3}$ Gm.
Sod. benzoate	7 Gm.	× $\frac{2}{3}$	=	$4\frac{2}{3}$ Gm.
Sod. salicylate	25 Gm.	× $\frac{2}{3}$	=	$16\frac{2}{3}$ Gm.
Alum	115 Gm.	× $\frac{2}{3}$	=	$76\frac{2}{3}$ Gm.

102. The N. F. gives the following formula for Emulsion of Castor Oil:

Castor oil	35 cc.
Acacia	9 Gm.
Tincture of vanilla	2.5 cc.
Syrup	20 cc.
Water, sufficient to make	100 cc.

Calculate quantities for:

(a) 2 gallons
(b) 4 fl. oz.
(c) 2500 cc.
(d) 1 liter
(e) 1 pint

103. Following is a formula for an ointment:

Thymol iodide	1 drachm
Olive oil	30 minims
Wool fat	2 drachms
Petrolatum, sufficient to make	1 ounce

Calculate the quantities which must be used to make:

(a) 500 Gm.
(b) 2 pounds (avoirdupois)
(c) 2 pounds (apothecaries)

104. Calculate the dose of each ingredient in the following prescriptions:

A. ℞ Arsenic trioxide..... 1 grain
Strychnine sulphate..... ⅔ grain
Phenolphthalein..... 30 grains
Mass of ferrous carbonate..... 2 drachms
Mix and make into 60 pills.

The answer is obviously secured by dividing each ingredient quantity by 60.

B. ℞ Arsenic trioxide..... 1 grain
Strychnine sulphate..... ⅔ grain
Tincture of ferric chloride..... 2 fl. dr.
Aromatic elixir, q. s..... 6 fl. oz.
Mix and make a solution.
Teaspoonful every 3 hours.

Explanation: 6 fl. oz. = 6 × 8 or 48 fl. dr. (teaspoonfuls).

By dividing each ingredient quantity by 48 the answer is obtained.

In dividing fractions by 48 it is to be remembered that the same result will be obtained as by multiplying by the fraction $\frac{1}{48}$.

$$\text{Thus: } \tfrac{2}{3} \div 48 = \tfrac{2}{3} \times \frac{1}{48} = \frac{1}{72}$$

105. Calculate the dose of each ingredient in the following prescription:

℞ Codeine sulphate..... .5 Gm.
Ammonium chloride..... 8.0 Gm.
Brown mixture..... 240.0 cc.
Mix and make a solution.
Teaspoonful every 4 hours.

Give the answer in metric units.

Calculating Doses for Children

Young's Rule:

$$\frac{\text{Age}}{\text{Age} + 12} \times \text{adult dose} = \text{child dose}$$

The adult dose of salol is 5 grains. What is the dose for a four-year old child?

$$\frac{4}{4 + 12} = \frac{4}{16} = \tfrac{1}{4} \times 5 = 1\tfrac{1}{4} \text{ grain}$$

Cowling's Rule:

$$\frac{\text{Age}}{24} \times \text{adult dose} = \text{child dose}$$

The adult dose of salol is 5 grains. What is the dose for a four-year old child?

$$\frac{4}{24} = \frac{1}{6} \times 5 = \frac{5}{6} \text{ grain}$$

Note: Young's rule is almost universally used.

Thermometers and Hydrometers

Rules—(*Centigrade and Fahrenheit Thermometers*) As explained in the Chapter on Thermometers, page 103.

Degrees C. = degrees F. − 32 × 1.8
Degrees F. = (degrees C. × 1.8) + 32.

Centigrade and Reaumur Thermometers—

Degrees C. × .8 = degrees Reaumur
Degrees R. ÷ .8 = degrees Centigrade

Fahrenheit and Reaumur Thermometers—

(Degrees R. × 2.25) + 32 = Degrees F.
(Degrees F. − 32) ÷ 2.25 = Degrees R.

106. Convert: (a) 30 degrees C. into degrees F.
(b) 100 degrees C. into degrees F.
(c) −40 degrees C. into degrees F.

107. Convert: (a) 32 degrees F. into degrees C.
(b) 100 degrees F. into degrees C.
(c) 98.4 degrees F. into degrees C.

108. Convert: (a) 20 degrees R. into degrees C.
(b) 100 degrees C. into degrees R.

109. Convert: (a) 212 degrees F. into degrees R.
(b) 0 degrees R. into degrees F.

Hydrometers—The commonest form of hydrometer is the Baumé instrument. This is manufactured in two forms, namely, for liquids heavier than water and for liquids lighter than water, each marked in degrees.

Often it becomes necessary to convert the arbitrary hydrometer readings into terms of absolute specific gravity.

(a) For liquids lighter than water:
Rule: Sp. Gr. = 140 + (130 plus degrees B.)

(b) For liquids heavier than water:
Rule: Sp. Gr. = 145 + (145 minus degrees B.)

Problems

110. Reduce to specific gravity the following degrees Baumé on the lighter than water scale: (a) 15 degrees Baumé
(b) 30 degrees Baumé
(c) 55 degrees Baumé

111. Reduce to specific gravity the following degrees Baumé on the heavier than water scale: (a) 25 degrees Baumé
(b) 40 degrees Baumé
(c) 55 degrees Baumé

CHAPTER VI

OPERATIONS REQUIRING THE USE OF HEAT

Generation of Heat

THE consideration of the theories which have been advanced from time to time to explain the phenomenon of heat, although very interesting and instructive, cannot be treated extensively in a work of this character, and the reader is therefore referred to any of the recent works on physics, which are easily accessible. The view which is now almost universally accepted is that known as the dynamical theory of heat, in which it is assumed that heat is produced by the constant motion of the particles composing the body, and that heat varies in quantity dependent upon whether the body is *solid*, *liquid*, or *gaseous*.

There is a difference between heat and temperature which is frequently overlooked. Temperature is quality or degree, heat is quantity; thus, if one fluidounce of boiling water is in one vessel and one gallon of boiling water in another vessel both will have the same temperature but the amount of heat is vastly different and is in direct ratio to the respective volumes.

It will be convenient to consider the various practical operations and appliances for generating heat under four heads:

1. Operations and forms of apparatus in which *solids* are used in developing heat.
2. Those in which *liquids* are used.
3. Those in which *gases* are used.
4. Those in which *electricity* is used.

In the first three groups there are certain elements present upon which the combustion value of a fuel depends. These elements are carbon and hydrogen. When carbon predominates, as in some solid fuels, as charcoal, coke, and coal, the fuel may be termed *carbonaceous;* wood is a *carbohydrate fuel, i. e.*, one in which carbon, hydrogen, and oxygen are all present, the latter two elements in the numerical ratio of two to one. Some liquids and gases are *hydrocarbon fuels* in which carbon and hydrogen only are present.

Combustion is a process of oxidation. Carbon oxidizes to CO or CO_2, depending upon the access of air. Hydrogen always oxidizes to H_2O. *Smoke* is a visible evidence of incomplete combustion in which solid particles of carbon or partly condensed gases that have not been raised to the ignition point are present. A *flame* is another visible evidence of combustion in which gases that have been raised to the ignition point are visibly undergoing oxidation.

The heating value of fuels is generally stated in terms of *calories* or more commonly in terms of *British thermal units* (*b. t. u.*). Two calories are in use, the small and the large. The latter is most generally used in this country. The *large calorie* is the amount of heat required to raise the temperature of 1 Kilogram of water one degree Centigrade. The *small calorie* is the amount of heat required to raise the temperature of 1 Gm. of water one degree Centigrade. A British Thermal Unit (b. t. u.) is the amount of heat required to raise the temperature of a pound of water from 60° to 61° Fahrenheit, at sea level.

Operations and Forms of Apparatus in which Solids are Used in Developing Heat

Kinds of Fuel—Under this head is included the solid fuels, as wood, charcoal, anthracite coal, bituminous coal, coke, etc., and the forms of apparatus in which they are used.

Wood is seldom relied upon as fuel in pharmaceutical operations where a regular, well sustained heat is desired, yet from its wide distribution, ready inflammability, and comparative cheapness it is indispensable in kindling a fire. The large quantity of unconsumed carbon which is either lost in smoke or deposited upon vessels that are being heated, constitutes the chief objection to its use.

Charcoal is more convenient, although more costly, than wood. It ignites easily, burns readily, and leaves but little residue. On account of its ready combustibility, it is well fitted for operations requiring a quick, strong heat.

Coal, which is the most economical of the solid forms of fuel, consists largely of carbon. *Anthracite* or *"hard coal"* sometimes contains nearly 95 per cent of carbon. *Bituminous* or *"soft coal"* contains from 15 to 20 per cent of hydrocarbons in addition to carbon. *Ash* is present in amounts ranging from less than 5 per cent in the better grades to nearly 20 per cent in the poorer varieties. Anthracite coal is not readily kindled but burns freely without producing smoke. Bituminous coal kindles easily but gives off much unconsumed carbon when burned in ordinary stoves.

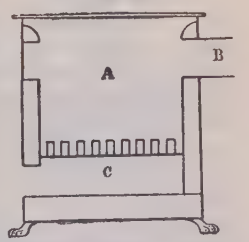
Coke, the residue obtained from the destructive distillation of soft coal, is an excellent fuel, and may be used either mixed with coal or by itself. It is more easily kindled than anthracite.

Methenamine (hexamethylenetetramine) is an interesting solid fuel, not at all economical, of course, but suitable for emergency use. A five grain tablet of this chemical if placed upon a suitable non-inflammable and non-conducting support and ignited with a match will burn with a non-luminous flame for a long enough time to heat 5 cc. of water in a test tube to the boiling point.

It affords an excellent and convenient fuel for heating small quantities of liquid for testing purposes as, for instance, in conducting a bedside test for albumin in urine.

Pharmaceutical Furnaces, etc.—Much ingenuity has been used in the contrivance of various forms of furnaces, ranges, stoves, etc., to meet general or special applications, yet in all there are certain fundamental principles of construction which must be well understood if faults are to be avoided. The elements of a furnace are the *airflue, combustion chamber*, and *vent* or *chimney*, and the relative proportions of these must depend upon the special object sought in the construction of the furnace, and the character of the fuel that is to be used. Fig. 57 represents a sectional view of a pharmaceutical furnace, —C being the airflue, A the combustion chamber, and B the vent.

Fig. 57



Pharmaceutical furnace, sectional view

The combustion or oxidation of coal requires the presence of a certain quantity of air in contact with the burning coal to furnish enough oxygen to combine properly with the carbon of the fuel. The result of the combination is carbon dioxide, CO_2, and carbon monoxide, CO, both of which are gases. It is very important to provide means of escape for these gaseous compounds, as they are both poisonous, and the former is a decided non-supporter of combustion. Theoretically, it has been calculated that one hundred

and fifty cubic feet of air are necessary to consume perfectly one pound of coal in an ordinary furnace, but practically, because of the obstruction of the ashes which prevents the thorough contact of the air with all parts of the glowing carbon, nearly double this amount is necessary.

Fig. 58

Portable furnace

Stoves and ranges are now so universally used that it would be needless to multiply illustrations of them. The proper selection of such as are suited to the special uses of the pharmacist must be left to individual decision, and will depend upon the space that can be spared and the character of the work that is to be done.

Fig. 58 illustrates a furnace suitable for heating large dishes and other apparatus. This is made by the J. L. Mott Iron Works, Trenton, N. J.

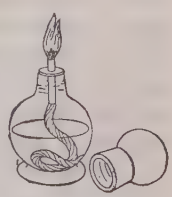
Operations and Forms of Apparatus in which Liquids are Used in Developing Heat

The liquids which are most used in pharmaceutical operations for heating are ethyl alcohol, denatured alcohol, methanol (methyl alcohol), petroleum or coal oil, and petroleum benzin, or gasoline. All of these liquids contain carbon and hydrogen, while ethyl alcohol contains 34 per cent and methanol 50 per cent of oxygen in addition.

Alcohol burns with a blue flame, which does not deposit soot, and the heat produced is intense. It is in many respects the best liquid fuel for generating heat in small operations, but the expense attending its use in this country is a serious objection, although this has been overcome in part through government regulations whereby *ethyl* or *grain* alcohol may be released from bond and sold for technical and industrial purposes if it has been denatured, that is, rendered unfit for use as a beverage. The denaturing must be under the supervision of Internal Revenue officers and the method used must have the approval of the Internal Revenue Department. The product is then known as *denatured alcohol*. In Great Britain it is called *methylated spirit*.

Refined *methanol* or *methyl alcohol*, also called *columbian spirit*, *colonial spirit*, etc., has nearly all of the advantages of alcohol when used for burning in lamps, and it is much cheaper than pure ethyl alcohol. It should, however, never be used as a solvent in pharmaceutical preparations, as it is very poisonous when taken internally and is dangerous even when applied externally or when inhaled; too much caution cannot be exercised to guard against its improper use. In burning alcohol, a glass spirit lamp, provided with a ground glass cap may be used (see Fig. 59). The cap prevents loss of alcohol by evaporation from the wick, when the lamp is not in use. In one of the simplest forms of alcohol stove, the alcohol is poured upon brass wire gauze, which covers a metallic box containing asbestos, by which it is absorbed; a lighted match is now applied to the gauze, which retains sufficient spirit to ignite, and a strong heat is at once obtained, the large extent of surface of the gauze producing a solid blue flame. The great advantages of spirit lamps of this kind are that, all parts being of metal, accidents from breakage are avoided, while explosions cannot occur, as neither the alcohol nor its vapor is confined in a tight receptacle, and if the lamp is upset accidentally no spirit can be spilled, because it is absorbed by the

Fig. 59

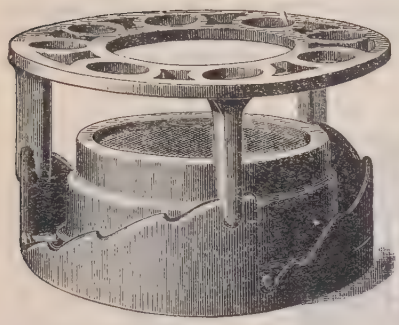


Spirit lamp

asbestos. Many modifications of this simple contrivance have been introduced which are elaborate and useful (see Fig. 60).

Fig. 61 shows a type of stove which is used for generating heat with denatured alcohol. The heated burner vaporizes the alcohol which burns very much

Fig. 60



Pocket alcohol stove

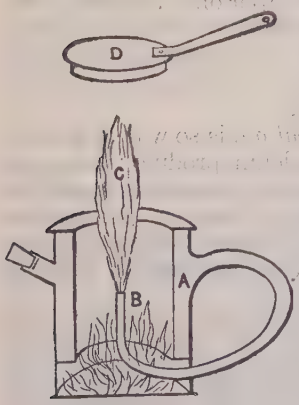
Fig. 61

Alcohol stove

like gas and the flame may be readily regulated by turning the knob which operates a needle valve and controls the flow of alcohol.

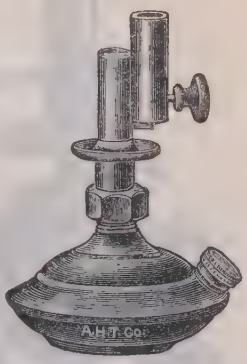
The so-called Russian blast lamp is one of the best contrivances for generating an intense heat. It is useful when glass tubes of large diameter are to be bent, or in crucible operations. A sectional illustration is seen in Fig. 62. It is made of sheet copper, and consists of a partially jacketed cylinder, A, with an opening on one side for introducing the alcohol, and on the opposite side a bent, tapering tube, B, which pierces the cylinder below the jacketed portion, and is turned upward as shown in the cut. The principle of action is that of the combustion of the *vapor* of the spirit.

Fig. 62



Russian blast lamp

Fig. 63



Alcohol blast lamp

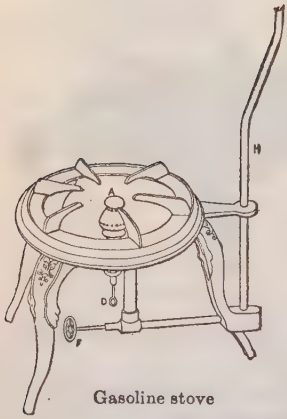
Despite the simplicity of its construction, the Russian blast lamp is not without danger. The intensity of its heat production has no regulation whatever. Modern alcohol blast lamps, however, are provided with a valve whereby the delivery of the heated vapor may be carefully controlled. A lamp of this type, known as the Barthel automatic burner, is illustrated in Fig. 63.

Denatured alcohol has also found extensive use as a fuel in the form of a *solidified alcohol*, known under such trade names as *sterno*, *smaragdin*, etc. Some of these consist of soluble gun cotton made into a paste with alcohol but a cheaper form is prepared by dissolving 1.35 Gm. of sodium hydroxide in

40 Gm. of alcohol and 8.5 Gm. of stearic acid in 50 Gm. of alcohol, mixing the two solutions, warming until the reaction is complete, and moulding into the desired form by pouring it into a suitable vessel.

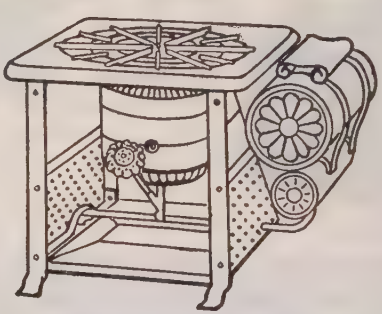
FIG. 64

Petroleum benzin, or *gasoline*, is now used for heating purposes, and Fig. 64 shows one of the most convenient stoves for employing this cheap but very volatile hydrocarbon. The difficulties in the use of the very inflammable and often dangerous liquids of this class for heating have been largely overcome. To avoid a smoky, luminous flame the *vapor is burned after being mixed with air*, while to prevent explosions the reservoir for the liquid is elevated and placed some distance away from the ignited vapor. The vapor only is burned, the gasoline being volatilized by the heat from the metal burner. It produces a blue and intensely hot flame, the size of which may be easily regulated.



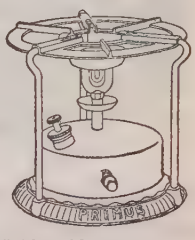
Gasoline stove

FIG. 65



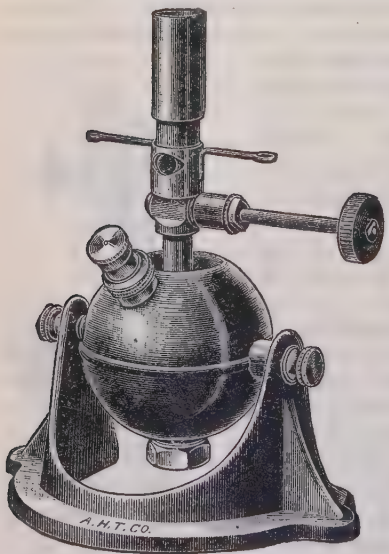
Wickless blue flame coal oil stove

FIG. 66



Wickless blue flame coal oil stove

FIG. 67



Benzene blast lamp

Kerosene, or *coal oil*, is so widely known as a refined petroleum product, that any extended notice of its properties would be superfluous; as it is heavier in specific gravity and has a much higher flashing and firing point[1] than gasoline, it is much safer for popular use.

The old form of coal oil stove, with wick burners, has been entirely replaced by the "wickless blue flame oil stove", in which the vapor of the oil is burned. Fig. 65 shows a good form, although three and four burner stoves are most frequently used. Fig. 66 shows a small, wickless, coal oil stove which is very efficient.

Benzol, or *benzene*, a hydrocarbon ob-

[1]By this term is meant the temperature at which any oil begins to give off inflammable vapor that forms an explosive mixture with air. This temperature for illuminating oils, fixed by the laws of different states, varies from 43.3° to 65.5° C. (110° to 150° F.).

tained by destructively distilling coal is employed for special purposes as a heating fuel. The lamp in which it is burned is of the Barthol type. It is shown in Fig. 67.

Crude oil is coming into use as a fuel to replace coal in heating furnaces. The more volatile constituents having been removed from crude petroleum, the resulting product may be burned in the form of a fine spray, by means of special burners.

Operations and Forms of Apparatus in which Gases are Used in Developing Heat

Gas—The extensive employment of manufactured illuminating gas and natural gas as sources of heat for pharmaceutical and other purposes, render necessary a somewhat extended notice of gas in this connection. Illuminating gas was formerly called carburetted hydrogen, but it is really a mechanical mixture of various gases, some of which produce luminous flames. Besides the hydrocarbon, CH_4 (methane or carburetted hydrogen), which is the principal constituent, it contains condensible hydrocarbons, hydrogen, carbon dioxide, carbon monoxide, aqueous vapor, and varying amounts of oxygen and nitrogen. The following analyses are typical of the illuminating gases used at the present time.

	Coal gas	Coke oven gas	Water gas	Flue gas
CO_2	1.1	2.5	5.6	8.7
Illuminant	2.3	1.7	8.5	0
O_2	0.9	0.8	0.7	0.3
CO	5.8	6.7	28.9	37.1
H_2	51.9	54.0	38.1	48.2
C_2H_6	0.7	0.8	1.6	0
CH_4	30.9	28.4	12.4	0.6
N_2	6.4	5.1	4.2	5.1
Total	100%	100%	100%	100%

The illuminant represents the light hydrocarbons from coal distillation added to the gas mixture to increase the candle power. The high carbon monoxide content of the water gas and the flue gas (which is non-carburetted water gas) accounts for the toxic character of these two gases. Death from coal gas is due to mechanical suffocation, whereas death from water gas or flue gas is due to a distinct physiological poison, namely, the carbon monoxide, which robs the blood of its oxygen carrying power, so essential to the continuation of life.

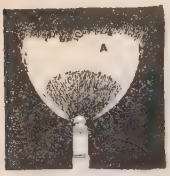
The odor of manufactured gas is usually a sufficient warning of a leak, and natural gas, which is frequently odorless, is given an odor, usually by the addition of sulphur compounds, to render it safer for domestic consumption.

Gas is usually produced by the destructive distillation of bituminous coal; coal tar, gas liquor, and coke are the liquid and solid by-products, and these are valuable sources for the manufacture of products in the chemical and other industries (see Part V). There are at present many kinds of gas which are used

for purposes of heating or illumination among which may be mentioned coal gas, water gas, producer gas, acetylene gas, and gasoline gas.

Gas which is fitted for illuminating purposes must have its composition modified by admixture with air before it is fit for heating purposes; this may be best illustrated by the examination of an ordinary fishtail gas flame. In Fig. 68 it will be noticed that three zones are visible,—the lower or dark central zone, which is not luminous and not at all hot, because the gas is fully ignited; A, the luminous zone, where the emission of light is due to the suspension of minute particles of incandescent carbon in the flame, caused by the incomplete combustion of the gas; and the outer non-luminous zone, or "mantle" which fringes the flame, and where the particles of carbon coming in direct contact with the air are entirely consumed. The products of complete combustion of illuminating gas are carbon dioxide and water vapor.

Fig. 68



Gas flame

The conditions necessary for the production of a flame with either solid, liquid, or gaseous fuels are as follows:

1. The material must be in the form of a vapor or gas.
2. This gas must be mixed with oxygen.
3. This mixture must be within certain limits as to proportions.
4. The mixture must be heated to the kindling temperature.

The blowing out of a flame is effected by either lowering the temperature of the burning mixture or scattering the vapor. This does not apply to glowing solids where blowing augments the burning by supplying oxygen.

Soon after gas came into use it was discovered that the properties which rendered it most valuable as an illuminant interfered with its use as a source of heat, because of the deposition of the particles of soot from the luminous portion of the flame upon vessels that were to be heated; indeed the luminous flame implies incomplete combustion whereas the non-luminous flame results from complete combustion. Doctor Duncan, of Edinburgh, showed that if gas properly mixed with air was made to enter at the bottom of a tall, tinned iron cylinder, the upper end of which was covered with wire gauze, it would burn when ignited above the gauze with a blue, smokeless flame. Bunsen, the famous chemist, improved upon Duncan's idea and in 1855, developed, in his Heidelberg laboratory, with the assistance of a local mechanic, the controllable burner which bears his name. The unnecessarily long cylinders (sometimes thirty inches) which were originally used were soon replaced by others of the length of five or six inches for the sake of greater convenience. This discovery was further utilized, in the construction of gas stoves and burners for various purposes.

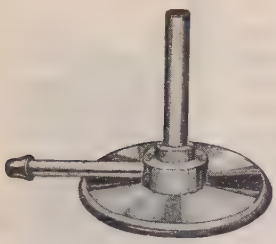
Fig. 69

Bunsen burner

Bunsen burners (see Fig. 69) are more frequently used in simple operations than any other form. The gas issues from a small orifice, near the base, passes up through a brass tube, four inches high, and is ignited at the top of this tube; large circular openings surround the small orifice at the base, and these may be closed either wholly or in part by a perforated brass ring; this permits the regulation of the supply of air, which mixes with the gas as it ascends the tube, and a blue, smokeless, intensely hot flame may be produced. If the perforated ring is turned so that the air openings are closed, a luminous, smoky flame results. One of the objections

to the ordinary Bunsen burner is that, after being used for a time under a low gas pressure, when the tube becomes hot the flame will sometimes recede and the gas become ingited at the lower orifice. This may usually be avoided by gradually turning the brass perforated ring, so as to admit less air to

Fig. 70

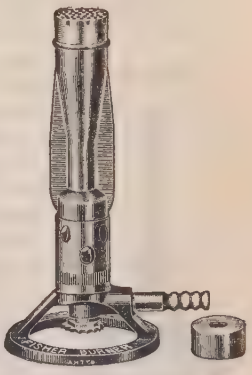


Micro burner

Fig. 71

Meker burner

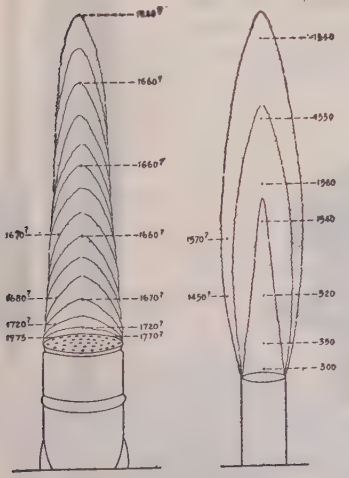
Fig. 72



Fisher burner

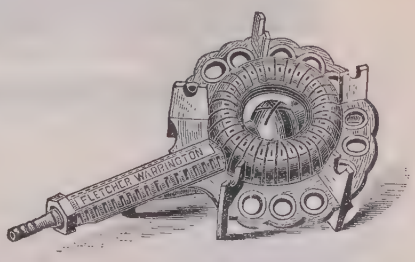
suit the diminished pressure. That the length of the perpendicular tube does not materially affect the smokeless character of the flame may be proved by means of the convenient little burner shown in Fig. 70, commonly called a "*micro burner*," which is very useful at the prescription counter. The newest development in this type of burner is seen in Figs. 71 and 72, representing the *Meker* and the *Fisher* burners. The special advantage afforded by these burners, which give a blast effect, is that the control of air and gas supply render it possible to have a flame entirely free of incompletely consumed carbon. A comparison of the temperatures obtainable from a Fisher burner and an ordinary Bunsen

Fig. 73



Comparison of Fisher and Bunsen burners

Fig. 74

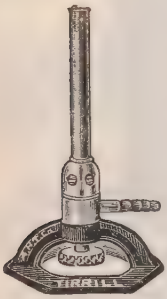


Fletcher's radial burner

burner, from the Scientific Materials Co., is illustrated in Fig. 73. The burners illustrated by Figs. 71 and 72, produce exceedingly high temperatures. This is the latest development of the grid top type of burner, giving greatly increased heating power and an absolutely homogeneous flame, all of which is available for heating from the top of the burner to the extreme point. The gas regulating device permits its use with any quality of gas delivered at any pres-

sure and permits regulation from the maximum to the smallest flame without back-firing. With blast attachment a temperature exceeding 1700° C. is obtained. Bunsen type burners with the tube arranged horizontally have grown in favor because they are less likely to be overturned, and if they have a broad base they will easily support a large vessel. Fletcher's radial burner (see Fig. 74) has the merit of having no loose parts, and as the casting is well annealed, it is well adapted for rough usage, the gas issuing from narrow slits cut radially in the raised circular burner; the flame is solid and non-luminous. No gauze is needed to distribute the heat.

Fig. 75



Adjustable Bunsen burner

In many localities outside of cities and towns, gas made by vaporizing gasoline and mixing air with it, is used for illuminating purposes. It is made by gas machines located in the cellar of the building, while the gas tank is buried underground at a safe distance. Special burners are required when this gas is used as an illuminant, and they require some adjustment at first to secure the proper proportion of air. Fig. 75 shows an adjustable laboratory burner, which gives a very hot, blue flame with this kind of gas, and it may also be used with ordinary gas. The milled head at the base of the burner is used to regulate the quantity of the gas admitted necessary to produce a blue flame.

Fig. 78

Gas furnace

Fig. 76

Gas stove

Fig. 79

Water heater

Fig. 77

Solid top gas stove

Gas stoves are now made in such variety that it seems difficult to make a judicious selection for general pharmaceutical work. The error most frequently made is in the choice of those which are intended to produce only very high temperatures. It is very seldom that a heat of great intensity is desired in pharmaceutical operations. The chief points to be secured in a good gas stove are—1, a smokeless flame; 2, a strong, firm, indestructible frame that will easily support a large or small vessel and is not easily overturned; 3, an easy and quick adjustment, whereby either a strong, well sustained heat or a low, diffused heat may be obtained. Fig. 76 shows a type of gas stove in

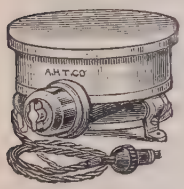
every way well suited for pharmaceutical operations. The solid top gas stove shown in Fig. 77 may be used for coal or natural gas. Its specific advantage is that its special construction renders it impossible to "smother" the flame when the entire top is covered or when liquids boil over. Fig. 78 illustrates a gas-heated furnace or caldron, capable of heating large quantities of materials to a high temperature. Fig. 79 shows a convenient hot water generator, well adapted for furnishing a supply of hot water in pharmacies if not otherwise available.

The advantages of the use of illuminating gas as a source of heat may be summed up as follows: 1. It may be adjusted to furnish a clean, smokeless flame. 2. It is cheap when compared with alcohol and other sources of heat. 3. The supply is unremitting, and the inconvenience of continually supplying fuel, which is always present in other forms of stoves, is not experienced. 4. The supply is under almost perfect control, and, after once regulating the flow suitable for a continuous operation, little apprehension need be felt, during the operator's enforced absence, of unexpected or unforeseen changes in temperature.

Operations and Forms of Apparatus in which Electricity is Used in Developing Heat

Electricity as a Source of Heat—The utilization of electricity as a source of light has naturally turned the minds of inventors to devising means of using it for heating purposes. In many localities it will often be found that for convenience, cleaniness, and ease of application electric stoves have an advantage. Fig. 80 shows a simple electric stove which can be used for small operations. The current flows through fine wires of highly resisting metal, and the heat produced by the resistance warms the top plate of the stove. Figs. 81 and 82 illustrate two forms of electric stoves. The heat may be regulated to "high", "medium", or "low", or may be turned off completely through the use of a switch operated by a button. The several stages of heat burn 880, 440, or 220 watts, respectively, of electric current, per hour.

Fig. 80

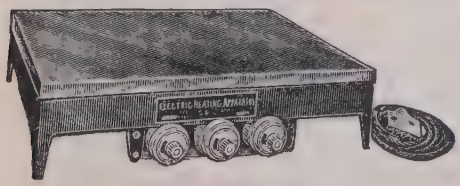


Small electric stove

Fig. 81

Electric stove

Fig. 82



Electric stove

Fig. 83

Immersion heater

Many other forms of electrically heated stoves are now available for heating ovens, sterilizers, jacketed kettles, and for general cooking purposes, etc.

A most convenient type of heater for small quantities of non-corrosive liquids is seen in Fig. 83. This heater is immersed in the liquid which it promptly heats when the current is turned on.

In certain industries electricity has been largely used as a source of heat, especially for high temperatures, or where a flame would be dangerous, and its ease of regulation and convenience has greatly extended its use in all laboratory operations requiring heat.

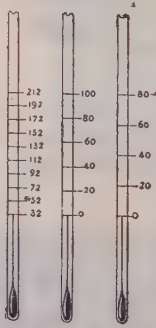
Paper scaler thermometer

Methods of Measuring Heat

To measure degrees of temperature in pharmaceutical operations, thermometers are used exclusively. A thermometer may be described as an instrument consisting of a glass tube having a capillary bore, with a cylindrical or globular bulb blown at the end, the bulb and a part of the stem containing a liquid (usually mercury), and the tube being mounted upon a graduated scale, or the tube itself graduated, in order to measure the degree of expansion of the liquid when subjected to the influence of heat. Unfortunately, the value of the degrees of thermometers in common use is not the same, there being no less than three arbitrary scales,—Centigrade, Fahrenheit, and Réaumur, the latter rarely used in English speaking countries.

The *Centigrade*, or Celsius, scale is best adapted for scientific work; it is given the first place in the U. S. P. (10th Rev.). The freezing point of water on this scale is zero, 0°, and the boiling point is 100°; the intervening space is divided into one hundred equal parts (see Fig. 84), and thus the system of decimal division, now so largely used in coinage and in weights and measures, is maintained for temperature. Most foreign scientific literature, especially the French and German, refers to the centigrade scale.

Fig. 87



Fahrenheit Réaumur Centigrade

The *Fahrenheit* scale is the most largely used in this country and Great Britain, and until the 1880 revision of the U. S. Pharmacopœia it was used exclusively in pharmacy. In this book the centigrade degrees of the Pharmacopœia are followed, methods for conversion to the Fahrenheit scale being given on pages 89 and 103. In Fahrenheit's thermometer the freezing point is 32°, and the boiling point is 212°, the intervening space being divided into one hundred and eighty equal parts (see Fig. 85). In Réaumur's thermometer the freezing point is 0°, and the boiling point is 80°.

Fig. 86 shows a convenient and cheap form of thermometer for pharma-

ceutical uses, but on account of its having a paper scale it should not be used for measuring temperatures above 300° F. as the paper will be charred.

In Fig. 87 the three thermometers are shown together to facilitate comparison. The lowest figures indicate the freezing points of each, the highest the boiling points.

RULES

1. *To convert Centigrade degrees into those of Fahrenheit*, multiply by 1.8 and add 32.

2. *To convert Fahrenheit degrees into those of Centigrade*, subtract 32 and divide by 1.8.

Another very simple rule is as follows:

To convert °C. into °F.—add 40, multiply by 9/5 and then subtract 40. Example: $100° \text{ C.} + 40 = 140 \times 9/5 = 252 - 40 = 212° \text{ F.}$

To convert °F. into °C.—add 40, multiply by 5/9 and then subtract 40. Example: $212° \text{ F.} + 40 = 252 \times 5/9 = 140 - 40 = 100° \text{ C.}$

By this method the confusing 32° is entirely eliminated.

Choice of Thermometers—It is important that the practical pharmacist should possess a good thermometer. The best form is one in which the graduations are made on the surface of the tube. The diameter of the instrument should be the same throughout its entire length; this permits its convenient use through perforated corks in distillations and other operations where it is necessary to observe temperature, and it is not so easily broken (see Fig. 84). The thickness of the glass of the bulb is not a matter of indifference. If too thick, the thermometer will not respond quickly to changes of temperature, while if too thin, the risk of fracture is very great. The bore of the tube should be flat or elliptical, and perfectly uniform throughout. Opaque, enameled glass behind the bore of the tube is of great assistance in reading the indication quickly. In many operations it is permissible to place a small section of rubber tubing over the mercury bulb to protect it from fracture. It is a good practice to send a thermometer to be officially tested,[1] and then to reserve it as a standard for correcting ordinary instruments. As glass usually reaches its limit of contraction in three years, such a thermometer should be at least this old before it is sent.

Care and Handling of Thermometers[2]—In the handling of thermometers it is often found necessary to manipulate the mercury within the capillary, in order to reunite with the main column a part of the mercury which has become separated, to remove gas bubbles from the mercury in the bulb or stem, or to separate a mercury thread for use in calibrating. There are four operations usually resorted to in manipulating the mercury, viz., (a) warming, (b) cooling, (c) tapping on the end, and (d) tapping on the side of the thermometer.

Warming the bulb of a thermometer may be done in water or oil or in air high above a gas or alcohol flame, but great care must be taken, especially with high temperature thermometers, not to heat the bulb to a temperature higher than the thermometer is intended to measure. The upper end of a thermometer stem may be warmed over a Bunsen burner if this is done very gradually. When the thermometer is warmed over a flame, it should be rotated about its axis.

Cooling may be accomplished in cold water, ice, a freezing mixture, or carbon dioxide snow, but such cooling should not be attempted while the thermometer bulb is still hot to the touch.

---

[1] Clinical and other thermometers are examined, and certificates are issued showing the corrections, by the U. S. Bureau of Standards, Washington, D. C.

[2] Extract from Circular No. 8 of the U. S. Bureau of Standards, on Testing of Thermometers.

Tapping or striking a thermometer on the end must be done carefully at all times and much more so when the bulb is only partially filled with mercury and the thermometer is inverted. This tapping may be soft, as when the thermometer is held vertically and the hand (not the thermometer) is struck on the table, or it may be sharp, as when the thermometer is held vertically and struck downward on a pad of paper.

Tapping on the side of a thermometer may be done softly with the hand or sharply with a pencil. Either must be done with care, as there is danger of breaking the stem. Different thermometers require different treatment, but the following procedure may serve as a guide in the manipulation of thermometers not filled with gas under pressure.

To remove mercury from the upper bulb when it is partially full, hold the thermometer vertically, bulb down. Tap softly on the side near the top and softly on the end, to bring the mercury to the lower part of the upper reservoir. Then try both tapping softly and sharply, on the end, and if this fails to bring the mercury down the stem, warm the bulb until the mercury rises and unites with that in the reservoir. Cool very slowly and probably the mercury will all come down. If not, try again, cooling more slowly.

To remove mercury from the upper reservoir when this is completely full or when the mercury persistently stays at the top reservoir, warm the upper end carefully over a Bunsen flame, beginning at the extreme tip. The mercury will be driven down the capillary by its own vapor pressure. If small mercury globules are left, warm a little more and they will condense farther down. Wait until the upper end cools to a temperature comfortable to the hand. Warm the lower bulb until the mercury rises and collects the small globules.

To find whether there is any residual gas in the thermometer bulb, warm the bulb until at least a few centimeters of mercury appear in the capillary; if mercury is already there, do not warm. Invert the thermometer and see whether the mercury runs down. If not, there is probably no gas in the bulb. If the mercury runs down, let it run a few centimeters and look for a bubble in the bulb. Right the thermometer and see whether this bubble entirely disappears when the mercury returns to the bulb. If this bubble disappears, no significant amount of gas is present.

To remove gas when found, invert the thermometer and run some mercury into the capillary. Right the thermometer and tap sharply on the side and on the end to bring the gas to the top of the bulb before the mercury all returns. Cool the bulb as much as possible, tapping sharply on the end when cold. Invert the thermometer and tap very softly on the end to bring down the mercury which is still separated by the air bubbles from that in the bulb. When this has come down, either tap "sharply" or warm to bring down the mercury from the bulb, but do not let the separated thread get into the upper bulb until the main mercury column is ready to join it. Get the two separated parts to join in any convenient enlargement or in the upper reservoir. Right the thermometer or hold it at an angle, with the top higher, and let the mercury run slowly into the bulb, watching carefully the point where the bubble is left, to be sure that the column does not separate. If the bubble begins to enlarge, run the mercury more slowly.

Bubbles can often be removed, even from high temperature thermometers, which are filled under pressure, provided there is an enlargement in the stem (*e.g.*, between the zero and 300° C. mark). If there is no such enlargement the gas can sometimes be removed by long, continued sharp tapping on the end, or sometimes by freezing the mercury by means of CO_2 snow, then warming

FIG. 88

Beckmann-type thermometer

the bulb (from the bottom) rapidly against the hand. Mercury will not break the bulb on freezing, as it does not expand.

Differential or *self-registering thermometers* are of great usefulness in certain analytic operations. The Beckmann type is illustrated in Fig. 88. This instrument has a range of 5° or 6° C., divided in 1/100°, reading either upward or downward and an auxiliary scale adjacent to the reserve reservoir, reading from −10° to+140° C., in 2° divisions.

The auxiliary scale under the reservoir permits the "setting" of the main scale at any desired temperature. For example, when the thermometer is to be used at 50° C., the bulb should be gently heated until the mercury in the reservoir reaches 50° C. on the upper or auxiliary scale. When setting for use at higher temperatures, heating the bulb is not desirable. This can be avoided by inverting the thermometer, and while holding the metal cap in the palm of the hand, with the inverted thermometer in a vertical position, jar the instrument by striking the hand (but not the cap) sharply from below. This will start the thread of mercury. The instrument should be turned to its normal position when the thread reaches the desired position on the auxiliary scale.

FIG. 89

Clinical thermometer

A sudden swing of the thermometer from left to right through an arc of about 45° while held in the vertical position, will break the mercury column and throw the superfluous mercury into the right arm of the reservoir.

The upper end of the mercury thread, which should appear in the main capillary about the middle of the main scale, will then be in the position equivalent to the temperature shown in the auxiliary scale at the moment of separation, *i. e.*, 50° C.

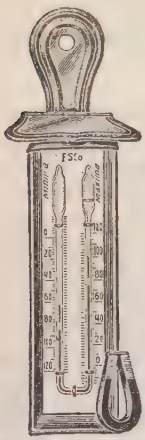
Fig. 89 illustrates one of the most valuable forms of the thermometer; it is called a *clinical* thermometer. The cross section is triangular instead of circular, and the capillary orifice is flattened so as to enlarge the diameter of the surface of the mercury, in order that it can be read easily. The normal temperature of the human body is 98.6° F. (37° C.). By inserting the bulb of the oral thermometer under the tongue, closing the mouth, and allowing the thermometer to rest there for a short time, from one to three minutes, depending upon the requirements of the thermometer, the body temperature may be determined.

Clinical thermometers are self-registering—that is, the mercury remains at the height to which it has risen until shaken down. It is therefore always necessary for them to be shaken down to about 95° after use. This is done by firmly grasping the upper half of the thermometer and giving a sharp quick jerk, repeating until it registers 95° F. Never force the mercury below 95° as this may prevent accurate registration, due to a slight contraction in the stem below this point. If this happens, it may be brought up again by placing it in warm water at not over 100° F. for a few moments.

Special clinical thermometers are also made for taking the rectal temperature which is 1° higher than by mouth.

Body temperature may also be taken by placing the thermometer in the axilla or in the groin where the normal temperature is 0.5° lower than by mouth.

FIG. 90.



Maximum and minimum registering thermometer.

Fig. 90 illustrates a *maximum and minimum registering thermometer*, of the Sixes type. The thermometer is "U" shaped with the high temperature at the top on one side and the low temperature at the top on the other side. Metal-floats rise with the mercury column; one remains at the lowest temperature reached, the other at the highest temperature. These floats are reset by means of the magnet supplied. The scales are on a milk-white glass plate, mounted in an enameled sheet metal case, with provision for hanging. Range, −10° to +120° F.

The specifications for thermometers established by the U. S. P. X are copied below.[1]

Melting Point—By this is meant the temperature at which a substance melts or fuses. It is used as a means of identifying a body or of proving its purity. The U. S. P. X cites the melting point of many bodies and has established an official method for their determination.[2] The official method for taking melting points is shown in Fig. 91. The melted substance is drawn into the small tube and allowed to cool, and

[1] **U. S. P. X Standard Thermometers**—*General Requirements*—The bulbs are to be normal glass or Corning normal thermometer glass, or of Jena 16 III. The stems may be made of other white enamel-back glass tubing having a circular cross section; the diameter of the capillary must not be greater than 0.1 mm. The diameter of the stem is to be 5.5 mm. (to within ±0.3 mm.), and the maximum diameter of the bulb must not be greater than the diameter of the stem. The thermometers are to have a pear-shaped reservoir at the upper end of the capillary having a volume at least equal to the volume of the entire graduated portion of the stem. The upper end of the stem is to have a small glass ring.

Graduation—The thermometers are all to be graduated in 0.5° (one-half degree) intervals. The 1° graduation marks are to be longer than those for the half degrees, the longer graduations preferably extending equally to the right and left of the shorter marks. The graduation marks are to be clean cut and fine, and to be uniformly well-filled with insoluble colored pigment.

Numbering—The 100° graduations (the 0°, 100°, 200°, 300° graduations on the different thermometers) are to be numbered in full and the intermediate 5° and 10° graduations are to be numbered 5, 10, 15, etc. . . . . 95, 100, 5, 10, 15, ... 95, 200, 5, 10, etc. The numbers must be distinct and easily legible, preferably in such position that they will be upright when the thermometer is vertical. The figures should not be unduly large. It is suggested that the figures opposite the 0°, 100°, 200°, 300° graduations be made about 2 mm. in height and the thermometer numbers 5, 10, 15, etc., somewhat less (about 1.4 mm.).

Annealing—The thermometers should be so thoroughly annealed that there will be no appreciable change in their indications after long continued exposure to the highest temperature on the scale.

Error of Scale—The maximum error at any temperature below 100° C. must not exceed 0.5,° nor exceed 1.0° in the interval 100° to 300° C.

Standardization—The thermometers should be submitted to the Bureau of Standards for standardization, or carefully compared with thermometers actually standardized by the Bureau of Standards.

Filling under Pressure—Thermometers reading over 200° C. must be filled under sufficient pressure to prevent the mercury column from boiling or breaking up into small pieces.

Thermometer No. 1—The thermometer is to be graduated from −10° to 150° C. in half degrees, the length of a 1° interval being 1.5 to 2 mm.

Thermometer No. 2—The thermometer is to be graduated from 95° or 98° to 300° C. in half degrees, the length of a 1° interval being 1.5 to 2 mm. The length of the thermometer between the lower graduation and the lower end of the bulb should not exceed 50 mm.

Auxiliary Thermometer—This thermometer is for emergent stem corrections. Use a standard thermometer from 15 to 20 cm. in length and graduated from 20° to 100° C., in degrees.

Thermometers for Boiling Points—In order to avoid the necessity of an emergent stem correction, it is advisable that an accurate standardized thermometer of the Anschütz type be used for boiling points. If such a thermometer is not available a thermometer such as is specified above (see Nos. 1, 2, or 3) may be employed, applying the emergent stem correction as described under *Melting Points* (see below), the length of emergent stem being measured, in degrees, from the lower end of the stopper to the highest point of the boiling temperature.

[2] **U. S. P. X Method for Determining Melting Points**

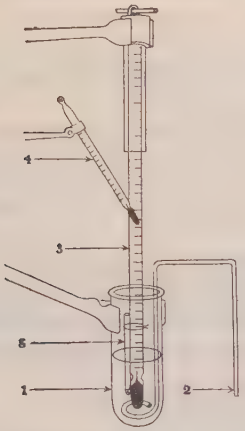
For the purpose of the Pharmacopœia the melting point is defined as that interval of temperature within which the substance is observed to melt when treated as directed below.

For the determination of the melting point, Pharmacopœial substances are divided into two classes:

Class I—Substances readily reduced to a powder.

the end of the tube is sealed. The tube is attached by a rubber band to a thermometer, and both immersed in a bath of some convenient liquid. The whole is gradually heated, and the point at which the substance melts is noted. Figs. 92 and 93 show Bensemann's method of collecting a fusible

FIG. 91



Taking a melting point

FIG. 92 FIG. 93

Bensemann's method of collecting fusible body

Class II—Substances not readily reduced to a powder, such as fats, fat acids, paraffin, petrolatum, and waxes.

Apparatus required (see illustration):

1. *A round-bottom, glass tube* of from 30 mm. to 40 mm. internal diameter and about 10 cm. long, flaring slightly at the top like an ordinary test tube. The walls of the tube are not more than 1.5 mm. thick at any point. The tube is made of glass which will permit heating over an open Bunsen flame.
2. *A stirring device*, which can be made from a glass rod of about 2 mm. external diameter. It is made circular at the end to fit the container (1) and is bent twice at right angles above the top of the container to bring its outer end within reach for convenient manipulation.
3. *A standard thermometer* covering the desired range of temperature (see above).
4. *An auxiliary thermometer* (see above).
5. *A capillary glass tube* about 6 cm. long and from 0.8 to 1.2 mm. internal diameter, the walls from 0.2 to 0.3 mm. thick and the tube closed at one end.

Procedure for Class I:

Reduce the substance to a very fine powder and, unless otherwise stated, render it anhydrous, when it contains water of crystallization, by drying it at the temperature given in the text, or, when the substance contains no water of crystallization, by drying it for twenty-four hours over sulphuric acid.

Select a bath suitable for the melting temperature to be determined and fill the container to a depth which will permit of such immersion of the thermometer that the upper end of the bulb will be from 2 to 3 cm. below the surface of the bath and the lower end of the bulb about equally distant from the bottom of the container.

Charge the capillary glass tube with sufficient of the dry powder to form a column in the bottom of the tube from 2.5 to 3.5 mm. high when packed down as closely as possible by moderate tapping on a solid surface. Attach the capillary tube to the thermometer by wetting both with the liquid of the bath or by means of a piece of platinum wire and adjust it so that the substance is centrally located by the side of the thermometer bulb. Heat the bath by means of a free Bunsen flame until a temperature 25° C. below the supposed melting point is reached, then carefully regulate the rate of rise in temperature to about 3° per minute until the substance begins to melt (the temperature at which the column of the substance is observed to collapse definitely against the sides of the tube at any point is defined as the beginning of melting) and from that time carefully regulate the rise in temperature to about 0.5° per minute until the melting is complete. (The temperature at which the substance becomes liquid throughout is defined as the end of melting.) The bath must be stirred constantly throughout the heating.

The result thus obtained as the melting interval must be adjusted by applying the calibration correction and that for the emergent stem, as follows:

Attach the auxiliary thermometer, as shown in the illustration, so that the center of its bulb is as close as possible to the stem of the main thermometer at a point midway between the surface of the bath and the supposed melting point. In order to prevent the heat from the burner or currents of cold air from affecting the temperature of the auxiliary thermometer, it is advisable to adjust to the stem of the main thermometer a movable platform made of stiff paper, having its edges folded so as to form a box-like shield surrounding the bulb of the auxiliary thermometer. Note the temperature registered by the auxiliary thermometer at the end of the melting of the substance and calculate the emergent stem correction by the following formula:

$$\text{correction} = 0.00015 \times N\ (T\text{-}t)$$

in which N represents the number of degrees of emergent stem from the bath, T the temperature at the end of melting, and t the temperature registered by the auxiliary thermometer; the correction to be added to the observed reading of the main thermometer.

To avoid the necessity of determining the emergent stem correction each time a melting point is taken, the corrections for intervals of 10° C. may be determined (at about 25° C. room temperature) and the

body by holding the tube horizontally until the melted body cools. When heated carefully the exact point at which it melts can be seen by the liquid flowing down the side.

Congealing Point—This physical factor is of value mainly in determining the purity of certain volatile oils and is dependent upon the presence of constituents which crystallize when cooled to the temperature indicated, known as the "congealing point". The official method is given below.[1]

---

results plotted on cross-section paper, the temperature of the bath represented by the abscissæ and the amount of correction by the ordinates. The correction for any intermediate temperature can then be interpolated.

NOTE: Suggestions regarding liquids to be used for baths in Class I:

For temperatures up to 200 °C., a purified, concentrated sulphuric acid is a suitable bath. For higher temperatures, up to about 350° C., a pure grade of cottonseed oil (almost colorless) will serve for a limited number of determinations. Other, though less desirable, substitutes for sulphuric acid at high temperatures are: (1) a pure grade of paraffin which has been freshly distilled; (2) clean, white, artificial (cottonseed) lard. A very satisfactory bath is prepared by cautiously boiling together, for five to ten minutes under a hood, a mixture of 70 parts of sulphuric acid and 30 parts of potassium sulphate, stirring constantly until the potassium sulphate is completely dissolved.

Procedure for Class II:

Carefully melt the substance to be tested at as low a temperature as possible and draw it into a capillary tube, which is open at both ends, to a depth of about 10 mm. Cool the charged tube at 10° C., or lower, for twenty-four hours, or in contact with ice for at least two hours. Then attach the tube to a standard thermometer by means of a rubber band, adjust and heat it in a water bath, as directed in Class I, except that, within 5° of the assumed melting temperature, the rate of rise of temperature is carefully regulated to about 0.5° per minute.

The temperature at which the substance is observed to rise in the capillary tube is taken as the melting point.

[1]U. S. P. X Method for Determining Congealing Points

Unless otherwise directed, about 10 cc. of the liquid to be tested is introduced into a dry test tube of from 18 to 20 mm. internal diameter, which is then cooled in water or a suitable freezing mixture, the temperature of which should be about 5° lower than the supposed congealing point of the liquid. To induce crystallization, rub the walls of the tube with a standard thermometer (page 106), or add a small crystal of the substance being tested. By alternated immersion of the tube in the bath, or removal from the bath and constant stirring with the thermometer, the temperature is so adjusted that the greater part of the liquid gradually congeals. The highest temperature remaining constant for a short time during the congelation is defined as the congealing point.

CHAPTER VII

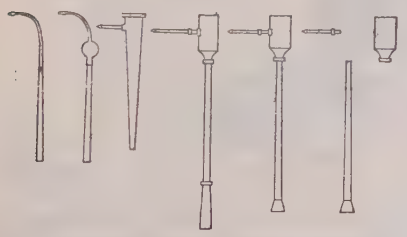
USES OF HEAT

THE consideration of the uses of heat in pharmacy naturally follows the preceding chapter upon its generation and measurement, and the subject may be properly considered under two classes: 1, Those operations in which comparatively high temperatures are required, and, 2, those which require moderate or low temperatures. It will be readily noticed that the latter class will embrace nearly all of the more important pharmaceutical operations in which heat is employed.

Operations in Which Comparatively High Temperatures are Required—In this class of operations must be placed some which seem to be in danger of becoming lost arts through the growth of special methods, now conducted on a large scale by manufacturers. It will, nevertheless, be found useful to refer briefly to these operations, for a certain amount of knowledge will frequently be of service to the practical worker in emergencies and on special occasions.

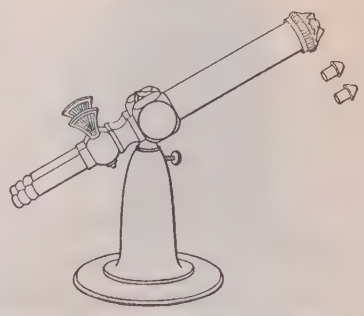
The Use of the Blowpipe—A blowpipe in its simplest form is a metallic tube, usually of brass or copper, slightly conical, gradually tapering to a minute orifice, the narrowest portion being curved or placed so that the axis of the orifice is at right angles to the principal portion of the tube. It is used by placing the widest end in the mouth, and inserting the other end into the edge of the flame, and forcing a current of air through the tube, with the effect of increasing the intensity of the flame by converting it into a miniature blast. Some skill and practice are required to produce an unremitting current of air, and this is effected by keeping the muscles of the cheeks distended and constantly supplying air from the lungs as it is needed. When the blowpipe is used with a luminous flame, the interior of the flame, owing to the carbon not being wholly oxidized, has the power of deoxidizing or reducing oxides, while the outer flame has opposite or oxidizing properties. A piece of lead glass tube held in the inner flame will be blackened through the reduction of the lead oxide to the metallic state; if this stain is held in the outer flame the metal is reoxidized, dissolves in the glass, and the glass again becomes transparent. The blowpipe is useful in pharmacy in working and bending glass, in testing fusible chemical substances, in soldering apparatus, etc. The various forms of blowpipes in common use are shown in Fig. 94.

FIG. 94



Plain blowpipe | Bulb blowpipe | Black's Berzelius' | Plattner's | Plattner's (dissected)

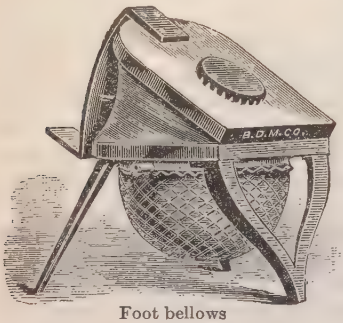
FIG. 95



Gas blowpipe

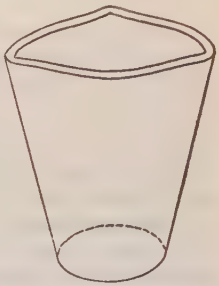
The gas blowpipe, shown in Fig. 95, furnishes an excellent and very powerful blast which is capable of delicate adjustment. It has a universal ball and socket joint, which enables it to be used in any position. The convenient foot bellows, shown in Fig. 96, may be used in connection with it for producing the blast or an electrically driven blast may be used.

Fig. 96



Foot bellows

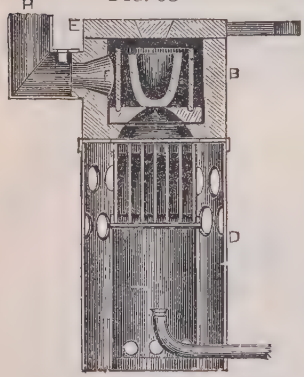
Fig. 97



Hessian crucible

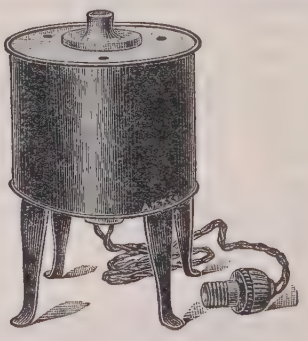
Crucible Operations—A crucible is a cup-shaped vessel made of platinum, silver, nickel, fused silica, graphite, iron, porcelain, or clay, and intended to withstand a very powerful heat. It is used in fusing metals or in determining ash or incombustible matter, and is indispensable in chemical analysis. The Hessian clay crucible (see Fig. 97) is the cheapest. It is unfitted for finer operations, for, although capable of withstanding great heat, its porous character permits the ready absorption of many substances. The graphite crucible is more expensive. It is less porous, is infusible, and has the merit of bearing great changes in temperature without risk of fracture. Porcelain crucibles are fragile, and have to be very gradually cooled to prevent breakage. A gas crucible furnace (see Fig. 98) is very useful in this connection. Electric crucible furnaces (see Fig. 99) are largely replacing all other forms. Of the metals used in making crucibles, platinum is superior to all. Its well-known power of resisting fusion, its cleanliness, and its non-liability to be acted upon by most chemical substances render it invaluable to the chemist, notwithstanding its costliness (see Fig. 100). Platinum substitutes, for high temperature crucibles, are now available, one of the most valuable of these being gold-iridium alloy.

Fig. 98



Fletcher's gas crucible furnace

Fig. 99



Electric crucible furnace

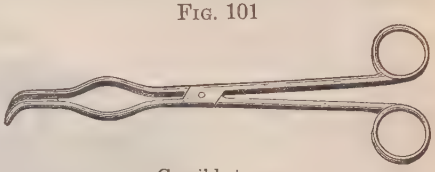
Fig. 100

Platinum crucible

Crucibles made from fused silica are now often used to replace the more expensive platinum. Such crucibles are not affected by mineral or organic acids, except by hydrofluoric acid and, at temperatures over 400° C., by phosphoric acid. They are non-porous, insoluble in water, may be heated up to

1200° C. without injury, and possess a low coefficient of expansion so that they are not readily broken by sudden changes in temperature. They are readily affected by alkali hydroxides, however, and have a limited use on that account. The other crucibles such as silver, nickel, and iron are used in analytical work for special operations. For lifting a hot crucible from the furnace, crucible tongs are employed (see Fig. 101).

Fig. 101



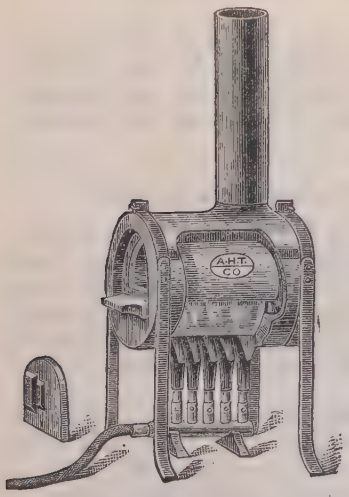
Crucible tongs

Torrefaction (known also as roasting) is the process whereby organic substances have some of their constituents modified by the application of a degree of heat somewhat less than that necessary to carbonize them. The most familiar example of this process is the roasting of coffee. Rhubarb in coarse, dry powder, when subjected to torrefaction, loses its cathartic properties, but retains its astringent qualities, and is known as *torrefied rhubarb.*

Carbonization is the process of heating organic substances *without* access of air until the volatile products are driven off, and the residue assumes the black color characteristic of free carbon or charcoal. The manufacture of bone-black and wood charcoal afford good illustrations.

Ignition, in the sense in which it is used in the Pharmacopœia and by chemists generally, is the process of strongly heating solid or semisolid substances to a definite and limited degree, the residue left at the conclusion of the process being the object sought. The U. S. P. X special assay for alkali salts of organic acids is a good example of ignition.

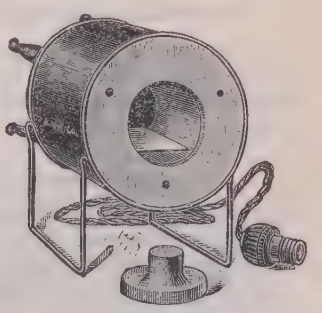
Fig. 102



Gas muffle furnace

Incineration is the process of strongly heating organic substances *with* access of air until

Fig. 103



Electric muffle furnace

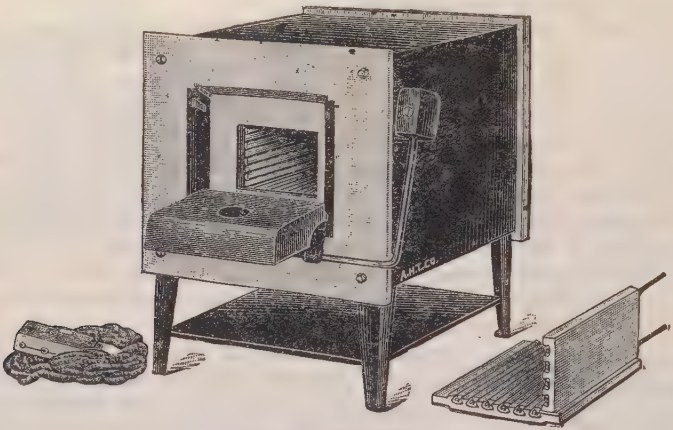
all the carbon is consumed, the ash which remains being the object sought. The process is frequently used in analysis to determine the amount of fixed or non-volatile matter in a substance. The muffle furnace illustrated in Fig. 102 is an excellent device for incinerating substances for analytical purposes. A battery of six wing burners furnishes the heat which, because of the special construction, is evenly distributed all around the material which is being incinerated. Electrically heated muffle furnaces (see Figs. 103 and 104), however, are largely replacing other forms.

Calcination is the process of separating volatile substances from fixed in-

organic matter by the application of heat without fusion. Its principal use in pharmacy is in the expulsion of water and carbon dioxide from carbonates, as in making magnesium oxide from magnesium carbonate. Its name is derived from "calx" (CaO) which is made from limestone, $CaCO_3$, by this operation.

Fusion is the process of liquefying solid bodies by the application of heat without the use of a solvent, as in the melting of wax.

FIG. 104



Electric muffle furnace

Deflagration is the process of heating one inorganic substance with another which is capable of yielding oxygen (usually a nitrate or a chlorate); decomposition ensues, accompanied by a violent, noisy, or sudden combustion. Deflagration is used in making some of the salts of antimony and arsenic, and in some qualitative work.

Operations requiring Heat in which Lower Temperatures are used

In this class of operations will be found the most important of those requiring the application of heat; almost all medicinal substances have their properties altered by the action of heat, and in many cases it is necessary to moderate the heat carefully in order to prevent the decomposition or destruction of the active constituent. For the purpose of controlling and distributing heat, various baths are used, as the sand bath, oil bath, solution bath, steam bath, water bath, air bath, etc.

Baths—The *sand bath* is usually an iron vessel of hemispherical or other convenient shape, containing dry, clean sand (see Fig. 105); the vessel to be heated is embedded in the sand, and the bath is then heated to the required degree. The object of this form of bath is to distribute and equalize the temperature, and to prevent a too sudden rise or fall of heat whereby unequal expansion or contraction might cause the fracture of a glass or porcelain vessel being heated. Iron wire clippings have sometimes been substituted for sand, with doubtful advantage, however.

FIG. 105

Sand bath

The error usually made by inexperienced operators in the use of the sand bath is in permitting too large a body of sand to rest between the bottom of the vessel to be heated and the flame; this results in an unnecessary waste of heat.

The *oil bath* is designed to furnish a regulated temperature below 260° C. (500° F.). A fixed vegetable oil is the medium usually employed for communicating the heat, but a mineral oil is more satisfactory for many reasons. Of course it is necessary to use mineral oils which have had the lighter fractions removed. Most fixed animal and vegetable oils, when heated above 177° C. (350.6° F.), evolve disagreeable fumes.

In fractional distillation on a large scale, oil baths are often used to control temperature, and the fumes arising from the heated oil are carried off through a flue.

The *glycerin bath*—In order to avoid the disagreeable odors arising from hot oil, glycerin is sometimes substituted. Acrolein, an acrid, volatile product is produced, however, if glycerin is heated nearly to boiling. A temperature of 250° C. (482° F.) can be maintained in a glycerin bath without much inconvenience.

Salt water baths are sometimes used in special operations; their principle of action depends on the fact that the boiling point of a liquid is raised in proportion to the quantity of salt dissolved in it. Water, as is well known, boils at 100° C. (212° F.), but if common salt is dissolved in water until it ceases to take up any more, and a saturated solution is produced, it is found that this solution does not boil until the temperature of 108.4° C. (227.1° F.) is reached. The following table shows the boiling point of certain saturated salt solutions as determined by Legrand and others:

Table of Boiling Points of Saturated Solutions of Various Salts

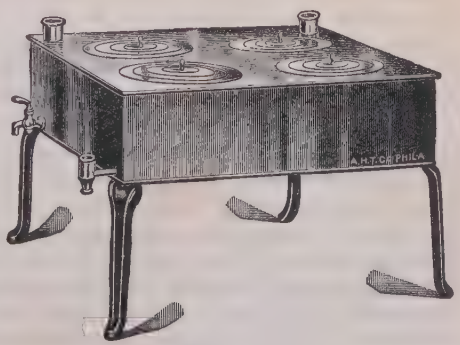
Salt	Boiling Point		Salt	Boiling Point	
	C.	F.		C.	F.
Sodium Chloride	108.4°	227.1°	Sodium Acetate	124.4°	256°
Ammonium Chloride	114.2°	237.6°	Potassium Carbonate	135°	275°
Potassium Tartrate	114.7°	238.5°	Calcium Nitrate	151°	303.8°
Potassium Nitrate	115.9°	240.2°	Potassium Acetate	169°	336.2°
Sodium Nitrate	121°	249.8°	Calcium Chloride	179°	354.2°

The *water bath*, often abbreviated "*b. m.*" in the older literature, from *balneum marinæ*, because sea water was used in the earlier forms, is one of the most useful of all the forms of pharmaceutical apparatus for regulating temperature, and the frequency with which it is directed to be used in works of authority indicates its importance as a necessary imple-

Fig. 106

Water bath

Fig. 107

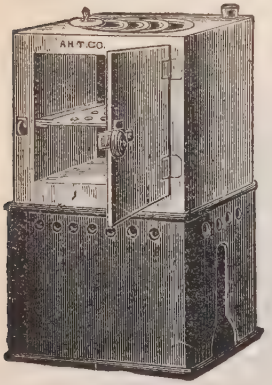


Water bath

ment in the equipment of every pharmaceutical laboratory. The water baths used by pharmacists are often extemporized, and these are generally crude and inconvenient; two dishes usually suffice, one of them somewhat larger in

diameter than the other. Water is poured into the larger dish, and the other dish, containing the liquid to be heated, is placed in the water and the heat applied; the steam escapes in the room and the plan is not very satisfactory.

Fig. 108

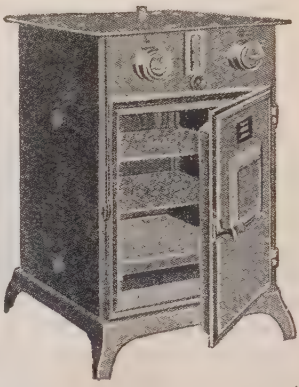


Gas-heated, water-jacketed air bath

Figs. 106 and 107 show the form of water bath used in most laboratories. The different sizes of the apertures render it convenient for vessels of various sizes.

An *air bath* is largely used in the chemical laboratory for drying chemicals for analysis. These are frequently arranged with a thermostat to maintain an exact temperature. Figs. 108 and 109 illustrate two modern types, gas and electrically heated.

Fig. 109



Electrically-heated and regulated air bath

The Use of Steam in Pharmaceutical Operations

The scope of this work will not permit of any extended consideration of the use of steam in technical pharmacy, yet it is of vital interest to be acquainted not only with the theories underlying its employment, but also with the apparatus used in its practical application.

When water is heated to the boiling point and steam is produced, a certain amount of heat is absorbed (or apparently lost). This has been termed *latent heat.* When steam comes in contact with surfaces having less heat than itself, it is condensed, water is produced, and the latent heat becomes *sensible* (or reappears), thus proving the well established physical law that *when a liquid assumes the gaseous state, a certain fixed and definite amount of heat disappears; and, conversely, when a gas or vapor becomes a liquid, heat to a corresponding extent is evolved.* Watts has illustrated this as follows: "When water at 0° C. is mixed with an equal weight of water at 100° C., the whole is found to have the mean of two temperatures, or 50° C. On the other hand, 1 part by weight of *steam* at 100° C., when condensed in cold water, is found to be capable of raising 5.4 parts of the latter from the freezing point to the boiling point, or through a range of 100° C. Now, $100 \times 5.4 = 540$; that is to say, steam at 100° C. in becoming water at 100° C. parts with enough heat to raise a weight of water equal to its own (if it were possible) 540° of the centigrade thermometer, or 540 times its own weight of water one degree of the same". When water passes into steam, the same quantity of sensible heat becomes latent. A consideration of these facts in physics leads to the practical application of steam as a transmitter of heat, whereby heat from any source may be absorbed by steam and carried through suitable pipes to the vessel designed to be heated. If this vessel is filled with a cold liquid, the latent heat of the steam is rapidly communicated to the liquid, the steam is condensed, and the result is this most convenient and economical method of producing a temperature which is capable of being regulated with great exactness.

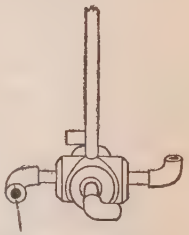
Steam Baths—These may be divided into two classes: 1, those in which steam is used without pressure; 2, those in which steam is used under pressure.

1. *The Use of Steam without Pressure*—In many cases open steam, as it is termed, is used (see Fig. 110). The pipe which conveys the steam from the boiler is conducted to the bottom of a hemispherical kettle, and the liquid to be heated is poured into a dish of larger diameter, which is placed upon the top; the steam is turned on, and as it condenses is carried off by the drip pipe. A temperature of about 100° C. (212° F.) can usually be maintained by this method.

Fig. 110

Open steam bath

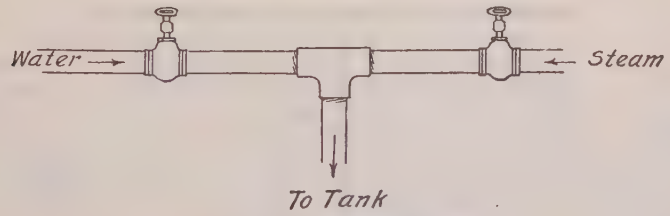
Fig. 111



Steam distributor

Sometimes the steam pipe is conducted directly from the top into the liquid to be heated. A steam distributor, as shown in Fig. 111, may be used at the end of the pipe near the bottom of the kettle; it is made by screwing a cross upon the end of the pipe, and an elbow to each arm of the cross; the steam issues usually with some force from each elbow and effectually stirs up the liquid, and rapidly produces a uniform temperature in it. The principal disadvantages of using steam in this way are the noise at first produced by the contact of the hot steam with the cold liquid, and the increase in bulk of the liquid through the condensation of the steam as well as the contamination likely to be produced, for the condensed distillate from the average steam boiler is by no means pure. The noise attending the running of steam into cold water may be largely overcome by mixing the steam with a small stream of water, in a T pipe, before allowing it to flow into the water, as illustrated in Fig. 112.

Fig. 112



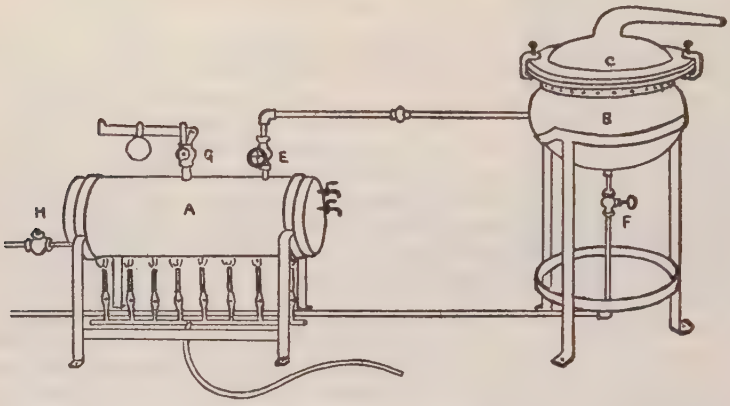
Live steam to tank without noise

2. *The Use of Steam under Pressure*—This is by far the most convenient method of using steam practically as a means of transmitting heat. It has been stated that steam produced in open and unconfined vessels, with the ordinary pressure of the atmosphere, has the temperature of 100° C. (212° F.). If water is heated continuously in a boiler capable of withstanding pressure, the water is prevented from boiling by the pressure of its own vapor, and the temperature of the steam rises in proportion as the pressure increases. It is usually stated that the pressure of the atmosphere is 14.7 pounds to the square inch. The following table shows the increase in temperature of steam when the pressure exceeds that of the atmosphere. Of course, the opposite effect is produced when the pressure is removed, and the water boils below the temperature of 100° C. (212° F.). (See vacuum apparatus, page 126).

The principle of the use of steam under pressure is shown in the apparatus (see Fig. 113). It was designed by Joseph P. Remington in 1872 to illustrate the subject practically upon the lecture table. A cylindrical copper boiler, A, supported by a stout iron stand, is heated by a row of six Bunsen burners;

water is forced into the boiler from the hydrant through a rubber hose attached to the pipe connected with the check valve, H. The steam passes into the jacketed kettle, B, and is controlled by the steam valve, E, the exhaust steam and condensed water passing through the pipe controlled by the valve F. The

FIG. 113



Use of steam under pressure

safety valve, G, warns the operator by "blowing off" steam when the pressure has reached the highest point desired. C shows the dome which may be attached when a liquid is to be distilled.

Table of the Temperatures of Superheated Steam

Pressure	Temperature of Steam		Pressure	Temperature of Steam	
Pounds per Square Inch	C.	F.	Pounds per Square Inch	C.	F.
14.7	100°	212°	55	141.6°	287°
17	104.2°	219.6°	60	144.7°	292.7°
20	108.8°	228°	65	147.7°	298°
23	113°	235.4°	70	150.5°	302.9°
25	115.6°	240.1°	75	153°	307.4°
30	121.3°	250.4°	80	155.5°	312°
35	126.2°	259.3°	85	157.8°	316.1°
40	130.7°	267.3°	90	160°	320°
45	134.6°	274.4°	95	162.2°	324°
50	138.3°	281°	100	164.4°	327.9°

An upright tubular steam boiler, suited to operations in the pharmaceutical laboratory, and a sectional view of the same, are shown in Figs. 114 and 115. An automatic steam boiler made by the Wm. Kane Mfg. Co., of Philadelphia, a sectional view of which is seen in Fig. 116, is adaptable to small laboratories without central steam supply. This boiler is gas heated, equipped with an automatic gas regulator which can be set to maintain any desired steam pressure simply by adjusting a weight on an arm.

The usual form of steam kettle is shown in Fig. 117. A copper pan, tinned inside, having flaring sides to facilitate evaporation, is securely connected about midway from the bottom with another copper pan, both being riveted together. An opening for the steam pipe is made in the jacketed side to admit steam, and at the lowest point of the bottom another pipe is attached to carry

off the water produced by the condensation of the steam. The upper edge of the kettle is protected by a flat brass ring, which is soldered and riveted to it, and which also serves to support the still top when the steam kettle is used for distillations. (See Chapter on Distillation.) Care should be exer-

Fig. 114

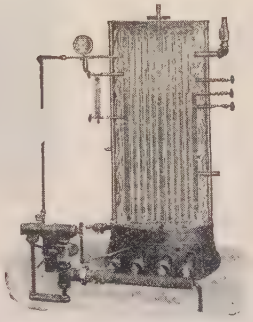
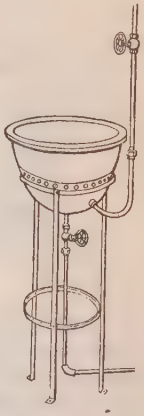
Fig. 116



Gas-heated boiler

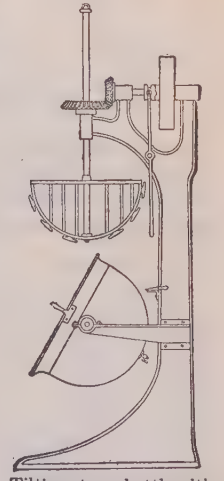
Fig. 117



Steam kettle

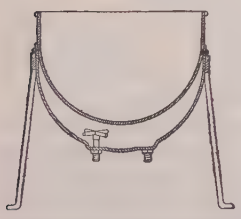
cised to have the bottom of the kettle made of copper heavy enough to resist the greatest amount of steam pressure that will be likely to be used on it, as instances have been known of collapse when this was neglected. In using the steam kettle, the liquid that is to be heated is run into it by a syphon or by other means; the drip or exhaust valve below is opened partially, and the steam slowly turned on. Steam valves should always be opened cautiously, as accidents and strains to steam apparatus often arise from the sudden shocks due to want of care in this respect. While the liquid is becoming heated, the condensed water should be allowed to escape freely, and when the proper temperature is reached, the steam valve should be carefully

Fig. 120



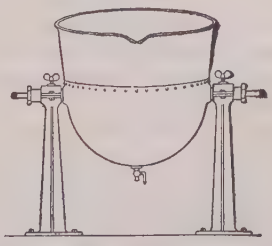
Tilting steam kettle with stirrer

Fig. 118



Steam kettle (sectional view)

Fig. 119



Steam kettle on trunnions

adjusted and the exhaust valve turned so that, while all the condensed water may escape, no steam shall be allowed to go to waste by its being opened too widely. One of the greatest objections to the use of tinned copper kettles is that the coating of tin soon wears off, and the contamination of an evaporating liquid with copper is almost certain to result.

Fig. 118 represents a sectional view of a steam kettle, showing the space for steam and a four-arm steam distributor with outlet. Fig. 119 shows a steam kettle mounted on trunnions. This form is very convenient when the operator wishes to pour out the contents. In the ordinary form of the kettle the con-

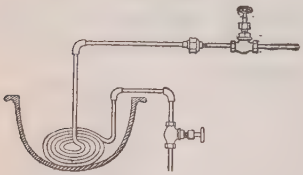
Glass-lined steam kettle

tents have to be removed with a dipper. Fig. 120 shows a modern form of steam kettle with a stirring apparatus which is easily removed when not in use. The tilting kettle is very convenient.

The enameled cast iron kettle shown in Fig. 121, is preferred to plain iron kettles, although the injurious cracking of the enamel from overheating and

Fig. 123



Kettle with steam coil

Fig. 124

Fig. 125

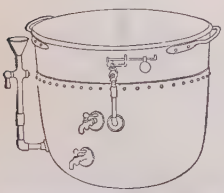
Horizontal steam coil

Fig. 126

Upright steam coil

the resulting exposure of the liquid to the iron surface beneath is an objection. It is proper to state that with care the enamel may often be retained for years in perfect condition. A great improvement in the process of enameling has now rendered this type of kettle very serviceable and satisfactory.

Fig. 127



Steam kettle for use over naked fire

Fig. 122 illustrates a kettle of this type which is termed "glass-lined". These kettles are made in many styles and of varying capacity, by the Pfaudler Co. of Rochester, N. Y. The J. L. Mott Iron Works, of New York, also manufacture similar kettles.

Pressure steam is frequently passed through coils of iron, block tin, or lead, which have been immersed in the liquid to be heated. Fig. 123 shows the usual form. It will be found very useful to the practical worker to use block tin pipe. Steam valves may be soldered to both ends of the pipe, and on account of the flexibility of the pipe it may be readily adjusted and coiled to suit available space, while the absence of danger from contamination when used for heating most medicinal liquids is an advantage which should not be overlooked. Steam, when passed through coils of various shapes, zig-zag pipes, etc., is also largely used in heating liquids in special operations, in drying drugs,

chemicals, etc. Figs. 124, 125, and 126 illustrate these forms. Zig-zag coils of silica have been used for evaporating permanganate solutions.

Pressure Steam without the Use of a Boiler—In Fig. 127 is shown a water bath jacketed kettle, which generates its own steam; it may be used over a gas burner, coal oil stove, or naked fire. Two gauge cocks indicate the quantity of water in the kettle, and the safety valve the amount of steam pressure; the funnel pipe is used for charging the kettle with water. The advantages of this kettle are apparent, the principal one being that it can be used by a pharmacist who desires to use steam heat without incurring the inconvenience and expense of installing a boiler in his store, laboratory, or cellar. A practical application of this principle is seen in sterilization by steam under pressure (see Chapter on Sterilization and Ampuls).

CHAPTER VIII

VAPORIZATION

THOSE pharmaceutical operations are included under this head in which volatile substances are separated from fixed bodies, or from others which are less volatile, usually with the aid of heat at varying temperatures. Vaporization is frequently employed in pharmacy, and it will be most convenient to consider its applications in the order of their importance: 1. To Liquids. 2. To Solids.

1. When vaporization is used to separate a *volatile liquid* from a *less volatile liquid*, it is called *evaporation*. This may be accomplished either with or without *ebullition* or boiling.

2. When the object sought is the *volatile liquid*, it is called *distillation*.

3. When it is used to separate a *volatile liquid* from a *solid*, it is called *desiccation* (*dehydration*), *exsiccation*, or *granulation*.

4. When it is used to separate a *volatile solid* from a non-volatile solid, it is called *sublimation*.

The following diagram may serve to impress the definitions on the memory:

Vaporization

Object Sought		Process
Liquids:		
Fixed or less volatile		Evaporation with or without ebullition
Volatile		Distillation with ebullition
Solids:		
Fixed		Desiccation (dehydration)
		Exsiccation
		Granulation
Volatile		Sublimation

The subjects of evaporation, distillation, sublimation, and desiccation will be considered in the chapters which immediately follow. Vaporization, as applied to granulation and exsiccation, will be more appropriately considered after the chapters on Solution and Crystallization.

The methods adopted by the Pharmacopœia are copied below.[1]

---

[1] **U. S. P. X Methods for Determining Distilling and Boiling Points**

Method I

For the purposes of the Pharmacopœia and general chemical analysis, a boiling point is defined as that range of temperature within which at least 95 per cent, by volume, of the substance distils, when treated as directed below.

Apparatus Required—A distilling bulb of from 50 to 60 cc. capacity to the lower part of the neck; the length of the neck is from 10 to 12 cm. and its internal diameter from 14 to 16 mm. The outlet tube of from 4 to 5 mm. internal diameter is to be attached to the neck at approximately its midpoint, forming an angle of from 70° to 75° with the lower end of the neck.

A straight glass condenser with a water jacket from 40 to 60 cm. in length; the distance from the upper end of the water jacket to the neck of the bulb being from 18 to 25 cm.

Thermometer—In order to avoid the necessity for emergent stem correction, it is advisable that an accurately standardized thermometer of the Anschütz type be used. If such a thermometer is not available, a thermometer used for melting points (page 106) may be employed, applying the emergent stem correction as described under *Melting Points* (page 107), the length of emergent stem being measured, in degrees, from the lower end of the stopper to the highest point of the boiling temperature. When placed in position, the lower end of the thermometer is from 2 to 3.5 cm. below the center of the orifice of the outlet tube.

An asbestos board of from 12 to 15 cm. square and from 3 to 5 mm. in thickness, having a circular perforation, located centrally, for the reception of the bulb. The edge of the asbestos around the perforation should fit closely to the bulb when the latter is set into it. The size of the perforation should be such that when the bulb is set into it the portion of the bulb below the upper surface of the asbestos will have a capacity of from 3 to 4 cc.

Procedure—Place the asbestos board on a tripod or other suitable support. Introduce into the distilling bulb 25 cc. of the liquid to be tested, insert the thermometer, stand the bulb in an upright position in the perforation of the asbestos board, and connect it with the condenser. Then distil the liquid at the rate of 1 cc. for each fifteen to twenty seconds, noting the temperature as soon as 5 drops of the liquid have distilled into the receiver and when 95 per cent of the original volume has distilled. Correct the reading for any variation

Evaporation

Although this term has in its more popular sense the signification of the separation of moisture from any body, whether solid or liquid, in pharmacy the word has a more restricted meaning, and signifies the driving off of the more volatile or less valuable portions of a liquid by the application of heat, with the object either of purifying or of concentrating it for the purpose of obtaining the less volatile portion. Illustrations are found in the concentration of syrups and liquids intended for crystallization, and in the treatment of weak percolates in making fluidextracts and extracts.

As *ebullition*, or *boiling*, is an important form of evaporation, it will be necessary first to consider its essential points. Ebullition in a heated liquid is caused by the formation of bubbles of vapor upon the surface of the vessel, which, rising to the surface of the liquid and bursting, permit the vapor to become diffused in the space above the boiling liquid. The *boiling point* of a liquid may be defined as the temperature at which the tension of its vapor is equal to the pressure of the atmosphere, this point being *definite*, while *evaporation* may take place in the same liquid at nearly all degrees of heat and hence the evaporating point is an indefinite temperature. The point at which a liquid boils varies with the composition of the liquid, other conditions being equal.

The boiling point of a liquid is affected by the cohesion of the liquid and the degree of pressure upon its surface. Water under the ordinary pressure of the atmosphere boils at 100° C. (212° F.). When confined in a steam boiler, it has been shown that water can have a temperature considerably over 200° C. (392° F.) without boiling, the bubbles being prevented from forming by the pressure of the steam in the confined space above the liquid. On the other hand, the creating of a partial vacuum by the removal of pressure causes a liquid to boil below its normal boiling point.

---

in the barometric pressure from the normal (760 mm.) by allowing 0.1° C. for each 2.7 mm., adding if the pressure is lower, and subtracting if higher.

NOTE: In order to have the entire volatile portion distil over at the prescribed rate, it is best to make a preliminary distillation of a separate portion of 25 cc. of the liquid, during which the source of heat (a Bunsen burner) is regulated so that the distillation proceeds at the prescribed rate. Having thus regulated the burner, temporarily remove it, clean the bulb, recharge it with a fresh portion of 25 cc. of the liquid, and conduct a new distillation as described above.

Method II

This method is to be used with liquids for which the permissible range in boiling temperature exceeds 5° C.

Apparatus Required—A 200 cc. distilling bulb with an outlet tube at approximately the center of the neck, forming an angle of from 70° to 75°, with the lower end of the neck. The length of the neck is from 10 to 12 cm. and its inside diameter is from 18 to 24 mm. The length of the outlet tube is from 10 to 12 cm. and its inside diameter is from 5 to 6 mm.

A straight glass condenser, a thermometer, and an asbestos board as in Method I. The diameter of the perforation in the asbestos board is 25 mm.

Procedure—Place the distilling bulb in an upright position in the perforation in the asbestos board and connect it with the condenser. The outlet tube is to extend from 25 to 35 mm. into the condenser beyond the connecting stopper.

Measure 100 cc. of the liquid* to be tested, using a cylinder having 1 cc. graduations. Note the temperature of the liquid and transfer it as completely as possible to the distilling bulb. Use this cylinder as the receiver for the distillate without rinsing out any of the adhering liquid. Insert the thermometer through a stopper in the position described in Method I and heat with a Bunsen burner protected from drafts until the liquid begins to boil, then distil at the rate of from 4 to 5 cc. per minute. The temperature when 5 drops of the liquid have distilled into the receiver is the minimum distillation temperature and, unless otherwise specified, the maximum distillation temperature is the temperature at which 95 per cent of the liquid has distilled over. Bring the distillate to the same temperature at which the liquid was originally measured, and note the volume. Correct the temperature reading for barometric pressure and apply the emergent stem correction as described in Method I.

Liquids which begin to distil below 80° C. are cooled to 10° or 15° C. before measuring the 100° cc. for the test. The end of the condensing tube is fitted with an adapter bent at a suitable angle and the end of the adapter is passed through a cork inserted into the receiving cylinder. The cork has a small perforation to permit the exit of air. The receiving cylinder is kept immersed in ice to within 2.5 cm. of its height during the distillation.

---

*For the determination of the distillation range of creosote from creosote carbonate and of cresol from compound solution of cresol, use the volume of the creosote or of the cresol obtained as described under the respective monographs.

Determination of Boiling Points—One of the simplest unofficial methods of ascertaining the boiling point of a liquid is illustrated in Fig. 128. The liquid is introduced into a test tube, and a glass tube is selected of such diameter as will permit a chemical thermometer to pass easily through it and leave a small space between; the tube should be about one inch shorter than the thermometer. A short piece of wire is passed through the glass ring of the thermometer, and slightly bent to hold it in position; a perforated cork should now be fitted tightly to the test tube, and the tube carrying the thermometer tube pushed through the perforation in the cork until the bulb of the thermometer is just above the liquid; heat should be applied cautiously by a sand bath or water bath. The vapor from the boiling liquid passes upward through the whole length of the thermometer, escaping at the top, and thus the error common to some methods, due to the difference in temperature between the portion of the thermometer in the test tube and that outside of the test tube, is measurably avoided.

FIG. 128

Boiling point test

Tension of Vapors—If a glass tube, thirty-six inches long, closed at one end, is filled with mercury, and the open end, after closing it with the finger, carefully inverted in a beaker containing mercury, it will be found that the mercury will run out from the tube into the beaker until a column of mercury about thirty inches in height is left. This column is sustained by the pressure of the atmosphere, and is, in fact, the well known *mercurial barometer* tube sometimes called the *Torricellian tube* on account of its discoverer (see Fig. 129). The six inches of space in the tube above the level of the mercury is, of course, empty, or vacuous. Now, if a few drops of water are passed into the tube by a dropper, they immediately rise to the level of the mercury in the tube and, although the temperature has not been increased, a portion of the water is vaporized, and the column of mercury is proportionately depressed. This depression is due to the elasticity or tension of the aqueous vapor. If the tube is forcibly pushed down into the mercury, the increased pressure will be found to have liquefied the vapor, and the original quantity of water is recovered; but the depression in the column of mercury may be increased by heat, and when a sufficient amount of heat has been applied to the tube to expel the mercury until none is left in the tube, it will be found that the temperature marks 100° C. (212° F.), which is exactly the boiling point of the liquid (water), showing that this point must be reached in order to overcome the pressure of the atmosphere. If alcohol or ether is substituted for water, it will be found that the mercury will be depressed in a far greater ratio,—this being due to the greater volatility and lower boiling point of these liquids. The *maximum density* of the vapor of a volatile liquid in a confined space in contact with the corresponding liquid is reached when its elastic force attains the limit beyond which pressure produces the liquefaction of the vapor. When this limit is reached, the vapor is said to be *saturated*. Maximum density varies with the temperature. If a saturated vapor in an enclosed tube is not in contact with an excess of liquid, increase of temperature lowers its density or expands it. On the other hand, when a saturated vapor is cooled, liquefaction

FIG. 129

Mercurial barometer

gradually takes place, the vapor above the liquid remaining in the condition of maximum density until converted into the liquid, so that cold and pressure have the effect of *converting vapors into liquids*, while heat and the removal of pressure have the reverse effect,—*i. e., the conversion of liquids into vapors.* A consideration of the foregoing facts leads to the following deductions:

1. The quantity of vapor that will form in a confined space depends primarily upon the amount of pressure and heat to which the liquid is subjected, but when the point of saturation of the surrounding space with the vapor is reached, evaporation ceases if the pressure and temperature remain the same.

2. The rapidity of evaporation of an aqueous liquid in the open air is influenced by the amount of the aqueous vapor always present in the air. If the saturation is at or near the maximum, evaporation is retarded; but if the aqueous vapor in the atmosphere is much below the state of maximum saturation, as is usually the case, evaporation is accelerated.

3. Rapidity of evaporation is increased by removing the pressure of the atmosphere.

4. Increase of temperature obviously accelerates evaporation by increasing the formation of vapor.

Humidity—Humidity is the term used to describe the amount of water vapor in the atmosphere. It may be "absolute" humidity, in which case the actual weight of water in a given unit volume of atmosphere is meant; but the more common application of the term is that of "relative" humidity. By this we mean the ratio of the actual humidity of the atmosphere at any given temperature to the absolute humidity of the atmosphere if it were saturated at the same temperature.

Fig. 130

Wet and dry thermometer

The atmosphere is said to be saturated or to have reached the saturation point, sometimes called the dew point, when it contains as much water vapor as it can possibly contain at any given temperature. For example, the absolute humidity of air at 70° F. is about eight grains of water vapor per cubic foot. At 0° F. it is only one-half grain per cubic foot. If the atmosphere of a room, the temperature of which is 70° F., contains four grains of water vapor per cubic foot, the relative humidity would be four-eighths or, as commonly expressed, fifty per cent.

Humidity, therefore, has a direct and important bearing upon evaporation and in many laboratories it is determined as a preliminary step to the successful carrying out of certain kinds of operations, as manufacturing granular effervescent salts, which cannot be made of uniform quality except when the humidity is below a certain figure. The instrument used in determining relative humidity is called a hygrometer. There are several types and forms of instruments used for the purpose. One form, known as the *hair hygrometer*, shows the relative humidity directly upon a dial. It is operated by taking advantage of the fact that a strand of human hair lengthens with dampness and shortens with drying.

Another form is known as the *wet and dry bulb thermometer* (see Fig. 130). Two thermometers are mounted a short distance apart on the same board. One of these is exposed to the free air, the other has its bulb covered with loosely twisted wicking which extends into an attached water reservoir. The bulb which is surrounded with moist wicking will show a lower temperature

than the dry bulb and this difference is directly proportional to the rapidity of evaporation of the water, which in turn is directly dependent upon the relative humidity or percentage of saturation of the atmosphere with water. A table accompanies such a thermometer which gives the relative humidity when the dry bulb temperature and the difference in the readings of the two thermometers are known.

A third form, giving more rapid results than the foregoing is known as the *sling psychrometer* (see Fig. 131). This form has the two thermometers mounted upon a whirling handle and placed so that one has the bulb considerably below the other. The lower bulb is covered with muslin and then moistened with water and whirled about the hand, readings being made every half minute until the difference in temperature between the two thermometers is constant. The same table may be consulted as is used in connection with the preceding instrument.

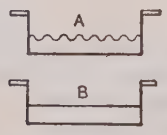
FIG. 131

Sling psychrometer

Evaporation of Liquids by Boiling—In evaporating by boiling, temperature, pressure, etc., being equal, the rapidity of the process depends upon the *extent of surface exposed to the heat.* Fig. 132 represents a cross section of two evaporators, *A* and *B*. The corrugated bottom of *A* gives twice as much surface as the smooth bottom of *B*, and hence if the same quantity of a liquid is made to boil in each, at the same temperature, the bubbles of vapor given off from the corrugated bottom will be twice as numerous as those formed on the plain bottom. The superiority of the tubular boiler over the ordinary plain or Cornish boiler also affords a good illustration of this fact (see Fig. 115).

When a pure, volatile liquid is heated to the boiling point in the open air, its temperature remains the same

FIG. 132



Evaporation by boiling

FIG. 133

FIG. 134

Evaporating below boiling point

until the whole of the liquid has evaporated. If, on the other hand, solid matter is dissolved in the liquid, the temperature of the solution is gradually increased until saturation is reached. This fact is well illustrated by considering boiling points of saturated solutions of various salts (see page 113), and it shows the importance of controlling and regulating the heat in the evaporation of solutions of organic substances as evaporation progresses, as, for example, in the making of extracts, etc.

The cohesion of a liquid affects its boiling point, dense, thick, and sticky liquids offering more resistance to the escape of the bubbles of vapor than mobile, or thin liquids.

The relative depth of a liquid also influences the boiling point. Shallow vessels favor ebullition, because they afford proportionally less weight of

liquid above the bottom of the dish, through which the bubbles escape, than deep ones. Rough metallic surfaces favor evaporation by boiling, and are better than smooth surfaces, because they expose a greater amount of surface to the source of heat.

Evaporation Below the Boiling Point—In evaporating liquids below their boiling point, temperature, pressure, etc., being equal, rapidity of evaporation depends upon the extent of surface exposed to the air. Figs. 133 and 134 show two vessels of exactly the same diameter, but of different capacity, containing water. Both expose the same amount of surface to the air, but that of Fig. 134 contains eight times more liquid than that of Fig. 133.

Fig. 135 Fig. 136

Porcelain evaporating dish Glass evaporating dish

If both be subjected to the same temperature, *provided it be below* 100° C. (212° F.), the water will evaporate as rapidly from one as from the other.

Proper Shape of Vessels for Evaporating Liquids—Broad, shallow vessels should be used for evaporating because the extent of surface is proportionally greater in vessels of this shape. Fig. 135 is an illustration of a porcelain evaporating dish having the proper shape. The chief objection to dishes of this kind is their liability to breakage. Care should be taken to dry the bottom of the dish thoroughly before placing it over a gas flame. A glass evaporating dish is shown in Fig. 136. This should always be used in a sand bath, or should be otherwise protected from direct heat. Enameled cast iron dishes (Fig. 137) are very useful, notwithstanding the lack of durability of the enamel. Enameled sheet iron dishes, called "agate ware", are very light, and are much more lasting than the ordinary enameled cast iron dishes (see Fig. 138).

Fig. 137

Enameled cast iron dish

Fig. 139

Fig. 138

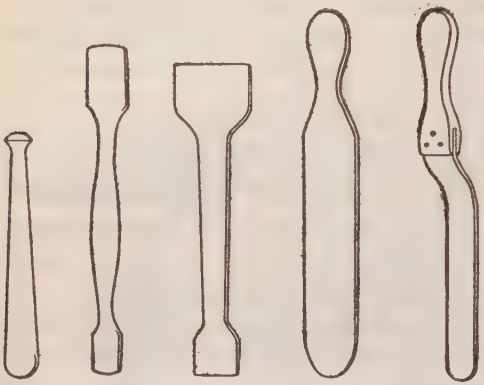
"Agate ware" evaporating dish

Pfandler glass-lined open crystallizing pan

For larger operations, cast iron, glass or acid-resisting, enamel-lined vessels of excellent quality and of varying capacity are now available (see Fig. 139 and also Fig. 122, page 118).

Use of Stirrers—By stirring an evaporating liquid the surface is largely increased, while the currents of air produced at the same time greatly assist in dissipating the vapors which rise. Upon the small scale, porcelain, horn, or wooden stirrers are used (see Fig. 140), while mechanical stirrers are usually employed in the laboratory in more extensive operations (see Fig. 117), page 117.

Fig. 140

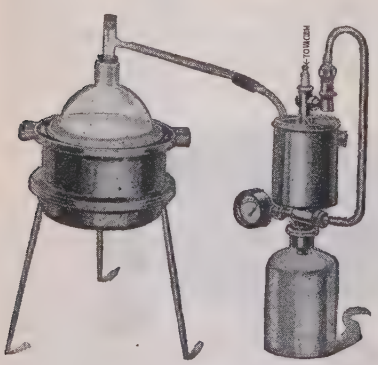


Porcelain stirrer | Double stirrer | Horn stirrer | Wooden stirrer | Bent horn stirrer

Vacuum Apparatus—On page 144 it is shown that the boiling point of liquids is lowered by removing the pressure of the atmosphere. This fact is easily proved by placing under the receiver of an air-pump some alcohol in a test glass containing a few pieces of broken glass, when, upon exhausting the receiver, many bubbles of vapor will rise from the surface, and the liquid will boil at the ordinary room temperature. Water will boil at 84° C. (183.2° F.) on the top of Mont Blanc on account of the diminished pressure of the atmosphere, and allowance must be made for such differences in temperature, due to increased altitude, in cooking food, as well as in preparing pharmaceutical and chemical preparations.

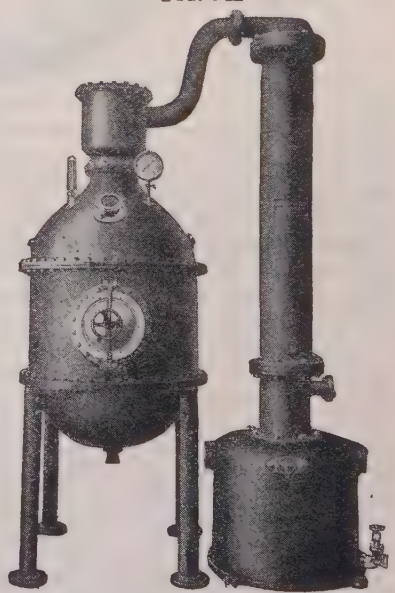
The practical application of these principles is of great importance in pharmacy, and vacuum pans are almost invariably used in the larger laboratories for concentrating solutions which are injured by heat under the ordinary pressure of the atmosphere,

Fig. 141



Small vacuum still

Fig. 142

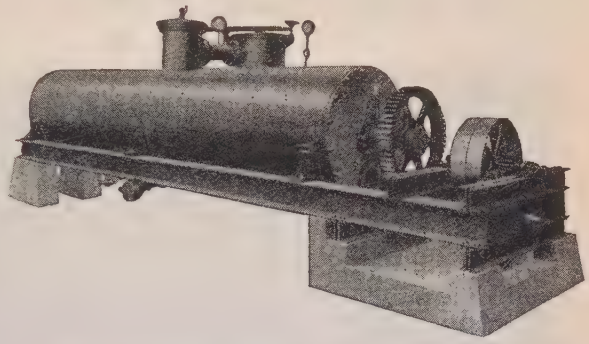


Vacuum still

especially in evaporating solutions of organic substances, for these are almost without exception injured by heat. Vacuum evaporators have the added advantage of lessening the time required for an operation and thus become an economy factor.

In Fig. 141 a vacuum apparatus is shown which illustrates the principle of this method of evaporation. Fig. 142 shows a larger vacuum apparatus adapted for manufacturing laboratories. At the left is seen a jacketed copper still containing manhole, eye glasses, aircock, and drain valve, the top being enlarged to provide for the frothing of the liquid in the still. The condenser is mounted on the receiving tank which is furnished with a water gauge, drain valve, and with inlets and outlets for the vacuum pump. Such stills are used to concentrate the percolates from vegetable drugs, at very low temperatures, and at the same time to recover the alcohol for use in another operation. Fig. 143 illustrates an apparatus in which the alcohol may be recovered directly from an exhausted drug by emptying the contents of a percolator into the still. Vacuum pumps operated by steam are to be found in all well equipped pharmaceutical laboratories, and pipes and attachments are just as easily connected with various forms of apparatus as are the pipes used for conveying steam under pressure.

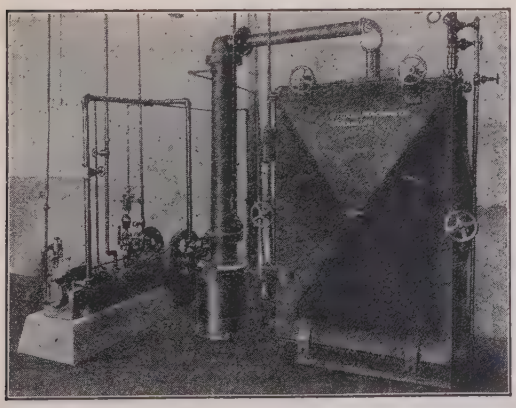
Fig. 143



Apparatus for recovering alcohol from exhausted drugs

The F. J. Stokes Machine Company, of Philadelphia, has perfected a vacuum drying apparatus of much value. Fig. 144 shows in detail the application of the vacuum applied to drying moist substances; the vapors may be condensed and reclaimed by the use of the condenser. These vapors may sometimes be injurious or objectionable if allowed to escape into the laboratory, and hence this plan of disposing of them is effective; the condenser may be disconnected, if found advantageous. Substances which require days to dry in heated rooms can be dried in several hours with this apparatus.

Fig. 144



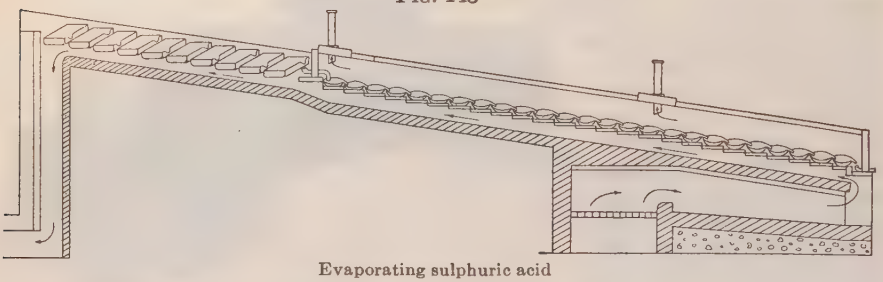
Vacuum dryer

Economical Surface Evaporation — In large industries where economy in operating is an essential factor, various forms of apparatus are constructed to meet this need. In Fig. 145 is shown a method of concentrating sulphuric acid.

Spontaneous Evaporation—By this term is meant the evaporation of a liquid at the ordinary temperature of the atmosphere, or without the application of strong, direct heat. It is used in cases where the residue or less volatile liquid is liable to injury or loss by the application of much heat, or in crystallization, when, by the slow vaporization of the volatile liquid, finely

formed crystals may be secured, and in other less important operations. Spontaneous evaporation is usually conducted in drying rooms or closets when they are accessible; these, as will be subsequently described, are rooms or closets which are very slightly heated by the use of exhaust steam or other means; or the liquid may be placed in shallow dishes or trays and the surface exposed to the rays of the sun during fine weather. Upon the small scale, one of the most convenient methods is to support the dish upon a tripod or shelf

FIG. 145



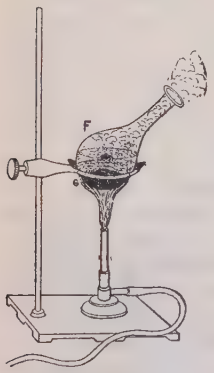
Evaporating sulphuric acid

above a coal stove, at a sufficient distance above the stove to avoid injury or to place it in the oven of a gas stove, the door being left open and a very low heat applied.

In industrial processes many forms of apparatus have been devised for accomplishing rapid evaporation and the drying of materials. Sugar, gelatin, granular chemicals, extracts, wash waters, and many other substances are handled on a large scale by special machinery.

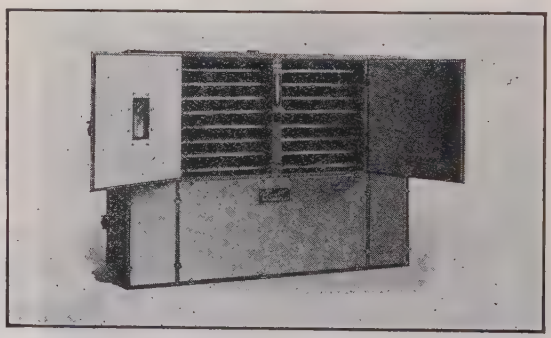
Evaporation by Direct Heat—This method usually requires the greatest amount of care in order to avoid loss or injury by overheating. It is, there-

FIG. 146



Flask evaporation

FIG. 147



Drying closet

fore, to be preferred only in cases where the residue is not easily injured by such an accident. The evaporation of saline solutions in crystallization, or of weak aqueous organic solutions, may usually be performed by the application of direct heat. Careful watching, however, is necessary, and also frequent stirring, to prevent the formation of a crust upon the bottom. Fig. 146 shows a method of evaporating by direct heat by using a flask, F, supported on a piece of brass wire gauze, G, on a retort stand.

Drying closets are used in many operations in the manufacturing labora-

tory. Usually they are heated by steam pipes or a gas stove and the air drawn through by an electric fan. Figs. 147 and 148 illustrate Proctor dryers.

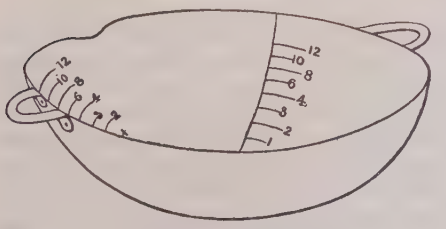
Evaporation to a Fixed Volume—This operation cannot be performed accurately without inconvenience, and hence it is much more satisfactory to evaporate a liquid to a definite weight,—all that is necessary in the latter case being to use a tared dish, and weigh the dish and contents when evaporation has progressed to the desired point. In evaporation to a definite measure, a

FIG. 148

Drying closet with trays on portable frames

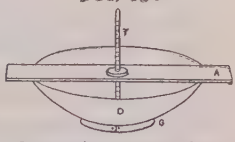
graduated evaporating dish (see Fig. 149) may be employed, care being taken to level it by noticing that the height of the liquid is the same on each side, or the expedient illustrated in Fig. 150 may be resorted to. An ordinary evaporating dish, *D*, is placed upon a grommet, *G* (see page 130), and subjected to heat (in this case the temperature is intended to be that of a warm room); a perforated wooden strip, *A*, is placed across the dish, and a glass thermometer, *T*, is supported in an upright position in the liquid by a perforated cork. Sufficient water is poured into the dish to equal the final measure of the liquid, and a small rubber band is slipped on the thermometer (or a piece of string tied on) to indicate the desired level of the liquid; the water is replaced by the liquid to be evaporated, and evaporation proceeds until the liquid has been lowered to the mark on the thermometer. When the use of the thermometer is unnecessary, a notched stick may be substituted. In order to arrive at results approaching accuracy by these methods, the liquid must be allowed to cool to the temperature of the water which was used as the measure of the liquid in the beginning.

FIG. 149



Graduated evaporating dish

FIG. 150

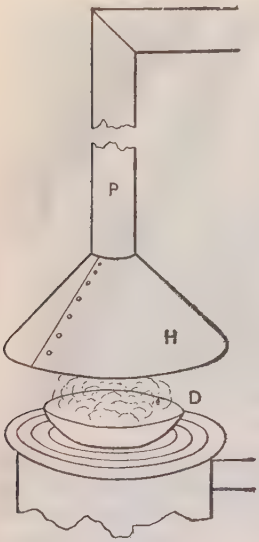


Measuring evaporation

Use of Hoods—A hood is a contrivance of a conical shape or in the form of a closet, usually called a *fume closet*, intended to collect and dispose

of vapors which, from their disagreeable odors or their suffocating effects, render the atmosphere of the store or laboratory unwholesome. Fig. 151 shows a form of hood which has been found useful on the small scale. It is made of galvanized iron, and connects by galvanized stove pipe with the strong draught of a good chimney; the stove pipe running horizontally to the chimney should have a damper in it. If any condensation of the vapors takes place in the stove pipe, the larger diameter of the circular hood will cause the drops of liquid to fall outside of the evaporating dish, and thus contamination of the contents of the dish is avoided. Hoods are usually made of wood or galvanized iron when intended for large scale operations.

Fig. 151



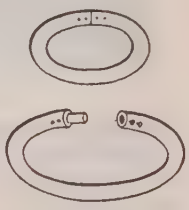
Hood

Fig. 152 illustrates a laboratory hood or *fume closet* such as is used in analytical laboratories where

Fig. 152

Fume closet

Fig. 153



Grommet

acid and other obnoxious fumes must be carried away. Such hoods are often equipped with specially constructed acid-resisting suction fans, electrically driven and placed somewhere in the flue pipe making the device more efficient.

Use of Grommets—One of the inconveniences in using round bottomed evaporating dishes is due to the shape, serious loss often occurring from tilting the dish and spilling the contents. To obviate this, *grommets* should be used. These may be economically made from straw, formed into a circle and tied, or from a cast off piece of rubber hose or tubing by bending it into a circle, placing a wooden plug in one end, tacking it securely, and inserting it in the other end and fastening it in the same manner (see Fig. 153). An elastic ring is thus formed upon which an evaporating dish or round bottomed vessel may be safely placed. They may also be purchased made of cork or other non-conducting material. Grommets serve another very important purpose, that of preventing the fracture of a porcelain or glass dish containing a hot liquid, by being placed between the hot dish and the cold surface of a table or counter.

CHAPTER IX

DISTILLATION

The first part of the process of *distillation* is identical with that of evaporation, for it is simply the vaporization of the volatile liquid through the application of heat. The second step of the process is the opposite of vaporization, and consists in the conversion of this vapor into a liquid by the application of cold. This part of the process is called *condensation*. The subject of vaporization was treated of in the preceding chapter. Condensation is to be considered here.

Condensation—It has been already shown (page 114) that when a liquid is vaporized a certain amount of heat disappears or is rendered latent, and when a vapor is liquefied a corresponding degree of heat is evolved or reappears. While the practical application of this law is of great service in the use of steam for heating purposes, the opposite process, namely, that of condensation, has its disadvantages, because of the relatively large quantity of cold water necessary to convert vapors into liquids.

The greater the difference in temperature between the condensing surface and the vapor, the more rapid is the condensation; and it has been computed that steam at 100° C. (212° F.) requires about twenty-five times its weight of water at 20° C. (68° F.) to condense it. The proper relation between the heating and condensing surfaces of apparatus used in distillation can only be known by careful study of the laws governing vaporization and condensation, or by practical experience.

Apparatus used in Distillation—In considering the many kinds of apparatus used in distillation, two typical forms are presented: 1, the *alembic* form (from the Arabic *al ambig*, the still), in which the vapor is condensed in an enclosed space immediately above the heated liquid, and, 2, the *retort* form (from the Latin *re-tort* to turn or twist again), in which the vapor is condensed in a vessel placed at one side of that containing the heated liquid, and connected with it by a suitable tube or pipe.

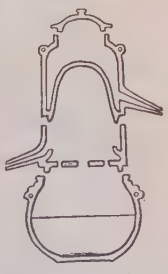
The Alembic—This is also called a *lambik* or *limbek* in the older literature of pharmacy. It is probably the most ancient kind of distillatory apparatus, but in its original form it is now rarely employed. The body, or *cucurbit*, is usually globular or oval in shape, and at its junction with the hemispherical head or dome there is a gutter or groove. This serves to collect the condensed vapor or distillate, which is carried off by a tube, as shown in the illustration (see Fig. 154).

Fig. 154

Alembic

Fig. 155 shows an old form of Japanese alembic. Into the boiler is fitted a short cylinder. This has a perforated bottom, and the gutter communicates with the spout; the condenser has a cover, and is also furnished with a spout for carrying off the water used in cooling the dome after it has been heated by the vapors rising from the boiling liquids in the bottom. This still, or, as it is called by the Japanese, *lambik*, is shown because it represents the alembic probably in one of its best practical forms, and the advantages possessed by this kind of distilling apparatus are seen to be compactness and simplicity.

Fig. 155



Japanese lambik

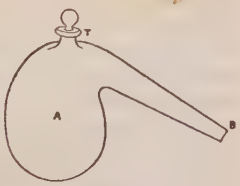
It is, however, not fitted for distilling very volatile liquids; is very inconvenient and troublesome, because of the necessity for constantly replacing the water used in the condenser, and distillation is slow and tedious. The *pelican* referred to in the older literature of distillation is an obsolete form of alembic with two beaks recurving into the still body for the purpose of promoting cohobation.

The Retort—This form of distillatory apparatus has many advantages over the alembic, which it has almost entirely replaced. A retort, in its simplest form, may be described as a long necked glass flask in which the neck is bent over until its axis makes an acute angle with that of the bowl of the flask. Retorts are of two kinds,—plain and tubulated. A plain retort is shown in Fig. 156. If it has a tubulure or orifice at the top of the bowl for the purpose of introducing the liquid to be distilled, it is said to be tubulated (see Fig. 157).

Fig. 156

Plain retort

Fig. 157



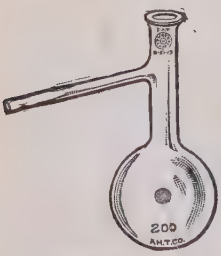
Tubulated retort

Retorts are made of glass, porcelain, earthenware, fused silica, platinum, iron, lead, copper, etc., according to the purposes for which they are to be used.

Porcelain and earthenware retorts are used in the distillation of phosphorus, mercury, etc.; platinum and iron retorts, in destructive distillation; leaden retorts, in making hydrofluoric acid, ether, etc.

The glass retort is the only kind, however, which will be considered here in detail. The shape of a retort is an important point to regard in its selection. Retorts having deep bowls are best suited for very volatile liquids. The lower surface of the neck of the retort should form a decidedly acute angle with the surface of the bowl if tubulated; a line drawn from the center of the stopper should touch the center of the bowl, A, so that when a funnel is introduced into the tubulure, T, to charge the retort, the contents may all be delivered into the bowl without soiling or splashing the neck. The neck of the retort should gradually taper to the end, and the beak, B, should never be larger in diameter than any other portion of the neck, otherwise difficulty may be experienced in making joints with adapters, receivers, or condensers (see Fig. 157). Such a fault may prevent the use of a cork ring in joining, for this ring should be made tight by forcing it up the gradually increasing diameter of the neck. The glass forming the retort should be carefully annealed and have a uniform thickness. Extremes should be carefully guarded against. If the glass is too thick, the sudden changes in temperature, to which retorts are constantly subjected in distillation, may cause fracture; on the other hand, if too thin, they are easily broken in cleaning. Retorts with scratches or imperfections in the bowl should be rejected. The objections to the use of retorts are mainly due to their peculiar shape, the principal one being the difficulty of cleaning them thoroughly. The necessity for having a variety of different shapes and sizes to suit special operations is greater than when distillation is performed with flasks and bent tubes.

Fig. 158



Distilling flask

Flask distillation will be usually found most practicable for pharmaceutical work. The best shape for a flask is shown in Fig. 191. The neck should have a sufficient diameter to admit a large cork, so that there will be room for a wide bent tube, a thermometer, and a safety or charging tube. The advantages of using a flask instead of a retort for all distillations suited to it are several: it is

easily cleaned, it is useful for other purposes, for instance, as a measure, as a container, or as a receiver for the distillate; the tubes are readily replaced in case of breakage. One of the most important parts of this apparatus is the bent tube for conducting the vapor to the receiver or condenser. The diameter of the bent tube should be as large as the receiver or condenser will conveniently accommodate.

Tubulated distilling flasks are now available and are superior to the extemporized apparatus described in the foregoing paragraph. They may be procured made of the low expansion borosilicate glass (Pyrex) which is highly resistant to heat and chemical action (see Fig. 158).

Steam Distillation—Where steam is to be used as the vaporizing agent in a distilling operation, the apparatus may be very conveniently assembled by adding to the regular distilling outfit a container for generating the steam. It will be recalled from a previous chapter, that steam possesses a great many advantages over direct heat and frequently in distilling operations it is necessary that no direct flame come in contact with the material being vaporized. The distillation of volatile oils and aromatic waters affords a notable example of such operations.

In the small laboratory a steam generating flask may be connected with the retort bowl or distilling chamber. In that event the only heat applied will be that necessary to generate the steam. In large operations live steam from a boiler may be made to pass directly into the still head.

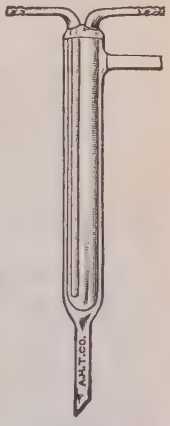
Fig. 159

Soxhlet apparatus

Reflux Distillation—Distillation is often used as a secondary process, that is, it is used simply as a means of recovering a solvent that has been vaporized and which is to be condensed and used over and over again, for the purpose of extracting the soluble material from a given substance. When it is so conducted the term reflux or continuous distillation is applied to it.

An example of this type of distillation is shown by the ingenious Soxhlet outfit illustrated in Fig. 159. *A*, representing the vaporizing chamber, *B*, the extracting chamber and *C*, the condenser. The special advantage of this type of distilling apparatus, or, more correctly, extraction apparatus, is economy of solvent and safety from fire hazard. The material to be extracted is placed in a porous thimble in *B*. The solvent is placed in the flask *A*. Heat is applied and the vapors of the solvent pass through the large side tube of *B* into the condenser where it is condensed and drops into *B*. There it will remain until the upper level of the condensed liquid reaches the tip of the small siphoning tube on the other side of *B*, when it will empty over into the vaporizing chamber *A* ready to be vaporized over and over again.

Fig. 160



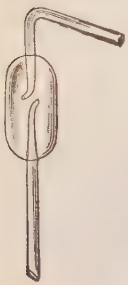
Special form of glass condenser

A quickly assembled reflux distilling outfit may be prepared by fitting a flask with a perforated rubber stopper through which is passed a glass tube one meter long, which will serve as the condenser. This form of apparatus is used when a substance is to be digested or boiled with a volatile solvent over an extended period. A condenser suitable for use used as a reflux condenser or as a regular condenser, is illustrated in Fig. 160.

Frothing—Frothing is a phenomenon which may occur in the distillation of liquids, particularly those which are alkaline or contain soap or one of the saponins. Various remedies have been suggested, none of which is infallible

for all cases. The presence of a film of mineral oil or of melted paraffin is sometimes effective. As it is a condition which is most troublesome at the onset of the heating and frequently disappears entirely after the operation has been continued for some time, the best method of obviating or controlling the trouble is to use a distilling flask of about ten times the volume of the liquid to be distilled and also to provide a trap bulb or overflow bulb (see Fig. 160 *a*), between the flask and the condenser.

Fig. 160 *a*



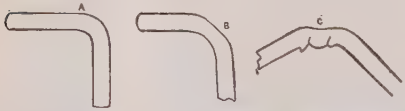
Trap bulb

Bumping—Another phenomenon frequently experienced in distillation operations, especially when a flask or retort is used, is known as bumping. It is caused by a sudden release of vapor and frequently throws the liquid through the condenser into the receiving flask, contaminating the distillate. It is most frequently experienced with resinous liquids but may occur in any distillation. Pieces of pumice, hard coal, broken glass, clay pipe stems, or short pieces of glass tubing are frequently added to retard this tendency by introducing the vapor phase, in the form of air which is occluded on these irregular pieces, down into the liquid where the heat is applied. The trap bulb is the surest device to prevent contamination of the distillate.

Cutting Glass Tubes—The glass should be moderately thick and of the proper length. A glass tube may be broken neatly by scratching it across with a sharp three-cornered file (a file cuts more effectively when moistened with a little oil of turpentine), and then grasping it with both hands, one on each side of the scratch, and making a slight outward pressure, which will generally produce a clean fracture. By holding the sharp edges for a few moments in a Bunsen or blast flame the edges may be rounded so that they will pass through a cork without cutting it and making a ragged opening.

Bending Glass Tubes—A tube may be bent by heating it properly over a gas flame. To make a symmetrical curve in a tube of large diameter requires

Fig. 161 Fig. 162 Fig. 163



Tube properly bent | Tube unequally heated | Tube hastily bent

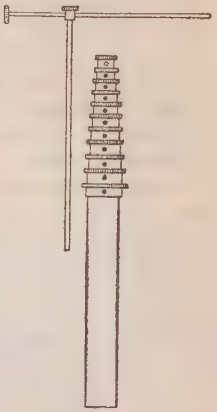
Fig. 164

Holding the tube

considerable skill and practice. One end of the tube should be closed by a cork, and the part of the tube that is to be bent held just above the flame and gradually rotated between the fingers, so that it may be heated evenly throughout. It should also be passed to the right and left through the flame for the space of an inch or two on each side of the middle of the proposed bend, and very slowly allowed to curve in one direction, so that the bend shall not be too abrupt. The object of closing one end with a cork is to prevent a current of air from passing through, and, in case collapse from overheating occurs, by gently blowing in the tube the softened glass may be swelled to its proper curve. Fig. 161 shows a tube properly bent, while Figs. 162 and 163 illustrate some of the defects produced by unskilled work. In Fig. 162 the tube was not rotated evenly, and at the top of the bend, *B*, it was hot enough to collapse. Fig. 163 represents the effects of hurry and unequal heating, the operator having forced the bend, *C*, before the tube was heated uniformly. A gas burner having a solid, steady flame is the best kind to use (see Figs. 71 and 72), and draughts of air should be avoided.

In Fig. 164 the method of holding a tube while "drawing it out" over the flame to make a tapering tube is shown. The line in the center shows the proper place to scratch it, when cold, with a fine, sharp, triangular file when it is to be broken apart. Fig. 165 shows a "well drawn" tube; Fig. 166, one which has not been revolved evenly or heated uniformly. Fig. 167 shows the same fault and careless work besides.

Fig. 168



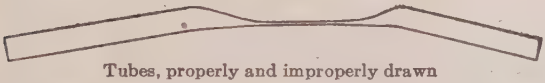
Cork borers

Cork Fitting—Corks for joining apparatus should be of the best quality. They are perforated for the passage of the glass tubes by the use of cork borers (see Fig. 168). These are cylindrical brass tubes of various sizes, sharpened at one end, and surmounted by a milled brass cap. They are furnished in sets. A small hole is drilled through

Fig. 165

Fig. 166

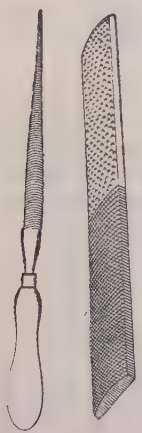
Fig. 167



Tubes, properly and improperly drawn

both sides of the brass cap, so that an iron rod may pass directly through it and form a convenient handle. They are used by holding the cork firmly with the left hand and pushing the borer through with the right hand, using a twisting motion at the same time so as to cut a smooth round hole. The mistake frequently made in using cork borers is due to haste. The attempt to force the borer through quickly without rotating it sufficiently always ends in breaking off pieces of the cork. The cutting edge of the borers should always be kept sharp and in good condition by the use of a grindstone or emery paper. Cork borer sharpeners are also available. When the cutters do not bore a hole of the exact size needed for the glass tube, which of course should fit tightly, it is best to select a borer which will cut a smaller hole than that desired, and then to enlarge the hole by filing with a rat tail file (Fig. 169), or, if the hole is large, with a half round file. When the tubes have been fitted, the cork should usually be thoroughly soaked in hot water, for the purpose of swelling and softening it. It should never be soaked before cutting or filing. The rasp and file shown in Fig. 170 will be useful in fitting up large flasks. Rubber stoppers can often be used to great advantage, and they may be readily perforated by dipping the cork borer in solution of sodium or potassium hydroxide or in strong ammonia water before beginning to use it. If rubber stoppers are well dried by wiping them thoroughly, they may be filed easily with a sharp, flat file. The main advantage of rubber stoppers is that they are practically impervious to vapors or gases, and hence require no luting. Moulded rubber stoppers already perforated for small glass tubing with either one or two holes, are also obtainable. Substitutes for rubber stoppers may be made by keeping dry corks in melted paraffin or wax until the pores are thoroughly filled, and then cooling.

Fig. 169 Fig. 170



Rat tail file Rasp and file

Lutes—A lute is a form of cement used for making water-tight joints in distillatory apparatus. The most satisfactory lute for ordinary distillations is made by adding flaxseed meal to boiling water and stirring until a thick, sticky mass results. When the perforated and soaked cork containing the tubes is inserted in the neck of the flask, a small quantity of lute should be pressed into the joints, and then followed by sufficient lute to make the joint vapor-tight. If future trouble from leaking is to be avoided, it is usually better to throw away a cork which will not make an almost perfect joint without lute, rather than trust to cover up serious deficiencies with lute. A neat finish may be given to the joint by dipping a finger into water, and with it smoothing the surface of the lute.

Bladder Joints—One of the most useful substances for the joining of tubes is a strip of moistened bladder. Hogs' bladders are usually preferred, and it is now possible to get them of excellent quality, prepared by being thoroughly cleaned and then soaked in an alkaline solution or in petroleum benzin to deprive them entirely of fat. In connecting two tubes of different diameters which are not to be subjected to a high heat, a bladder joint is especially useful. For an ordinary joint of each glass tube, a strip about six inches long and an inch and a half wide should be moistened and wrapped around the proposed joint; the upper end of the bladder is then tied tightly with strong linen twine, leaving the short end of the twine at least six inches long (see Fig. 171); this end is carried along the top of the bladder and tied tightly around the lower end of the joint; the long end of the twine is then wrapped spirally and regularly around the bladder until the lower end is reached, and both ends should be there tied tightly (see Fig. 172). Strips of writing paper soaked for a few moments in water, and then coated with ordinary, smooth flour paste to which 10 per cent of glycerin has been added, may also be used for joining apparatus, as may also parchment paper.

Fig. 171

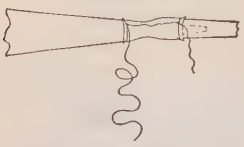


Fig. 172

Bladder joints

Rubber joints are preferred to bladder joints when there is no likelihood of vapor or high heat dissolving or softening the rubber, and when the tubes to be joined are nearly of the same diameter. The ease and celerity with which such joints can be made are their strong points. A piece of rubber tubing is moistened on the inside with water, and stretched over one end of the glass tube, and then over the end of the other glass tube. Success largely depends upon having the rubber tube slightly smaller in diameter than the glass tube, so that the elasticity of the rubber alone will be sufficient to make a tight joint, otherwise the rubber tube must be tied on, and then the advantage over a bladder joint is lost (see Fig. 173). In all cases it is preferable to select tubes which differ slightly in diameter, so that one may slip into the other, the smaller, of course, having the higher position, so that the vapor or liquid shall not come in direct contact with the rubber.

Fig. 173

Rubber joint

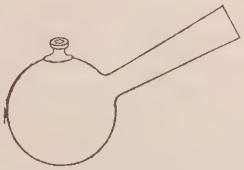
Receivers are glass vessels, usually globular in shape, intended to receive distillates. They are of three kinds,—*plain*, *tubulated*, and *quilled* (see Figs. 174, 175 and 176). When a plain receiver is required, an ordinary flask will answer, but if difficultly condensable vapors are produced, it is necessary to provide for their escape, or an explosion may occur from the accumulated pressure. This may be done in a tubulated receiver by occasionally removing

the stopper, or, better, by connecting a bent glass tube with the receiver and allowing the end of the tube to dip into water, or into an acid solution if the vapors are alkaline, or into an alkaline solution if the vapors are acid. A quilled receiver is useful where the distillation is to be carried to a definite

Fig. 174

Plain receiver

Fig. 175



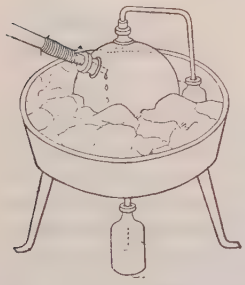
Tubulated receiver

Fig. 176

Tubulated and quilled receiver

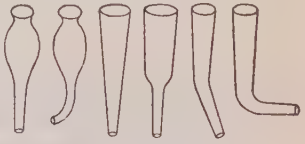
point and a certain amount of distillate is to be received, or, as in the preparation of hydrocyanic acid, the end of the quill is made to dip below the surface of cooled diluted alcohol or water, in order to condense all of the gas. In the distillation of very volatile liquids an effective mode of using a quilled receiver is shown in Fig. 177. A hole is cut in the bottom of a rather shallow tin pan and a short tube soldered into it; a perforated cork will permit the quill of the receiver to pass through it, and at the same time a tight joint should be made; ice is heaped up over the receiver, and any uncondensable gases may escape from the bent tube in the tubulure or be absorbed by the liquid into which the tube dips.

Fig. 177



Mode of using quilled receiver

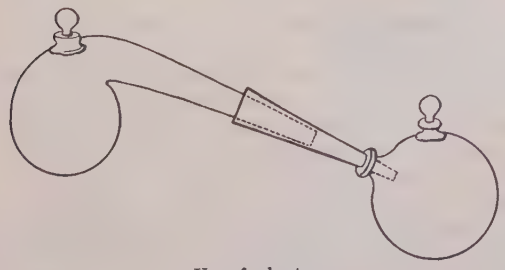
Fig. 178



Adapters

Adapters are tapering tubes of glass which are used to connect retorts with receivers. Fig. 178 shows the various shapes. Good adapters may be made from retorts having broken bulbs by cutting off the broken portion, scratching the tube with a file, and extending the crack thus made entirely around it by slowly passing a red hot iron over the line marked for the fracture. Fig. 179 shows an adapter of this kind in position. Adapters are also employed to deliver the distillate from condensers into receivers or flasks.

Fig. 179

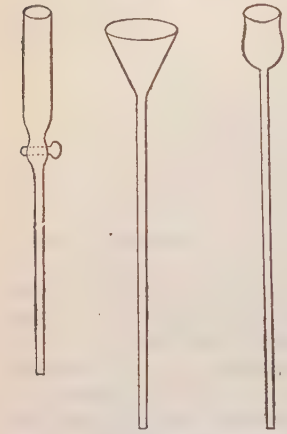


Use of adapter

Charging Retorts—Plain retorts must be charged by using a funnel tube; this may be a funnel with an elongated tube, or a modification of it, as shown in Fig. 180, or one may be improvised by selecting a tube of sufficient diameter to permit of the introduction of a small funnel (see Fig. 181). The object of using a funnel tube is to prevent the soiling of the neck of the retort; as the object of distillation is

usually to purify the liquid, the latter must be delivered into the bowl of the retort without touching the neck. Fig. 182 shows the method of charging a plain retort; a small piece of rubber tube is sometimes placed on the end of the funnel tube to guide the liquid safely and guard against fracture. Tubulated retorts are charged by simply placing a funnel in the tubulure and pouring the liquid through it.

Fig. 180



Stoppered funnel tube | Funnel tube | Thistle top funnel tube

Fig. 181

Improvised funnel tube

Fig. 182

Charging a plain retort

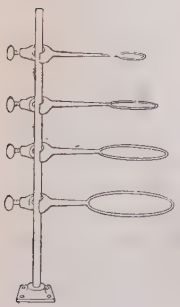
Fig. 183

Safety tube

Safety Tubes—It is sometimes impossible to avoid sudden evolutions of vapor during distillations and at times the pressure produced is sufficient to break the apparatus. When there is a likelihood of this occurrence, it is advisable to insert a safety tube (Fig. 183) into the tubulure of the retort. The bulb shown on the loop of the tube is partly filled with mercury, and when undue pressure occurs, the mercury is forced into the thistle top and the vapor escapes; when the retort has been thus relieved, the mercury descends into the bulb and the distillation proceeds.

Retort Stands are used to properly support retorts, flasks, receivers, etc., during distillation, although they are also employed by pharmacists for a variety of other purposes, as in filtration, percolation, evaporation, etc. Fig. 184 shows a retort stand which has been used with much satisfaction in the laboratory of the Philadelphia College of Pharmacy and Science. It is more substantial than those that are commonly furnished by the chemical apparatus makers. The clamp (see Fig. 185) is made upon the principle of one originally devised by S. Floyd Wiegand, and is hook shaped, so that any of the different sizes of rings may be unscrewed from the upright rod without disturbing the rest. The almost universal fault of the retort stands in common use is their extreme lightness and want of stability; the rings frequently bend under such weights as should be easily borne, and, owing to the base being too light and small, the whole stand is sometimes upset during an operation (see Fig. 186). Fig. 186 *a* illustrates another form of stand much used in the chemical laboratory. In the stand shown in Fig. 184 the base plate is per-

Fig. 184



Retort stand

Fig. 185

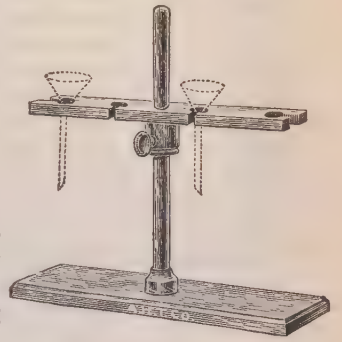
Retort ring clamp

manently fastened to the operating counter in a place known to be the most convenient; if the counter is one that must be used for other purposes, the base plate may be screwed to the under side of the counter, and a five-eighths inch hole bored through the counter, so that the center shall coincide with the center of the hole in the base plate. When the retort stand is not in use, the hole in the counter may be closed with a cork. The upright is made of half-inch iron tubing, and can be quickly screwed into the base plate with the hands without the use of pipe tongs. The rings and clamps are all in one piece, and are made of malleable iron, so that if dropped on the floor they are not likely to break. These retort rings are made on request by J. M. Maris Co., Philadelphia, and the pipe and stand are readily obtainable from any plumber. When used for holding a glass percolator or funnel, the danger of fracture on account of the contraction of the iron ring may be avoided by stretching three split sections of rubber tubing upon it (see Fig. 187).

Fig. 186

Portable retort stand

Fig. 186*a*



Funnel stand

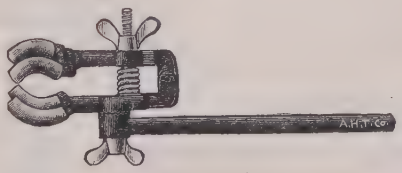
Fig. 188 illustrates a Universal clamp extension, which is very useful for holding condensers, retorts, etc.; the jaws of the clamp are lined with rubber to serve as non-conductors and protectors against fracture. Fig. 189 shows a clamp holder for attaching extension clamps, rings, etc., to apparatus supports.

Leibig Condensers—Many forms of condensers are available. The older form known as the Leibig, or variants of this form, is still largely used. This form, although now bearing the name of the great chemist, was used before his time. It consists of a long glass tube, surrounded by another tube of larger diameter; two small openings are made, one near the bottom and the other near the top of the large tube. Connection is

Fig. 189

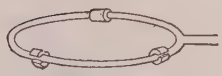
Clamp holder

Fig. 188



Clamp extension

Fig. 187

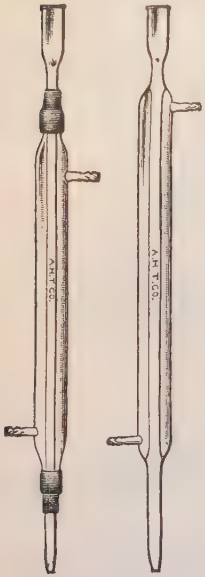


Ring with split sections of rubber tubing

made with the tube leading to the bottom with a cold water supply, and the water circulates in the space between the inside of the large tube and the outside of the smaller tube, and finally has its exit at the opening near the top. Various forms of glass condensers are illustrated in Fig. 190. The distilling outfit illustrated in Fig. 191, still largely used in the chemical laboratory, was much in use a decade or so ago, for the purpose of preparing distilled water, and a great many varieties were placed on sale, each having some special feature. Their use is now largely discontinued through the fact that distilled

water is an available commercial article throughout the country. Occasionally, however, the pharmacist finds use for a water still and the types described, namely the Barnstead (see Fig. 199), the Stokes (see Fig. 198), and the Colton stills, have won their way into the laboratory because of compactness and practicability.

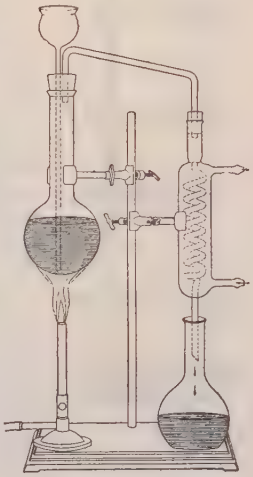
Fig. 190



Various forms of Leibig condensers

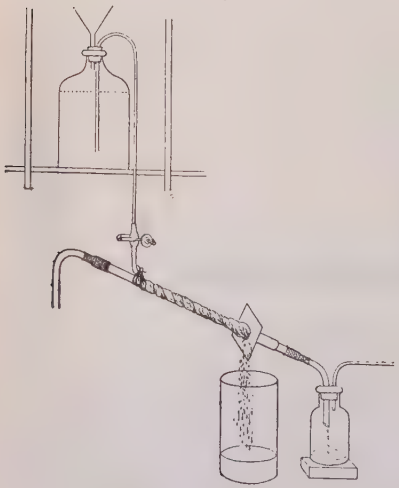
Fig. 192 shows a method of refrigeration which may be used in an emergency when the ordinary condensers and a steady supply of water are not to be had. A wide tube is connected with the distilling flask, and some lint, lampwick, or other absorbent material is wrapped spirally around it and tied at the ends; a square piece of cardboard is perforated so that it will fit tightly upon the tube, and it is pushed upon the lower end until it is in close contact with the lint. If water can be supplied from a faucet, a rubber tube is connected with it and conducted to the upper part of the condensing tube, and tied in such a position that a stream of water will trickle from it and be carried down by the lint until it reaches the cardboard, where it falls into the vessel prepared to receive it. If a continuous supply of water is not available, a large bottle containing water may be placed upon a shelf, and a syphon, having a rubber tube and pinchcock, attached, as shown in the cut. Figs. 193 and 194 illustrate two convenient types of pinchcocks. These are slipped over rubber tubing and by opening and closing, the rate of flow of liquid through the tube may be easily regulated.

Fig. 191



Flask distillate

Fig. 192



Tube condenser in use

The Condensing Worm—The method of condensing by the use of the worm is very old, and its advantage in securing economy of space and its ease of appli-

Fig. 193

Pinchcock

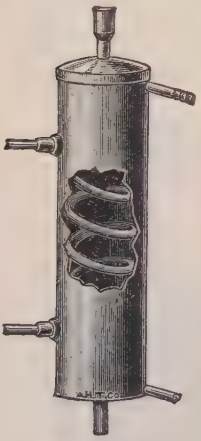
Fig. 194

Pinchcock

cation are very apparent. Fig. 195 affords a good illustration of this kind of condenser. Block tin pipe is the best that can be used for general pharma-

ceutical work. Copper or tinned copper tubing should be avoided, because it is impossible to prevent the action of acid vapors or liquids upon the copper. Soluble salts of copper would thus be formed and the distillate often rendered poisonous. An iron tube is not admissible, on account of contamination from the formation of iron salts. Pure tin is not affected so easily, and the salts that possibly would be formed are not so objectionable. Block tin pipe may be wound spirally around a convenient cylindrical vessel, such as a tin can or similar object, to give it the proper shape, and then fastened to three notched uprights and placed in position. Earthenware condensing worms of all sizes, of excellent quality, are available for condensing acid vapors, as in the manufacture of ethyl nitrite by distillation; these condensers are undoubtedly superior to metallic ones. Glass worm condensers are especially efficient for small operations.

Fig. 195



Metallic worm condenser

Glass worm condensers are largely used in laboratories and are superior to the straight tube type because of the large surface which they expose to the condensing liquid (see Fig. 196).

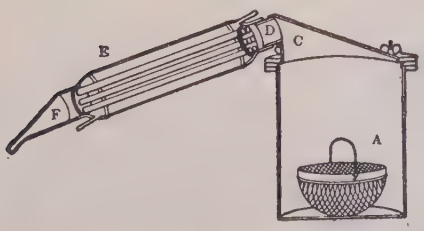
Fig. 196

Glass worm condenser

Pharmaceutical Stills

Metal stills are preferred in all distillatory operations where the liquids or vapors do not act chemically upon the metals of which they are made. Tinned copper is the best material to use in the construction of stills, for, although tinned iron is cheaper, the greater durability of the former renders them in the end more economical. The same typical forms are used in the construction of pharmaceutical stills as in glass distillatory apparatus,—*i. e.*, the alembic and retort. The older forms of stills described in earlier editions of the Practice of Pharmacy, and devised by such well-known pharmacists as Procter, Wiegand, Curtman, Stevens, Rice, and Remington are no longer available.

Fig. 197



Remington still (sectional view)

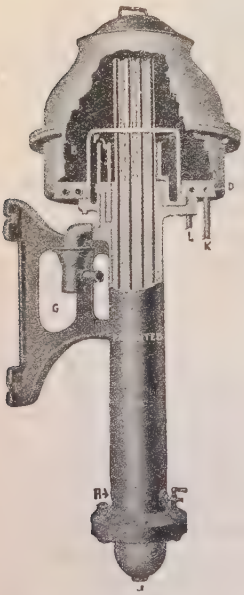
The *Remington still*, a sectional view of which is illustrated in Fig. 197, was devised by Professor Joseph P. Remington and possessed a great many advantages over the forms which were in use at the time of its invention. It is not now commercially available. Unlike the Stokes and the Barnstead still it is to be noted that this still could be used for the purposes of distilling volatile oils, or preparing aromatic waters, etc., for which uses the other named stills are not designed.

The Stokes' still (Fig. 198) is made by the F. J. Stokes Company of Philadelphia and may be obtained in various sizes and styles with a capacity of from one-half gallon to one hundred gallons per hour. Gas, gasoline, or live steam may be used to supply the heat. The principle upon which it operates is as follows: The feed or raw water enters at *H*, surrounds the condenser

tube *C* and serves first to condense the steam generated in the still *B* as it descends the condenser tubes, converting it into distilled water. In so doing the raw water becomes heated to the boiling point by the time it reaches the top of the condenser where the ammonia and other gases escape into the air through an opening in the cover. A part of this feed water escapes over the goose-neck, either into a waste pipe or cistern, and the balance passes into the still.

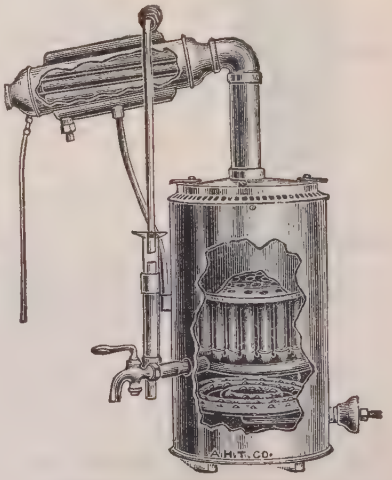
In the illustration, it will be seen that there is a zone of water at the top of the condenser, which being above the outlet to the overflow *G*, is not drawn off except to replenish the water in the still as it evaporates. This zone of water at the top of the condenser is constantly kept boiling by the steam from the still descending the condenser tubes, and it is here the ammonia and other gases are liberated. The still in the illustration is heated by live steam with a pressure of twenty pounds or over, which circulates in the copper coil *D*, and serves to boil or evaporate the raw water. The distilled water comes out at *J* and can be piped to any receptacle. The condenser tubes extend to the extreme top of the steam chamber and high above the water level, so there is no danger of water being carried over by steam.

Fig. 198



Stokes' automatic water still

Fig. 199



Barnstead water still

The Colton Mfg. Co., of Detroit, also manufactures an automatic water still similar in design to that just described.

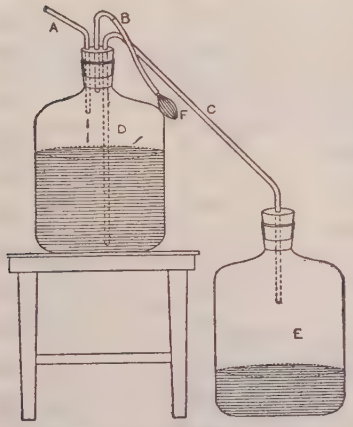
The Barnstead Still Company, Boston, Mass., manufactures an efficient water still (Fig. 199) which may be had in various capacities and equipped for steam, gas, or electric heat. The small laboratory type ranges in capacity from 1 to 10 gallons per hour. The boiler is of the tubular evaporator type, thus presenting to the flame a maximum of heating surface in a minimum of space, and the condenser consists of a series of parallel tubes similar to the Remington still. The water is supplied automatically and is preheated by the condenser before entering the still. A small opening at the extreme end of the condenser permits the escape of the more volatile gases so that an exceptionally pure water is obtained.

Fig. 200 illustrates an ingenious plan for receiving distilled water from an automatic water still. It was suggested by Paul S. Pittenger. The water from the still flows into the glass container at *A*. A second container is provided at a lower level and connected with tubing as illustrated. Should the attendant [illegible] that the first container is almost full the siphon may be started by pumping in by pressing *F*. Should the upper jar not be emptied before

it is full it will automatically empty itself through the siphon *C*. When full, container *E* must be replaced by an empty container.

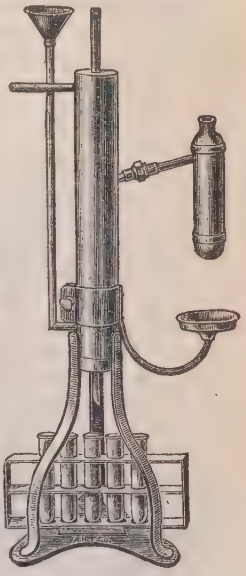
Fractional Distillation—By this term is meant the process of separating by distillation liquids having different boiling points or vapor densities. When a mixed liquid, or one consisting of liquids of unequal volatility, is distilled, the first portion of the distillate contains a larger proportion of the most volatile constituent than of the others; hence the boiling point is observed to rise as the distillation proceeds; and if a means is provided for collecting the distillate in several portions, or fractions, as they are called, fractional distillation offers a process by which liquids may be purified or separated. Fig. 201 illustrates the Regnault still designed for the fractional distillation of small quantities of liquids. It is impossible, however, in a single operation to effect a sharp separation of the component parts of a mixed liquid, because the distillate obtained at any period of the process is nearly identical with the vapor that is rising from the hot liquid, and therefore it is made up of the condensed vapor of that part of the liquid having a boiling point at or below the temperature registered by the thermometer, plus the smaller amount of condensed vapor that is given off from the constituents having higher boiling points, but which emit sensible vapors much below the point at which they actively boil. The relative proportions of the constituents of the mixed liquids have also a bearing in determining the composition of the distillate. By collecting the fractions carefully at stated temperatures, and redistilling each by itself, a more thorough separation may be effected, and this method is usually followed when such a separation is necessary.

Fig. 200



Receiving distilled water from automatic still

Fig. 201



Regnault still

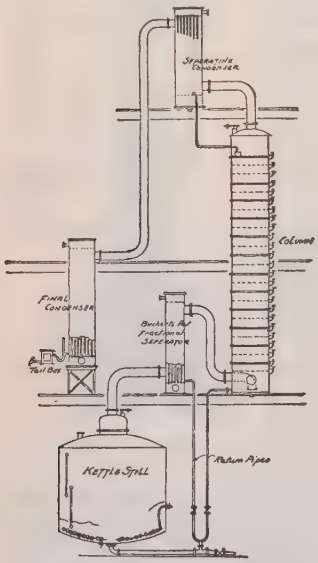
On the small scale a simple form of apparatus for fractional distillation is made by taking a glass flask having a bent lateral tube in the neck, adjusting a perforated cork in the neck of the flask to receive a thermometer, and passing the tube from the flask into a loosely-stoppered test tube, which is placed in a vessel surrounded with ice or otherwise properly refrigerated. A more efficient method is to connect the lateral ascending tube of a flask with the end of a worm, or a condenser so arranged that the liquid condensed at a certain temperature may run back into the flask. Vapors having lower boiling points pass through it uncondensed until they reach the second condenser, which is refrigerated to a degree sufficient to condense all the vapor.

Special forms of glass distilling apparatus for fractional distillation are listed by apparatus dealers. On the large scale the most perfectly devised forms of fractional distillation are found in the alcohol, coal tar, and petroleum

industries. In these the fractionating or rectifying column is utilized to increase the effectiveness of condensation. The concentration of the distillate is enhanced by the special construction of the column which utilizes a series of interfering "baffles" to aid the process of condensation (see Fig. 202). The more easily condensable liquid, such as water, is thus separated from a less readily condensable liquid, such as alcohol, the special construction of the upright column causing the condensation of the aqueous vapor which is returned to the distilling chamber while the alcohol or other volatile liquid passes into the receiving vessel.

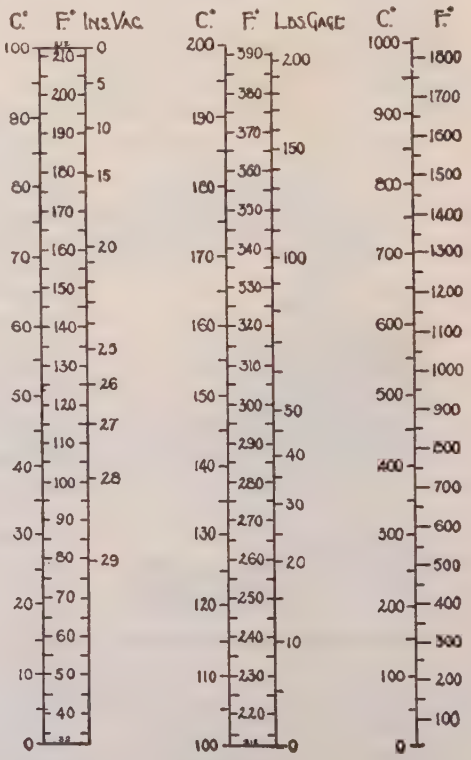
Vacuum Distillation—The removal of air pressure from the distilling chamber greatly facilitates the vaporization of the contained

FIG. 202



Redistilling outfit with rectifying column

FIG. 203



Temperature under vacuum

Temperature under pressure

liquid, at the same time permitting the operation to be conducted at a lower temperature (see Fig. 142). Apparatus for the conduct of vacuum distillation on a small scale may be assembled without much need for special parts other than an aspirator. Dealers in laboratory supplies, however, list special outfits for the purpose. Such an apparatus is shown in Fig. 141.

It is upon the large scale that the special advantages of vacuum distillation are capitalized and elaborate installations may be seen in industrial establishments such as gasoline refineries, distilleries, and factories for the manufacture of solvents. The first column in Fig. 203 graphically illustrates the changes in temperature within a still when a vacuum is applied, indicating the low temperature at which liquids may be boiled or evaporated. The second column shows the increase in temperature under pressure, and the third column gives a comparison of Centigrade and Fahrenheit thermometer scales. This table was supplied by the F. J. Stokes Co.

Destructive Distillation is the process of heating dry organic matter in a distillatory apparatus until all volatile substances are driven over. The residue is said to be carbonized. Destructive distillation is a process which is rarely employed by the pharmacist; hence it is not necessary in this work to treat the subject in detail. Glass vessels are not adapted to the process, because they will not usually stand the heat required without fracture, and the solid residue frequently fuses, is insoluble in water, and becomes so firmly attached to the bottom and sides that it cannot be removed without great difficulty. The best form of apparatus is an open vessel of cast iron, like a crucible, having a flange at the top, a dome with a corresponding flange, and a bent tube for carrying off the gaseous products. The connection is made with fire-clay lute and iron clamps. The manufacture of acetic acid, creosote, methyl alcohol, etc., affords illustrations of the use of this process, which is nearly always performed on a large scale.

The application of the process of destructive distillation to wood results in the production of many valuable products, as acetone, methanol, acetic acid, creosote, tar, etc., while charcoal remains in the still. When applied to coal, the distillate yields illuminating gas, ammonia products, coal tar, from which is obtained numerous phenol bodies, cresols, benzene, toluol, dye color bases, etc., coke remaining in the still. When applied to animal matter such as bones, etc., the distillate contains ammonia and characteristically offensive empyreumatic products used as denaturants, etc.

The distillate from this operation represents a decomposition product,—*i. e.*, a substance which did not exist in the original matter placed in the still, but which results from the application of heat without the presence of air. A characteristic smoky odor, called empyreuma or more often spoken of as an empyreumatic odor, is usually recognized in the distillate but may be removed by purification.

Registration of Stills—The regulations of the U. S. Department of Internal Revenue require that all pharmaceutical stills, other than the small, glass, analytical laboratory type, be registered with the department. Application should be made to the nearest Commissioner of Internal Revenue and appropriate blanks will be supplied.

CHAPTER X

SUBLIMATION

SUBLIMATION is the process of distilling *volatile solids*. The product is termed a *sublimate*.

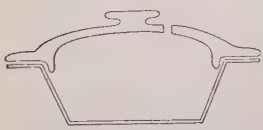
The objects of sublimation are as follows: 1. To purify volatile solids from admixed and fixed impurities. 2. To provide a convenient means of collecting volatile solids resulting from chemical reaction at either high or low temperatures. The retorts or apparatus used may either be of iron or glass, or of stoneware if the degree of heat necessary will admit of the use of the latter.

Sublimation as a manufacturing process is almost exclusively confined to operations conducted on a large scale, as the production of ammonium chloride or flake naphthalene. As a purifying operation it is frequently employed in analytical chemistry. A process was formerly official for the sublimation of benzoic acid. It consisted in placing benzoin in a shallow tinned iron pan, and pasting over the top a sheet of filter paper. A pasteboard hood, shaped like a hat box, was then fitted to the pan and tied or pasted with paper to make a tight joint. The apparatus was placed on a hot plate and subjected to a low but uniform heat. The vapors of benzoic acid, passed through the pores of the filtering paper, were separated from impurities, and, coming in contact with a cooler atmosphere in the hood, slowly condensed, often forming crystals of great beauty.

The temperature at which the condensation of the vapor is effected in sublimation has a very important influence in determining the physical character of the sublimate, and three kinds of sublimates are produced—1. Cake sublimates, illustrated by camphor and corrosive sublimate, etc. 2. Powder sublimates, illustrated by calomel, sublimed sulphur, etc. 3. Crystal sublimates, illustrated by iodine, naphthalene, etc.

Cake Sublimates—If the temperature of the condensing surface and of the air in contact is but slightly below that at which the volatile body is capable of subliming, the particles will be deposited in compact masses, like corrosive sublimate, commercial sal ammoniac, or ammonium carbonate. Fig. 204 shows simple apparatus for obtaining sublimates in cakes or masses. A shallow sheet iron dish, having its upper edge turned out so that it forms a flat ring, is provided with an earthenware cover (it will be usually found more convenient to have the iron dish made to fit the cover than the reverse), through which a hole is drilled to permit the escape of air (this may be done with a three cornered file). After the substance which is to be sublimed has been placed in the iron dish, a piece of asbestos twine, slightly longer than the circumference of the ring, is laid upon it, and this is covered with a lute composed of equal parts of potters' clay and flaxseed meal with sufficient water; the earthenware cover is pressed upon it until it adheres, and, when necessary, iron clamps are used to make a tight joint. The aperture in the cover is loosely covered with a cone of cardboard, the dish is placed in a sand bath and gradually heated. The aperture is kept open during the sublimation by occasionally probing it with a glass rod. After cooling, the sublimate will be found adhering to the earthenware top in one cake or mass, and may be removed by a spatula. The earthenware top may be replaced by

FIG. 204



Subliming apparatus (cake)

a sheet iron one in cases in which the former would be likely to be fractured by excessive heat. In the production of phthalic acid anhydride a cast iron dish, provided with a *"dur-iron"* cover is employed. Dur-iron is an iron containing a high proportion of silicon and hence highly resistant to the action of acids.

Powder Sublimates—If the apparatus for conducting sublimation is so contrived that there is a marked difference between the temperature of the air in contact with the vapor and the subliming point of the volatile body, the sublimate will be deposited very rapidly and in small particles, like calomel, sulphur, etc.

Crystal Sublimates—Some substances sublime in beautiful distinct crystals, the size of which depends largely upon the time during which the condensation is allowed to take place and the temperature of the condensing surface. Some substances, as camphor, which under ordinary conditions occur as cake or powder sublimates, according to the type of apparatus employed, may be obtained in the form of crystals if the conditions of condensation are suitably altered. Other substances as iodine, menthol, naphthalene, and benzoic acid normally sublime in distinct crystals in any form of apparatus, the size of the crystals depending upon the rapidity of condensation of the vapor. For iodine, earthenware vessels are always employed.

In the nomenclature of pharmacy sublimed products are frequently called *"flowers"* as *"flowers of sulphur"*, *"flowers of benzoin"*, etc. This is a relic of oriental imagery of early times, the development of a sublimate, often from a dark unsightly substance, being likened to the blossoming of a flower.

CHAPTER XI

DESICCATION

Desiccation is a dehydration process for depriving solid substances of moisture, and in pharmacy should be effected at as low temperatures as possible. (See Exsiccation.) The moisture thus driven out is known as *hygroscopic moisture* as distinguished from that combined in chemical salts as water of crystallization.

The objects of desiccating medicinal substances are threefold: 1. To aid in their preservation. 2. To reduce their bulk and weight. 3. To facilitate their comminution.

1. To Aid in Preservation—Vegetable drugs soon become mouldy or undergo bacterial decomposition if allowed to remain in a moist condition, and desiccation is absolutely necessary to preserve them unless they are made up into galenical preparations immediately, as is done in fresh drug tinctures.

2. To Reduce Bulk and Weight—If desiccation is performed successfully,—*i. e.*, at properly regulated temperatures under certain precautions,—the substance is merely deprived of water without suffering any loss of medicinal activity, and the reduction in bulk and weight that follows is a practical advantage which results in adding to the strength of the medicinal substance and materially reducing the cost of transportation and storage.

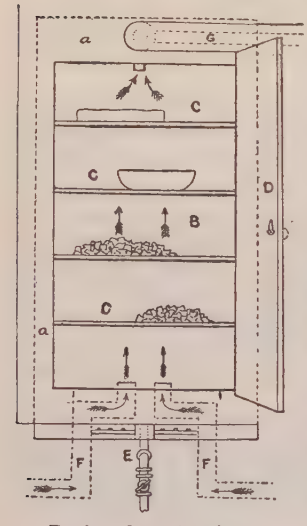
3. To Facilitate Comminution—The presence of water gives to drugs an elasticity which makes it difficult to bruise, grind or powder them. One of the first steps in comminution is to dry the substance thoroughly in order to make it brittle or crisp.

The apparatus employed in desiccation is frequently of the simplest character, and the heat is usually not especially created for the purpose, for it is most economical to use the waste heat from kitchen fires or cellar furnaces or the diffused heat in lofts or unused attics. There can be no objection to this if care is taken to provide protection for the substance from dust, light, and other injury during desiccation. Herbs may be dried by tying them in bunches and suspending them to the attic ceiling or to the rafters of a barn during summer weather, and this is an excellent method usually, notwithstanding its slowness, because there is no danger of the heat being strong enough to cause loss of valuable volatile principles. Roots, barks, and leaves may be dried by spreading them out upon clean tables or floors in a dry room and turning them repeatedly, so as to expose fresh surfaces to the dry air. On the large scale, and in the laboratory, special apparatus must be employed such as is illustrated under Vaporization, page 128. The Grinnell dryer or the Proctor dryer, Figs. 147 and 148, are admirably adapted for operations on a large scale. Smaller dryers of the same type may readily be built by a local carpenter. Live steam is passed through the pipes when higher temperatures are needed, but waste or exhaust steam from steam kettles is economically and properly used. Trays of suitable size, containing the substance to be dried placed on thin muslin, become the shelves of the rack. It is an important factor in drying to provide for a current of air to pass over or through the material to be desiccated and out through a suitable ventilator. This is often overlooked, but it is essential for effective or rapid drying.

Fig. 205 shows a pharmaceutical drying closet which is simple, economical,

and easily made. The heat may be derived from a gas or electric stove. The frame which supports the closet is made of half inch steam pipe, and the retort rings (see Fig. 184) may be clamped to the uprights, and the filtration of chilled oils in winter time, or warm filtration, or percolation may be carried on. The sides of the closet are of galvanized sheet iron or of asbestos cloth, wired to the iron frame, and cleats at convenient intervals are arranged for the trays to slide upon. A stovepipe connects with the flue to create a draft and carry off the moist air. Lozenges, crystallized salts, extracts, filters, etc., may be dried in this cheap and simple closet. One practical point about desiccation is frequently overlooked; it is that substances which are being dried must be repeatedly stirred or turned over, to expose the parts underneath to the dry atmosphere. In the case of salts, crystals, and other bodies, if this is not done, a hard crust is formed upon the surface which is often difficult to break up and which prevents the interior from properly drying.

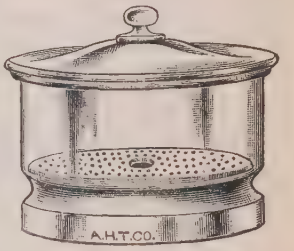
Fig. 205



Drying closet (gas heat)

A drying oven, intended for drying precipitates, etc., in analytical work, but very useful for desiccating small quantities of pharmaceutical substances, pills, lozenges, or drugs like squill, saffron, Castile soap, etc., is shown in Fig. 147. Automatically regulated and electrically heated air baths (see Fig. 109) have largely replaced other forms.

Fig. 206



Desiccator

In Fig. 206 is shown a desiccator for use in chemical laboratory operations. A suitable dehydrating agent, such as concentrated sulphuric acid, calcium chloride, or unslaked lime, is placed in the lower part of the desiccator and the crucible or vessel carrying the material to be dried rests upon the perforated porcelain plate which is held in place by the projecting ledge. The cover has ground edges and is usually greased with petrolatum to insure an air-tight joint.

Loss in Drying Medicinal Substances—When drugs are powdered, loss is always experienced. This arises partly from the escape of fine particles, but principally from loss of moisture in drying. In the powdering of most drugs, a small portion remains which resists disintegration. This is called by the miller "gruffs" or "tailings," and the Pharmacopœia directs that this shall be kept and ground with the next lot of the same drug. The dose of a powdered drug is usually somewhat less than that of the same drug before it was pulverized, because the weight it has lost generally represents inert matter, water, etc. Powdered ipecac is a good illustration of this. The active principle, *emetine*, resides in the starchy cortical portion of the root; the internal ligneous cord constitutes the "gruffs" of ipecac, and is inert. The exception to this is the case of those drugs containing an active volatile constituent, as the aromatics, clove, cinnamon, nutmeg, or asafetida, myrrh, cubeb, etc. These drugs, when powdered, generally contain less of their active constituents than they did before they were ground. The volatile oils to which their virtues are due are driven off to a greater or less extent by the amount of heat

necessary to make them brittle enough to be readily pulverized. The U. S. Pharmacopœia recognizes the importance of this fact by directing myrrh "in moderately coarse powder", not fine powder, in tincture of myrrh, and asafetida, not powdered asafetida, in emulsion of asafetida. If care is exercised in desiccating, the powders of most drugs possess all their medicinal properties, and in many cases will retain indefinitely these properties unimpaired if they are properly preserved and not unduly exposed to air, light, or moisture.

The practice of some drug millers of establishing a loss in the weight of a drug as a regular standard, and then making up the deficiency by adding the same amount of some inert substance, is reprehensible and a drug thus treated would be legally considered adulterated.

Dehydration is a term which has come into recent use to describe an operation which up to the present time has been applied only to edible vegetables and fruits and not to drugs. They are distinctively different from sun dried products or those dried by a low artificial heat, in that the operation is conducted in a confined space in connection with a vacuum and is so rapidly accomplished and under such peculiarly favorable conditions that the resulting fruit or vegetable, when restored to its original hydrated condition by soaking, can hardly be distinguished in texture or quality from the fresh fruit, or vegetables. The name "dehydrated", therefore, applied to such fruits and vegetables as have been successfully marketed, implies a distinctively different product from that described by the term "dried" or by the frequently and incorrectly used term "evaporated".

When this process shall have developed to the extent that it can be applied to the dehydrating of fresh vegetable drugs, greater interest will probably be taken in drug therapy by those who appreciate the fact that drugs as ordinarily handled in commerce lose much of their value as compared with the fresh plant tissue which they represent.

Another ingenious process for desiccating liquids has been developed in which the fluid is vaporized by blowing it through a small orifice into a large room which is heated to a high temperature. The moist vapor is dried almost instantaneously and the dried material falls as a fine powder. This process has been applied commercially to milk and to lemon juice. Products so dried are exceptionally free from foreign odor or taste and when rehydrated produce products much like the fresh material.

CHAPTER XII

COMMINUTION

COMMINUTION is the process of reducing drugs to particles, or breaking up their state of aggregation.

Medicinal substances in their natural state require to be mechanically divided in order to facilitate the action of menstrua or solvents, or to permit their administration in the form of fine powders.

A simple illustration is offered in the case of alum. A solid lump of alum weighing one ounce, if added to a pint of water, will not dissolve nearly so quickly as will one ounce of the same alum in the same quantity of water *if finely powdered*. Vegetable substances offer varying degrees of resistance in powdering, owing to the proportion and toughness of their ligneous fiber and the amount and kind of cellular tissue.

Under the head of *comminution* will be grouped the various mechanical operations used in pharmacy by which the surface of solid substances is increased, whether by trituration, levigation, elutriation, contusion, rasping or grating, cutting, slicing, chopping, stamping, grinding, pulverizing, or by other processes.

A great number of substances employed in medicine are derived from the vegetable kingdom, and, while many of the processes of comminution used for these are also applicable to the chemical and animal substances of the materia medica, it will be necessary in the following chapter to note the apparatus specially adapted to each class.

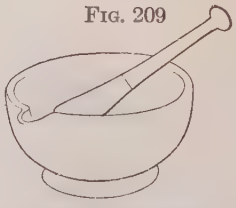
FIG. 207

Trituration

FIG. 208

Spiral track of the pestle

FIG. 209

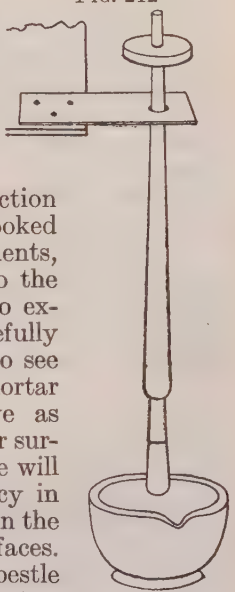


Mortar for trituration

Trituration is the process of reducing substances to fine particles by rubbing them in a mortar with a pestle. It is also used to designate the process by which substances in fine powder may be intimately mixed. The pestle is given a circular motion, accompanied by downward pressure, and the most effective method of using the pestle is to begin in the center of the mortar and describe a circle of small diameter with the pestle on the substance, and gradually increase the size of the circle with each revolution until the side of the mortar is touched, when the motion is reversed and circles continually smaller in diameter are described until the center is reached. The powder is frequently scraped from the sides of the mortar and pestle by the use of a spatula and the trituration repeated until pulverization is effected. By this treatment all the particles are brought under the action of the pestle. Fig. 207 shows the manner of holding the mortar during trituration and Fig. 208, the spiral, showing the direction traversed by the pestle in trituration as described above. The mortar and pestle best adapted for this operation have the shape shown in Fig. 209. Mortars with pestles having flattened ends are the best. Wedgwood ware is very serviceable, but is difficult to keep clean. As triturating mortars

are rarely subjected to blows, porcelain mortars of proper shape are preferred. One of the principal annoyances in the use of wedgwood or porcelain mortars and pestles is that of the continual loosening of the handle of the pestle. The cement employed by the manufacturer is frequently of inferior quality, and in using the pestle the particles of loosened cement often drop into the mixture in the mortar during trituration. The best plan is to pull the handle out of the pestle entirely as soon as possible and reset it. This is easily done by heating the end of the pestle in a sand bath until the cement has softened so that the handle may be extracted, then some hot cement (made by fusing three parts of beeswax with one part of shellac) is poured into the pestle hole, and the wooden handle is at once pressed forcibly in place and held by wedging or by other means until the cement has hardened. A pestle with a hard rubber handle, which is made to screw accurately into the head (see Fig. 210), is a great improvement over the ordinary form of pestle, and the additional cost is more than repaid by the comfort of using it. Solid porcelain pestles are not well adapted to trituration. Where trituration is combined with contusion, as frequently happens in effecting solutions of crystalline chemical substances, a wedgwood mortar of the shape shown in Fig. 211 is well suited for the purpose. In furnishing a pharmacy, the selection of good mortars and pestles is frequently overlooked amidst the many items of detail; but few implements, if properly selected, bring more satisfaction to the operator. It is a safe rule to examine every purchase carefully before accepting it finally, to see whether the pestle fits the mortar accurately. It should have as much bearing on the interior surface of the mortar as its size will permit, because its efficiency in trituration depends largely on the amount of contact of the surfaces. The use of a round surfaced pestle in a flat surfaced mortar is just as great a waste of labor as that of a flat surfaced pestle in a round surfaced mortar. Trituration, as a distinct method of preparing a class of preparations, is officially recognized in the U. S. Pharmacopœia, and a general formula is given in which 10 per cent of active ingredient and 90 per cent of lactose are to be uniformly combined by trituration.

Fig. 212



Triturating with a loaded pestle

Fig. 210

Pestle with hard rubber handle

Fig. 211

Wedgwood mortar and pestle

The proper procedure for making triturations or mixtures containing a very small proportion of a very powerful ingredient, so as to insure uniformity, consists in weighing the medicinal substance and diluent separately, placing the substance previously reduced to a moderately fine powder, in a mortar, and adding about an equal measure of diluent. This should be mixed well with a spatula, and the two powders should be thoroughly triturated together. Fresh portions of diluent are added from time to time, until the whole is combined, the trituration being continued after each addition until the substance is intimately mixed with the diluent and reduced to a fine powder.

Fig. 212 shows a device for facilitating trituration. It was suggested by Charles Rice, and is simpler and more effective than similar contrivances which have been described. It consists of an ordinary mortar and pestle, the

latter having been lengthened by cutting down the mushroom top of the handle so as to admit of its being inserted into the large end of a wooden handle shaped somewhat like a ball bat, and between two and three feet long. The upper end of this handle should be about an inch in diameter, and during the use of the pestle is to be kept upright and steady by passing through an opening in a piece of wood which may be tacked to the under side of some convenient shelf. The mortar should stand on a counter about three feet from the floor.

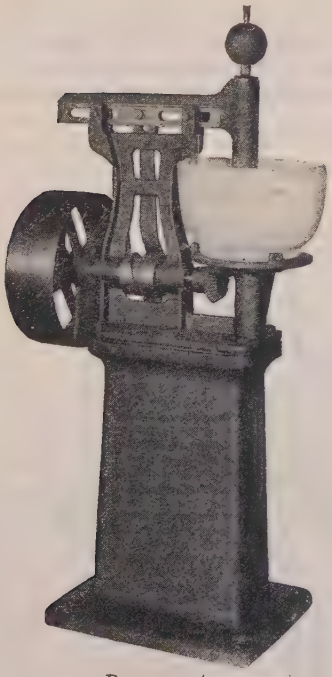
Mortars and pestles are sometimes made of green or white glass. The former are to be preferred because they are stronger; the latter, however, present a handsomer appearance. Glass mortars are not as well suited for trituration as for dissolving certain chemical substances directed in prescriptions, like corrosive sublimate, the alkaloids, etc., or for making solutions of iodine which would stain wedgwood or porcelain mortars.

Fig. 213

Porcelain mortars and pestles

Porcelain mortars and pestles (see Fig. 213) are, however, more generally useful as solution or emulsion mortars. Pestles entirely of porcelain are objectionable, because they are easily broken.

Fig. 214

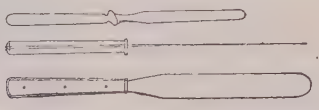


Power mortar

Fig. 214 illustrates a power mortar which is very useful in the preparation of small lots of tablet triturates or other mixtures requiring extended trituration. The pestle revolves and also rises and falls to conform to the contour of the mortar which is made to pass through a figure-of-eight movement. A scraper continuously returns the material to the center of the mortar.

Spatulas—The process of trituration as ordinarily performed requires the use of spatulas. These consist of flexible steel blades attached to handles, and in trituration they serve to loosen the substance as it becomes packed upon the sides of the mortar. Spatulas are largely used in extemporaneous pharmacy,

Figs. 215, 216



Solid handle and balanced handle spatulas

and they will be alluded to frequently under various special heads in Part V. The blade of a spatula is sometimes broken when too much pressure is applied, but if the broken blade remaining in the handle is rounded by grinding or filing it may often be useful.

Spatulas may now be had of excellent quality. The best form is the balanced handle spatula (see Figs. 215 and 216). In this the metal of the handle and that of the blade are continuous and of the same width, so that the annoyance of the tang becoming loose in the handle, as in old style spatulas, is avoided. The flat metal handle is enlarged by riveting smooth, flat pieces of hard wood to it to insure convenience in using. The balanced handle derives its name from the fact that when lying upon the counter the weight of the handle is sufficient to

overcome the weight of the blade, so that contact of the blade with the counter is prevented. Solid handled spatulas (see Fig. 214) are also made, the whole being of one solid piece of metal, and the handle being nickel plated. A pocket spatula, which closes like a clasp knife, is also furnished by dealers.

FIG. 217

Spatula, blade coated with hard rubber

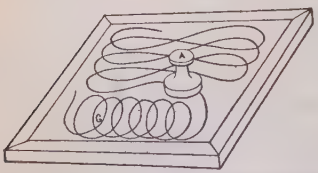
FIG. 218

Solid hard rubber spatula

Fig. 217 shows a spatula coated with hard rubber for making ointments which contain corrosive substances, or substances acting on steel. Solid hard rubber spatulas are also made (see Fig. 218).

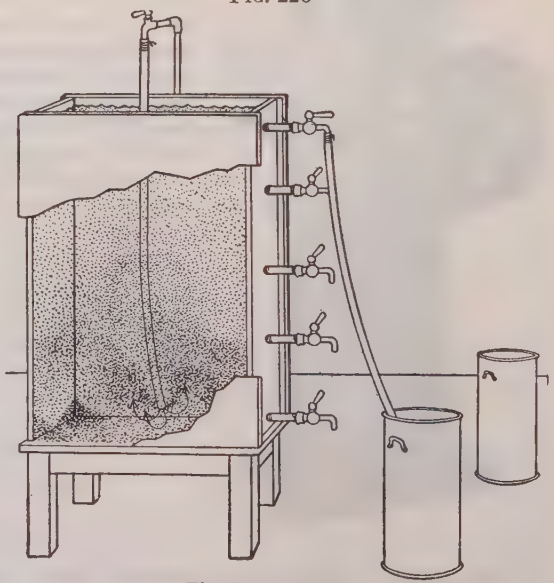
Levigation is the process of reducing substances to a state of minute division by triturating them after they have been made into a paste with water or other liquid. This is effected in a shallow mortar with a properly fitting pestle, or upon a ground glass slab with a flat surfaced glass muller (see Fig. 219). The motion imparted to the muller, *A*, closely resembles the figure 8; this is frequently varied with that of oval loops which intersect each other, the object being to vary the motion so that all particles of the powder may be brought under the action of the muller upon the slab *G*. Certain substances like red mercuric oxide and zinc oxide, if made into a paste with alcohol or water are more readily reduced to fine powder in this way than by the action of the mortar and pestle. The process is termed *porphyrization* when performed with a slab and muller made of the hard rock material called porphyry.

FIG. 219



Slab and muller

FIG. 220



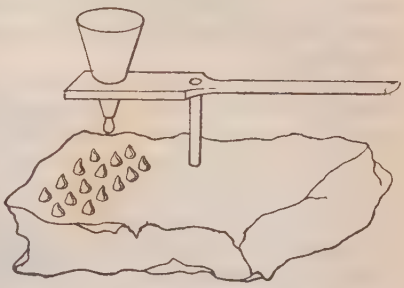
Elutriating apparatus

Elutriation is the process of obtaining a substance in fine powder by suspending an insoluble powder in water, allowing the heavier particles to subside, and decanting the liquid containing the lighter particles into another vessel, and there collecting them. It is a form of *water-sifting* wherein the greater weight of the larger particles is used as a means of separating them from the smaller. Fig. 220 illustrates elutriation. The stopcocks on the side of the tank are intended to be used for drawing off a fraction of the liquid after the heavier particles have subsided; these fractions may be transferred to other

vessels wherein the fine particles are permitted to settle. Prepared chalk is a familiar illustration of an elutriated powder.

Trochiscation is the process of shaping the pasty mass or magma obtained by elutriation into dry, conical masses. This is usually accomplished by the use of the form of apparatus shown in Fig. 221. This consists of a tinned iron cone, supported in a circular wooden frame which has one short wooden leg and a handle. A slab of chalk or other porous substance is provided, and after filling the cone with the pasty mass the handle is taken in the hand and the leg of the frame is tapped gently upon the slab of chalk. The shock causes a conical mass of the substance to fall upon the slab, whereupon the moisture present soon becomes absorbed, so that the little cone dries quickly. A succession of taps with a slight lateral movement, deposits the cones in regular rows, and when the slab is full the first cones are found to be dry enough to be transferred and the process becomes practically continuous. Chalk and other insoluble powders are formed into conical nodules in this way.

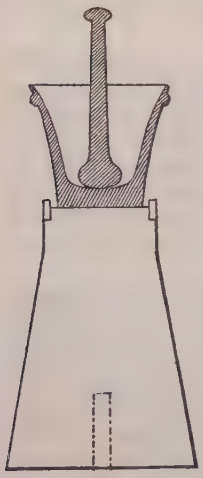
Fig. 221



Trochiscator

Pulverization by intervention is the process of reducing substances to powder through the use of a foreign substance, from which the powder is subsequently freed by some simple method. No general process can be given for this method of pulverization, as the character of the substance must determine the method. Metallic gold may be powdered by rubbing gold leaf in a mortar in contact with potassium sulphate. The latter is subsequently dissolved out with water. Camphor may be pulverized through the addition of a few drops of alcohol, chloroform, or other solvent. The foreign substance in this case is disposed of by evaporation. Metallic tin may be granulated by melting it and pouring it into a box containing powdered chalk, followed by prompt agitation. The chalk is subsequently dissolved out with diluted acetic acid. Phosphorus may be pulverized by placing it in water contained in a small flask, then heating the water gradually until the phosphorus is melted, and shaking the flask while the phosphorus is cooling. The agitation in the presence of water keeps the particles from cohering.

Fig. 222



Contusion mortar and pestle

Contusion or the operation of bruising, is resorted to occasionally. It may be defined as the process of reducing a drug to particles by striking it a succession of blows. The instrument generally employed is a form of the well-known mortar and pestle, which, for contusing drugs, should be made of cast iron, bell metal, or brass. The shape best adapted for this purpose is shown in Fig. 222, the mortar being represented on a *mortar block*. The bottom of the mortar should be flat and heavy, so that it may rest firmly upon whatever base it is placed; the sides should flare slightly, but the mortar should be so deep that substances will not be easily scattered by the blows of the pestle. A leather or wooden cover may be used upon the mortar when corrosive or irritating substances are contused. The pestle should be heavy

and so shaped on the under surface as to coincide with the concave surface of the bottom of the mortar. The inner surface of the mortar may be tinned, to prevent rusting and facilitate cleaning. It is important that such a mortar be supported by a firm base such as a concrete block or turned wood mortar block (see Fig. 222). This will provide a solid foundation for resisting the blows of the pestle, and jarring and vibration are prevented which are so destructive to balances and fragile apparatus. Sometimes this block extends through the floor in the form of a post, and is set in the ground floor, to avoid all jarring.

When it is necessary to use an iron mortar and pestle for a continuous operation, for a considerable length of time, it will be found advantageous to connect the upper part of the pestle with an elastic $\frac{3}{32}''$ copper wire spring attached to the ceiling, so that the labor of lifting the pestle will be lessened. The spring should be of such length that the pestle barely touches the bottom of the mortar when the spring is stretched to its utmost tension. On account of the large number of mills established over the country, established for grinding drugs, and the increase of facilities for grinding and powdering drugs on the large scale, the skilful use of the mortar and pestle by the pharmacist must be regarded as a lost art. The necessity for thoroughly drying drugs before subjecting them to comminution has already been mentioned. (See Desiccation.)

Wooden mortars and pestles are occasionally used for contusing soft bodies, like prune pulp, almonds, fresh fleshy roots and leaves, substances that are affected by iron, etc. Lignum vitæ is a very hard and suitable wood for this purpose, although boxwood is preferable when it can be procured, because it has less tendency to split. Lignum vitæ mortars must not be used for powdering alkaline substances which extract the resin from the wood.

Marble mortars are also used for operations of a similar character on a somewhat larger scale; but such mortars are not suitable for acid substances, on account of the reaction upon the marble and the consequent contamination of the product.

Rasping or Grating—A half round rasp (see Fig. 170) or a nutmeg grater is very useful at the prescription counter, as it frequently enables the pharmacist to prepare a small quantity of a crude drug powder for a prescription in case the regular stock bottle is found empty or a very fresh powder is needed. The small pocket pepper mills for grinding whole pepper at the table will be found especially useful.

FIG. 223

Rotary grater

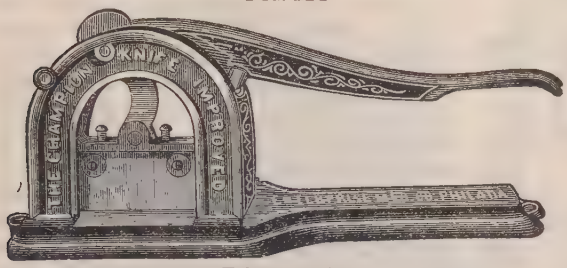
The inexpensive rotary grater (Fig. 223) is a convenience at the prescription counter, especially for grating oil of theobroma for suppositories.

Cutting, Slicing, and Chopping—This process is used principally in bringing roots, barks, leaves, herbs, etc., to the proper condition for treating with suitable solvents. For very small operations either the pruning knife or pruning shears works very well. The tobacco knife or herb cutter shown in Fig. 224 is well adapted for the purpose. It should be observed, however, that the principle upon which a knife operates successfully should be carefully carried out in constructing apparatus designed for cutting. Direct pressure without a slight drawing or sawing motion is not effective; therefore those knives which have guides arranged so that the blade has a horizontal as well as a vertical movement are greatly preferred. Fig. 225 shows a roller knife which is very serviceable. The circular blades or knives are made of the same quality of steel that is used for saws, and are mounted upon a shaft, being separated by a series of spools or collars. The handles are of wood and

mounted loosely on the ends of the shaft, thus permitting them to be grasped tightly while the knife blades revolve. The substances to be cut are placed upon a smooth board and the roller knives passed over them with more or less pressure. This instrument is useful in preparing the "Species" of the National Formulary.

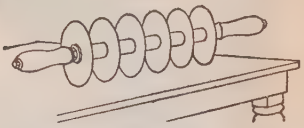
Upon the large scale drugs are cut with silage or fodder cutters, implements usually consisting of four or more circular blades fastened to a shaft and revolving at the end of a trough, down which the substance that is to be cut is gradually fed. Sarsaparilla

Fig. 224



Tobacco cutter

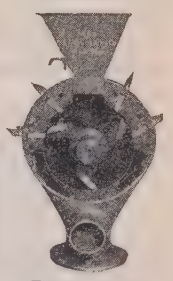
Fig. 225



Roller knife

root is cut in this way before it is contused or ground. Fig. 226 shows a rotary cutter made by the Abbé Engineering Company, of New York. A cylinder to which five blades are attached revolves in a circular case, upon the inside surface of which are fastened six blades; the blades are straight but are set at a slight angle, so that a "shearing action" is exerted on the substance to be cut. The bottom of the case consists of a perforated plate, which can be replaced, and as the blades revolve a portion of the cut substance drops through the perforations. What remains is carried around and again subjected to the action of the cutters. By selecting the perforated plates the product may be cut coarser or finer as required.

Fig. 226



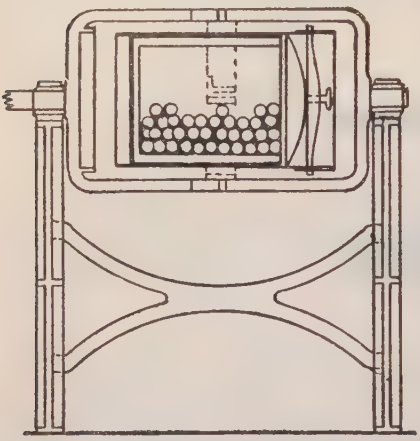
Rotary cutter

Grinding and Pulverizing—The former term is applied to the reduction of a substance by mechanical means to *coarse* particles, the latter to the production of *fine* particles. These processes are the most important considered under comminution. At present they are very largely carried on by drug millers. It is necessary for the pharmacist to be familiar with the methods employed, however, if intelligent judgment is to be exercised in the subsequent treatment of the vegetable and mineral substances of the materia medica. Before pulverizing a substance it must be dried and the desired fineness of the powder determines the character of the preliminary treatment. In order to properly grind or powder substances upon the large scale, special knowledge and experience are required; previous acquaintance with the methods best suited to accomplish the object on the small scale, while useful to some extent, will be found inadequate. If a drug is to be coarsely ground, the necessity for thoroughly drying it is generally not so important as when a fine powder is to be made of the substance; drugs containing volatile oils are apt to be rendered worthless if they are dried sufficiently to enable them to be ground to a fine powder. Myrrh, clove, cubeb, nutmeg, etc., afford a good illustration of this; hence such drugs are preferred when coarsely powdered. Within the last few decades an important change in pharmaceutical practice in this respect has been effected, and preparations in which, formerly, very fine powders were directed are now ordered to be

made from coarse powders. The processes for extracting the soluble principles having been greatly improved, the necessity no longer exists for using the very fine powders, and, hence, volatile principles are not lost.

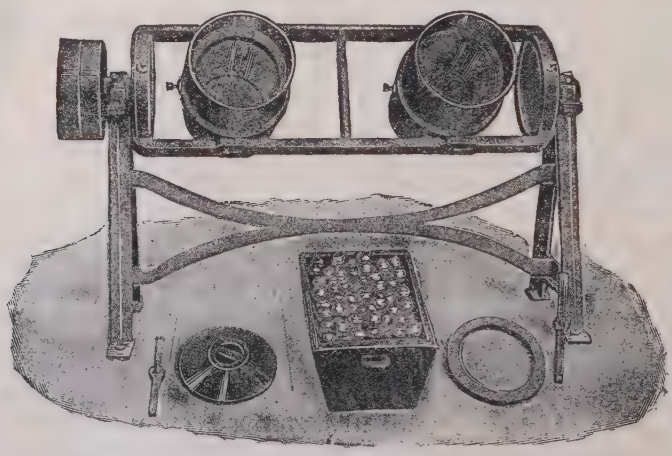
Pebble or Ball Mills—These mills, which are also called "pot mills" or "jar mills", are operated on the principle of attrition and percussion, the grinding being effected by placing the substance in jars or cylindrical vessels, lined with porcelain or a similar hard substance and containing "pebbles" or "balls" of flint or porcelain. These cylindrical vessels then revolve horizontally on their longer axis and the tumbling of the pebbles or balls over one another and against the sides of the cylinder quickly effect pulverization with a minimum loss of material. The advantage of such mills is that they afford a large grinding surface within a limited space. They are cleanly in their action, economical, and, on account of the simplicity of their construction, not liable to get out of ordêr. Much depends however, upon the hardness of the pebbles; for it must be seen that these are continually striking against each other while in action. Such mills are adapted for grinding hygroscopic substances, extracts, and expensive chemicals. Fig. 227 shows a sectional view of a single jar mill. Fig. 228 illustrates a double jar mill, and the number of jars may be increased indefinitely. The advantage of multiplying the jars is that four, six,

Fig. 227



Single jar mill

Fig. 228



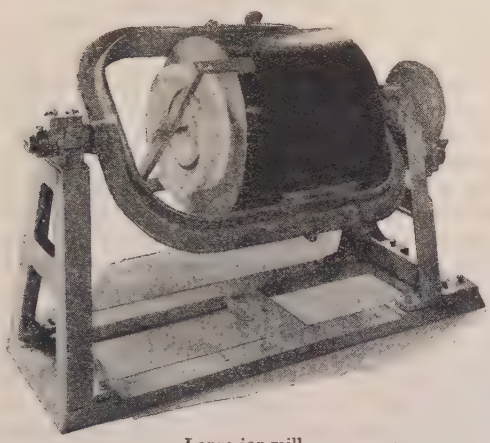
Double jar mill

or a dozen different substances may be ground at one time. Fig. 229 shows a picture of a large jar mill used in the laboratory of Eli Lilly and Company. It was built for special requirements and has a capacity of 25 gallons. It has the advantage of triturating large quantities of material in a short time.

A larger size mill of this type, lined with sheet iron and containing iron balls (cannon balls) is used under the name of a *barrel mill* or *cannon ball mill.*

The so-called "pot mills" are more or less pumpkin shape (Fig. 230). They are built of iron, and steel balls are used to accomplish the pulverization. Some of the mills of this type, however, are lined with a vitreous wall and porcelain balls are used. In some instances the axis about which the mill rotates

FIG. 229



Large jar mill

FIG. 230

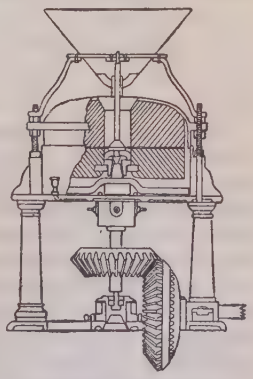
Pot mill

is set at an angle of 45°, while in other cases the axis is parallel to the floor. The pot mill is also used in the preparation of ointments on a large scale and for the extinguishing of mercury for the ointment or mass.

Drug Mills

The buhrstone mill is very extensively employed in drug milling. There are two kinds, termed respectively under runners and upper runners. The principle upon which this type of mill operates is that of reducing the substance to particles by the friction and contusion that follow the delivery of the substance in the contracted space formed by a rapidly revolving stone disk, brought into close contact with a similar disk which is stationary. In the under runners the upper stone is stationary and the lower stone revolves, the upper stone having a central circular opening through which the substance is fed, as shown in Fig. 231, the under stone being connected with the shaft. In the upper runners the lower stone is stationary, the upper stone being perforated as in the under runners. In both, the moving stones revolve horizontally. The stone used must be very hard. The best buhrmill stone is obtained from the old and celebrated quarries of La Fertésous-Jouarre, in France. The surfaces of the millstones are crossed with "furrows", which pass from the center to the circumference, as shown in Fig. 232. The object of the furrows is to provide a means for the passage of the ground particles to the outer circumference and to the trough. This is accomplished through the centrifugal force and current of air

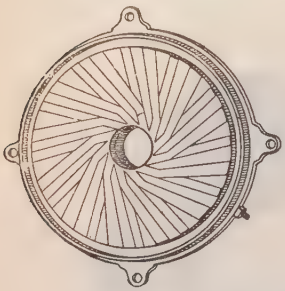
FIG. 231



Munson's under runner buhrstone mill

caused by the rapid revolution of the stone in motion. The fineness of the powder is regulated by raising or lowering one of the stones, this of course increases or decreases the space between them; the character of the powder is also influenced by the dressing of the stone. Fig. 231 illustrates one of the best of the buhrstone mills,—Munson's under runner. The ground drug coming from a buhrstone mill requires bolting or sifting to separate the coarse particles which are then returned to the mill for regrinding.

Fig. 232

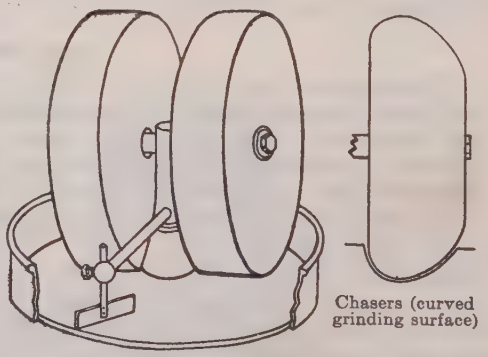


Buhrstone

The Bogardus mill is constructed on a very ingenious principle. The grinding surfaces are two horizontal chilled iron plates, the lower one revolving, the upper one stationary; both have corrugations with sharp edges, arranged concentrically. The peculiarity of this mill is that the centers of the grinding plates are not directly over each other as in buhrstone mills, but the center of the lower plate is placed a few inches to one side; by this arrangement the substance to be ground is caught by the ring edges of the revolving plate and dashed against the cutting edges of the stationary upper plate at an angle, the effect being to incise it as if cut with scissors and crush it at the same time.

Chaser mills are so called because two heavy granite stones, mounted vertically like wheels and connected by a short horizontal shaft, are made to revolve or *chase* each other upon a granite base (see Fig. 233). The stones are discoid, and the grinding surfaces are the circumferential edges of the stones and the surface of the granite base; an iron cylinder, called a "curb", surrounds the circular base, and a "scraper", made of iron and adjusted at an angle, is connected with the shaft. It is evident that if the substance to be powdered is delivered upon the granite base in the path of the rapidly revolving stones it must speedily be reduced to powder, not only on account of the crushing weight of the heavy stones, but also because of the attrition caused by the outer edge of the stone travelling through a longer distance than the inner edge. In some mills the stones having flat, grinding surfaces have been replaced by stones having curved surfaces, and the flat base by a circular gutter curved to correspond with that of the surface of stone. In this way the grinding surfaces have been greatly increased and rapid pulverization facilitated. Fig. 233 also shows the stones of this form. In practice the chasers are enclosed in a tight box or small room, closed with air-tight doors, and the substance to be powdered is fed in from the top by an elongated funnel, the spout of which delivers the material immediately upon the path of the stones. The height of the curb is increased by pasting heavy paper around it, and the fineness of the powder is influenced by the height of the curb. The revolution of the chasers produces an upward current of air; this carries over the lighter particles, which fall outside the curb and are subsequently col-

Fig. 233



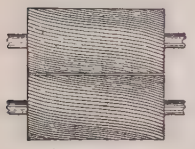
Chasers

lected as a fine powder; those particles which are larger are of course heavier and cannot rise to the height of the curb, but fall back under the stones to be reground. In this way refractory substances can be reduced to very fine powder. Such powder is termed *air-sifted*. Chasers are more largely employed in making " dusted " or very fine powders than any other form of pulverizing apparatus.

Chaser mills are also used extensively in grinding cacao beans to form the paste which is commercially known as "chocolate liquor".

Roller mills operate by crushing, or crushing and cutting, the substance. In its simplest form this mill consists of two iron rollers revolving in the same direction at different rates of speed. The distance between the rollers may be regulated by adjusting screws. This principle has been developed and improved in modern milling, so that for grinding certain drugs this type of mill gives excellent results. The rollers are made of steel, chilled iron, or porcelain, and are corrugated or ribbed to suit special purposes. Fig. 234 shows the position of the grooved rollers, and Fig. 235

FIG. 234

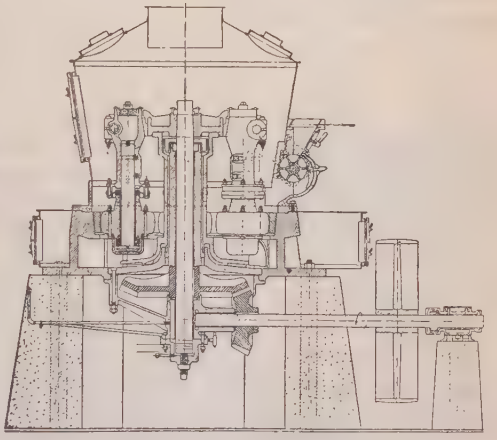


Grooved rollers

FIG. 235

Grooved roller (cross section)

FIG. 236



Raymond roller mill (cross section)

shows a sectional view. The roller mill is the type used in grinding wheat flour on an immense scale. The term roller mill is also applied to a more modern type of mill in which the rollers are hardened steel disks revolving horizontally within closely set rings also of hardened steel. The Raymond Roller Mills are of this class (see Figs. 236 and 248).

Hand Mills

It is difficult to construct a drug mill for the general use of the pharmacist. The drug miller has the choice of a buhrstone mill, chaser, disintegrator, iron mill, etc., which he can adjust to suit the character of the substance he desires to grind. The pharmacist's drug mill, on the other hand, is expected to do all kinds of work rapidly and well. It must, therefore, be capable of ready adjustment, possess durability, and have cutting surfaces not quickly dulled, and working parts not liable to get out of order.

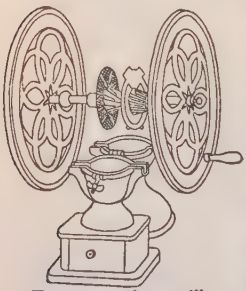
It is not easy to realize that every medicinal substance has an individuality of its own, but he who neglects the study of the physical characters of the substances of the materia medica can never expect to overcome successfully the obstacles which stand in the way of disintegration. Hand drug mills may be divided into three classes: 1. Those having vertical grinding surfaces. 2. Those having horizontal grinding surfaces. 3. Those having conical grinding surfaces. They have the following points in common: iron is the principal

material of construction, the grinding surfaces are of hardened iron or steel and consist of teeth arranged in concentric rows, and the regulation of the fineness of the powder is controlled by adjusting screws by which the plates are made to approach or recede from each other.

1. Hand Drug Mills with Vertical Grinding Surfaces

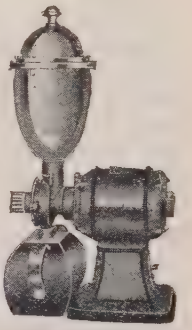
Swift's Mill—This hand mill has been in use longer than any other in the American market. Its introduction marked an era in the history of small scale drug grinding, and, although superseded now by greatly improved mills, it is still remembered with grateful feelings by those, who had been previously accustomed to laborious mortar practice. In this mill there are two vertical grinding plates, one of which is stationary, while the other is connected with the horizontal revolving shaft; a conical breaker is also attached to the shaft, and when in position it is immediately below the lower opening of the hopper; a fly wheel with a handle is bolted to the outer end of the horizontal shaft, and furnishes the power required. The teeth are of iron and arranged in concentric rows, and the plates are made to approach each other or to separate by an adjusting screw.

Fig. 237



Enterprise drug mill

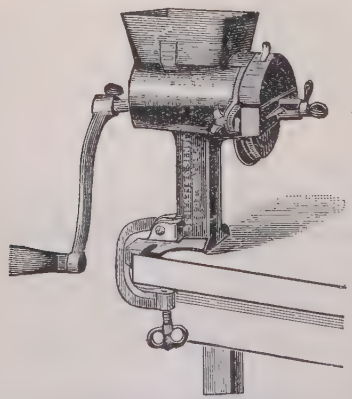
Fig. 238



Electrically driven mill

The Enterprise Mill—This mill embodies the principle of supporting the grinding plates upon a horizontal shaft, to the extremities of which heavy fly wheels are attached. It also provides facilities for lifting all the working parts out of the interior to facilitate their cleaning. Fig. 237 thoroughly illustrates this mill. The left hand grinding plate revolves, being geared to the shaft, while the one on the right hand is stationary. When in position for grinding they are nearly in contact. The opening of the interior is effected by simply turning the thumb screw in front. Practically all modern mills of this type are driven by an electric motor. (See Fig. 238.)

Fig. 239



Quaker City F. No. 4 mill

Plates and crushers

The Quaker City F. No. 4 Mill (Fig. 239) in its general appearance looks

much like a meat grinder. It is equipped with a worm crusher and feeder which forces the drug between the two grooved grinding plates at the end of the worm shaft. The plate with the larger opening is attached to the body of the mill and is stationary while the second plate is attached to the feeder shaft and is rotated. This same type of mill is manufactured in a larger style when it is power driven. These mills are made by the A. W. Straub Company, of Philadelphia.

2. Hand Drug Mills having Horizontal Grinding Surfaces

Swift's B Mill—In this mill the grinding plates are horizontal, the lower one revolving, while the upper one is stationary and forms the lower part of the hopper. It has two fly wheels, but the receptacle for the powder is an open one. A valuable feature of the Enterprise mill is present here,—*i. e.*, that of opening horizontally in the center. The fineness of the powder is regulated by raising or lowering the lower plate by the thumb screw.

3. Hand Drug Mills having Conical Grinding Surfaces

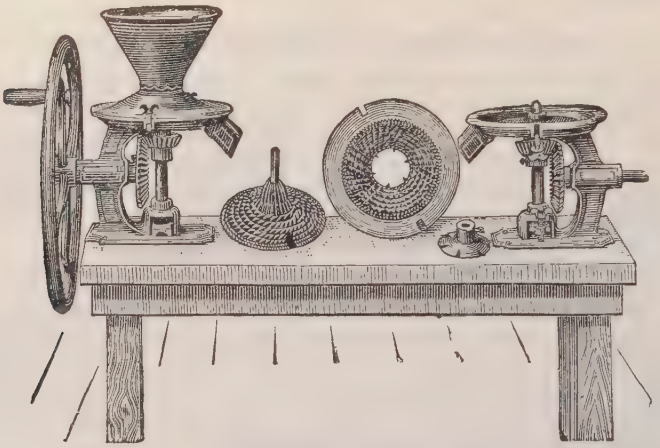
The principle of construction in these mills is probably the best, because it avoids the fault of those constructed on the vertical plate principle, that of permitting particles to drop into the receptacle before they are finely ground, and also the fault of the horizontal plate mills, which may hold the ground particles too long, often until clogging results. The conical plate mill, if properly constructed, leaves little to be desired.

Hance's Mill is made on this principle. Formerly, the objection to this mill was the loss of time and labor consumed in getting it apart. This has been obviated by the introduction of the principle of opening it horizontally with the same kind of thumb screw and hinge that is used in the Enterprise mill. The Hance mill is better adapted for heavy work than any other of the hand drug mills, and, if desired, a belt and pulley can be attached for steam power, or it may be operated by an electric motor. The lower plate is conical in shape, the summit being elongated into a breaker; the teeth are arranged in consecutive rows, a scraper being attached to the under surface of the lower plate; the upper grinding surface is situated upon the lower surface of the hopper, and corresponds in shape and in the arrangement, number, and size of teeth with the surface of the lower plate. The revolving plate is attached to the upright shaft by a simple key; this permits the easy removal of the plate when the mill is to be cleaned, yet holds it securely when in operation. Power is communicated by means of two shafts at right angles, geared with bevel cog wheels. The fineness of the powder is regulated by a thumb screw at the base, which elevates the revolving plate. The support to the mill is a strong iron frame, which is cast in one piece, and, although the mill has but a single fly wheel, this is partially compensated for by the length of the bearing for the horizontal shaft. Figs. 240 and 243 show the form which is designed to be bolted to the working table or counter. Fig. 242 shows the upper grinding plate and Fig. 241 the lower plate; a feeder is shown lying upon the counter, which is fastened to the upper portion of the lower plate by its set screw, so that seeds and similar drugs may be automatically fed to the mill.

General Rules for Operating Hand Mills—Much of the dissatisfaction experienced in operating hand mills has arisen from improper methods of using them, or from failure to measure accurately the degree of resistance to disintegration possessed by the substance to be ground. One of the first requisites, as before mentioned, is to dry the substance as perfectly as its physical char-

acter will permit without injuring it. If coarse, bulky, fibrous roots, barks, or similar substances are to be ground, they must first be cut or bruised. Most substances are ground with less labor if they are first passed through the mill with the coarse adjustment, returning the portion which is sifted out, for regrinding, after setting the plates more closely together. This plan is repeated

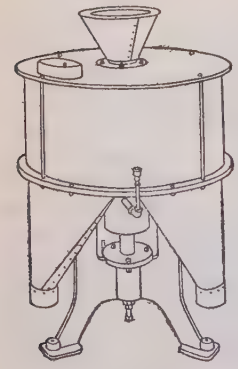
Fig. 240 Fig. 241 Fig. 242 Fig. 243



Hance mill Lower plate Upper plate Base

until the whole is ground. Care should be taken not to feed the substance into the hopper faster than it can be ground. The desire to get through quickly is the most frequent cause of clogging the mill, and when this occurs much time is lost, and the operator is strongly reminded of the well worn proverb about undue haste. If a considerable quantity is to be ground, two persons can operate the mill to better advantage than one,—one feeding the mill carefully, the other supplying the physical labor, and after the expiration of a given time, exchanging places. Good judgment is necessary in determining the rapidity with which substances can be fed into the hopper. Resinous or oily drugs, or substances which soften by heat, require very careful treatment and cannot be fed rapidly; dry ligneous barks or roots, on the other hand, can be fed as rapidly as the extent of grinding surface of the mill and the muscle of the operator will permit. The mill should be thoroughly cleaned after each operation, particular attention being given to the grinding plates. In the case of substances which form hard lumps by heating or clogging up the plates, the quickest way is to use boiling water to soften or dissolve the lumps; the plates should then be quickly dried, to prevent rusting. By running sawdust, bran, or rice chaff through a mill, after an odorous drug has been ground, it may be speedily cleaned and freed from odor.

Fig. 244



Max mill

High Speed Mills

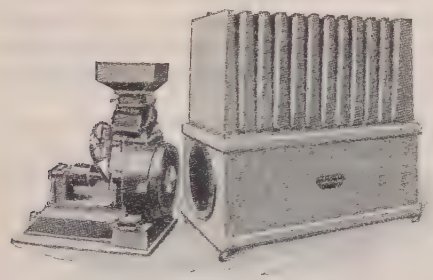
These mills differ from those thus far considered in the principle of construction, in the character of the grinding surfaces, and in the method of operation.

The *Max Mill* is an illustration of this type (see Fig. 244). It is made by

the Abbé Engineering Company, and acts on the principle of *percussion* at a high rate of speed. Power is conveyed by a vertical shaft, to which is attached a carrier provided with hard steel beaters, and as the substance is fed into the mill it is thrown by centrifugal force against a corrugated hard iron plate, the particles at the same time being thrown into violent contact with each other. Coarse or fine powders can be made at will.

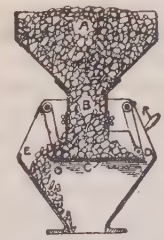
The Limited Pulverizer (Fig. 245), which is built by the Schutz O'Neill Co., also works on the principle of percussion at a high rate of speed. The mill is equipped with either a Vibrator or a Breaker Feeder. The *vibrator feeder* (Fig. 246), is used only for material which has first been broken down to corn size. The amount of feeding is controlled by a hand lever which may vary from ten to several thousand pounds per hour. It is fitted with a magnet to prevent metal from entering the mill as it passes over the vibrating plate. The *breaker feeder* (Fig. 247) will handle lumps up to six inch cubes, gradually reducing

Fig. 245



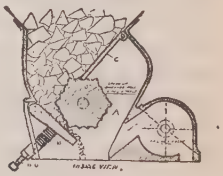
The limited pulverizer and receiver

Fig. 246



Vibrator feeder

Fig. 247



Breaker feeder

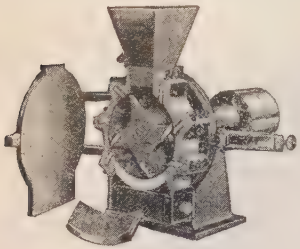
them into bits and finally feeding them into the grinding chamber. Its capacity is about equal to that of the Vibrator Feeder. The drug is broken by a hexagonal roll which revolves over the breaker plate that is made to rise and fall.

As the drug enters the grinding chamber it is beaten from side to side by beaters or lugs which are attached to a steel plate which whirls at a very rapid gait. The outer edge of the grinding chamber consists either of a corrugated shell or a perforated steel shell, the latter being preferable for pulverizing fibrous stock. The back of the grinding chamber consists either of a smooth plate or it may be fitted with an outer corrugated circle which greatly increases the efficiency of the mill for tough stock like nux vomica or licorice root. The discharge section of the mill is fitted with a cone and cone plate with whizzers. The cone plate is perforated with half-inch holes and has almost complete control of the air current passing through the mill as well as the fineness of the powder. Setting the plate inward toward the cone increases the quantity of air; this carries out larger particles with it; setting the plate flush with the end of the cone decreases the amount of air passing through, thereby carrying out only a finer degree of powder. The material which is too coarse to be carried out by the air current, is automatically returned to the tailings valve and by means of a rotating paddle, fed into the grinding chamber again.

Fig. 253 illustrates a new mill designed by Dr. Samuel W. Wiley, of Wiley & Co., Inc., Baltimore, especially for the proper preparation for chemical analysis of commercial products such as drugs, fertilizers and feed stuffs without loss of moisture from heating during the preparation of the sample. This is now offered by the A. H. Thomas Company.

Four knives on a revolving shaft work with a shearing action against six which are set in the frame. The screen is dovetailed into this frame so that none of the material comes out of the grinding chamber until it is fine enough to pass through the mesh. Three sieves with screen of ½ mm., 1 mm., and 2 mm. mesh, respectively, are furnished with each mill. A hinged front permits easy cleaning. The mill is 21 inches high and occupies a floor space about 14 x 20 inches. The grinding chamber is 8 inches inside diameter, with knives 3 inches wide. The mill should be operated at from 400 to 800 revolutions per minute.

Fig. 248

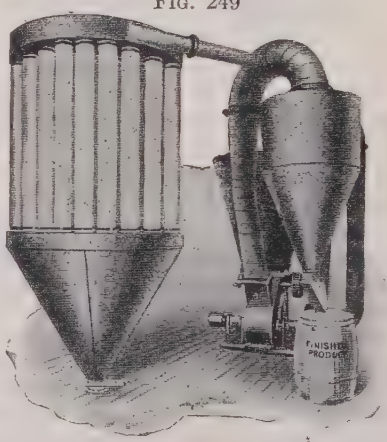


The Wiley mill

Receivers for high speed mills—In the high speed mills the intake of air is so great that special forms of receivers for the finished product must be provided to prevent loss. The receiving boxes are equipped with air strainers of strong fabric which keep the pulverized material from escaping and allow the air to pass through. These air strainers are of different shapes. A plain balloon form is sometimes used but the zigzag or accordion form, or the tubular style are most commonly used (see Figs. 245 and 249).

In *Mead's Disintegrator* high speed mills, the grinding is effected by hardened steel beaters riveted to a steel disk, which revolves vertically between corrugated rings; the beaters are placed on the side of the disk nearest to the feeding trough, and catch the material as it enters the mill, beating it with great force against the corrugated rings until it is fine enough to pass between the disk and the face of the rings; as soon as it passes here, it is on the side of the mill from whence it is discharged, and all that is fine enough is immediately driven out by the beaters on the back of the disk. That portion of the substance which is not fine enough is caught by the beaters and beaten against the screens until sufficiently fine to pass through. The screens are two inches in width, and extend around three-fourths of the diameter of the mill. They are made of square steel bars, and present a grinding surface to the beaters, but there is sufficient space between them to permit the passage of fine particles. A new type of screen—the cross cut blank screen (Fig. 250), and the cross cut perforated screen (Fig. 251) have been designed for use in the Mead mill to afford a means of producing finer grindings and pulverizations. The screens are made of steel with a cross cut surface presenting hundreds of sharp cutting edges to the material to be ground. The perforated screen contains a perforation at the apex of each pyramid. By combining the cross cut blank screen, the cross cut perforated screen, and the bar screens, it is possible for the miller to grind the drug to any degree of fineness. The substance, as it is ground, falls into a receiving box below the mill, or is discharged through the floor into a room below. One prime requisite in running this mill is high speed. The disk must make three thousand revolutions a minute. The disintegrator is capable of grinding one

Fig. 249



Raymond roller mill (receiver and air strainer)

hundred and fifty pounds of ignatia bean, one thousand pounds of jalap or six hundred pounds of wild cherry bark, in one hour. Fig. 252 gives an illustration

Fig. 250

Cross cut blank screen

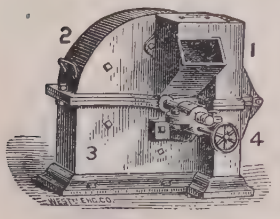
Fig. 251

Cross cut perforated screen

of the mill, while Fig. 253 shows an enlarged view of the revolving disk and a section of the bar screens immediately above.

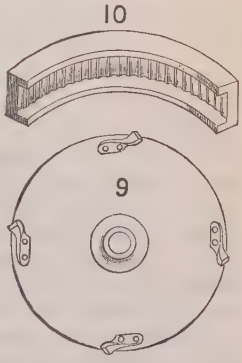
Sifting is the process of passing a powdered substance through the meshes of perforated material with the object of separating the coarser from the finer particles. Sieves are employed in this process. The frames of hand sieves are usually round, although sometimes they are oval, square, or rectangular. The ordinary sieve is usually made by stretching wire gauze over a flat wooden ring, and keeping it in its place by slipping over it a narrow wooden ring of slightly greater diameter, which is tacked securely. Covered sieves, or drum sieves, have tight covers for the top and bottom. The simplest pharmaceutical sieves for general use are obtained by making five rectangular frames, each four inches deep, ten inches wide, and sixteen inches long. These should be light but strong, and the bottoms covered with brass wire gauze of different degrees of fineness. A box, ten inches deep, twelve inches wide, and twenty-two inches long, with a tight cover, is provided to hold the sieves and prevent dust from escaping. Two cleats are nailed horizontally upon the sides of the box, five inches from the top, for the sieve to slide upon, and a hole is cut in the front of the box in order to permit a handle, with a hook at the end, to pass through and be attached to a screw eye in the front side of the sieve; two large corks are screwed to the back of the sieve at either end to act as buffers. The powdered substance is introduced into the proper sieve, which is placed upon the cleats, and the handle passed through the hole and hooked to the sieve; the cover is then placed in position, and the sieve pushed backward and forward, touching the back lightly.

Fig. 252



Mead's disintegrator

Fig. 253



Revolving disk and screens

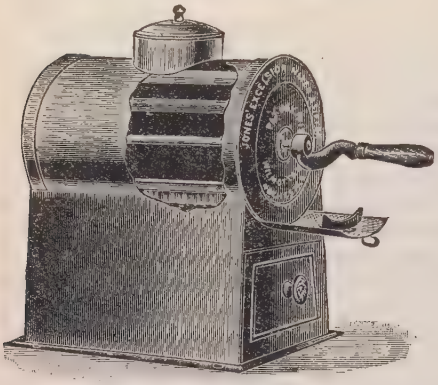
A very important point, which must not be overlooked after sifting substances, is the thorough mixing of all portions of the sifted powder, in order that each part of the finished powder may have a uniform composition. The starchy portions of a drug will be powdered more quickly than the ligneous portions, and will usually pass through the sieve first; hence the sifted powder must always be thoroughly mixed. Upon the small scale this may be easily effected with a spatula or mortar and pestle; upon a larger scale special apparatus is needed.

Jones' Mixer and Sifter (Fig. 254) is well adapted for smaller operations; the principle is that of using revolving mixers and brushes. A perforated metal

plate forms the bottom of the sifter, and, when mixing, an unperforated plate is pushed over the perforated plate, so that when the powder is thoroughly mixed this plate can be pulled out, and the powder then sifts through the perforated plate into the drawer below.

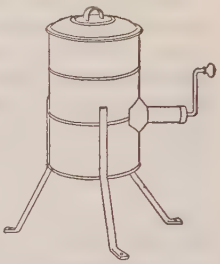
In Fig. 255 is seen an enclosed sifter well adapted for many purposes, while Fig. 256 shows a sectional view of the same kind of sifter for smaller operations. The sieve is hemispherical in shape, and is contained in a tinned iron scoop. (See Fig. 257, which shows the end view.) Two circles of stout wire are soldered to a central axis at right angles to each other, and the axis passes through the tin handle and terminates in a crank. When a powder is placed in the scoop, and the wire rings are made to revolve by turning the axis with the hand, the particles of powder are rapidly forced through the meshes of the sieve. This apparatus is especially useful in breaking up moistened lumps in powders which are about to be percolated. These forms of sifters are manufactured for household use and are obtainable at stores selling kitchen supplies.

Fig. 254



Jones' mixer and sifter

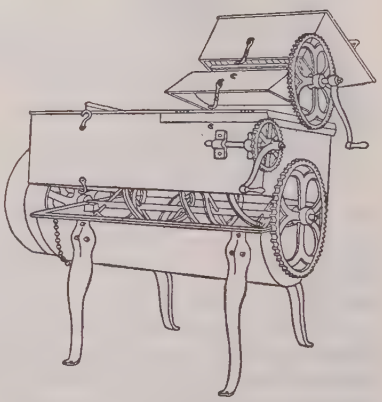
Fig. 255



Enclosed sifter

Hunter's sifter is one of the most effective large machines; it is shown in Fig. 258. In this the powder is sifted in the cylindrical sieve, and adhering particles or small lumps are brushed through by the revolving brushes; the revolving spiral mixers in the large box cause the particles to be thoroughly mingled. The illustration shows the method of operating so well that further description is unnecessary.

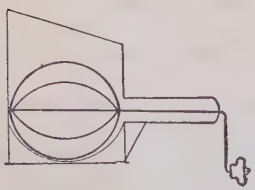
Fig. 258



Hunter's mixer and sifter

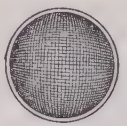
The gyrating type of sifter is extensively used at the present time for the sifting of powdered drugs. The *Rotex Sifter* (Fig. 259) is a good example of this type. This sifter which has a gyratory hand sieve motion has a double screen in its sifting frame; the screen on the under side of the sifting frame is of a very coarse mesh and supports a number of rubber balls, which in their motion keep the sieve-pores open by coming in contact with the screening surface of

Fig. 256



Scoop sifter

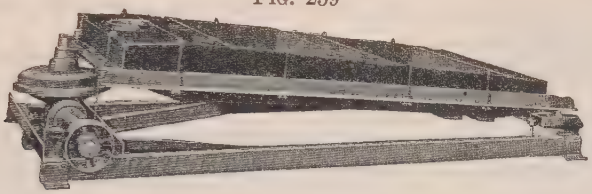
Fig. 257



Scoop sifter (end view)

the sieve cloth which is fastened to the upper side of the sifting frame. The frame is equipped with a number of bevelled cross bars which tend to deflect the ball upward, tapping the sifting cloth. This action may be likened to that of tapping the fingers against the under side of a sieve, but at the rate of

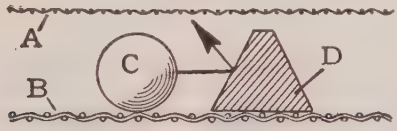
FIG. 259



Rotex sifter

300 taps per minute. Fig. 259*a* illustrates the principle upon which it operates. The inclined sifting box which encloses the sifting frame is equipped with three spouts, one as a feeder, one for the purpose of carrying off the sifted powder, and the third for carrying off the tailings.

FIG. 259*a*



A—The Sifting Cloth.
B—The Coarser Ball Support Screen
C—The Ball, of Solid Rubber
D—The Inclined Surface for Deflecting the Ball Upward

DIAGRAMMATIC REPRESENTATION OF THE ROTEX CLOTH CLEANING SYSTEM.

In some milling establishments, sifters of this type are connected with the Receiving Box of the drug mills and as the tailings are sifted off they are carried back to the grinding spout by means of an elevator carrier. This insures uniformity in powder, as the tailings are being continuously reground and added evenly to the powdered drug instead of regrinding the entire amount of tailings after sifting has been completed and then mixing this with the the previously sifted portion.

The *Ro-Tap Sifter* is a handy mechanical device for making sieving tests. The sieves which fit into a frame are given a rotating effect, and a small mallet at the top of the frame automatically taps it, helping to keep the sieve pores open. These Ro-Tap sifters are equipped with a variable time control.

U. S. P. DESCRIPTION AND STANDARDS

Fineness of Powder—The fineness of powder is expressed, in the Pharmacopœia, by descriptive words which correspond to numbers indicating the number of meshes to a linear inch of the sieve through which the powder will pass. The number of openings to the linear inch, however, is not an indication of the size of the openings in the sieve due to the variation in the diameter of the wire used in various sieve cloths.

For this reason the Bureau of Standards has established specifications for *standard sieves*, as given below.

These specifications also establish tolerances for the evenness of weaving as irregularities from careless weaving might permit much larger particles to pass the sieve than would be indicated.

A Special Committee of the U. S. P. X., under the Chairmanship of Prof. E. L. Newcomb, made a special study of drug powders and reported that

commercial milling methods made it impracticable to specify too narrow a limit for powdered drugs. In any unmanipulated sample there would necessarily be a considerable proportion which would be finer than the specified size. The U. S. P. X therefore established the following specifications:

"A *coarse powder* (No. 20) is one in which all of the particles will pass through a No. 20 standard mesh sieve and not more than 40 per cent through a No. 60 standard mesh sieve.

"A *moderately coarse powder* (No. 40) is one in which all of the particles will pass through a No. 40 standard mesh sieve and not more than 40 per cent through a No. 80 standard mesh sieve.

"A *fine powder* (No. 60) is one in which all of the particles will pass through a No. 60 standard mesh sieve and not more than 40 per cent through a No. 100 standard mesh sieve.

"A *very fine powder* (No. 80) is one in which all of the particles will pass through a No. 80 standard mesh sieve".

For determining uniformity of degree of fineness of a powdered vegetable drug, the standard testing sieves which meet the requirements of the Bureau of Standards, U. S. Dept. of Commerce shall be used. These specifications for standard sieves are:

Specifications for Standard Sieves

Sieve No.	Sieve opening in millimeters	Wire diameter millimeters	Tolerance in average opening
10	2.000	0.760	±3%
20	0.840	0.420	±5%
40	0.420	0.250	±5%
60	0.250	0.162	±6%
80	0.177	0.119	±6%
100	0.149	0.102.	±6%

For very fine powders, bolting cloth is often used for the sifting medium, although sieve cloth No. 300 size or even smaller is now available. When acid substances are to be sifted, horsehair sieves are used.

Gruffs and Tailings—In powdering drugs there is frequently a small portion which is not easily reduced to powder; with reference to this, the Pharmacopœia directs the following procedure: " In the preparation of ground or powdered drugs, no portion of the drug shall be rejected during milling or sifting unless specifically permitted under the official description of the drug. It is permissible, however, to withhold *final tailings* not exceeding 5 per cent of the drug being powdered, which may be added in no greater percentage to other lots of the same drug in subsequent millings".

CHAPTER XIII

SOLUTION

Solution—In pharmacy this term is applied to the process whereby any substance, sometimes called a *solute*, is liquefied or made to disappear when brought in contact with a liquid. The particles of the substance, being uniformly diffused through the liquid, do not separate upon standing. The liquid used to effect this change is called a *solvent*, and, the combination with the dissolved substance, a *solution;* if the liquid has exercised its powers as a solvent to its utmost extent, and is incapable of retaining any more of the dissolved substance, it is termed a *saturated solution*. A substance which is not acted on by a solvent is said to be *insoluble*. This term is often used in a relative sense to indicate a negligible degree of solubility.

All substances are not soluble to the same degree nor do all solvents have the same effect upon a given substance. Solubility is usually expressed in mathematical terms, although for the sake of convenience certain arbitrary terms have come into use in pharmacy and medicine to indicate the degree of solubility of a substance in water (see page 175). Unless otherwise stated, water is assumed to be the solvent when no other liquid is mentioned.

The expressions "*soluble in*" and "*dissolved by*" are not exactly synonymous as correctly used in scientific descriptions. "*Soluble in*" implies solution without chemical decomposition. "*Dissolved by*" implies that chemical reaction has taken place. Thus it is correct to say that sugar is soluble in water, but it is not correct to say that zinc is soluble in hydrochloric acid. The correct statement here would be: zinc is dissolved by hydrochloric acid.

When a solution is perfectly homogeneous and when the dissolved substance is found by physical and chemical tests to be dispersed in the molecular condition, the solution is said to present a *single phase* and is known as a *true, simple,* or *molecular solution*. It is this type of solution that will be discussed in the pages immediately following. In a simple solution the solid suffers no change in its identity on being dissolved, and if the reverse operation of evaporation is applied, the solid substance is recovered with its identity unchanged. The making of solution of potassium hydroxide, and of solution of boric acid are examples of simple solution.

Another form of solution is known as a *chemical solution*. Here the identity of the dissolved body is changed by the action of the solvent or of other ingredients in the solution, and the simple process of evaporation does not yield the original substance or substances. The making of solution of ammonium acetate or of solution of magnesium citrate are examples of chemical solution.

There is still another type of solution which is known as *colloidal*. This type will be discussed later under the heading, *Colloids* (see page 184).

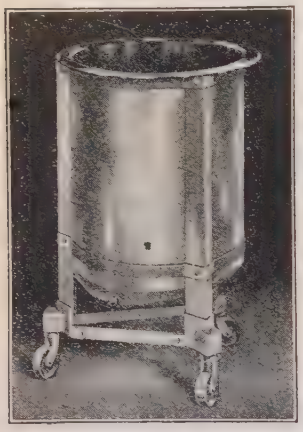
Solution of Solids—This operation is frequently performed by the pharmacist. In this place only the methods of effecting the solution of solid bodies which can be entirely dissolved in the solvent will be considered. This excludes the operations of infusion, decoction, percolation, maceration, etc., which will be considered at length in subsequent chapters.

Effects of Pulverization and Agitation—The solution of a solid may be facilitated by pulverizing it and also by agitating it in contact with the solvent. This increases the extent of surface exposed to the solvent and promotes the

frequent contact of the surface with fresh portions of the solvent. This is easily illustrated, as already noted in the chapter on comminution, by placing half an ounce of lump alum and half an ounce of powdered alum each in a separate pint of water at the same time. A few vigorous stirs will soon cause the latter to dissolve, while the former will require a much longer time even if continuously agitated.

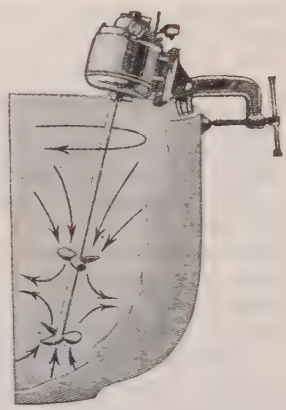
Fig. 260 illustrates a portable, glass-lined tank, made by the Pfaudler Chemical Company, for preparing solutions and Fig. 261 a portable agitator sold by the Alsop Engineering Company. Such an equipment greatly facilitates the making of solutions on a large scale.

Fig. 260



Portable glass-lined tank

Fig. 261



Portable agitator

Effect of Heat—The application of heat generally increases the degree of solubility, for nearly all substances are more soluble in hot solvents than in cold ones. In addition to this, the convection currents in the liquid caused by heat hasten solution by constantly bringing fresh surfaces into contact with the liquid.

Density of Solutions—The effect of dissolving a solid body, specifically heavier than the solvent, is always to increase the density of the liquid in which the solid is dissolved. The specific gravity of water is 1.000. If 5 per cent of sucrose or sugar, which has a specific gravity of about 1.60, is dissolved in it, the specific gravity of the resulting solution is 1.021; if 10 per cent, 1.070; if 20 per cent, 1.088, etc. This increase of density is capable of optical proof, for if any very soluble substance is suspended near the surface of some water in a transparent glass vessel, the downward currents of the solution can readily be noticed if the experiment is viewed by transmitted light.

Solubility of Substances in Saturated Solutions—While a saturated solution is one which is incapable of dissolving any more of the substance which was dissolved in the liquid, it must not be assumed that the saturated solution will not dissolve other solids. In fact, saturated solutions of some substances are better solvents for certain other substances than the plain solvent would be. A saturated solution of potassium iodide for example, is an excellent solvent for iodine, which by itself is scarcely soluble at all in water.

Reduction in Temperature Caused by Rapid Solution—When a solid dissolves rapidly in a liquid without chemical action, a reduction in temperature always takes place, and cold is produced, in accordance with the law governing the conversion of solids into liquids, whereby sensible heat is converted into latent heat. This is a frequently observed phenomenon at the prescription counter when a saturated solution of potassium iodide or of some other soluble salt is made. The so-called *freezing mixtures* are produced by utilizing this principle. Thus, if 5 parts of potassium sulphocyanide are quickly mixed with 4 parts of cold water, the temperature of the solution falls to −20° C. (−4° F.); 32 parts of sodium chloride, if mixed

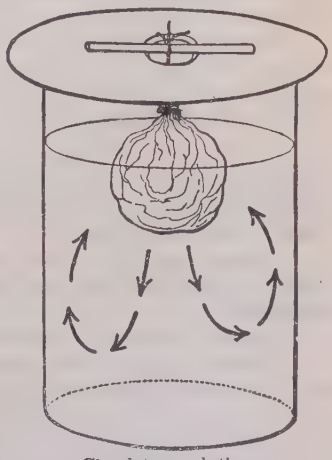
with 100 parts of finely chopped ice, will produce a brine having a temperature of −23° C. (−9.4° F.). Equal parts of crystallized calcium chloride and finely chopped ice, when well mixed, will have a temperature as low as −45° C. (−49° F.).

Elevation of Temperature Produced by Solution Accompanied by Chemical Action—If chemical action or hydration takes place while solution is progressing, the opposite effect, or elevation of temperature, is frequently produced, as when some oxides are dissolved in aqueous solutions of acids and in dissolving certain anhydrous salts in water. Sodium iodide, although chemically analogous to potassium iodide, liberates heat when it dissolves in water. This is due to the fact that there is but one form of potassium iodide, the anhydrous form. Sodium iodide however, exists not only in the anhydrous form but in the form of a compound containing two molecules of water of crystallization and it is in the transformation of the anhydrous to the hydrated form that the heat is produced.

Modes of Effecting Solutions of Solids—The method usually employed by the pharmacist when a chemical salt is to be dissolved in water in compounding a prescription is one which requires the use of the solution mortar and pestle (see Fig. 213). The ordinary practice is to crush the substance into fragments in the mortar with the pestle, and then pour the solvent upon it, meanwhile stirring with the pestle until solution is effected. If definite quantities are used, and the whole of the solvent is required to dissolve the given weight of the salt, a portion only of the solvent should be added at first, and when this is saturated the solution is poured off and a fresh portion of solvent added. This operation is repeated until the solid is entirely dissolved; the solutions are then mixed. Other methods of effecting solution are to shake the solid with the liquid in a bottle or flask, or to apply heat to the substances in a suitable vessel.

With hygroscopic compounds like pepsin, scaled iron salts, argyrol, and some others, the best method of effecting solution in water is to pour the substance directly upon the surface of the water in which solution is to be effected and then stir vigorously with a glass rod. If the ordinary procedure, such as using a mortar and pestle, is employed with these substances, gummy lumps are formed which are exceedingly difficult to dissolve.

Fig. 262



Circulatory solution

The *solubility* of chemicals and the *miscibility* of liquids are important physical factors for the pharmacist to know as they often have a bearing upon the intelligent and proper filling of prescriptions. Mainly for the information of the pharmacist the U. S. P. gives figures to indicate the degree of solubility or miscibility of the various official substances.

Circulatory Solution—A very satisfactory method of dissolving substances, is to suspend the solid near the top of the liquid upon a porous diaphragm or a suitable retaining device, or to tie it in a gauze bag if its nature will permit of this treatment. The substance immediately in contact with the solvent is dissolved, and the solution descends, its place being supplied by fresh portions of the solvent. A circulation is thus created and solution facilitated (see Fig. 262).

Solvents Used in Pharmacy—*Water.* The most useful of all solvents is water. It has a more extensive range of solvent action than any other liquid, and the aqueous solutions are among the most important preparations of pharmacy. They are especially treated in later chapters, under the heads of Liquores, Aquæ, Syrupi, etc. Water is also the best solvent known for most inorganic salts. As a diluting medium for other solvents with which it is miscible, as alcohol, glycerin, etc., water is indispensable in many preparations.

Alcohol, as a solvent, is next in importance to water. It has an important advantage over water in the fact that preparations made with it keep almost indefinitely, while most aqueous solutions of organic substances soon decompose or become worthless. Resins, volatile oils, alkaloids, glucosides, etc., are dissolved by alcohol, while many inert principles, like gum, albumin, and starch, are insoluble in it, so that it has also great usefulness in its negative character. Mixtures of water and alcohol, in proportions varying to suit specific cases, are exceedingly common. They are often referred to as *hydroalcoholic* solvents or *menstrua.*

Glycerin is an excellent solvent, although its range is not so extensive as either of the preceding. It has in its concentrated state preservative qualities of a high order, but has not the valuable negative qualities of alcohol. It dissolves the fixed alkalies, a large number of neutral salts, and vegetable acids, pepsin, tannin, and some other active principles of plants, etc., but it also dissolves gum, soluble carbohydrates, starch, etc., and thus its solutions are generally loaded with inert constituents. It is also of special value as a simple solvent as in glycerite of phenol, or where the major portion of the glycerin is simply added as a preservative and stabilizer of solutions that have been prepared with other solvents. (See Glycerites and Fluidglycerates.)

A certain group of solvents which do not mix with water are known as *immiscible solvents.* The more important of these are ether, petroleum benzin, chloroform, carbon disulphide, benzene, and carbon tetrachloride.

Ether is a good solvent for special purposes. Oils, fats, resins, and some of the alkaloids and neutral principles are dissolved by it. It is one of the solvents used in making prepared oleoresins.

Petroleum Benzin is very similar in its solvent properties to ether. It is frequently used in pharmacy to remove inert and objectionable fatty and waxy constituents from such drugs as opium, digitalis, strophanthus, lactucarium, etc., prior to extracting the active principles with a hydroalcoholic menstruum.

Chloroform resembles ether and petroleum benzin as a solvent. It has an advantage over both, however, in not being inflammable. It is used in preparing solution of gutta percha and several N. F. solutions of resinous substances (see page 342).

Carbon Disulphide is an excellent solvent for rubber, phosphorus, etc. Its range is limited, however, and its odor and inflammability detract from its usefulness.

Carbon Tetrachloride is a valuable non-inflammable solvent for fats, oils, etc.

Coal-tar Benzene has solvent properties similar to those of the majority of the other immiscible solvents.

Acetone is not an immiscible solvent but stands midway between alcohol and ether in its solvent action. It was used officially as a solvent for extracting the prepared oleoresins but has been replaced by ether for this purpose for economic reasons.

Acid and *alkaline* solutions are sometimes used as solvents for special cases.

Oils are also used as solvents in liniments, etc.

New Solvents—In consequence of the stimulation of organic chemical research brought about by the World War, and the coincident rise in price of tax-paid alcohol due to the passage of the Prohibition Amendment, many new solvents have made their appearance and most of these are now available in large quantities and in prices below that of tax-paid alcohol. For special technical uses unconnected with the preparation of official medicinal preparations many of these are finding a place, and inasmuch as the fields of research connected with the use of these solvents is bound to grow in the near future it is considered advisable to include a list of these solvents, classified in order of their volatility.

Solvents boiling below 100°C.: Acetone, benzene, ethyl acetate, ethyl alcohol (anhydrous), ethyl propionyl, isopropyl alcohol, methyl acetate. Solvents boiling at about 125° C.: Amyl acetate, amyl alcohol, butyl acetate, butyl alcohol, diethylcarbonate, ethyl butyrate, toluene. Solvents boiling between 150° and 200° C.: Benzyl alcohol, diacetone alcohol, diethyl oxalate, ethyl acetoacetate, ethyl benzoate, ethyl lactate, xylene. Solvents boiling at about 300° C.: Diamylphthalate, dibutylphthalate, dibutyltartrate, diethylphthalate, diethyltartrate, triacetin, tricresylphosphate, triphenylphosphate.

Solubility as a Test—The solubility of a substance in various solvents constitutes a factor whereby its identity and purity can, in some degree, be determined, but the U. S. P. X has recognized the fact that the degree of solubility of the various official substances is primarily valuable as information required by physicians and pharmacists in connection with the preparation and dispensing of medicines. The U. S. P. makes the following statement concerning solubility as a physical factor.

"The following points must be observed in the accurate determination of solubilities: 1. Purity of both the dissolved substance and the solvent is essential, since impurities in either effect the solubility to a greater or less extent. 2. Constancy of temperature must be accurately maintained during the course of the determination. 3. Complete saturation must be secured. 4. Accurate analysis of the saturated solution and correct expression of the results are imperative. In connection with the above named essential features of a correct solubility determination, attention should be called to the varying rates of solution of different compounds, and to the marked effect of the degree of fineness of the particles upon the time required for the saturation of the solution. In general, it may be said that an equipment comprising a thermoregulator and a constant agitation device is indispensable for accurate solubility determinations.

"The solubility data given throughout this volume have for the most part been determined under the above described conditions, and will, therefore, frequently show a somewhat greater solubility than would be found in the daily experience of most pharmacists.

"When in Pharmacopœial texts it has not been possible, or in some instances not desirable to indicate exact solubility, a descriptive term has been used. The following table indicates the meaning of such terms:

	Amount of solvent in one part of solute
Very soluble	Less than 1 part.
Freely soluble	From 1 to 10 parts.
Soluble	From 10 to 30 parts.
Sparingly soluble	From 30 to 100 parts.
Slightly soluble	From 100 to 1000 parts.
Very slightly soluble	From 1000 to 10,000 parts.
Practically insoluble	More than 10,000 parts.

TABLE OF THE SOLUBILITY OF OFFICIAL SUBSTANCES

Terms used and their relative values

Abbreviations

	Solvent
v. s. = Very soluble	Less than 1 part.
fr. sol. = Freely soluble	From 1 to 10 parts.
sol. = Soluble	From 10 to 30 parts.
sp. sol. = Sparingly soluble	From 30 to 100 parts.
sl. sol. = Slightly soluble	From 100 to 1000 parts.
v. sl. sol. = Very slightly soluble	From 1000 to 10,000 parts.
pract. ins. = Practically insoluble	More than 10,000 parts.

Other abbreviations:
alm. ins. = Almost insoluble.
dec. = Decomposed.
inc. sol. = Incompletely soluble.
ins. = Insoluble.
m. r. sol. = More readily soluble.
m. sol. = More soluble.
n. ins. = Nearly insoluble.
p. sol. = Partially soluble.
r. sol. = Readily soluble.

"*Method for Determining Solubilities.*—In brief, this consists in preparing a saturated solution of the given substance and ascertaining, by analysis, the amount present in a definite quantity of the solution. Complete saturation can be attained most readily by constant stirring or agitation by means of a suitable mechanical contrivance. A simple apparatus for this purpose consists of a test tube of medium size fastened upright in a water bath maintained at constant temperature. The solvent and excess of solids are placed in the tube and stirred by means of a motor-driven rotating glass spiral. After a given period of stirring, a definite weight of the clear solution is analyzed and the stirring continued for an additional period of several hours. If analysis shows no increase of dissolved substance after the second period of stirring, the result is to be taken as the solubility at the particular temperature. Minute details of methods for determining solubilities are described in Bulletin No. 67 of the Hygienic Laboratory, U. S. Public Health Service".

The U. S. Pharmacopœia indicates the degree of solubility of a chemical substance by stating the number of cc. of solvent which will be required to dissolve 1 Gm. of the substance. The temperature at which solution is to be effected is frequently given.

Solution of Gases in Liquids

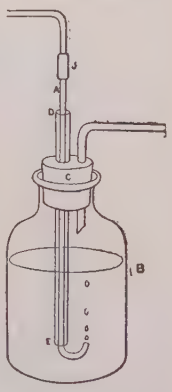
When gases dissolve in liquids, they sometimes do so to form simple solutions as in the case of chlorine water and hydrochloric acid. The majority of such solutions, however, are chemical solutions. These may be divided into two classes, *i. e.*, those in which the original gas is recovered on heating, as in carbonic acid water ("soda water"), solution of sulphurous acid and of ammonia water, and those in which the original gas is not recoverable by simple heating, as in nitric acid and in sulphuric acid. Some gases dissolve to form solutions having a specific gravity less than 1.000, for example, ammonia gas; others form solutions which are heavier than water, as hydrochloric acid.

The methods employed to effect the solution of gases in liquids differ essentially from ordinary processes of solution, and depend upon the solubility of the gas in the liquid, the relative specific gravity, and the strength of the solution desired. It is usually sufficient to conduct the gas into the liquid by a suitable tube, reaching nearly to the bottom, when more or less of the gas is absorbed by the liquid. This operation should always be conducted in a fume chamber or in some location where escaping gases will not be offensive or dangerous. For a continuous operation, as in making hydrochloric, nitric, and hydrobromic acids, and similar liquids, the well-known Woulff's or three-necked bottles, see Fig. 263, are employed advantageously, the gas which escapes solution in one bottle passing over into the next. The washing bottle shown in Fig. 264 is easily made, and well adapted for purifying gases prior to final absorption. *B* is an ordinary wide-mouthed bottle, closed with a perforated rubber stopper, *C*; a wide tube, *DE*, passes nearly to the bottom, and a narrow tube, *A*, is joined by a short piece of rubber tubing, *J*, to the tube leading from the generating flask, and at the other extremity is curved upward so as properly to deliver the gas into the water placed in the bottle

Fig. 263

Woulff's bottle

Fig. 264

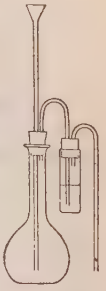


Wash bottle for gases

to wash it. It escapes by the bent tube, T, which is continued until it dips into the liquid in which the gas is to be dissolved. The space between the tube A and the wide tube DE acts as a safety valve. If the pressure accumulates through the too rapid generation of the gas, or if a stoppage occurs in the delivery tube, the liquid in the bottle is first blown out through this space, and the pressure is thus relieved.

Fig. 265 shows a very convenient apparatus for generating and washing small quantities of gases, for applying emergency tests, or for other purposes. As the apparatus suitable for each operation must be especially selected, general observations on the solution of gases will not be so useful in this chapter as a detailed process in connection with each preparation where it is described in the subsequent pages. One general rule should be noted, however,—*i. e.* that gases are always more rapidly and thoroughly absorbed by cold rather than by hot liquids. Hence the receiving bottle should be kept surrounded by ice or otherwise refrigerated.

Fig. 265



Gas generator

Solutions of gases are almost always potentially dangerous when exposed to warm temperatures on account of the liberation and expansion of the dissolved gas which may cause explosion or accident through the bursting of the container. Bottles containing such solutions should be cooled before opening if practicable, and the stopper should be covered with a cloth before attempting its removal.

CHAPTER XIV

COLLOIDS AND DIALYSIS

The term *colloid* was first used in 1861 by J. Graham to describe certain jelly-like substances which were incapable of passing through moist parchment under certain specified conditions. The opposite of the term colloid, as used by Graham was *crystalloid*, and the colloids and crystalloids were discussed for many years in pharmaceutical and chemical literature, in connection with the operation known as dialysis, in which a diaphragm of parchment, or some similar membranous film or sheet was employed for the separation of these two classes of substances. The term *osmosis* came to be used by biologists to describe the diffusion through membranes, which takes place in natural tissues of plants and animals, as well as in laboratory experiments; the term *exosmosis* meaning outward-diffusion and *endosmosis* meaning inward diffusion.

About 1905 the increasing attention given to physical chemistry led to the invention by Zsigmondy and Siedentopf of what is known as the ultra-microscope, which enables objects too minute to be seen by the most powerful magnification under direct illumination, to be rendered indirectly visible by illumination at right angles to the field of vision. The employment of this instrument in studying suspensions and solutions gave an impetus to the subject of *colloidal chemistry* as it has now come to be called.

It is now recognized that colloids do not exist as a distinct class of substances, but that the term colloid is correctly applied to a state of matter in which, by infinite subdivision and dispersion, some remarkable properties are developed.

Collodial chemistry may be defined as the chemistry which deals with matter in a finely subdivided state, in which, however, the particles are larger than molecules.

The smallest particle which can be seen under the highest magnification of the ordinary microscope by direct illumination is about 0.5μ (the μ is called the micron, and is $\frac{1}{1000}$ of a millimeter). The ultra-microscope renders visible particles which are fifty times smaller than the foregoing figure or $10\mu\,\mu$ (a $\mu\,\mu$, called *micro-micron*, is $\frac{1}{1000}$ of a micron). The largest molecules are smaller than $1\,\mu\,\mu$, and up to the present have never been seen by any power of magnification. Fig. 266 illustrates a comparison of the sizes of molecules of several common substances, with the sizes of particles of colloidal gold and the sizes of particles that may be taken as indicative of those in a mixture where there is no colloidal suspension. These comparisons are taken from "The Chemistry of Colloids" by Zsigmondy.

In a true or molecular solution there is perfect homogeneity throughout. In what is known as a colloidal solution there is a suspension or *dispersion* of one substance in another.

The substance that is so subdivided is known as the *disperse phase;* the substance that gives bulk and continuity is known as the *dispersion* medium. Some authorities refer to these two factors as the *dispersed phase* and the *continuous phase*, respectively.

Solutions differ from mixtures in that, by filtration the suspended substance is removed from the latter.

Colloidal solutions resemble true or molecular solutions in that filtration removes nothing from them.

We may have a continuous gradation from mixtures to true solutions. This is illustrated by the following diagram:

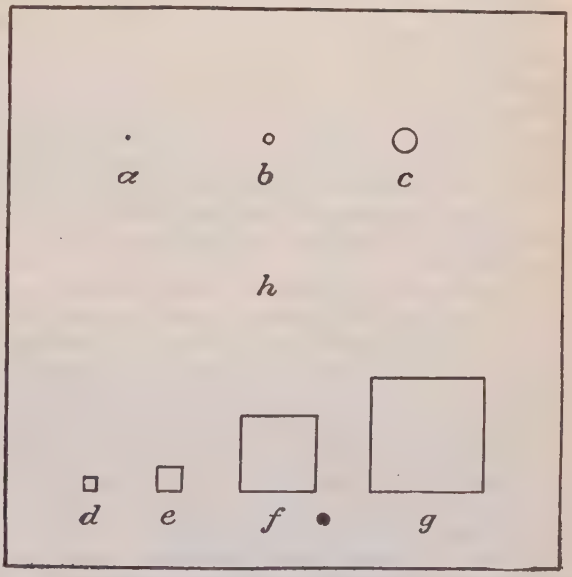
Mixtures	Colloidal solutions	Molecular solutions
Particles greater than 0.1μ; do not pass through filter paper; can be seen by direct illumination with the microscope; not dialyzable.	Particles ranging in size from 0.1 to $1\mu\mu$; easily pass through filter paper; can only be seen by use of ultramicroscope; not dialyzable.	Particles smaller than $1\mu\mu$; easily pass through filter paper; cannot be seen with microscope; are dialyzable.

One of the phenomena by which colloidal solutions may usually be distinguished from true or molecular solutions, without the aid of a microscope is due to the fact that colloidal solutions show an apparent condition of turbidity or cloudiness when viewed by reflected light, while by transmitted light they are perfectly transparent.

A simple and interesting experiment, by which both a colloidal solution and a molecular or true solution may be prepared, using the same ingredients but varying the temperature, may be carried out as follows:

In each of two 500 cc. flasks place 490 cc. of water. Heat one of these until the water begins to boil, allowing the other to remain at room temperature. Add to each of the flasks 10 cc. of official solution of ferric chloride. Observe the difference. In the flask containing the cold water, the ferric chloride will produce a molecular solution, very pale yellow in color and perfectly transparent in all lights. In the flask which contained the boiling water, the solution will be found to be deep red in color by transmitted light, with a pronounced appearance of turbidity when viewed by reflected light.

FIG. 266



Comparison in size of colloidal particles and molecules
Scale 1: 1,000,000
a. Hydrogen molecules.
b. Chloroform molecules.
c. Hemoglobin molecules.
d, e, f, g. Particles in colloidal gold.
The enclosing square indicates the comparative size of particles in a mixture in which there is no colloidal suspension

The effect of minute subdivision in changing physical properties is remarkable. A cubic inch of gold has a surface area of 6 square inches. By subdividing it to the point where its particles are of colloidal dimensions it is found by calculation that the surface area has increased to over one square mile, and that the particles are no longer subject to the law of gravitation, but form a colloidal suspension, or solution, deep red by transmitted light and showing apparent turbidity by reflected light, in which the particles remain suspended indefinitely and cannot be removed by the finest filtering mediums.

The colloidal state of matter occurs in a great variety of combinations. These may be tabulated as follows, stating first, the dispersion medium and second, the dispersed phase, and giving examples of each:

1. Gaseous—liquid	Mists—Fogs.
2. Gaseous—solid	Smokes—cosmic dust.
3. Liquid—gaseous	Foams.
4. Liquid—liquid	Emulsions.
5. Liquid—solid	Suspensions (ordinary colloidal solutions).
6. Solid—gaseous	Solid foams.
7. Solid—liquid	Solid emulsions.
8. Solid—solid	Solid suspensions.

Some of these classes are of scientific interest only, but classes four and five are of great importance in pharmacy. Emulsions will be considered later in Part XI, under The Prescription Pharmacist.

One of the interesting facts in connection with colloidal solutions is the constant vibratory motion of the suspended particles. This phenomenon was observed in 1827 by an English botanist named Brown, in the case of fine powders suspended in water, and is known to microscopists and physicists as the "*Brownian movement*". The ultra-microscope reveals the particles in a colloidal solution in a similar state of vibratory oscillation or motion and the fact may account for the indefinite suspension of the particles.

Colloidal solutions in water are called "*hydrosols*". In some rare instances other dispersion mediums are used and are called by appropriate names as "*alcosol*", etc.

A noteworthy property of many colloidal solutions is to leave a jelly-like residue upon concentration. These are frequently called *hydrogels*. In some cases the gelatinous or even dry residue possesses the property of resuming the colloidal state of dispersion when the lost water is replaced. These are called "*reversible sols*" or "*reversible gels*" as the case may be. If the dried residue does not reproduce a colloidal suspension, it is called *irreversible*.

Coagulation, *flocculation*, or *precipitation* sometimes takes place in colloidal preparations, in which the colloidal character is entirely lost. This is always an irreversible change, and is frequently produced by the addition of an electrolyte or ionizable salt to the preparation.

Under favorable conditions some solid or gelatinous residues undergo changes in the presence of water and other constituents, whereby they are transformed into colloidal dispersions. This phenomenon is called *peptization*.

The term *suspensoid* is sometimes applied to the solid disperse phase, while the corresponding term *emulsoid* is applied to the liquid disperse phase in a colloidal suspension.

Some colloidal substances are inherently so, and we know of them in no other form. Many of this class possess the property of communicating the colloidal property to compounds or substances not normally possessing it. These are known as *protective colloids*.

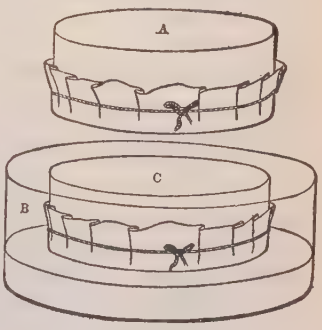
From the foregoing fundamental facts it will be appreciated that the colloidal state of matter is very common, and that it has a widespread range of possibilities. The color of gems and of ruby glass, the iridescence of the butterfly's wings, are a few instances of the effects produced by the colloidal state. The industries of rubber, of tanning, of clays, soils, and cements are but a few of the practical possibilities in connection with the study of colloids, for all of these industries have been benefited by the application of scientific principles based upon the study of colloids.

One of the phenomena connected indirectly with colloidal chemistry is that

of adsorption. Adsorption differs from absorption in that, in the latter case, a substance is simply taken into a porous medium and the degree of absorbability is simply one of volume, while in adsorption there is a manifestation of surface energy, and dissolved solids or gases are concentrated on the surface of the adsorbing agent. Adsorption plays an important part in decolorization (see page 213).

A very practical application of colloidal chemistry, as this branch of study is called, is concerned with the separation of colloids from substances which are not colloidal by placing a liquid in which both are present upon a suitable diaphragm which has its under surface in contact with water.

Fig. 267

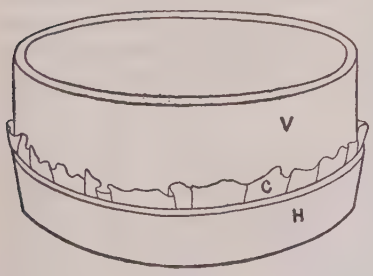


Dialyzer

A thin layer of gelatin interposed between two liquids offers no obstacle to the passage of the crystalloids from one to the other, while it completely prevents the passage of the colloids. This property belongs not only to gelatin, but to other substances, as bladder, parchment, parchment paper, and collodion film.

Upon the principles stated above Professor Graham contrived a very simple apparatus which he called the dialyzer (see Fig. 267). It consists of two parts, one a circular glass recipient *B*, about a foot in diameter and six inches deep, the other *A* a similar circular vessel, from six to ten inches in diameter and about two inches deep, made of hard rubber, celluloid, glass, or some similar substance, and the bottom covered with a circular piece of the material selected for the dialyzing diaphragm or septum, the edges of which are brought over the lower rim of the inner vessel nearly to the top and fastened securely outside of it by a string. The outer part, or circular basin, should contain distilled water in an amount from five to ten times the quantity of the liquid that may be introduced into the smaller vessel. The latter is to float upon the surface of the water in the former, and is to receive the liquid to be submitted to dialysis, which should not be more than half an inch deep. It is important that the diaphragm employed should have no defects, and should be brought well up and secured on the outside of the inner vessel to prevent the escape of liquid. If any liquid containing a mixture of colloidal and crystalloidal matter be placed in the floating vessel, after some hours it will be found that a portion of the latter has passed through the parchment paper, and is held in solution by the distilled water of the larger vessel, while the colloidal matter remains in the inner vessel and is called the *dialyzate*. The solution in the outer vessel is called the *diffusate*. The process is applicable to the dialysis of substances held in aqueous solution only, and will not answer for alcoholic or ethereal liquids. The hard rubber sieve, which has already been described (see Fig. 268), makes an excellent dialyzer if floated upon pure water in an evaporating dish or beaker. Fig. 269 shows another form in which the glass dialyzer has its upper edge expanded into a flat shoulder which rests upon the upper edge of the round dish, sometimes called the

Fig. 268



Dialyzer

"exarysator", containing the water. This has the advantage of keeping the diffusate covered while the dialysis is progressing. It is obvious that very different arrangements might be made to accomplish the same ends. Thus, a thoroughly clean bladder three-fourths filled with a mixture, suspended in a jar of distilled water, would yield similar results. Graham's apparatus is preferable to others only for its convenience. Collodion films have been largely used in laboratory experimental work.

The following applications of the process of dialysis have been made: 1. It facilitates in many instances to a considerable extent the separation of the active matter of any artificial or natural mixture from the inert and useless, the former being very often crystalline and the latter colloidal. In effecting the purification of organic chemicals, one of the most embarrassing problems is to get rid of contaminating impurities, and the process of dialysis may here often be brought to the aid of the operator. 2. In searching for poisons in organic mixtures, as in stomach contents, in which the application of tests is hindered by the colloidal matter present, the problem of the presence of the poison may sometimes be solved by submitting the suspected matter to dialysis. The poison, if diffusable, will be found in the diffusate separated from the other matters, and may then be detected by the application of appropriate tests, after concentration. 3. An application was formerly made of the process in the restoration of salted meat to a comparatively fresh state. If some salt beef with its brine is enclosed in a bag of material suitable for dialysis, as of untanned leather, and the bag immersed in sea water, in the course of some days the beef will have been rendered sufficiently fresh for use, the salt having passed out into the sea water. A number of extensively used forms of medicine are colloidal in character. *Colloidal silver, colloidal iron, colloidal bismuth, calomel, gold, copper, iodine,* etc., are all known and used. Such of these as are of importance will be discussed under their appropriate headings.

FIG. 269

Dialyzer (glass)

Dialyzed iron, or *Ferrum Dialysatum,* is a colloidal preparation made by placing a mixture of basic ferric chloride and ammonium chloride upon a dialyzing septum. The crystalloids (ammonium chloride and ferric chloride), with any free acid, pass into the diffusate, leaving the neutral colloidal liquid upon the septum. The resulting preparation is a colloidal form of ferric hydroxide and was at one time extensively used, but its instability led to its discontinuance.

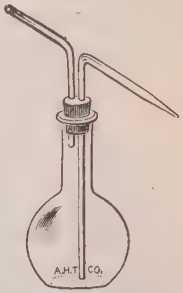
CHAPTER XV

SEPARATION OF FLUIDS FROM SOLIDS

THE operations considered under this head are among those which are most frequently used in pharmacy,—*i. e.*, Lotion, Decantation, Colation, Filtration, Clarification, Expression, Percolation, etc.,—and the principles which govern the successful performance of these practical processes should be well understood. They are almost exclusively mechanical processes.

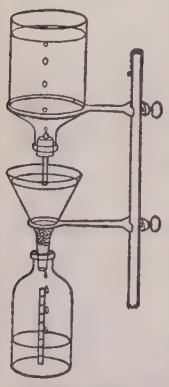
Lotion, or Displacement Washing is the process of separating soluble matter from a solid by pouring a liquid upon it which will dissolve and wash out the soluble portion. The separation of the fluid from the solid is generally effected by placing an obstruction in a funnel or cylindrical vessel, such as a pledget of cotton, notched cork, filter paper, etc., and then, having introduced the solid into the funnel and arranged a suitable vessel beneath, the liquid is poured upon it. (See Percolation.) Precipitates are frequently freed from contaminating soluble matter in this way. A very convenient method of applying the liquid is by the use of the spritz bottle (see Fig. 270). This is usually made from a flask, but a round shouldered pint bottle of the diameter most easily grasped by the hand is very satisfactory. Two glass tubes, one bent at an acute angle and the other at an obtuse angle, are used; one end of the former is drawn out to a capillary orifice, and the other extends nearly to the bottom of the bottle. The obtuse angled tube merely enters the bottle below the stopper; the upper portion of this tube should be held in the gas flame, so as to fuse the edges of the glass and thus prevent cutting the lips when it is used. By filling the bottle with liquid, and blowing with the mouth through the tube, a stream of liquid is ejected from the capillary orifice which can be directed to any portion of a solid substance that is to be washed. It is often desirable, in order to save time, to use the liquid hot. For that purpose, in an active laboratory, the spritz bottle may be kept on the water bath. The neck of the hot water spritz flask should be covered with some insulating material such as wicker, to prevent burning the fingers during its handling.

FIG. 270



Spritz bottle

FIG. 271

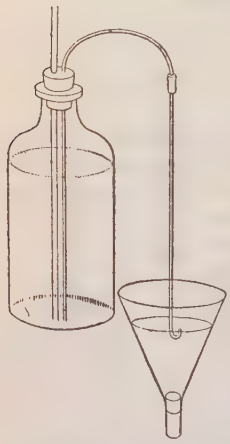


Continuous washing

Continuous Washing—The use of the spritz bottle for small operations is convenient. A simple method of automatically supplying the wash liquid in larger quantities is shown in Fig. 271. This requires no attention from the operator except at the beginning of the operation. The bottle is furnished with a perforated stopper and a short glass tube. All that is necessary is to fill the bottle and adjust it over the funnel so that the end of the tube shall be at the height desired for the liquid. On tilting the bottle slightly (if the tube selected is not too narrow in diameter) the liquid will run out into the funnel until it rises to the orifice of the tube, when the flow will cease. As the liquid gradually passes through the solid substance in the funnel, the level falls, and bubbles of air pass through the tube into the bottle, the liquid once more flows, and the

operation continues until the upper bottle is empty. Many elaborate methods of continuous washing have been suggested, but if care is taken in the simple apparatus just described to have the tube of proper diameter, at least so wide that the force of capillary attraction shall not be strong enough to prevent the ingress of air, it is the most satisfactory of all. Bottles having narrow mouths may often be used in the same way, and the cork and tube dispensed with. A little practice will enable the operator to make an apparatus in which the parts are adjusted to a nicety. On the larger scale, two carboys may be used,—one above and inverted, containing the liquid, supported by a box having a circular hole cut in its side, and the other inside the box, containing the funnel and filter.

Fig. 272

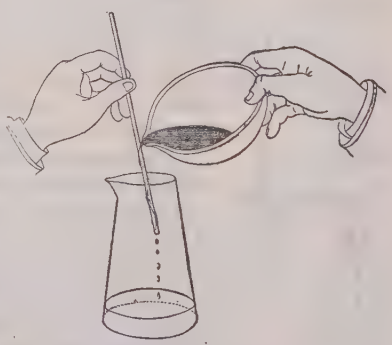


Continuous washing apparatus

A modification of Gay Lussac's apparatus is one of the most successful and practical for continuous washing (see Fig. 272). The bottle containing the wash liquid is furnished with a doubly perforated stopper and two glass tubes. One is bent as shown in the cut, and its lower extremity curved upward so that the outlet of both ends of the syphon tube are on the same level. By blowing a current of air through the other tube the syphon tube is filled, and the extremity may then be adjusted to such a height in the funnel as is desired. When the level of the liquid in the funnel falls below the orifice of the tube, bubbles of air will enter the bottle through the air tube, and the liquid will run out until it rises in the funnel to the level of the ends of the tubes, when it will cease. It will be found a practical convenience to cut the syphon tube just below the bend, so that a piece of rubber tubing may be used to form a flexible joint.

Decantation—The process of separating a fluid from a solid by decantation is very simple, and consists usually of allowing the solid to deposit at the bottom of the vessel, and then carefully pouring off the liquid by inclining the vessel. The effectiveness of decantation as a washing device, may be illustrated by the following example. If 360 grains of mercuric chloride dissolved in 50 fluidounces of water are mixed with 220 grains of potassium iodide dissolved in 50 fluidounces of water, double decomposition takes place, an insoluble precipitate of mercuric iodide subsides, and 100 grains of potassium chloride remain dissolved in the 100 fluidounces of water. As it is desirable to free the mercuric iodide from the contamination of potassium chloride, the supernatant liquid is poured off; if 90 fluidounces are decanted, 90 grains, or $\frac{9}{10}$ of the whole quantity of potassium chloride, are thus disposed of, and 10 grains are left. If the vessel is filled with water to 100 fluidounces, and 90 fluidounces are again poured off, 9 grains are again removed, and only 1 grain is left; this by a third washing and decantation in a similar manner would be reduced to $\frac{1}{10}$ of a grain, and thus the purification is speedily effected. Some skill is required to decant liquids neatly from vessels of various shapes, particu-

Fig. 273

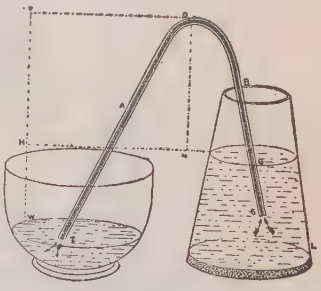


Use of the guiding rod

larly if they are not furnished with lips, or if filled nearly to the brim. The *guiding rod* may be used in many cases with effect. Indeed, it is a good practice to form the habit of using a stirrer or rod as a guide in decanting, as shown in Fig. 273, for it has a tendency to steady the hand of the operator. The practice recommended by some writers of greasing the rim of the vessel to facilitate decantation is a clumsy and usually unsuccessful expedient.

The Syphon (or Siphon)—It often happens in washing solid substances that decantation by pouring off the liquid cannot be successfully performed, either because the vessel is too full, or because, owing to the light character of the precipitate, the inclination of the vessel is sufficient to cause a disturbance in the powder, and an admixture of the liquid and solid. In such cases, and in many others, the useful instrument known as the syphon may be resorted to. This usually consists of a glass tube bent at a rather acute angle, and having one of the arms longer than the other. It is used by filling the syphon with liquid, and then inserting the short arm into the liquid that is to be drawn off, when a flow of liquid from the long arm is established, which need not cease until as much of the liquid is abstracted as is desired. After filling the syphon the liquid may be prevented from running out (if a tube of small diameter is used) by stopping up the end of the long arm with the forefinger of the right hand. If the liquid to be drawn off is not caustic or unpleasant to the taste, the short arm of the syphon may be placed in the vessel at the proper height, and suction applied by the mouth at the long end until the current is established. The principle of the action of the syphon is shown in Fig. 274. The combined lengths of the arms of the syphon are not equal to the length of the glass tube, *T O S*, but the real syphon is only the tube acting between the levels of the liquid in the vessels. In all operations with the syphon there must be a difference in the levels of the liquid.

Fig. 274



Syphon diagram

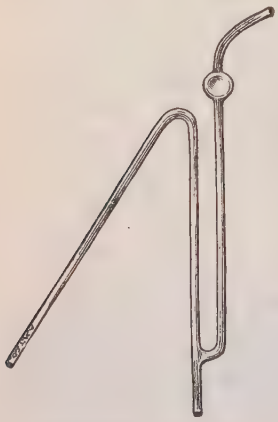
In Fig. 274, *O S* represents the liquid in the short arm, and *O T* the liquid in the long arm. It is apparent that, if a narrow tube syphon, with arms of equal length, is filled with liquid, and held level in liquid on the same plane, there can be no movement in the liquid; equilibrium is established, because the tubes are equal in length and in level liquid, and the pressure of the air is the same upon all parts of the liquid. But as the descending column of liquid in the long arm exceeds in weight that in the short arm, it follows on account of the excess of weight of liquid in this arm that if it is once set flowing through the longer arm it will continue until the levels of the liquid in the two vessels are the same. It will be observed that the custom of having one arm longer than the other is not a necessity, for if there is sufficient difference between the levels of the liquid the syphon will operate with the position of the arms reversed; but it is a convenience in a syphon of unequal arms always to immerse the short arm, as there is then the certainty that the other arm contains the longest column of liquid. The syphon, obviously, cannot be operated in a vacuum, or if the length of the upward column of water exceeds thirty-three feet.

Syphons for Special Purposes—In the larger laboratory operations the most convenient syphon is made from a six-, eight-, or ten-foot length of rubber hose. This syphon, on account of its flexibility, can be used in many operations where glass or metal would be inconvenient or inadmissible, while

its durability and simplicity of operation make it a necessity. Indeed, the utility of glass syphons is greatly increased by cutting the long arm just below the bend and joining it to the other by a piece of rubber tube.

The method, already referred to, of starting a syphon by applying suction with the mouth at the long end, or filling the syphon with liquid, is not always practicable, and various other expedients are in use. The *syphon with a bulbed lateral tube*, illustrated in Fig. 275, is used where caustic liquids are to be decanted. The finger is placed over the end of the long arm, and suction applied at the small tube until the downward current is started.

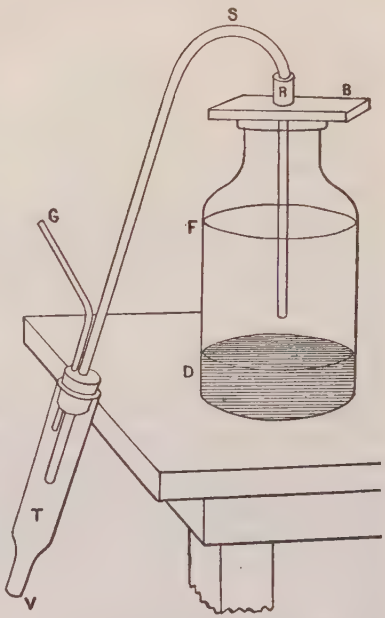
Fig. 275



Syphon with lateral tube

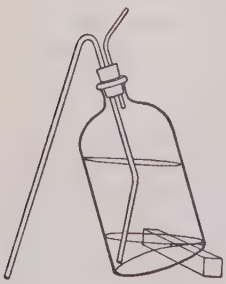
Negretti's syphon has a glass syringe attachment upon the lower part of the long arm to accomplish the same purpose. Fig. 276 represents a modification of Mohr's syphon which may be readily assembled extemporaneously. It is started like the syphon with a lateral tube, the moistened forefinger closing the lower aperture, *V*, while suction is being used at *G* until the liquid has been started. A simple glass tube, with a short piece of rubber tube attached, is in practical hands an efficient substitute for an elaborate contrivance to start the flow in a syphon; even if the liquid is caustic or disagreeable, there is no risk in careful hands if the rubber tube is held between the thumb and finger so that it can be instantly pinched tightly to prevent the upward flow of the liquid into the mouth.

Fig. 276



Syphon with starter

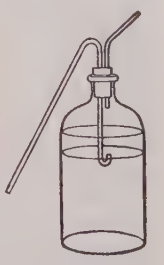
Fig. 277



Syphon in bottle

Fig. 277 represents a form of syphon for drawing off the liquid to almost the last drop in the bottle. The shorter arm of the syphon is bent, and the syphon is started by blowing through the shorter tube in the cork. Fig. 278 shows a syphon with the shorter arm "turned up". This form has the advantage of retarding the tendency to empty itself, and, in syphoning the liquid from precipitates, there is not so much danger of stirring up the particles on the bottom.

Fig. 278

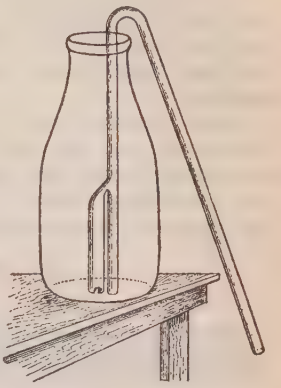


Syphon

Another form of glass tube syphon has the end sealed and a lateral opening just above the blunt sealed end. This also permits a liquid to be drawn off very closely without disturbing a sediment.

A self-starting syphon, known as a *siphonette* and made by D. R. Kasanof and Company, of New York City (see Fig. 279), admits bubbles of air to the short arm from a lateral bulb, the air lifting the liquid until the flow is established from the long arm. It is used especially for separating "top milk" but may be given general application. Other forms of self-starting syphons are on the market.

Fig. 279



Self-starting syphon

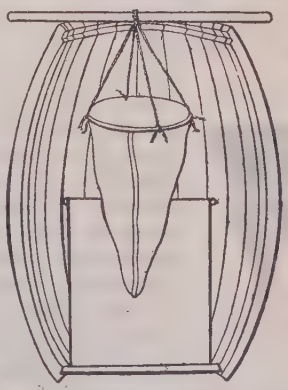
Colation, or Straining (*colare*, to strain), is the process of separating a solid from a fluid by pouring the mixture upon a cloth or porous substance which will permit the fluid to pass through, but will retain the solid. This operation is frequently resorted to for separating sediment or mechanical impurities of various kinds from liquids. Gauze, fine muslin, cotton, flannel, woolen, felt, and other fabrics are used. Strainers are employed where the solid particles to be removed are not in very fine particles, or where complete separation is not especially desired.

It is sometimes difficult to distinguish between colation and filtration for they imperceptibly grade into each other. Felt strainers usually effect a separation equivalent to filtration while even a coarsely woven fabric at times becomes a filter by the accumulation of material which fills up its pores and makes a "filter bed".

Felt strainers are usually made of felted, seamless, conical bags; the material is of wool or hair and quite thick. They form excellent strainers for melted fats, petrolatum, wax, oils, syrups, elixirs, etc., where a large quantity of substance is to be strained. Their expensiveness is, however, an objection to their use, and the difficulty of cleaning them, owing to the tenacity with which they retain odors, unfits them for general use by the pharmacists, but for special purposes in a manufacturing laboratory they are very useful.

Woolen strainers made of twilled woolen cloth, flannel blanket material, etc., are more economical, because they can be cut to any size desired, and the material costs less, and if the seams are closely sewed or overseamed they will last a long time. The form known as Hippocrates' sleeve (see Fig. 280) is that generally used. Fig. 281 shows the shape and dimensions before being sewed. A wooden hoop or brass ring is required to keep the opening extended. This should be arranged so that it can be removed when the bag is to be washed. The most convenient support is a stick passed through the cords which are attached to the strainer, the whole suspended

Fig. 282



Use of strainer]

Fig. 280

Strainer, Hippocrates' sleeve

Fig. 281

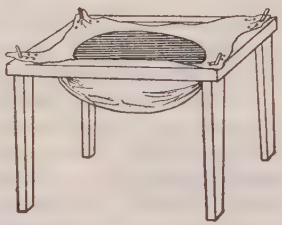
Pattern for Hippocrates' sleeve

in a barrel or tank arranged as shown in Fig. 282. The object of suspending it in the barrel is to avoid currents of air, which, in the case of many liquids, would cause evaporation from the surface and the formation of a crust, and thus impede the rapidity of colation. A tin or copper can of proper size may be placed in the barrel to collect the strained liquid.

Cotton flannel or Canton flannel strainers are cheaper than woolen, and if bleached they have the great advantage that they can be used for alkaline solutions. The unbleached cotton flannel is probably stronger, but the coloring matter naturally present, being soluble in alkalies, is apt to discolor the liquid.

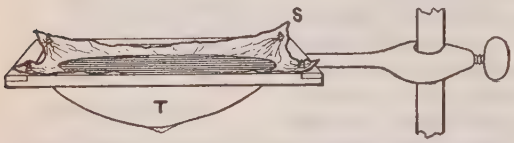
Cotton cloth or muslin strainers are generally suspended on a wooden frame, (*tenaculum*) see Fig. 283. The frame should be securely joined without glue, and at each corner there should be a strong, pointed nail projecting slightly outward. Fig. 284 shows the method of fastening the strainer to the frame.

Fig. 284



Strainer and frame (tenaculum)

Fig. 283



Cotton cloth strainer

It should be secured at each corner, first upon the permanent nails, and then two tacks at the side of each nail should be driven two-thirds of their length into the frame; this partial driving of the nail is sufficient to hold the cloth and permit of the easy removal of the tacks. A strainer hung in this way will hold more liquid and do much better work than one which is tacked all around the frame. This method of straining is particularly useful in collecting precipitates which require washing.

Colation in Smaller Operations—When solid particles are to be separated from liquids in the operations of the dispensing counter, several methods may be used. One of the most convenient is to insert a plug of absorbent cotton in the neck of a funnel and then pass the liquid through; a funnel with a circle of brass wire gauze soldered in it two-thirds of the way down is sometimes used, although not recommended, because of the difficulty of cleaning it. A very popular piece of apparatus for this purpose is shown in Fig. 285. It is a two piece funnel made of hard rubber. A piece of muslin can easily be placed between the two sections, forming a quick and convenient means of straining preparations at the prescription counter.

Fig. 285

Hard-rubber strainer

The cotton cloth used by the makers of cheese, called cheese cloth, is admirably adapted for many kinds of straining.

Fig. 286

Careless straining

In using a funnel for straining, care should be taken to see that the strainer, is not too large, for if the wet strainer projects over the edge of the funnel, a syphon action due to capillary attraction may be set up and more of the liquid delivered outside of the bottle than inside. Fig. 286 shows the action of such a strainer.

Fabrics of some kinds, particularly those of cotton, are usually treated or impregnated with a material called *sizing* to improve their appearance and quality for certain purposes. For use as a strainer this sizing material must be removed as it is always objectionable in that it fills up the pores and causes contamination. There is a wide range of substances used for sizing, some being soluble only in cold water, others only in hot water. The proper method for their removal, therefore, is first to soak the fabric for some hours in cold *distilled water*, then rinse thoroughly and cover with *distilled water* and boil for a few minutes, finally rinsing well in distilled water to carry out the last traces of the gelatin, albumin, glue, or starch which may have been present in the sizing.

CHAPTER XVI

FILTRATION

Filtration is the process of separating liquids from solids with the view of obtaining the liquids in a transparent condition. The intervention of a porous substance, called the *filter* or the *filtering medium*, to intercept the solid particles, is necessary in performing this process. The filter may be made of paper, paper pulp, sand, siliceous earth, asbestos, ground glass, charcoal, porous stone, etc. The liquid which has passed through the filter is called the *filtrate*.

Paper filters are the most useful of all filters for the pharmacist, and they are employed in all the finer operations requiring filtration. The solid particles are much more completely separated by filtration through good paper filters than through strainers, owing to the pores of the paper being smaller and more numerous. The paper used for this purpose is especially prepared, and is called *filter paper*. It is now made upon a large scale, and can be had of excellent quality. Unlike a strainer, it is rarely used more than once; its cost is so trifling, and it is so easily ruptured when wet, that it is not worth while to attempt to save filters for subsequent use. Filter paper is found in commerce in two forms,—in large, nearly square sheets, and in circular sheets. The former is used for large filters, and has some advantages, if the waste pieces can be put to use; but it is now almost universally the custom for the pharmacist to rely upon the circular sheets of different sizes. For pharmaceutical purposes the gray paper, which is made from a mixture of cotton, flax, wool, etc., answers sufficiently well for filtering drug preparations, as fluidextracts or tinctures, but, owing to the coloring matter it contains, it should never be used for any colorless or light colored chemical solutions.

It is well to form the habit of using white filter paper for all liquids that are intended to be colorless when filtered; of course, for analytical work a special quality of paper should be employed. Satisfactory filter papers are now made in this country although many pharmacists yet prefer to use French filter paper of the "Prat Dumas" brand. A high grade of white filter paper made in Sweden, by Munktell, is preferred for the process of ignition and analytical work; it yields the smallest amount of ash, and is practically free from soluble salts and impurities. The Durieux filter paper, of French manufacture, has gained great favor with careful pharmacists and chemists. It is credited with not only high quality but also unusual toughness.

The Whatman English filter papers, first produced in 1915 under difficult circumstances incident to war conditions, from the mills of W. and R. Balston, Ltd., makers of the famous Whatman drawing and other hand-made papers, successfully met a great need for quantitative filter papers during the period when other European papers were unavailable. Since that time constant improvements have been effected and maintained in all grades, and they are now very popular, particularly in the analytical laboratory.

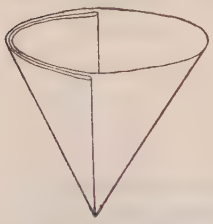
Another high grade filter paper is that produced by the firm of Carl Schleicher and Schüll, Germany. This firm also markets a serviceable filter hat of vertical shape made into a seamless cone with an angle of 60°.

Methods of Folding Filtering Paper—Two kinds of paper filters are used, the *plain* and the *plaited*.

1. *The Plain Filter*—This filter is used habitually by the analytical chemist, and is preferred by the pharmacist where precipitates are to be

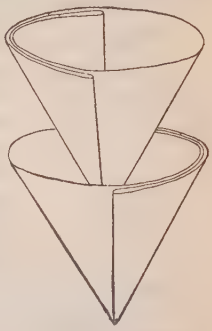
collected, and in some other operations (see Fig. 287); it is made by exactly doubling a circular sheet of filtering paper upon itself, and then folding this directly in the middle, so that, when opened, four equal divisions or sectors appear; the filter is used by separating one of the sectors from the other three, and placing the cone formed into a funnel; the liquid is then poured upon the filter, and the process of separating the solid from the liquid commences. The advantages of the plain filter are, 1, simplicity and rapidity in folding, no skill being required; 2, in collecting precipitates, but one-half of the surface of the filter (two sectors) is in contact with the moist precipitate, which is often closely adherent, and therefore but one-half of the surface has to be cleaned. In some cases there may be a disadvantage in the use of the plain filter, owing to the unequal rate of flow,—the tendency of the three folds being to attract the liquid to the side of the funnel upon which they rest, and thus the precipitate may be unequally washed. A stronger and more rapid filter may be made by placing one plain filter inside of another, so that the three sides of the upper one shall be in contact with one side of the lower one, and *vice versa* (see Fig. 288). If the sides of the funnel have an angle of 60°, the plain filter made as described will fit the funnel properly; but it frequently happens that the angles of funnels vary, and if an ordinary plain filter is placed in a funnel not having an angle of 60°, a portion of the filter is left unsupported, and the weight of the liquid is apt to rupture the moist paper. This difficulty may be overcome by making a fresh crease in the outside fold of the plain filter; if this is made to the right of the original crease of the 60° filter, and the inside fold pushed around a corresponding distance, a filter having a smaller angle is produced, while if the fresh crease is made to the left of the original crease, a larger angled filter may be made. Rother's method of making a plain filter has the advantage of furnishing two filters from the same sheet that is usually required for one filter. To make it, the circular disk of filtering paper is cut through in the line of its diameter, and half of the disk is folded into two equal parts; the double edge of the cut sides is turned down and folded over on itself narrowly several times (see Fig. 289), and with the blade of a spatula the fold is compressed so that it will retain its shape (see Fig. 290). This filter may be used in collecting precipitates.

Fig. 287



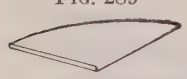
Plain filter

Fig. 288



Double plain filter

Fig. 289



Rother's filter (first step)

Fig. 290

Rother's filter

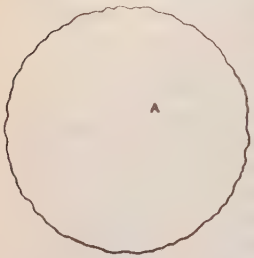
2. *The Plaited Filter* may well be called the "pharmacist's filter", for it is the form largely used in ordinary filtering operations. Figs. 291 to 301 show the progressive steps in the folding of a plaited filter. It is made by folding a circular sheet of filtering paper twice, as in making a plain filter.[1] The edge *B D*, Fig. 294, is then laid upon *E D*, and the crease *F D* is formed; in like manner *C D* is laid upon *E D*, and *H D* is formed. Then *D B* is laid upon *F D*, and *I D* is formed, and by rolling over the fold in the same direction once more until *F E* is laid upon *E D*, the crease *K D* is made (see Fig. 296). Now

[1] It will be observed that in the first folding of French filters, "Prat Dumas", the disks are not perfect circles. This causes one edge to project (see Fig. 292), and facilitates the opening of the filter.

in the same way *C D* is laid upon *H D* and *H D* upon *E D*, and it will be noticed that the folded semicircle has been creased into eight equal spaces, and that the direction of each crease is the same, so that if the paper is lifted it will appear as shown in Fig. 298.

The next step is to fold each one of these spaces *back on itself* (Fig. 296). *B D* is laid upon *F D*, and then *B D* is turned upward and back until it is laid upon *I D*. This makes the crease *Q D*, which is the first fold in the opposite direction. Taking both folds between the forefingers and thumbs of both hands, the edges *B D* and *I D* are folded upward and back upon

Fig. 291

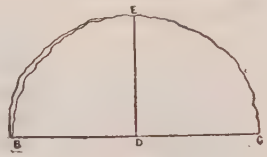


Filter

Fig. 292

Folding plaited filter

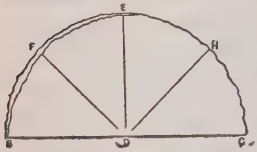
Fig. 293



Folding plaited filter

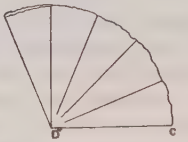
F D, and the crease *P D* is formed; then these three edges, *B D*, *I D*, and *F D*, are taken all together and folded back upon *K D*, and the crease *O D* is formed, and so on, each space in turn being folded back in the opposite direction, until the last one is reached. The folded filter is then held at the

Fig. 294



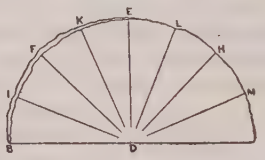
Folding plaited filter

Fig. 295



Folding plaited filter

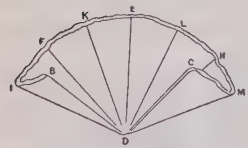
Fig. 296



Folding plaited filter

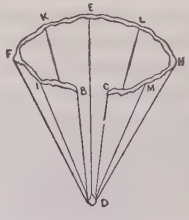
apex with the left hand upon a table or flat counter, and pressed and smoothed out with the right hand in order to emphasize the folds. It should then be placed in the funnel, while still unopened, to see whether it needs trimming; if the rough edges of the filter project above the top of the funnel, the filter

Fig. 297



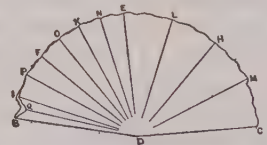
Folding plaited filter

Fig. 298



Folding plaited filter

Fig. 299



Folding plaited filter

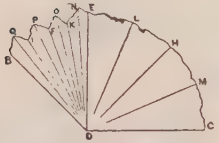
must be removed, and they must be cut off neatly with a sharp knife or a pair of scissors so that the whole of the filter may be placed inside of the funnel.

Another method of folding a plaited filter is illustrated in Figs. 302 and 303. A plain filter is folded as in Fig. 287, and the quadrant, consisting of four thicknesses of paper, beginning at the left hand side, is folded at once into

narrow parallel plaits backward and forward. Fig. 302 represents the filter after being opened, and Fig. 303 shows the inside of the filter. It will be observed that the creases do not converge to a point as in the plaited filter (see Fig. 301), and hence the apex is less likely to be weakened.

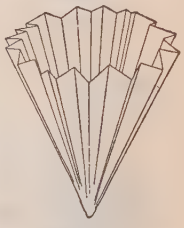
Maxims—1. In folding a filter, care should be observed not to extend the creases entirely to the apex, but to end them at a distance of about half an inch from it, because the point at which all the creases converge would be thereby so weakened that the weight of the liquid would rupture the filter. When the filter has been accurately plaited and the creases emphasized by pressure, it is then carefully opened, placed in a dry funnel, and with the open hand pressed firmly into place so that the point enters the throat of the funnel. This serves to support the apex of the filter upon which must rest the weight of the liquid above and also forms channels through which the filtrate may flow. The speed of filtration is markedly increased if this precaution is carefully observed. When a filter is carelessly placed in the funnel, it forms a bag at the apex, which readily breaks, or clings to the sides of the funnel, and retards the flow of the filtrate from above.

Fig. 300



Folding plaited filter

Fig. 301

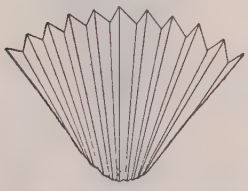


Plaited filter

2. The filter in the funnel should be moistened with the liquid to be filtered or with a liquid corresponding to the solvent employed. This promotes rapid filtration, and washes the filter besides.

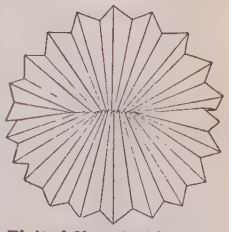
3. If the liquid to be filtered contains free acid or alkali, or a very fine precipitate, or is very dense or hot, a double filter should be used. In the case of plain filters, they should be arranged as in Fig. 288. If plaited, two sheets of paper should be taken and folded as if they were single. A filter may be also strengthened by placing a small capping filter or plain filter, a piece of well washed linen or muslin folded like a plain filter, or a plug of absorbent cotton, into the funnel before introducing the filter. In analytical operations the apex of the filter is usually supported by means of a small cone made of perforated sheet platinum. The apex is always the weakest, the most exposed, and yet the most important part of the filter.

Fig. 302



Plaited filter, parallel folds

Fig. 303



Plaited filter, inside view

4. In pouring the liquid into the filter, the stream should never be delivered directly upon the apex, but upon one of the sides, so that the force of the fall will be broken before the weakest point is reached.

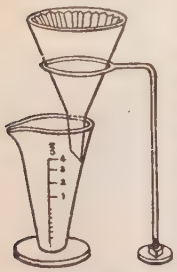
5. The filter should be entirely within the funnel. If the edges of the paper project above the funnel, waste from evaporation of volatile liquids, also from the increased and unnecessary absorption due to the excess of filtering paper, ensues, and in addition an untidy and careless habit is encouraged.

6. If the receiving vessel is small, the end of the funnel should touch its side, so that the filtrate will trickle down its inside edge. By this expedient splashing will be avoided (see Fig. 304).

7. In filtering into a bottle, care should be taken to leave sufficient space between the neck of the funnel and the mouth of the bottle for the escape of

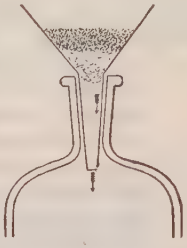
air, otherwise filtration will be retarded or prevented; a piece of twine placed between the two surfaces generally serves the purpose. *The end of the funnel should project below the lowest part of the neck of the bottle* (see Fig. 305). If the diameter of the end of the funnel is too large to admit of this, or if it is only half inserted, the filtrate will be very apt to fill the intervening space and flow over the outside of the bottle, as shown by the arrows in Fig. 306.

Fig. 304



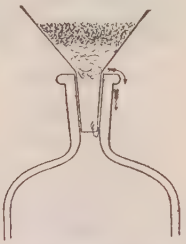
Arrangement of funnel in filtration

Fig. 305



Filtering into a bottle (proper method)

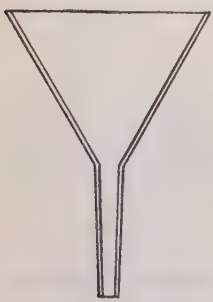
Fig. 306



Filtering into a bottle (improper method)

Funnels, sometimes called *tunnels*, are conical shaped utensils intended to facilitate the pouring of liquids into narrow mouthed vessels, and, they have also an important service to perform for the pharmacist in supporting filters, as just described. Funnels are made of tinned copper, tinned iron, hard rubber, porcelain, queensware, granite or agateware, earthenware, or glass. Metallic funnels have an advantage in point of durability over porcelain and glass, but a disadvantage in being acted upon chemically by liquids and in being more difficult to clean. The triangle formed by the sides of a funnel, and the line joining them, should be equilateral (see Fig. 307). The angles being each 60°, a funnel having this shape will accurately support a plain filter made in the usual way. Funnels are frequently fluted, grooved, or ribbed on the inside for the purpose of facilitating the downward flow of the filtrate (see Fig. 308), or wire frames, either fixed or folding, are arranged in a funnel with the same object. These aids are of doubtful utility, however, while the tendency of the raised ribs is to form a lodgement for foreign substances. *A well made plaited filter* in a plain funnel will perform as much work in the same time, and if the habit is once formed of always carefully and skilfully folding a filter, its importance in saving time and labor will be appreciated ever afterwards. Some of the glass funnels in the market have an improvement in the neck, which, instead of being round, is triangular or grooved. The necks of some copper funnels are similarly grooved. A copper funnel made by H. Sherman, of Philadelphia (see Fig. 309) has a square shaped outlet and is specially efficient. These devices permit the free escape of air from the interior of the bottle, and are superior to the indistinct groove often made on the neck of some glass and porcelain funnels. Plain *glass funnels* are more generally useful to the pharmacist than any other kind. They are readily cleaned, and dirt upon them may be easily seen. They are very useful as percolators, and the whole process of filtration or percolation may be observed

Fig. 307



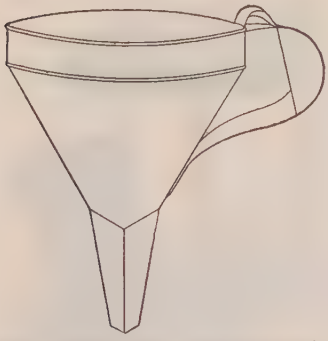
Plain funnel

Fig. 308

Ribbed funnel

without trouble. Their chief disadvantage is the ease with which they are broken. The next in value from the standpoint of usefulness is the tinned-copper funnel. *Copper funnels* are far superior to those made from tinned iron, and the difference in cost is greatly in favor of tinned copper, if true economy is considered (see Fig. 310). They must never be used for acid or alkaline liquids, however, and they really have a very limited use except for transferring hydro-alcoholic solutions of vegetable drugs from one container to another. *Hard*

Fig. 309



Tinned copper funnel with square neck

Fig. 310

Tinned copper funnel

Fig. 311

Hard rubber funnel

rubber funnels are light in weight, and are not very easily broken, for they may be even dropped upon the floor without injury (see Fig. 311). They are not acted upon by chemical substances, and with ordinary care will last a lifetime. They lack one advantage of those made from glass, however, in the absence of transparency. A hard rubber funnel divided to hold a strainer may be used at the dispensing counter (see Fig. 305). Porcelain, or queensware, funnels are of course, not transparent, and they have the disadvantage, at least in the larger sizes, of being heavy. They are, however, not affected by liquids, but their advantages over glass are so slight (being somewhat less fragile) that they are not often employed. Earthenware funnels, if well glazed, are very useful in filtering *hot liquids*. Enameled funnels, called granite or agateware, etc., are made from sheet iron having the surface entirely covered with a glazed composition which resists the action of most chemical substances. If carefully used, they serve many purposes. Their greatest objection arises from the brittleness of the enamel, which is apt to chip off if the funnel is dropped upon the floor or subjected to a blow, and at the point where the neck of the funnel is joined to the body, the enamel coating is so thin that by constant use it is soon chipped off, the exposed iron quickly rusts, and the neck breaks off. Tinned iron funnels which are frequently used, are popular because of their cheapness; but it is quite possible for a pharmacist to ruin in one operation a preparation worth ten times the cost of the funnel by filtering it through a tinned iron funnel and allowing it to come in contact with the iron exposed by the wearing off of the tinned surface.

Fig. 312

Funnel stand

Fig. 312 shows a funnel stand useful for small filtering operations in the

laboratory or at the prescription counter; the two long-stemmed funnels are of the type used in chemical work. This type permits more rapid filtration by the increase of weight of the liquid in the longer stem. Retort stands (see Figs. 184 and 186) are frequently used as funnel stands.

Fig. 313 shows a funnel designed for filling bottles, in which the flow of the liquid is controlled by the valve operated by the thumb. This is convenient when filling bottles arranged in rows, and if carefully used the bottles need not be soiled on the outside through overrunning, and the quantity in each bottle may be accurately adjusted.

Fig. 313

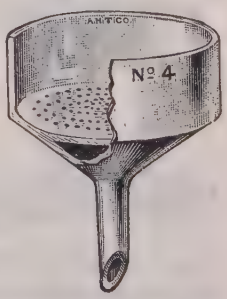
Valve funnel

Fig. 314

Kiefer glass tray filter

When funnels are used as supports for the filtering paper in the process of filtration, only a small portion of the paper, mostly the apex of the folded filter, is in action at one time. Figure 314 shows Kiefer's glass tray filter consisting of a square, shallow glass dish with flat perforated bottom, resting in a slightly larger tray, but supported in such a position as to allow space between the two vessels. A square, unfolded filter paper is placed upon the perforated bottom and moistened, after which the liquid to be filtered is poured into the dish, or, admitted from an inverted bottle containing the liquid. In this way a constant level of liquid is maintained over the filter bed, and no decrease either in pressure or in available filtering area occurs, as when a funnel is employed. A drawback to this form of filter, however, lies in the added space required for its operation. It is important to use the ground-glass cover to avoid excessive evaporation.

Fig. 315



Buchner funnel

The *Buchner* type of funnel (see Fig. 315), is largely used today in pharmaceutical laboratories. A piece of round filter paper is laid on the perforated porcelain diaphram and filtration may be conducted either with air pressure applied to the surface of the liquid on the filter or through application of a vacuum to the receiving vessel.

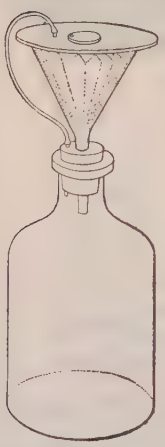
Continuous Filtration—Most of the expedients used in continuous washing (see page 189) are applicable to continuous filtration.

Filtration of Volatile Liquids—It is evident that the ordinary methods of filtering liquids will not be practicable for very volatile liquids, because of the loss through evaporation, and the liability to explosion, in the case of inflammable volatile liquids, if brought in contact with a flame. Funnels must be covered, and provision made for the escape of the confined air in the receiving

vessel. The following method is preferred to the elaborate expedients usually recommended. A bent glass tube is arranged in a glass or metallic funnel, so that the tube will lie close to the side of the funnel and allow one end to project above the filter, but not above the edge of the funnel. It may be held in its place by a ring of absorbent cotton gently thrust into the throat of the funnel, or a rubber cover perforated to admit a tube is placed on top, and connection between the bottle and funnel effected as shown in Fig. 316.

Among many other devices to obviate the use of open funnels, from which much evaporation is liable to occur, especially in the filtration of alcoholic liquids, the type of filter known as the monopad filter, and manufactured by the Karl Kiefer Machine Co., Cincinnati, is recommended (see Fig. 317). It requires but a moment to renew the filtering sheets. There are no rubber gaskets or wire screens, just a top and bottom plate which are easily cleaned and any grade of filter paper can be used. It is substantial, compact, easily handled, and may be carried from place to place.

Fig. 316



Filtration of volatile liquids

A quart, a gallon or hundreds of gallons can be filtered through this filter. All parts of the filter that are in contact with the liquid are made of bronze and when so desired may be heavily silver-plated.

Fig. 317

Monopad filter

Other Filtering Media—Many devices have been advanced to replace filter paper, which, it must be admitted, has many disadvantages, particularly for use on the large scale. In the modern pharmaceutical laboratory one may see a great many variations of filtering processes, each designed to fit the needs of special cases. The filter press, the centrifugal filter, the vacuum filter, the sand bed filter, the charcoal filter, paper-pulp filter, porous porcelain filter, all may be seen, each applied to its special purpose. Each one of these possesses some advantageous quality, and it is the working experience of the laboratory operators that guides them in their selection of appropriate filtering devices. Reference is made later in the text to many of these special large scale filters.

However, it will not be inappropriate here to refer briefly to special filtering devices which may be useful in the small laboratory or at the prescription counter.

Cotton Filters—A small pledget of absorbent cotton, loosely inserted in the neck of a funnel serves well to remove large particles of extraneous material from a clear liquid. Although this might be properly termed colation, the cotton can also be used to serve as a most efficient filter. It is sometimes necessary to return the liquid a number of times to secure perfect transparency. This should be remembered in filtering eye lotions through cotton, when small detached filaments are carried through at first.

Asbestos and Glass Wool Filter—Where strongly active chemical solutions such as acids or alkalies are to be filtered, filter paper cannot be used. In its place either asbestos or glass wool may be used as one uses absorbent cotton for filtering. These two substances are resistant to ordinary chemical action

and when properly packed into the neck of a funnel constitute very effective filtering media.

Stoneware Filters—For small and large scale filtrations there are available many patent varieties of porous stoneware filters. These are peculiarly effective for some purposes, their special advantage being derived from the fact that they may be cleaned by igniting them to red heat, thus destroying organic matter, or by treatment with strong acids, to which they are highly resistant. Special porous filters are used for removing bacteria from liquids. They are usually made of diatomaceous earth and answer the most exacting requirements of filtration, removing even the most minute bacteria (see Fig. 318).

Fig. 318

Candle filter, Berkefeld type

Alundum Filter—This kind of filter is made of an aluminum silicate in the form of dishes or crucibles and replaces the Gooch crucible for collecting the finest precipitates, no asbestos being necessary. (See Fig. 319.) It is patented.

Fig. 319

Alundum filter

Sand Filters—This type of filter is used on a large scale only, such as in the municipal purification of drinking water. A large bed of properly proportioned layers of sand, stone, and gravel constitutes the filter through which the great bulk of water passes on its road to purification. These filters are materially aided in their water-purifying efficiency by the action of bacteria in the filter bed.

Aids to Filtration—It has long been known that the addition of an insoluble absorbent powder or other material to a liquid prior to its filtration greatly increases the efficiency of the process. Purified talc, siliceous earth (or kieselguhr), clays, charcoal, paper pulp, chalk, magnesium carbonate, etc., have been used for this purpose. There are also proprietary compounds, such as *"filter-cel"* and *silica gel* which are so used.

It must not be overlooked, however, that powdered substances employed for such purposes must be insoluble and inert and not all of the foregoing list of substances are applicable for general filtration purposes.

Talc is non-adsorbent and is a safe medium for filtering any liquid without fear of depreciating its value, if it has been purified for this special purpose and provided it is not the impalpably fine variety which will pass through the filter paper. The U. S. P. directs that, as a filtering medium, purified talc should not be finer than the powder which passes through a No. 80 sieve but is retained by a No. 100 sieve.

Kieselguhr is almost pure silica (SiO_2). It is as generally applicable as talc for general filtration purposes, with no danger of removing active constituents by adsorption.

Siliceous earths of the type of *clays*, such as fuller's earth or kaolin when in the hydrated form, which always occurs when they are brought into contact with aqueous liquids, are safe for general use only in filtering fixed oils. Liquids containing coloring matter or alkaloidal principles must not be filtered through these media, for adsorption of both color and alkaloids occur and the liquid is depreciated in value.

Wood charcoal is a decolorant and deodorant, and *animal charcoal* possesses adsorptive properties, not only toward alkaloids but toward some glucosides

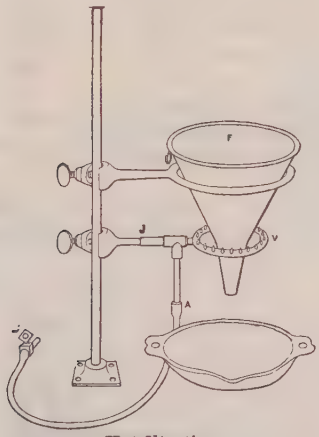
and bitter principles as well. It should never be used as a filtering medium unless the removal of such constituents is desirable.

Chalk and *magnesium carbonate* are readily attacked by acids and are slightly dissolved by aqueous liquids with the production of alkalinity in the filtrate. This is particularly true of magnesium carbonate, in which the degree of alkalinity communicated to the filtrate is sufficiently great to cause precipitation of alkaloids. Either of these media, when added to an alkaloidal preparation prior to filtration, will precipitate and remove all of the alkaloidal constituents. Neither of these media is suitable for general use.

A study of the foregoing facts makes it apparent why care should be exercised in the selection of a filtering medium where the choice is left to the pharmacist.

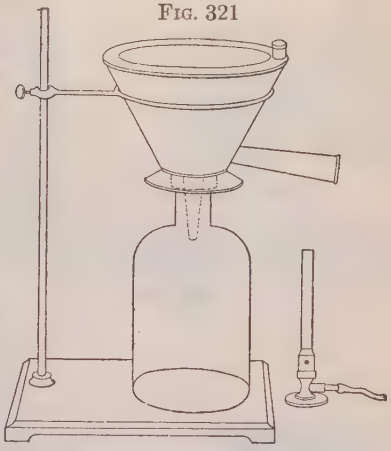
Hot Filtration—This process is not resorted to as frequently as it might be with advantage, because of the difficulties which are asserted to attend it.

FIG. 320



Hot filtration

FIG. 321

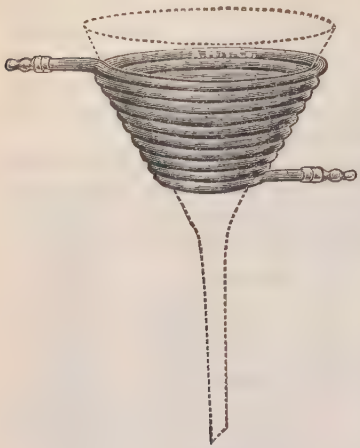


Jacketed hot water funnel

These have been greatly overestimated, for by the use of simple, properly contrived apparatus many preparations which heretofore have been dispensed, bearing an unsightly cloudy appearance, can be greatly improved. Yellow wax is frequently full of mechanical impurities; ordinary straining will not remove these, but by the application of heat it may be filtered through paper and thoroughly purified. Jellies, benzoinated lard, petrolatum, cerates, ointments, etc., may thus be filtered. One of the simplest and most easily managed forms of apparatus (see Fig. 320) is made by filing off the ring from one of the ring supports of a retort stand, *J*, and slipping on to the arm a brass circular jet, *V*, attached to a tee carrying the gas supply pipe, *A*. A tinned copper or tinned iron funnel is supported by an appropriate ring at a suitable distance above the jet. The filter is placed in the funnel, a receiving vessel adjusted below, and the hot liquid poured into the filter. It is plain that the liquid can be heated to almost any degree, and the filtration conducted at a much higher temperature (if need be) than by the jacketed hot water funnel (see Fig. 321), and, on the other hand, the heat may be regulated so that it will be very moderate. The hot water funnel is an old device, and consists simply of a jacketed funnel having a wide tube soldered at the lowest point, and an opening in the upper edge for the water supply. A burner or lamp flame will heat the water contained in the jacket, and a regulated heat not exceeding that of boiling water is obtained.

Fig. 322 shows another form of funnel to be used for hot filtration; the coil of pipe may be used for steam or hot water, by connecting it with a suitable supply.

Fig. 322



Funnel in coil

Rapid Filtering Apparatus—Much attention has been given to methods for increasing the rapidity of filtration. This may be accomplished by introducing pressure upon the filter or by creating a vacuum in the receiving vessel.

Vacuum Filtration — One of the first practical efforts made to create a vacuum to aid filtration was by means of the Bunsen pump. The action depends upon the principle that a column of water descending through a tube from a height is capable of sucking with it the air contained in a lateral tube, if the latter is properly placed. This form of aspirator is only practicable where water pressure is available.

Fig. 323

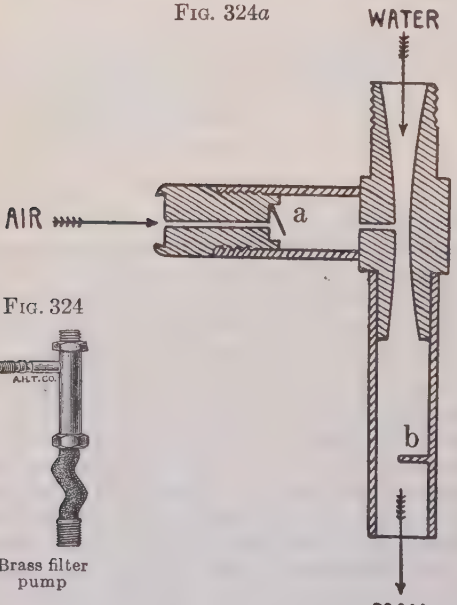
Glass filter pump

Water Pumps Acting by Pressure—The varieties of aspirator or vacuum pump which operate under the influence of water pressure are all based upon

Fig. 324

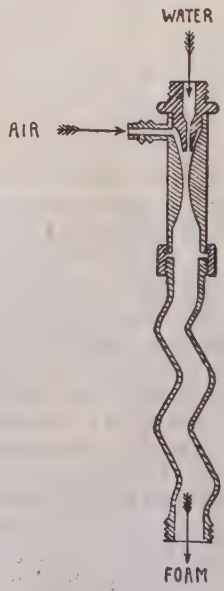
Brass filter pump

Fig. 324*a*



Chapman's pump

Fig. 325

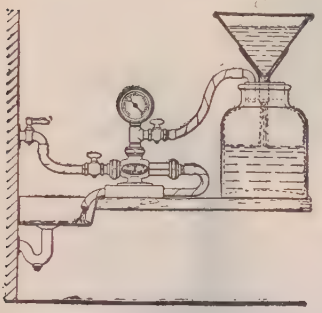


Richard's pump

the same principle. The following are selected from the great variety in use as being good illustrations. Fig. 323 shows a filter pump of glass, although the glass variety is not recommended because of its extreme liability to break-

age. Fig. 324*a* shows Chapman's vacuum pump. The valve at "*a*" prevents the water from flowing into the bottle which carries the filter when the pressure of water ceases or is reduced. Figs. 324 and 325 illustrate Richard's pump, largely used in analytical laboratories for hastening filtration. The zigzag form of the tube serves the same purpose as the projection in the lower portion of the outlet tube of the Chapman pump, *i. e.*, to break the direction of the solid stream of flowing water and assist in drawing the air from the bottle.

Fig. 326



Method of using filter pump

Fig. 326 shows a very efficient form of filter pump capable of exhausting a one gallon vessel, to produce a twenty-nine and one-half inch vacuum in ten minutes with a ten pound water pressure.

Fig. 327

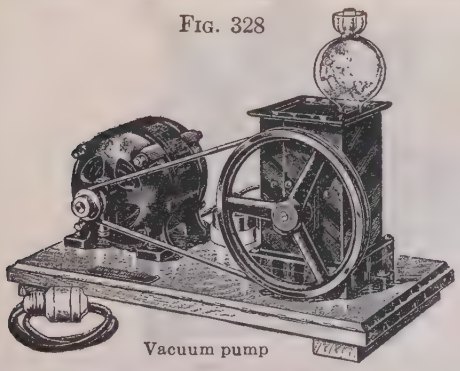
Vaccu-filter

The vacuum filter (see Fig. 327) obtainable from the Alsop Engineering Company, provides an inexpensive and rapid form of vacuum filter, in which filter paper or felt may be used. It has the added advantage of preventing evaporation and of being made of nickel-plated brass, and is non-corrosive. The filter may easily be taken apart and cleaned.

On a larger scale the vacuum for filtration is produced by one of the many forms of vacuum pumps now available. An excellent form for laboratory use is made by the Central Scientific Company. (See Fig. 328.)

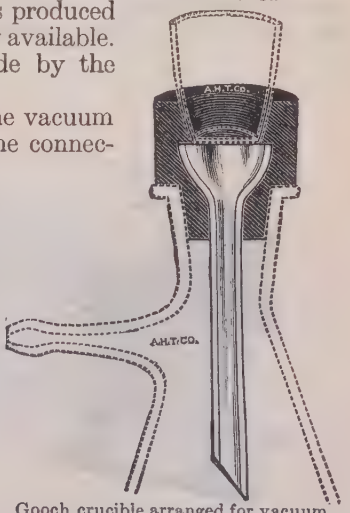
In assembling a filtering apparatus, using the vacuum principle, it is necessary to have no leaks in the connections from the filter to the aspirator. If filter paper is used in connection therewith, a plainly folded paper must be used and its tip must be protected against breakage by reinforcing it with a filter paper support or some other device, or a Buchner filter may be used employing a specially strong filter paper.

Fig. 328



Vacuum pump

Fig. 328*a*

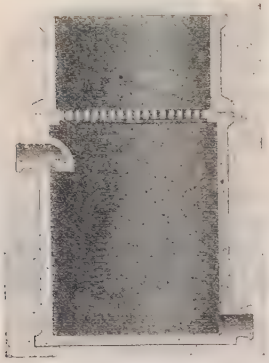


Gooch crucible arranged for vacuum

In analytical work it is customary to use the Gooch crucible and flask (see Fig. 328*a*) for rapid filtration. The flask, of especially thick glass, is provided with a side tube which is to be connected with the vacuum pump

The perforated crucible bottom is converted into a filter bed of extreme fineness by means of a layer of asbestos fibers prepared by pouring upon the porcelain base a suspension of these fibers in water. It is to be noted that in analytical work the residue left upon this filter bed is generally of more importance than the filtrate.

Fig. 329



Stone crock for filtration

Fig. 330

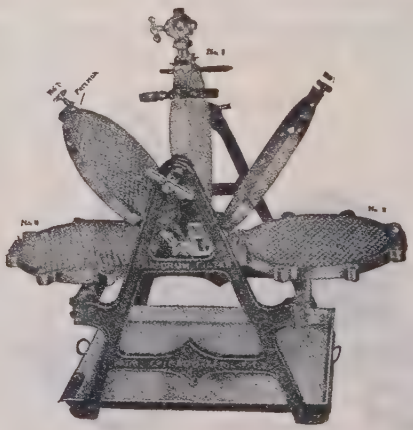
International filter

The principle of vacuum filtration is also applied on the large scale through the use of a perforated diaphragm arranged in a barrel or crock. Paper pulp which has been thoroughly steamed is packed on the porous diaphragm and forms a very efficient filter bed for many pharmaceuticals. The filter may

Fig. 331

Monocell filter

Fig. 332



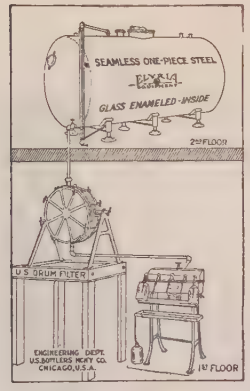
U. S. Drum filter

also be formed from plates of porous stoneware and "chinked" with asbestos fiber when corrosive liquids are to be filtered. This is especially rapid if a vacuum is applied. The stone crock made by Maurice A. Knight, of East Akron, Ohio, provides an excellent apparatus (see Fig. 329).

Filtration Under Pressure—Fig. 330 illustrates a form of laboratory filter for use when a large quantity of the same liquid is to be filtered. It is made by

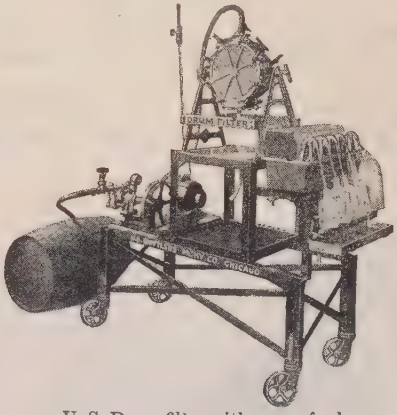
the International Filter Co., of Chicago. A sheet of filter paper is placed between the upper and lower porous disks, which are then clamped together, and the liquid to be filtered is forced upward, through the filter. Pressure from gravity or a pump is applied to increase the rapidity of filtration.

FIG. 333



U. S. Drum filter with gravity feed

FIG. 334

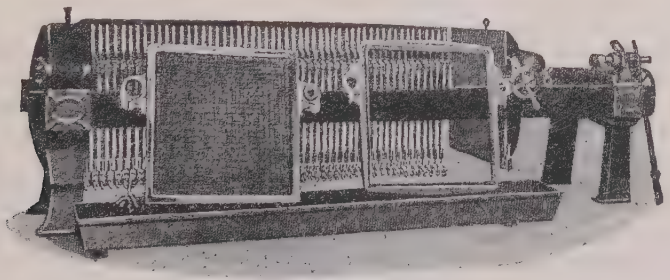


U. S. Drum filter with pump feed

A similar filter known as the monocell filter is illustrated in Fig. 331 and is made by the Karl Kiefer Company. This filter employs a paper sheet or cloth pad and may be used with from two to fifty pounds pressure.

The U. S. Drum Multiple Disc Filter, sold by the Illinois Glass Company, is illustrated in Fig. 332. Cloth filter disks or paper filters may be used and it is readily opened and cleaned. Fig. 333 illustrates a gravity feed arrangement with bottle filler, and Fig. 334 the same Drum filter and a bottle filler fitted with a pump feed.

FIG. 335



Filter press

Another type of pressure filter designed for large scale filtration is shown in Fig. 335. This filter is made by T. Shriver and Company, Harrison, N. J., and serves as an example of the filter press which finds use in the large manufacturing establishments. It may also be procured in small experimental size and made of various materials, such as wood, iron, bronze, tin, aluminum, monel metal, etc., to suit all needs.

The Vallez rotary filter is another form mostly employed upon the large scale, although small outfits suitable for a pharmaceutical laboratory are

available. The filter plate may be covered with monel metal, nickel, or phosphor bronze sieves. The filtering medium, paper pulp or kieselguhr, covers the sieve to increase the efficiency of the filter. (See Fig. 336.)

The Karl Kiefer Machine Company, of Cincinnati, also manufacture a pulp filter which may be operated with from one to ten filtering plates. This very efficient filter (Fig. 337) requires cotton pulp as the filtering medium and is especially suited for clarifying fruit juices, syrups, perfumes, etc. Smaller forms may be procured.

Centrifugal Filtration—This principle has been applied to the filtration of pharmaceutical products where large quantities of liquids require clarification. In the rotating bowl of the Sharples Laboratory Super-Centrifuge, made by the Sharples Specialty Company, of Philadelphia (see Fig. 338), which revolves at the rate of 40,000 revolutions per minute, a separating force of approximately 40,000 times the force of gravity is applied to the liquid under treatment. The suspended solid particles from the cloudy liquid collect on the inside surface of the bowl and the resulting clear filtrate is continuously discharged through the spout. It is necessary to remove the sediment from the bowl of the machine from time to time.

Centrifugal filters are also manufactured by the DeLaval Separator Company, of New York, and other companies.

CHAPTER XVII

CLARIFICATION AND DECOLORATION

CLARIFICATION is the process of separating from liquids, *without the use of filters or strainers,* solid substances which interfere with their transparency. The processes of clarification and decoloration from a pharmaceutical point of view and on the small scale have declined in importance of late years, owing to the fact that chemical and other substances requiring the processes are supplied in a purified condition so cheaply that it is impossible for the pharmacist to compete with the manufacturer who operates on the large scale and uses apparatus and methods which are thorough and economical. This is particularly true of sugar and of the alkaloids. Formerly the apothecary bought raw sugar and clarified the syrup; now the difference in price between raw sugar and pure sugar is so slight that official syrup is never made from raw sugar. The decoloration of alkaloidal solutions and the manufacture of alkaloids cannot be attempted on the small scale by the pharmacist because of economic conditions. It is, nevertheless, very important to comprehend thoroughly the principles underlying both processes, as emergencies may arise when such information would be of great value.

Clarification may be effected in several ways:

1. By the application of heat or by otherwise increasing the fluidity of the liquid. 2. By the use of albumen. 3. By the use of gelatin. 4. By the use of milk. 5. By the use of paper pulp. 6. By fermentation. 7. By subsidence through long standing.

1. *By the Application of Heat*—When a viscid liquid is heated its specific gravity is diminished, and usually particles which are suspended in it, and interfere with the transparency of the liquid, will separate, the heavier ones falling to the bottom, and the lighter ones rising; in the latter case, ebullition facilitates the separation, the minute bubbles of steam becoming enveloped in the viscid particles rise through their buoyancy, and a scum is formed which may be readily separated. The process formerly official for the clarification of honey (Mel Depuratum) is a good illustration of the use of heat in this connection.

Clarification may also be effected by *increasing the fluidity of the liquid* in other ways. The specific gravity of the liquid may be decreased by the addition of water, alcohol, or other liquid lighter specifically than the one to which it is added; this causes the suspended particles to deposit, and the clear liquid may then be decanted.

2. *The Action of Albumen*—The property possessed by albumen of undergoing solution at ordinary temperatures and becoming coagulated by heat renders it one of the most useful substances that can be employed in the process of clarification. Its action is mechanical, and where albuminous principles exist naturally in the liquid, as in many fruit and vegetable juices, the simple heating of the liquid suffices to coagulate the albumin, which envelops the particles that render the liquid cloudy, and these rise to the top and are skimmed off. Albumen, or white of egg, is frequently added to liquids to clarify them; in such cases it should always be added before the liquid is heated. This is best accomplished by adding about an equal bulk of the liquid to the albumen, then pouring the mixture onto a muslin strainer and squeezing

it through the meshes of the cloth by gathering up the corners and spirally twisting the strainer, when the structure of the albumen is destroyed, and a smooth mixture results; the strained solution is then added to the liquid to be clarified, and the whole heated gradually (usually until it boils), without stirring, until coagulation is effected. In most cases the white of one egg is sufficient for a gallon of liquid. The error most frequently made by operators is the use of an excess of albumen. Care must be exercised in the employment of albumen as a clarifying agent where the active principle of a liquid forms a precipitate by combining with it, as would be the case with phenols, heavy metals, etc.

3. *The Use of Gelatin*—Gelatin is used when tannin is present, whether or not it is the cause of the cloudiness which it is desired to remove. Its action depends upon the fact that gelatin forms with tannin an insoluble compound which is the basis of leather. Isinglass or fish glue, as it is sometimes called, one of the purest forms of gelatin, is preferred by some users of the method. Gelatin is used by adding a weak solution of it in hot water, about 1 or 2 per cent, to the liquid and then allowing it to stand. After a short time a flocculent precipitate forms which gathers together the particles causing the turbidity. The insoluble compound formed must always be strained or filtered out. An ounce of gelatin will suffice for clarifying a barrel of wine and it is the preferred medium for this purpose. The operation is called "*fining*".

4. *The Use of Milk*—The presence of casein in milk, and the fact that acids precipitate it in the form of a curdy precipitate, are taken advantage of in the use of milk as a clarifying agent. It is employed particularly for the clarification of wine, but should not be used in excess. A half pint of milk suffices to clarify a barrel of wine. Milk is also applicable where tannin is present and in such cases forms an insoluble precipitate, as does gelatin.

5. *The use of paper pulp* does not depend upon chemical combination, its action is purely mechanical. Paper pulp for filtering is best prepared by placing unsized paper, such as white blotting paper or white filter paper, into a mortar or other suitable vessel, and pouring enough solution of sodium or potassium hydroxide on it to saturate it, then stirring it with the pestle until it is reduced to a pulp. This should then be washed by placing a loose plug of absorbent cotton in a funnel and pouring in the mixture. When it has drained, hot water should be poured upon it until all traces of alkalinity are removed; the dried purified pulp may then be placed in stoppered wide-mouthed bottles until needed. Paper pulp for filtering may also be purchased ready for use. It is preferable to soften it by heating with a jet of live steam. It is used as a clarifying agent by adding a portion to the cloudy liquid, agitating the mixture and allowing the whole to stand quietly until the liquid is clear.

6. *By Fermentation*—The changes in the composition of juices during fermentation usually lead to the deposition of those substances which previously interfered with their transparency. The generation of alcohol through fermentation produces a liquid in which the substances causing turbidity are insoluble, hence the formation of the deposit. The preparation of syrup of raspberry (N.F.V.) affords a good illustration of the principle of clarifying juices by fermentation, while in the manufacture of wines the principle has been known and practiced for centuries.

7. *By Subsidence through Long Standing*—This method involves the least possible amount of labor and expense, and is resorted to very frequently (particularly upon the large scale) when haste is unnecessary, and whenever the liquid readily withstands the tendency to spoil during the time necessary to effect complete separation. The deposit formed is usually called a *sediment*. In some industries it is termed a "*sludge*". These terms are

not synonymous with *precipitate. A sediment is solid matter separated merely by the action of gravity from a liquid in which it has been suspended. A precipitate, on the other hand, is solid matter separated from a previously clear solution by physical or chemical change.* The fixed oils are usually clarified by subsidence; in the vegetable oils the sediment consists principally of albuminous and gummy substances, cellular tissue, and water which have been separated with the oil during the process of expression.

Decoloration or *decolorization*, as it is sometimes called, is *the process of depriving solutions of color by the use of an appropriate medium. Animal charcoal* is the most widely used decolorizing medium, while *kaolin, fuller's earth, and other clays are employed for special purposes.* Decoloration is used in the abstraction of coloring matter from fats, oils, petrolatum, syrups, etc. Animal charcoal, or bone black, which is produced by heating bones in closed vessels out of contact with air, and then grinding the resulting charred mass, is generally preferred in decolorizing operations. Wood charcoal possesses much less decolorizing power. The selective removal of color from liquids passed over or through them, by certain charcoals and clays, is an *adsorption* phenomenon and will be found extensively discussed in books on colloidal chemistry. Animal charcoal varies greatly in its decolorizing power. Purified animal charcoal is not so powerful as a decolorizer as the crude animal charcoal from which it was made (see filtering media, page 204). The inorganic matter (calcium salts) present in crude animal charcoal is capable of causing contamination of some kinds of solutions, particularly those which are acid, and it is sometimes necessary to use purified animal charcoal even though it possesses a lower degree of efficiency. The animal charcoal which possesses the greatest efficiency as a decolorizer is produced by carbonizing dried blood. For other information about the properties of charcoal, see *Carbo Animalis* and *Carbo Animalis Purificatus,* U. S. Dispensatory, 21st edition. For most decolorizing operations of the pharmacist on the small scale, the solutions, melted fats, oils, etc., can be poured directly upon the animal charcoal, which is placed in a funnel and prevented from passing through by the insertion of a plug of absorbent cotton, or it may be arranged in an ordinary percolator, and the cold liquid percolated through the charcoal. It is not satisfactory simply to shake the charcoal with the liquid and subsequently filter, as is done with clays which are used as decolorizing media. The deeper the layer of charcoal through which the liquid must pass, the greater the efficiency of the operation.

Clays are used as decolorizing agents by mixing them intimately with the liquid to be decolorized and, after allowing them to stand for a time, filtering to remove the clay. The removal of the color by the clay is also due to adsorption (see Colloids). It is very important to remember that both charcoal and clay absorb a number of valuable principles used in medicine,—*e.g., bitter substances,* like gentiopicrin, aloin; *astringents,* like tannin; *alkaloids,* like quinine morphine, strychnine, etc. (see Filtration, page 204). Charcoal has even been used as an antidote for poisoning with the alkaloids. It should always be used, in decoloration, with discrimination and judgment, for it may be found that in striving to improve or restore the appearance of a preparation by lessening the color its value has been sacrificed. John Uri Lloyd has demonstrated that aluminum silicates in the form of kaolin, fuller's earth, or especially prepared hydrous aluminum silicate, even when simply shaken with solutions of alkaloids, completely remove them from solution. These substances should therefore never be used as filtering or clarifying agents for alkaloidal preparations. This action of aluminum silicate is now applied to the commercial separation and preparation of alkaloids.

CHAPTER XVIII

SEPARATION OF IMMISCIBLE LIQUIDS

The separation of liquids which are mutually soluble is usually effected by distillation, if one or both of the liquids are volatile (see page 131); but the separation of liquids which do not mix with each other is generally a simpler process, and the object of this chapter is to show the methods at present in use.

Separations of this kind are necessary in—1. Alkaloidal assaying. 2. Manufacturing operations. 3. Distillation of volatile oils. 4. Accidental contaminations and admixtures.

The Pipette—This instrument, which is usually employed for accurately measuring small volumes of liquids, has other uses as well. It consists of a narrow tube with its lower end drawn out to a capillary orifice. To increase its

Fig. 339 Graduated pipette

Fig. 340 Measuring pipette

Fig. 341 Pipette (sheet rubber top)

Fig. 342 Glass syringe

Fig. 343 Open separatory funnel

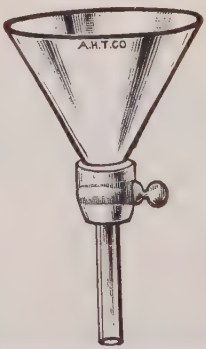

Fig. 344 Pear shaped separator

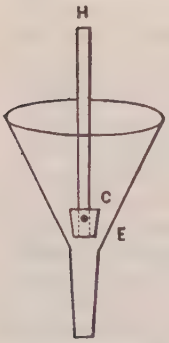
capacity the diameter of the middle portion is often increased, or a bulb, either globular or elongated, is blown in it near the top. Small amounts of liquids floating upon the surface of other liquids may usually be separated by the careful use of a pipette. The lower orifice is dipped into the liquid that is to be separated and suction applied with the mouth at the upper end; the liquid rises, fills the bulb, and if the end of the moistened forefinger is applied to the top, the liquid may be transferred to a more appropriate receptacle. Figs. 339 and 340 show two forms of the instrument. A useful kind of pipette may be made of a thistle tube with a piece of sheet rubber tied over the top (Fig. 341). If pressure is applied to the rubber, the air is partially expelled; if the point of the pipette is then applied to the liquid and the pressure relaxed, the liquid will rise, and it may be transferred to another vessel. In a modification of this, a rubber bulb is attached to the pipette and used in a similar manner. A medicine dropper may be used for very small quantities.

A glass syringe (see Fig. 342) is very useful in collecting a small quantity of oil floating on top of a liquid contained in a beaker or open vessel. The piston of the syringe should be well soaked in warm water before attempting

this simple but delicate operation. A soft rubber ear syringe or infants' rectal syringe is also useful in some cases.

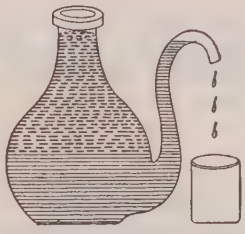
A separatory funnel, as indicated by its name, is used to facilitate the separation of immiscible liquids. An open funnel having a glass stopcock in its neck is illustrated in Fig. 343. The mixed liquid is poured into the funnel, which is kept at rest until separation takes place, then the lower liquid is allowed to run off by opening the stopcock. With careful use, liquids can be separated with great accuracy in this way. Where the liquid is valuable or very volatile, as some of the oils, the closed separatory funnels, such as the pear shaped separator (Fig. 344), which can be securely stoppered and evaporation prevented, are preferred. In assay processes, when immiscible liquids are to be separated, this latter form is preferred, because of the narrowing of the lower portion and the line of demarcation between the liquids can be more accurately observed. Doctor Mitchell devised a cheap but efficient substitute for the separatory funnel for emergency uses (Fig. 345). A good, well pressed cork, *C*, is fitted into the throat of a funnel, *E*, and a wooden skewer, *H*, or other

Fig. 345



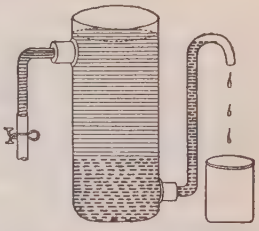
Mitchell's separator

Fig. 346



Florentine receiver

Fig. 347



Receiver for light and heavy oils

suitable wooden rod, is whittled to a flat wedge, and this forced tightly into the cork. The lower portion of the rod is notched, and the upper part of the cork is tied securely to it, or a wooden pin may be driven through it and the cork, to fasten it. It is used by forcing the cork *C* into the neck of the funnel, pouring in the liquids, and, when they have separated, lifting the handle *H* carefully until the lower liquid has entirely escaped, and then pushing it down to stop the flow.

Florentine Receiver—The separation of volatile oils from the water which usually accompanies them during distillation is a very important part of their process of manufacture. Where the volatile oil is lighter than water, the receiver shown in Fig. 346 is used. The mixed oil and water collect in the glass receiver during distillation, the oil floating on the top, while the water ascends the bent tube from the bottom; further addition of distillate causes an overflow, and the water from the bottom of the receiver is discharged through the tube into a suitable vessel, and this is continuous as long as the distillation proceeds. The reverse action can be produced in the receiver for light or heavy oils (Fig. 347) in which either a lighter or a heavier fraction may be continuously collected. The process of separation is continued automatically.

CHAPTER XIX

PRECIPITATION

Precipitation is the process of separating solid particles from a previously clear liquid by physical or chemical changes. The separated solid is termed a *precipitate;* the cause of precipitation, the *precipitant;* the liquid which remains in the vessel above the precipitate, the *supernatant liquid.*

The precipitate usually falls to the bottom of the vessel. It may, however, remain suspended or rise to the top.

The objects of precipitation in pharmacy are,—

1. As a convenient method of obtaining solid substances in the form of fine particles. Example, the precipitation of calcium carbonate.

2. To effect the purification of solids. Example, the preparing of precipitated calcium phosphate.

3. To observe by means of classified and carefully conducted tests the presence or absence of certain substances. Example, as in qualitative analysis.

One of the most important uses of precipitation is in testing, as it affords the most ready means of identifying chemical substances or of ascertaining their purity. A great many pharmacopœial tests are based upon this process. The color, quantity, and character of the precipitate are all taken into account. The terms *curdy, granular, flocculent, gelatinous, crystalline, bulky,* and others, which are sufficiently distinctive, are used to define the peculiar form which the precipitate assumes when thrown out of solution. A *magma* is a thick, precipitate left after the liquid is decanted. (See Magma Magnesiæ, Magma Bismuthi, etc.)

FIG. 348

Precipitating jar

Methods of Effecting Precipitation—Precipitation may be produced in many ways. The following are some of the causes of precipitation. If solutions containing albuminous matter are heated, a flocculent precipitate of coagulated albumin will be thrown down; while if solutions of the silver salts are exposed to the light, precipitation will take place. Precipitation will usually occur when a hot saturated solution of an amorphous substance is allowed to cool, as in the preparation of antimony oxysulphide, or when to a solution is added a liquid in which the dissolved substance is insoluble, as when strong alcohol is added to a small quantity of mucilage of acacia, or if water is added to an alcoholic solution of a resinous substance. Precipitation in the form of fine crystalline granules usually takes place when alcohol or alcoholic liquids are added to strong solutions of chemical salts.

Precipitation is generally caused by *chemical* reaction and some of the most interesting processes in pharmacy are the results of this method of producing it,

Vessels used in Precipitation—Precipitating vessels should be deep, comparatively narrow, and broader at the bottom than at the top (Fig. 348). This construction permits the precipitate to occupy less height in the vessel by causing it to spread out upon the bottom; thus the supernatant liquid can be more thoroughly decanted, the particles of the precipitate will lie in closer contact, and a better opportunity is given for the escape of imprisoned air or gas which frequently exercises a buoyant effect on the particles and prevents their subsiding rapidly and closely. Upon the large scale, cedar tanks, of the shape just described, may be used; these may have wooden spigots introduced, at

convenient distances apart, so that the supernatant liquid may be conveniently run off from different levels as the case may require. Large earthenware jars or glass-lined steel tanks are also used for the collection and washing of precipitates.

Manner of Conducting the Process—If two solutions are used, and it is known that they contain the exact molecular quantity of solid substance to react mutually without leaving an excess of one or the other, the rapidity with which the substances are mixed is immaterial though the physical character of the precipitate is sometimes affected by the speed of the reaction; but when this is not the case, and the precipitant is to be added until precipitation ceases, it is necessary to proceed with caution. The precipitant is then added gradually, and where acid or alkaline solutions are used and carbonates or bicarbonates are not present, litmus paper is useful in indicating the approach of an excess. In other cases the precipitate may be allowed to subside, and the precipitant slowly dropped into the clear liquid above until it is noticed that further addition is without effect. If the precipitate is too bulky to subside quickly, the whole may be vigorously stirred until thoroughly mixed, a small portion transferred to a small plain filter and the filtrate tested by a further addition of precipitant. If this small portion is weighed, or measured, or is a known proportion of the whole, a simple calculation will determine the quantity necessary to complete the precipitation. Ammonia water is one of the most useful of alkaline precipitants, because an excess is at once noticed by the odor. This is easily done by blowing the air from the surface of the liquid, thoroughly stirring up the mixture, and then noting whether it possesses an odor of ammonia.

The Production of Heavy and Light Precipitates—Hot, dense solutions usually produce heavy precipitates, and such precipitates are more readily washed from adherent contaminating salts than those which are light and bulky. An additional advantage is that they occupy less space, and consequently their dose is less bulky. A good example of this is found in the manufacture and use of the heavy and light magnesium carbonates. In many cases of precipitation the order of mixing the ingredients may be disregarded and either may be looked upon as the potential precipitant. This is not always the case, however, and it is particularly not true of precipitates caused by mixing solutions of iron salts with solutions of carbonates or hydroxides.

In this case the proper order is to pour the solution of the iron salt into the solution of the carbonate or hydroxide in order that the latter may be in excess at all stages of the operation, for, if the reverse is done, the first portions of the precipitate are partly composed of basic salts of iron which remain as a contamination.

When in doubt a safe rule to follow is to use as the precipitant the solution containing the electropositive element or group of the desired precipitate. Thus in precipitating lead sulphate pour the solution of the lead compound into the one containing the sulphate. In forming a precipitate which is a hydroxide always try to keep the hydroxide in excess to the end of the operation.

Collecting and Washing Precipitates—In small operations precipitates are collected upon plain filters or in a Buchner apparatus upon a flat filter. The special advantages of such filters have been already pointed out. (See page 202). Upon the large scale muslin strainers are generally used. These are suspended on frames, as shown in Figs. 283 and 284. In washing precipitates which are placed on strainers of this kind, care must be observed to close up the fissures which usually appear in the magma after it has been allowed to stand a short time, by stirring the precipitate thoroughly before adding more water. (See Lotion, Decantation, pages 189 and 190.)

CHAPTER XX

CRYSTALLIZATION, GRANULATION, AND EXSICCATION

Crystallization is the process whereby substances are caused to assume certain determinate forms termed *crystals*. These are distinctive and when perfect are bounded by geometrical surfaces. Crystallization is a molecular phenomenon and very frequently solids which have no external regularity of form or substances apparently in fine powder are in reality crystalline. Crystalline character is not always easily recognizable therefore, and sometimes requires the use of the microscope and polarizing apparatus to arrive at a definite decision. Those substances which are not in a crystallized condition are termed *amorphous*. The main object of crystallization is the purification of the substance. The descriptions of the crystalline forms assumed by bodies form the basis of the interesting science of *crystallography*. In a work of this kind it is impossible to more than briefly outline the basis for the classification of crystals, since the practical process of crystallization must receive the most attention. (See Bragg and Bragg's *X-Ray and Crystal Structure*, Walker's *Crystallography*, Mier's *Mineralogy*, and Rinne's *Crystals and the Fine Structure of Matter*, etc). Every crystallizable body invariably assumes its own characteristic form, or some form directly derived from it or related to it, and in order to classify them crystallographers recognize at the present time six systems, to one or the other of which every crystal is referred.

The plane surfaces bounding a crystal are termed *faces;* when two contiguous faces intersect, an *edge* is formed; an *angle* is formed when three or more faces intersect.

The faces, edges, or angles of a perfect crystal have equal faces, edges, or angles opposite to them, and if the middle points of the opposite faces or edges, or the opposite angles, be joined by straight lines, the point at which these lines intersect will be the centre of the crystal. The lines drawn through this point are called *axes* (the plural of the word axis).

When the same body crystallizes in two or more forms belonging to different systems, it is said to be *dimorphous, trimorphous, polymorphous,* etc. When different substances crystallize in the same form, they are said to be *isomorphous.*

Prismatic (or prism-like) crystals are those which are extended principally in the direction of their longest axis. *Tabular crystals* are those crystallizing in flat planes; *laminar,* those crystallizing in thin plates; *acicular,* those which are needle shaped, etc.

Other terms are used to describe the physical characters of crystals, which are readily understood and are not technical in their meaning.

The systems of classification are based upon the length and relative position of the axes of the crystal. Those in which the three axes intersect at right angles are termed *orthometric;* and when the angles caused by their intersection are oblique, they are called *clinometric.*

Systems in Crystallography

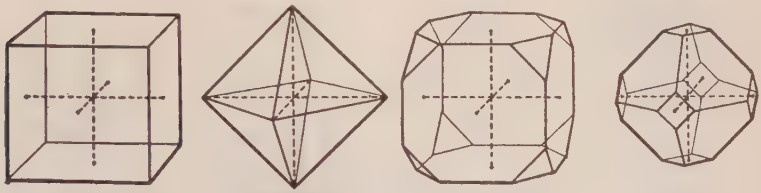
I. Monometric, Cubic, or Regular System—The crystals have three axes of *equal* length intersecting at right angles (see Figs. 349, 350, 351, and 352). Potassium and sodium bromides and iodides, sodium chloride, and the alums crystallize in the monometric system.

II. Dimetric, Tetragonal, or Quadratic System—The crystals have three axes, two of which are *equal,* the other *different* in length, all intersecting at right angles (see Figs. 353,

354, 355, and 356). Calomel, though rarely seen in crystalline form, belongs to this system of crystals.

III. Trimetric, or Rhombic System—The crystals have three axes of *unequal* length, all intersecting at right angles (see Figs. 357, 358, 359, and 360). The crystals of iodine, sulphur and zinc sulphate belong to the trimetric system.

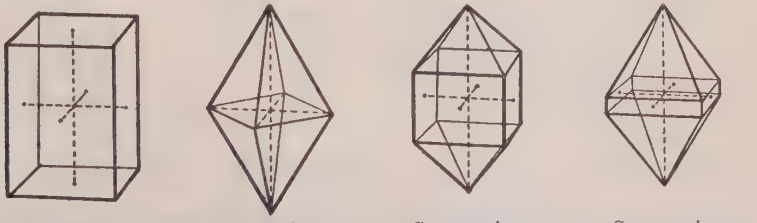
FIG. 349 FIG. 350 FIG. 351 FIG. 352



Cube Octahedron Truncated cube Truncated octahedron

IV. Hexagonal, or Rhombohedric System—The crystals have four axes, three of *equal* length, in the same plane, and inclined to one another at angles of 60°. The fourth axis is *different* in length, and intersects the plane of the three at right angles (see Figs. 361, 362, 363, and 365). Citric acid, silver nitrate, quartz, and calcium carbonate crystallize in the hexagonal system.

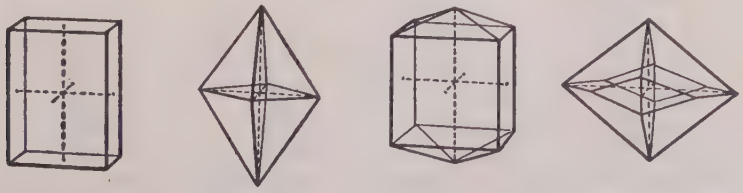
FIG. 353 FIG. 354 FIG. 355 FIG. 356



Right square or dimetric prism Dimetric octahedron Square prism, pyramidal summits Square prism, pyramidal summits

V. Monoclinic, or Oblique Prismatic System—The crystals have three axes of *unequal* length, two of which are obliquely inclined to each other, the other axis forming right angles with these two (see Figs. 365, 366, 367, and 368). Tartaric acid, lead acetate, potassium bicarbonate, sodium phosphate, sucrose, ferrous sulphate, and many other chemicals crystallize in this system.

FIG. 357 FIG. 358 FIG. 359 FIG. 360



Rhombic prism Rhombic octahedron Rhombic prism, pyramidal summits Rhombic octahedron (partially truncated)

VI. Triclinic, or Anorthic System—The crystals have three axes of *unequal* length, all obliquely inclined to one another (see Figs. 369, 370, 371, and 372). Boric acid, potassium dichromate, and copper sulphate are illustrations of the triclinic system.

Determination of Crystalline Form—The method of determining the position of a crystal in one or other of the systems above noted is to measure the inclination of the angles which the faces of the crystal make with one another. From the data obtained, the length and inclination of the axes are

calculated. A reflecting goniometer, such as Penfield's or of the Goldschmidt type, is used to measure the angles of larger crystals.

Most commercial crystals are not perfect examples of the system to which they belong, and are therefore difficult to classify. Methods of examining and

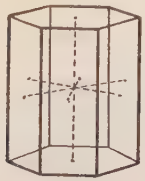


Fig. 361. Hexagonal prism

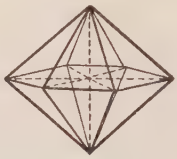

Fig. 362. Double hexagonal pyramid

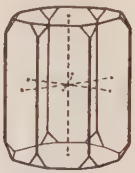

Fig. 363. Hexagonal prism (truncated)

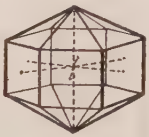

Fig. 364. Hexagonal prism, pyramidal summits

classifying crystals of microscopic size have been developed in recent years in the Bureau of Chemistry of the United States Department of Agriculture, by Edgar T. Wherry, who has made some remarkable and valuable discoveries in connection with this work.

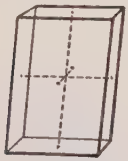

Fig. 365. Monoclinic prism

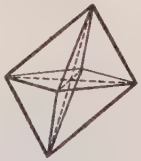

Fig. 366. Monoclinic octahedron

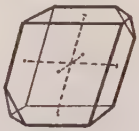

Fig. 367. Monoclinic prism (partly truncated)

Fig. 368. Monoclinic prism, pyramidal summits

In microscopic work the identification of plant tissues is frequently dependent upon the recognition of the crystals which are present. A special goniometer is attached to the microscope to obtain their measurements and characteristics.

Cleavage—If a crystal of potassium ferrocyanide or a piece of mica is broken and examined, it will be noticed that the cohesion of the particles is

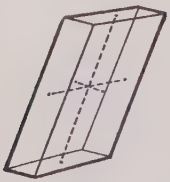

Fig. 369. Triclinic prism

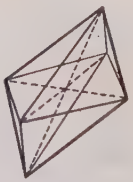

Fig. 370. Triclinic octahedron

Fig. 371. Triclinic prism (truncated)

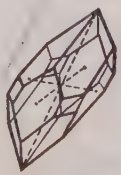

Fig. 372. Triclinic octahedron (partly truncated)

less in one direction than in any other, and if the blade of a knife is inserted in the proper place, the crystal may be easily split or cleft. Other crystals possess this property, but to a greatly varying extent. Perfect crystals may sometimes be formed by cleavage from larger crystals which are irregular.

The process of crystallization generally takes place when a body passes from a liquid or a gaseous condition into the solid state. A few instances are known where amorphous solids become crystalline upon long standing without becoming liquefied, as in iron or brass wire, sulphur, barley sugar.

Methods of Obtaining Crystals—1. By fusion and partial cooling. 2. By sublimation. 3. By deposition from supersaturated solutions as they cool. 4. By deposition from solutions during evaporation. 5. By deposition from solutions upon passing a galvanic current through them. 6. By precipitation. 7. By the addition of a substance having a strong affinity for water.

1. *By Fusion and Partial Cooling*—Substances which have low melting points, like sulphur, and some of the metals, like bismuth, antimony, etc., may be crystallized in this way. To obtain crystals of a substance like sulphur, it should be melted in a deep vessel and then allowed to cool, so that a crust will be formed; a hole is then made in the crust, and a smaller one on the opposite side; the vessel is now inclined toward the side having the larger hole, and the melted substance runs off; when the surfaces inside are examined, they will be found studded with crystals. If the quantity of material used is large, and the mass has been gradually cooled, the crystals will be large and distinct. The crust should be perforated as soon as it is fairly formed, and the fluid contents quickly removed.

2. *By Sublimation*—This is one of the most useful methods of obtaining crystals (see Sublimation, page 146).

3. *By Deposition from Supersaturated Solutions*—This is the method most frequently employed to obtain crystals. The solution of the substance is generally effected by the use of heat (see Solution, page 172). This solution should be filtered, and evaporated to the proper degree, the latter part of the operation being the most important in determining the size and beauty of the crystals. As a rule, substances which are very soluble in water and which make concentrated solutions produce small, ill defined crystals, while substances which are less soluble and which make comparatively dilute solutions, even when they are supersaturated, produce crystals of more perfect form. The proper strength of the solution must always depend upon the solubility of the substance.

Perfect rest for a solution designed for crystallization must be secured, if well defined crystals are desired, and the solution must not be cooled quickly. Sometimes crystals creep or travel up the sides of a crystallizing vessel, and even over its edge, if a small amount of mother liquor has been allowed to remain, or if they are of an intermittent deliquescent type that alternately becomes moist and dry with changes in atmospheric condition.

It has long been known that if a smooth glass rod having a single scratch upon it be placed in a solution ready to crystallize, crystals will first attach themselves to the scratched part, and the smooth part of the rod will frequently not have any separate crystals upon it. Rough surfaces, by offering more points of adhesion, attract the nuclei upon which the crystalline body is subsequently deposited. It is for this reason that rough stoneware vessels are frequently used for crystallization or that strips of wood, glass, or lead are suspended in liquids intended for crystallization, while in the manufacture of rock candy, threads are usually strung across the crystallizing tubs at regular intervals, columnar masses of fine crystals being thus produced. Sometimes crystallizing liquids are *seeded*, as it is called, by adding some small perfect crystals from a previous operation. These act as *nuclei* for the more rapid formation of crystals. Perfect geometrical crystals may be obtained by the practice of "nursing", which consists in selecting from the ordinary stock as perfect a crystal as can be found for the nucleus, and then suspending it by a horsehair or piece of sewing silk in a warm saturated solution of the salt.

Warm saturated solutions of various salts, particularly if contained in chemically clean vessels, protected from the dust, and left at absolute rest

until cooled, usually fail to crystallize. If the receptacle is shaken or jarred, or if a crystal from which the solution has been made, or any other solid substance is dropped into it, crystallization sometimes takes place in an instant, and considerable heat is evolved. This is particularly noticed with salts capable of crystallizing with more than one molecule of water, as sodium sulphate, sodium carbonate, sodium acetate, etc. This phenomenon is known by the name of *retarded crystallization.*

4. *By Deposition from Solutions During Evaporation*—This process is especially useful where the liquid is more volatile than water, as alcohol, ether, petroleum benzin, and chloroform. There are some instances in manufacturing pharmacy where the method is used, but in the case of volatile liquids the expense attending their loss, if spontaneously evaporated, is great, and, as a usual thing, rapid evaporation or recovery of the solvent by distillation is not practicable where large and distinct crystals are desired.

5. *By Deposition from Solutions Through the Action of Feeble Electrical Currents*—This method is not used commercially but is mentioned because Becquerel and others have produced crystals of metals and metallic oxides by the slow but continuous action of feeble electrical currents through the solutions, kept up for months, sometimes for years. Beautiful crystals of gold and copper have been obtained in this way.

If a strip of zinc is suspended in a clear solution of lead acetate, beautiful crystalline spangles of metallic lead seem to sprout and grow until a large arborescent form results. This is called a *lead tree,* and is an interesting window display experiment.

6. *By Precipitation*—Crystals are produced in some cases by the precipitation resulting from the mixture of certain solutions (See Precipitation, page 216.) The crystals formed by this method are frequently granular (See Granulation, page 224.) A crystalline precipitate of potassium bitartrate is produced when solution of potassium hydroxide is added to a strong solution of tartaric acid.

7. *By the Addition of a Substance Having a Strong Affinity for the Water in a Solution*—If anhydrous calcium chloride is added to an aqueous solution of sodium chloride, the latter crystallizes out. Alcohol mixed with a solution of potassium nitrate causes the crystallization of the salt, because the potassium nitrate is not soluble in the mixture of alcohol and water. The crystallization of sugar is frequently observed in syrups to which alcohol in the form of a tincture or fluidextract has been added, and this is often a source of annoyance to the pharmacist. Crystallization sometimes unexpectedly occurs from this cause in extemporaneous dispensing and is one of the forms of incompatibility, described in Part XI.

Many substances in the act of crystallizing combine with water, and the water so combined is termed *water of crystallization* or *water of hydration.* The same substance does not always contain the same number of molecules of water of crystallization. Sodium carbonate, for instance, usually contains ten molecules. Under some conditions it may be made to crystallize with eight or with only five molecules, and in the official salt it contains but one molecule of water. This combination with water must be carefully distinguished from the mechanical retention of a liquid in the interstices of crystals, which takes place particularly where the crystals are large and have been formed rapidly. Water retained in this way is termed *interstitial water,* or *water of decrepitation,* as it is the cause of the *decrepitation* of bodies when exposed to heat. The sudden expansion of the water causes the substance to crackle and burst into fragments. Crystals containing water of crystallization frequently lose part of

it on exposure to the atmosphere, and the transparency noticed when the crystal was fresh is replaced by opacity and is finally followed by the crumbling and disintegration of the crystals. This change is termed *efflorescence.* There are very few substances which will part with all of their water of crystallization at ordinary temperatures, nearly all requiring a high heat to effect the object. The operation of driving off the water and reducing the crystals to the form of a dry powder is called *exsiccation* (see Exsiccation, page 224). Some substances absorb water from the atmosphere, and, instead of becoming dry, grow moist, and in some cases are converted entirely into liquids. Such substances are said to be *hygroscopic,* and the phenomenon is termed *deliquescence.* Examples are found in potassium acetate or in zinc chloride which have been exposed to moist air.

Salts containing water of crystallization are frequently distinguished from those that do not by being termed *hydrated.* Example, *monohydrated sodium carbonate.*

The liquid remaining after the crystals have formed is called *mother liquor,* and consists of a saturated solution of the salt together with any impurities that did not crystallize out with the substance. Usually it may be evaporated and another crop of crystals obtained, if desired, although the second crop of crystals is always less pure than the first.

Where two salts are in solution it is obvious that the more soluble salt must exist in larger proportion in the mother liquor. Chemical salts or active principles of plants are frequently separated from each other by taking advantage of their difference in solubility. Thus cinchonine is separated from quinine. The process is termed *fractional crystallization.*

Crystallizing vessels should be deep, and made of rough glazed stoneware or porcelain. On the large scale, wooden tanks or vats or glass-lined or enameled steel tanks or pans are employed.

Collection, Draining, Washing, and Drying of Crystals—On the small scale it is usually sufficient, after the mother liquor is decanted, to break the crust of crystals, and, having dropped a few pieces of clean broken glass in the throat of a funnel, to place the crystals upon them and drain thoroughly. They are then to be washed by pouring the proper solvent carefully and sparingly upon them. If the crystals are very soluble in water, and it is necessary to free them entirely from mother liquor, they must either be washed with alcohol or with some liquid in which they are not so soluble, or with ice cold distilled water, used very carefully but quickly by pouring it drop by drop upon the crystals, so that the smallest quantity will suffice. After draining or centrifuging they may be transferred to a double sheet of white filtering paper, placed on a bed of two or three newspapers or cloths, loosely covered with a clean sheet of white filtering paper, and removed to a dry atmosphere. If the crystals are liable to effloresce, they should be turned several times, and bottled as soon as fairly dry. When crystals are prepared on a large scale, as in the making of sugar or sucrose, the crystals are dried by passing them through a rotary dryer in which they are made to fall repeatedly through dry air, the exact time being regulated to avoid deliquescence.

Intermediate crystallization is a term used to define the process of crystallizing a substance which is comparatively insoluble in simple solvents, by causing it to dissolve in a hot solution of another substance. Red mercuric iodide may be made to crystallize in this way in brilliant scarlet crystals by dissolving it in a hot solution of sodium chloride, potassium iodide, or mercuric nitrate.

GRANULATION

Granulation is the process of producing, either by the process of interrupted crystallization or by precipitation, a finely crystalline, granular powder; granular crystals are sometimes described as sabulous (sandy) because of the appearance of the particles. The practical advantages of the granulated form of chemicals are so well recognized now at the prescription counter, that their use in preference to large crystals is rapidly extending. This is particularly true of salts which are not very soluble in water, or which are commonly found in commerce in hard, tough, crystalline lumps or masses. The process of granulation is one which requires care, but no great amount of skill. The solution of the substance is generally evaporated rapidly until a scum of minute crystals, called a *pellicle*, forms upon the surface. Then the heat is moderated, in order to prevent spurting or caking. Great care must be exercised at this stage of the process to stir the mass constantly, as there is a tendency to form a hard crust on the bottom of the dish, and when this crust is once formed and afterward broken up by the stirrer it is difficult to avoid the formation of lumps. If the crust is prevented from forming, by constant stirring, the salt will separate in distinct grains, which will not adhere to each other. Toward the end of the process the heat should be very moderate, and the product should be introduced at once into a clean, warm, dry bottle.

Sometimes commercial granulated salts are simply coarsely ground crystals made by the use of a drug mill. This form should not be called *granulated* but *ground*.

EXSICCATION

Exsiccation is the process of depriving a solid crystalline substance of its water of crystallization or moisture by heating it strongly.

The object of exsiccation is to reduce the bulk and weight of substances and thereby enable them to be given in a smaller weight or volume.

The product is usually a fine powder, and the original crystalline condition of the substance may be restored by redissolving it and evaporating the solution. The process is conducted by exposing the crystals to the air or to a warm temperature until they are effloresced, and then gradually heating, with stirring, until they cease to lose weight; the residue is then powdered and kept in well-stoppered containers.

The initial exposure at a low temperature is to prevent the fusing of the salts, which would interfere with the subsequent drying by reducing the amount of surface exposed. Thus ferrous sulphate crystals melt at 65° C., and if this salt were placed directly upon a water bath, at first it would liquefy, but if it be partly dried first by ordinary exposure, the latter part of the operation may be carried out at water bath temperature with no difficulty and with great advantage.

Exsiccated salts, in consequence of their having been deprived of water, are invariably very hygroscopic. Unless they are supplied in glass containers and kept properly protected, they will absorb enough moisture to cause them to lose their distinctive character. Some firms supplying chemicals do not furnish official exsiccated salts except on order specifying "U. S. P". The product usually furnished is commercially called "dried and powdered" and as supplied in pasteboard cartons is intermediate between the powdered hydrated chemical and the real exsiccated salt. Such products should not be accepted for use in dispensing operations where exsiccated salts are demanded.

CHAPTER XXI

EXPRESSION

Expression is a process of *forcibly* separating liquids from solids. It is generally effected by the use of a press, although for many pharmaceutical operations upon the small scale, the use of straining cloths with hand pressure suffices. Expression is no longer an important operation in pharmacy and will be but briefly discussed. At least six mechanical principles have been recognized in the operation of expression: namely, by the use of—1. The spiral twist press. 2. The screw press. 3. The roller press. 4. The wedge press. 5. The lever press. 6. The hydraulic press.

1. **The Spiral Twist Press**—The principle of this press is best and most practically illustrated in the usual process of expressing with the hands a substance contained in a cloth. The mixture to be expressed is placed in a bag or cloth held in one hand by the four corners, which are gathered together, and the lower portion, or bag, is rotated with the other hand, so that, beginning at the top, the point of smallest diameter, the strainer is spirally twisted, the pressure forcing the liquid between the meshes of the cloth. Figs. 373 and 374 show Gigot's press, in which this principle is used upon a larger scale. Upon the left is shown a sectional view of the press as it appears when filled with material. This principle may be effectively applied on the small scale by placing the material to be expressed, which has been placed in a muslin bag, between the folds of strong canvas, about fifteen inches wide and four or five feet long, sewed together like a roller towel. Round sticks, about eighteen inches long, are run through each end and twisted in opposite directions. Substances which are hot may be expressed by this plan without scalding the hands. It is necessary for two persons to perform this operation.

Fig. 373

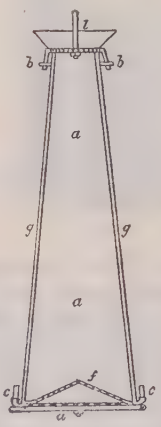

Fig. 374

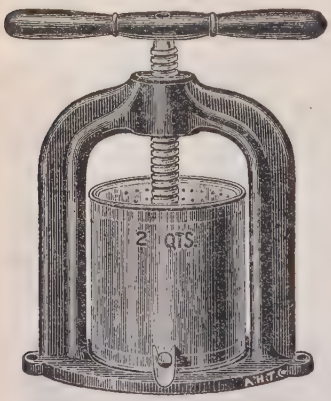
Gigot's press

2. **The Screw Press**—This is the most useful of all forms for pharmaceutical work where very great power is not desired. The screw is always used in combination with one or more levers, and this form of press is employed in great variety to accomplish special purposes. There are two kinds of screw presses: 1. Single screw presses. 2. Double screw presses. Each of these forms may be subdivided into those in which the position of the screw or screws is *vertical*, and those in which the position of the screw or screws is *horizontal*.

Single Screw Presses—In this form of press the single screw is generally used in a vertical position, and operated with a lever or a combination of levers. It is the simplest kind of press, and if well made will admirably answer the general purposes of the pharmacist. The screw should have a square faced thread, and be well made. The plunger should be disconnected from the end of the screw or else move freely around it. The parts of the press which come in direct contact with the material to be pressed should be coated with tin or

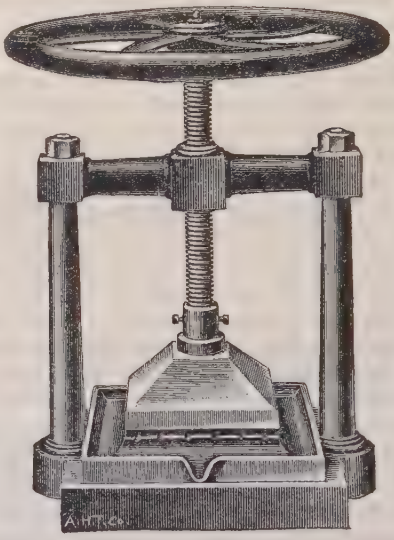
enamel, so that liquids containing acid or tannin shall not be affected injuriously. Fig. 375 shows a press of this description, with a perforated cylinder. The principal objection to the single screw press is, that unless the material in the press is nearly homogeneous, so that the press cake is equally pressed upon at all points, unequal action results, the press block is pressed against one side of the case, causing friction and resistance and the thread of the screw binds upon one side, full pressure thus being defeated. The main objection to the vertical screw is that the press block and plate must be in a horizontal position, the result being that

Fig. 375



Single screw press

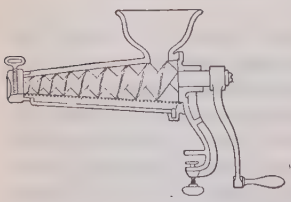
Fig. 376



Porcelain press

the liquid pressed out adheres to the cloth, and cannot be collected readily without tilting the press. Fig. 376 is an illustration of a porcelain press for materials which must not be allowed to come in contact with metals. Fig. 377 illustrates a horizontal screw press, made by the Enterprise Manufacturing Company, of Philadelphia, which is operated without a press cloth. It consists essentially of a tapering case, with a hopper on the upper side at its large end, and a strong screw fitting closely to the inner surface, the thread of which diminishes in size as the screw becomes smaller. Along the under side of the cylinder is formed a channel adapted to receive a perforated brass plate. This latter has a transverse concavity corresponding to that of the inner surface of the cylinder and the perforations allow the escape of the expressed fluids into the channel or gutter beneath, from which it escapes by a proper outlet.

Fig. 377



Enterprise press

Double screw presses are preferred by some users. These are always of the horizontal screw form as shown in Fig. 378.

It is apparent that the double screw press is very powerful, and the pressure being equalized, good results are obtained.

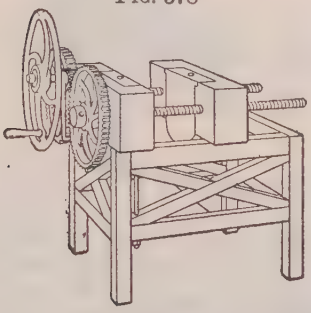
3. **The Roller Press**—This is used upon the large scale for pressing oily seeds, fatty substances, etc. Its principle is thoroughly shown in the well known clothes wringer, which, although made for the laundry, serves as a very efficient press for many substances. Care must be taken to apply the force

gradually to the bag containing the material to be pressed, and not to use it upon substances which will soften or dissolve the rubber rollers.

4. **The Wedge Press**—This form of press is powerful, economical, and inexpensive. It is objectionable principally on account of the noise necessarily made in driving the wedges. Fig. 379, taken from Knapp's *Technology*, illustrates the wedge press.

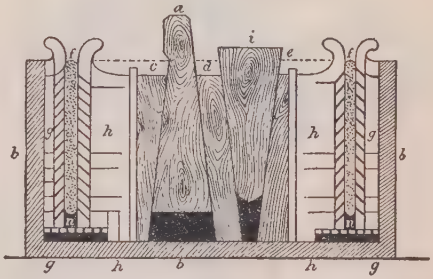
5. **The Lever Press**—The only advantages possessed by this press over those previously noticed are its cheapness, and that it may be made by any one possessed of even moderate mechanical ability. Prof. Wm. Procter, Jr. recommended the following method of construction. "A piece of timber twelve feet long, and with lateral dimensions sufficiently great to be inflexible with the force to be applied to it, has one of its ends securely attached to a wall or upright post in such a manner as to admit of the motion of the other end. The pressing box being placed about one foot from the fixed end, on a firm block of wood, is subjected to the action of the lever by placing a piece of wood vertically between the piston block of the pressing box and the lever. It is

FIG. 378



Double screw press

FIG. 379



Wedge press

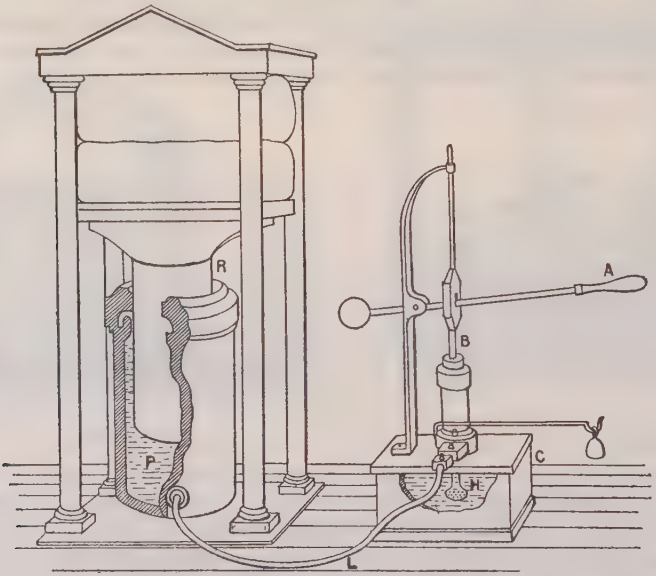
obvious that a weight of one hundred pounds at the opposite end causes a downward pressure equal to eleven hundred pounds at the box. The pressing box most usually employed is a cylinder, closed at one end, made of thick tinned iron, secured with bands of the same material, which are soldered on, and between these, numerous holes are perforated. This cylinder is set in a tin dish with a lateral spout. The piston block is constructed of hard oak wood with the grain running transversely to its axis". The objection to this press is that, compared with other presses, it yields but little power in proportion to the space occupied; but as an offset to this it can be made to work simply and quickly.

6. **The Hydrostatic or Hydraulic Press**—Of the presses heretofore mentioned, each has some especial advantage or use, but each has also some fault or objectionable feature. The spiral twist is not powerful, and its action is limited. The screw presses of both varieties have friction to contend with. The friction of a screw increases with the intensity of the pressure applied, and when a certain limit is reached all further force applied is wasted, and if persisted in, involves the destruction of the press. The roller press is very limited in its action; the lever press is unwieldy and not powerful; the wedge press is noisy and can be used only for special purposes. The hydrostatic press is expensive, but after the first cost it is the most economical, because the greatest power is obtained at the expense of the least labor. The principle is shown in Fig. 380. It must be remembered that the molecules of fluids move freely in contact with one another almost without friction, and, according to Pascal's

law, "Pressure exerted anywhere upon a mass of liquid is transmitted undiminished in all directions, and acts with the same force on all equal surfaces and in a direction at right angles to those surfaces".

Although it has been proved that liquids are to a slight extent compressible it has also been shown that they are *perfectly elastic;* so that if a plug be forced into a liquid which entirely fills the vessel, the pressure is felt equally upon every square inch of the surface of the vessel and upon every square inch of the surface of any body immersed in the liquid, and if the pressure is removed from the plug it will be immediately forced out of the vessel and the liquid will at once regain its original volume. Now, if a vessel is constructed having two columns communicating at the bottom, as in Fig. 380, and if water or other

FIG. 380



Hydraulic press

fluid is placed in it, it will be found that a pressure of one pound applied at the piston in the tube, B, will be communicated to every portion of the lower surface of the ram, R. If the area of R is ten times greater than that of B, it follows that a pressure of one hundred pounds on A, conveyed through the lever, exerts an upward pressure of one thousand pounds on R. By increasing the area of the ram the power may be greatly multiplied so that pressure applied by one man on the lever may be communicated to the liquid and made to exert an upward pressure of several tons.

The following maxims should be observed in operating presses:

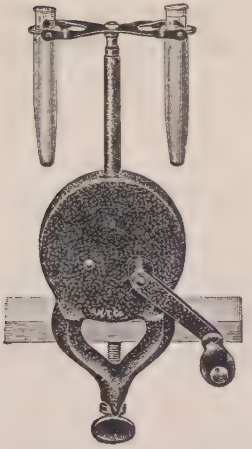
1. All moving parts of the press should be well lubricated before attempting expression.

2. Pressure should be *gradually* increased; sudden strains should always be avoided. If this precaution is neglected, either the press cloth or press bag will burst, the finer solid particles will be forced through the meshes, or breakage of press plates or press will result.

3. Pressure, to secure the best results, should be unrelaxed, but intermittent. After apparently reaching the limit of compression, the action of the

press should cease, and if the pressure is maintained unrelaxed it will be found that in a short time further pressure may be applied and more liquid separated. In this way, by alternately exerting pressure and resting, the utmost limit of

Fig. 381



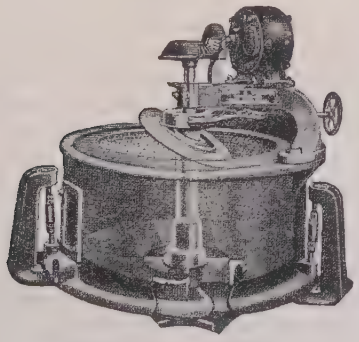
Hand laboratory centrifuge

Fig. 382

Covered laboratory centrifuge

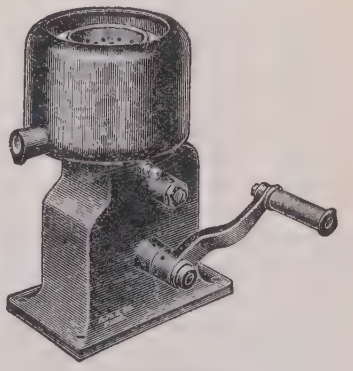
the power of the press may be gradually reached without undue strain. Screw presses have more ability to retain pressure than hydraulic presses; the valves of the latter frequently leak slightly, and the pressure has to be continually renewed.

Fig. 383



Self-balancing centrifuge

Fig. 384



Small centrifuge

Filter Presses—A form of apparatus known as a filter press has replaced for large scale industrial operations all of the presses but the hydraulic press. It is described under filtration (see page 209, Fig. 335).

Centrifugal Machines or Centrifuges—For separating liquids from solids the principle of centrifugal motion has been successfully used. Laboratory centrifuges are used for the rapid separation of sediments or precipitates, as in the examination of urine, and also for the rapid separation of immiscible liquids,

Figs. 381 and 382 illustrate two forms. The latter is electrically driven and covered to avoid injury from an accident. On a large scale centrifuges are used for the separation of mother liquor from crystals, the removal of solvents from insoluble residues, etc. This type is illustrated in Fig. 383. The machine consists of a central, perforated cylindrical cage surrounded by a case; the cage is attached to a vertical shaft, which is capable of being speeded to several thousand revolutions a minute. The wet material is placed in the cage, the machine started, and the liquid forced by rapid motion through the perforations into the space between the outer case and the cage. An experimental centrifuge of this type is shown in Fig. 384.

CHAPTER XXII

EXTRACTION BY MACERATION AND DIGESTION

Under these heads are included those operations which have for their object the separation of the soluble principles from drugs by treating them with a liquid capable of dissolving them, which is called the *menstruum*. *Extraction* differs from solution in the fact that the presence of insoluble matter is implied in the former, and the soluble constituents must therefore be *extracted* or separated, by appropriate methods, from those which are insoluble. The principal modes of extraction employed in pharmacy at present are as follows: 1. Maceration. 2. Percolation. 3. Infusion. 4. Decoction.

Maceration, and *digestion*, which is merely a modified form of maceration, are old processes and will be considered first; percolation is much more important and useful, and will be treated of in a separate chapter; infusion and decoction are processes which are used in producing separate classes of official preparations, hence they will be considered in Part II.

Maceration

The process of *maceration*, which is of ancient origin, consists simply in soaking the properly comminuted drug or substance in the menstruum until the cellular structure is thoroughly penetrated and the soluble portions softened and dissolved. The usual method is to introduce the drug into a bottle with the solvent or menstruum, stopper it tightly, and agitate it occasionally for a period ranging from two to fourteen days; then to pour off the liquid, express the residue to avoid loss, and filter the mixed liquids. An advantage is sometimes gained by suspending the ground drug, tied in a bag, in the upper part of the menstruum (see Fig. 262). This has been termed *circulatory maceration*. Maceration is the process directed by the German Pharmacopœia in preparing tinctures. The drugs are ordered in all cases to be macerated in definite weights of alcohol for a week in a closed bottle, in a dark place, with frequent agitation, at a temperature of about 15° C. The liquid is then separated by straining or expressing from the insoluble residue, and, after having been allowed to settle, it is filtered. Evaporation during filtration is to be avoided as much as possible. Maceration has no advantages over percolation in making the greater number of liquid preparations from drugs, except in the hands of the careless or unskilful. If an operator possesses no knowledge whatever of the process of percolation, it is safer to use the maceration process, for here no particular skill or judgment is necessary; the soaking process is completed in due time, and the separation of the absorbed liquid, while laborious and uncleanly, has at least the merit of leaving the tincture uniform in strength; if the process of expression is not thoroughly performed, pecuniary loss results through the smaller yield, but the finished preparation properly represents the drug. On the other hand, in percolation, if the operator, through careless packing, has failed to exhaust the drug thoroughly with the amount of menstruum used, a portion of the activity of the drug remains in the residue, which is thrown out, and the preparation is thus deficient in strength. The maceration process must be used in the extraction of some drugs, notably

those containing little or no cellular structure as benzoin, aloe, styrax, tolu, etc; this is recognized by the U.S.P. processes.

Maceration should be conducted at a temperature of from 15° to 20° C.

Digestion is that form of maceration which consists in the application of a gentle heat to the substance which is being treated. It is used in those cases where a moderately elevated temperature is unobjectionable; the heat increasing the solvent powers of the menstruum. If the solvent or menstruum is volatile it is necessary to attach a reflux condenser to the vessel in which the digestion is being conducted so that the solvent may be recovered and returned.

CHAPTER XXIII

EXTRACTION BY PERCOLATION

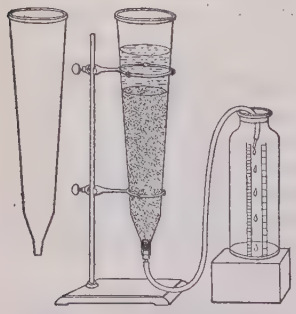
Percolation, or displacement, is the process in which a powder contained in a suitable vessel is deprived of its soluble constituents by the descent of a solvent through it. The importance of this process cannot be overestimated, as the progress made in pharmacy in America during the last century is largely due to the study and development of percolation, and the introduction of preparations which are the direct outgrowth of the process.

History—The practice of exhausting wood ashes of their soluble constituents by pouring water upon them after their introduction into a conical shaped wooden vessel, called a lye hopper, is an ancient one, and the process is still practiced and known as *lixiviation.* It is known that about 1813 a sort of percolator was used by Dumont in decolorizing syrups with charcoal in the refining of sugar and that in the Cafetière de Dubelloy a similar outfit was used in the preparation of coffee but the first attempt on record to apply the principle to powdered drugs was made by Count Real, who about the year 1815 invented a press which consisted of a metallic cylinder with a stopcock in the bottom and containing a perforated diaphragm for supporting the substance, and with a tight cover at the top, to which was attached an upright tube, ten or twelve feet high, having a funnel soldered to its upper extremity. The cylinder was packed with the coarsely ground drug, and water poured into the tube. The pressure of the column of water was so great, however, that the principal difficulty in using the apparatus was in securing tight joints, and in preventing the incomplete exhaustion of the drug on account of the too rapid passage of the water through it. M. Robiquet subsequently made some experiments to determine the power of ether as a solvent in extracting the fixed oil from the bitter almond. He observed that ether poured on powdered bitter almond displaced the fixed oil without mixing materially with it, and he published his observation. It was reserved, however, for the Boullays of Paris, in 1833, to apply the ideas of Real and Robiquet to drugs and medicinal substances in general, and to them belongs the credit of first demonstrating the value of the process of percolation in its pharmaceutical applications. The researches of the Boullays at once attracted the attention of American pharmacists, and the labors of Duhamel, Procter, Grahame, Squibb, Diehl, Oldberg, and others during the last century and the adoption of the process in all of the Pharmacopœias of the United States since 1840, sufficiently show the growth in favor of percolation. In Great Britian, France, and Germany the process is well known, and is practiced to some extent, but maceration still holds in these countries the chief place as a means of extracting the soluble principles of drugs. For a very complete history of percolation, see the *American Journal of Pharmacy,* 1919, page 16, written by James F. Couch.

Principle of Action—*When a powder placed in a cylindrical vessel with a porous diaphragm below is treated from above with a liquid capable of dissolving a portion of its substance, that portion of the fluid first in contact, in passing downward, exercises its solvent power on the successive layers of the powder until saturated, and is impelled downward by the combined force of its own gravity and that of the column of liquid above it, minus the capillary force with which the powder tends to retain it.* The physical forces playing an important part in percolation are *gravitation, viscosity, adhesion, friction, osmosis, capillarity,*

and *solution*. If the quantity of liquid added is not more than enough to satisfy the capillarity of the powder, no liquid will pass the diaphragm; but the careful addition of liquid upon the top displaces that absorbed in the powder without mixing materially with it, and takes its place, to be in turn displaced by a fresh portion of liquid. The instrument used to hold the powder is called a *percolator;* the liquid poured on top of the powder, the *menstruum;* the liquid coming from the percolator impregnated with the soluble principles, the *percolate*. In order thoroughly to understand the process of percolation as applied to powdered drugs, it must be remembered that the soluble principles of vegetable substances are in a hard and dry condition, and are generally contained in cells which are more or less disintegrated by the process of grinding. If the soluble principles could be perfectly separated from the insoluble cellular substance by any means, and be deposited in the interstices of the ground particles, percolation would indeed be a rapid process, for the descending column of liquid would immediately dissolve the soluble principles, which would be found in the receiving vessel, while the insoluble substances would remain in the percolator, and the separation would then be easily accomplished. But the powdering of the drug only partially separates the soluble principles from the insoluble, and the finest dust of the powder always contains a larger proportion of the soluble principles than of the insoluble substance, because the latter, often being largely ligneous, offers the greatest amount of resistance to disintegration. Hence the first portion of the percolate is always the most dense, the most highly colored, and contains the largest proportion of the soluble principles. This is because the first portion of menstruum, in its descent through the powder, has the first opportunity to come in contact with the largest proportion of the soluble principles, which are to be found in the finer dust scattered through the powder, and in the thoroughly disintegrated particles, which offer but slight resistance to the passage of the menstruum. In every well conducted experiment in percolation it will be noticed that, as the operation proceeds, each succeeding portion of percolate is less highly colored, and less active than the one preceding it; and in the case of drugs containing easily dissolved coloring matter, an examination of the percolate will show that the shading is very marked, the lowest portion being very dense and dark colored, the upper portion almost colorless, while in the intermediate liquid the gradations of the tint are clearly perceptible.

FIG. 385 FIG. 386



Official percolator Official percolation

Shape of the Percolator—In the U. S. P. 1880 the shape and size of the cylindrical percolator preferred for pharmacopœial operations were for the first time definitely fixed (Fig. 385). There can be no question that the glass cylindrical percolators (Fig. 387) commonly furnished by the manufacturers are proportionally too broad for use in percolating drugs for fluidextracts where the quantity of drug is large in proportion to the quantity of menstruum; but for ordinary tinctures, where the conditions are reversed, they answer admirably. The inference then is obvious, the pharmacist should have percolators not only of different sizes, but also of different shapes. Fig. 388 shows the narrow percolator first recommended by Prof. C. Lewis Diehl but commonly known as the "*Oldberg percolator*". It is narrower than the cylindrical percolator directed by the U. S. P. X. The studies on percolation during the last half century have been directed toward

simplifying the process, and the elaborate apparatus of Count Real and others has been replaced by the ordinary percolator and funnel. The conical percolator of the Pharmacopœia is understood to be a glass funnel (Fig. 389).

Judgment is required in selecting a percolator for an operation. In making a fluidextract, a comparatively narrow percolator should be chosen, because it is desirable that the menstruum should traverse a higher column of powder, for every drop of the menstruum must be economically applied. The rate of flow of the percolator is thereby proportionally diminished, the percolate becomes saturated more rapidly, and thus the operation is more easily controlled, provided the limit has not been exceeded. *The character of the drug influences the limit.* For instance, one which contains a large quantity of soluble matter, like kino, could not be successfully percolated in a narrow percolator, because the percolate would soon become so dense that it would cease to descend. In making tinctures and weaker preparations, a wider percolator is to be preferred, because the quantity of menstruum is greatly in excess of the amount necessary to exhaust the drug, and more rapid action is desirable. Figs. 390, 391 and 392 show three percolators of the same height, but of very different shapes. Exactly the same weight of powder is represented in each. The great difference in the height of the columns of powder will be readily noticed, and the necessity for judgment in selecting percolators is illustrated. If a fluidextract from the drug is to be made, the tall percolator, Fig. 390, should be selected; if a strong tincture, Fig. 391 indicates the shape; while for a weak tincture, the funnel shown in Fig. 392 would be preferred, it being understood that in each case the drug is not an exceptionally difficult one to percolate. The size of the percolator selected should be in proportion to the quantity of drug extracted. When properly packed, the drug should not occupy more than two-thirds of the height of the percolator. The percolator is best constructed of glass, but, unless otherwise directed, may be made of any suitable material not affected by the drug or menstruum. Metallic percolators are required for hot percolation.

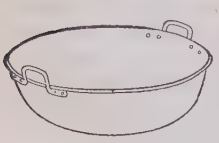
Comminution—The degree of comminution proper for each substance must depend upon the physical structure of the drug, the ease with which the menstruum dissolves the active or desirable constituents, the length of time required to exhaust the powder, and the relative proportion of menstruum to drug. Nux vomica and ignatia are drugs having a tough, horny structure, in which the soluble constituents are embedded. If these drugs are to be quickly exhausted of their soluble principles, they must be in fine powder. On the other hand, gentian and rhubarb are drugs which part easily with their active

constituents, because their structure is loose and quickly penetrated by the menstruum. Therefore these may be readily exhausted when in coarse powder. The relative proportion of menstruum to drug also has a bearing in determining the fineness of the powder, for it is clear that if a fluidextract is to be made in which one hundred volumes shall represent *one hundred* parts by weight of the drug, the powder should be a finer one than would be required for a tincture where one hundred volumes are used to exhaust *ten* parts by weight of the drug. In all cases, whether coarse or fine powder is directed, the powder should conform to the specifications of the Pharmacopœia for that degree of fineness and should be uniformly mixed. The object of this is to permit the uniform descent of the liquid, for fine particles offer more resistance to the passage of the menstruum than coarse ones; if the powder is not uniform, and the finer particles are deposited upon one side of the percolator, imperfect exhaustion may occur, through the passage of the greater portion of the menstruum down the channel of least resistance—*i. e.*, through the coarser particles.

Moistening the Powder—The general rule in percolation is to moisten the powder, and there are very few instances in the official processes where it is not directed. The object of moistening the powder is very apparent. If a perfectly dry sponge is held in the hand and a gentle stream of water poured upon it, it will be noticed that very little water is absorbed by it; but if the sponge is thoroughly soaked, and all the water squeezed out that possibly can be removed, it will greedily absorb water. Vegetable drugs are substances which in their natural state contained moisture, however the process of desiccation has hardened and dried the tissues, so that, like the sponges, they do not absorb moisture quickly, and when compressed, as they are when packed in a percolator, the resistance is still greater. If a dry powder, like ground orange peel, is tightly packed in a glass percolator and water poured upon it, it will be noticed that the water will penetrate the powder only a short distance. Its further passage is prevented by the particles which are immediately in contact with the water, which have become swollen to such a degree that they press tightly against the sides of the percolator, and thus entirely overcome the gravitating force and penetrating power of the water. If, on the other hand, the powdered orange peel is moistened *with sufficient water to satisfy its tendency to swell, before it is packed* in the percolator, the addition of water is followed by its slow percolation through the mass without stoppage, and the utility of moistening the powder is thus proved.

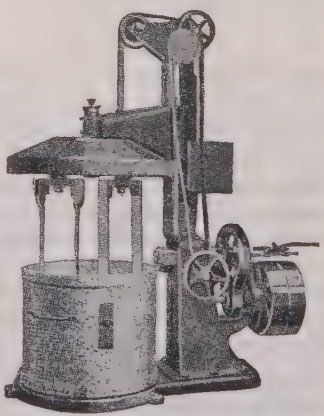
Fig. 393



Pan for moistening powders

The special cases in which the powder should not be moistened are those in which the addition of menstruum would produce adhesiveness and cause the powder to form lumps that could not be easily penetrated, those in which the moistened powder would offer too little resistance to the passage of the menstruum, and those in which the menstruum is too volatile or too inflammable to render moistening desirable or safe. An instance of the first case is found in the so-called cold percolation of sugar in making syrups; instances of

Fig. 394



Power moistener for drugs

the second and third cases, in the preparation of the oleoresins where ether is used as the menstruum. In a small operation the moistening may be best accomplished by adding the menstruum to the ground drug contained in a relatively large, shallow dish (Fig. 393), the drug being rubbed between the hands to secure uniformity. On a large scale a covered power mixer (Fig. 394) may be used. This is the so-called *pony mixer* and the one illustrated is made by the J. H. Day Company. Other forms are also available. The drug may also be placed in a wooden trough or on a clean cement floor, the menstruum added, and the mixing done with a shovel. The latter plan may serve for aqueous menstrua, as in the percolation of cascara sagrada, but would not be economical if the menstruum is alcoholic.

Packing the Powder—The directions of earlier pharmacopœias with regard to this important part of the process of percolation varied continually. Where the degree of pressure was immaterial, no special directions were given. Where there was a likelihood of too much pressure being exerted, so that percolation would cease before it should, the directions were, "pack it moderately"; on the other hand, if there was danger of the operator allowing the menstruum to pass through too rapidly, so that the drug would not be exhausted of its active principles, the directions were, "pack it firmly". Owing to the introduction of Type Processes, the U. S. P. has omitted this valuable aid to the beginner and it is necessary for each operator to determine for himself the degree of pressure to apply in packing the drug. Before beginning to pack the powder, the throat of the funnel or of the percolator must be obstructed by a loose plug of absorbent cotton or a deeply notched cork (Fig. 395), or by some other method. Care should be taken not to moisten the cotton or cork with water unless the menstruum is aqueous, because if the drug to be percolated is resinous, the first portions of percolate which come through will be precipitated by the water in the cotton or on the cork. Instances have occurred where the percolation has been stopped from this cause. Where the notched cork is used, it is well to place over the top of the cork, when it is in place, a small circle of scored filtering paper (Fig. 396). This must be slightly larger in diameter than the cork, and the edges are therefore deflected up the sides.

Fig. 395 Fig. 396

Notched cork Scored paper

Fig. 397

Packer

The moistened powder should be carefully deposited in the percolator in layers, each succeeding layer being packed according to the requirements, "moderately" or "firmly", as the case may be, care being taken to use the same degree of pressure with each layer. Fig. 397 shows a convenient utensil for packing a percolator. It should be made of hard wood, preferably lignum vitæ; for the narrow percolators a longer packer must be used. The skill used in this part of the process will be proved by the manner in which the menstruum permeates the moistened powder. If the descent is regular and uniform, it will be shown in a glass percolator by the line marking the descent of the menstruum being perfectly horizontal. If the line is irregular, it is easy to point out just where the pressure was insufficient or too great. Fig. 398 shows loose and irregular packing, too much pressure being made on the right side, the menstruum descending upon the left side more rapidly and escaping unsaturated. Fig. 399 illustrates a percolator which has been properly packed, the liquid descending uniformly.

Adding the Menstruum—When the last portion of moistened powder is introduced into the percolator, a sheet of filtering paper, scored at the edges

and slightly larger in diameter than the surface of the powder (Fig. 396), should be laid upon it, for the purpose of causing an even distribution of the menstruum. A weight of some kind is usually placed upon the paper, to keep it from floating out of place. Clean pebbles, a bottle stopper, or a small glass funnel may be used, but in Fig. 400 is shown a glass percolator weight, which has been made for this purpose by the Whitall Tatum Company. It is easily cleaned, is not readily broken, and does not take up much room. Where the percolator is large enough to hold the whole of the menstruum, it may be at once added carefully. When this is not the case, and the menstruum must be added in divided portions, care must be observed to follow with the succeeding portion before the first has entirely disappeared, or otherwise fissures may appear in the powder, and the menstruum will of course then seek the outlet offering the least obstruction, and will leak through the fissures instead of percolating through the powder. This is more apt to occur in percolating very fine powders than in percolating coarse ones, although it is liable to take place in either. Where a large quantity of menstruum is required, a contrivance for continually supplying the menstruum should be used, in the form of an inverted bottle or flask (Fig. 271), or any of the methods for continuous washing may be employed. The use of rubber tubing attached to the outlet, as illustrated in Fig. 386, and then bent with an upward curve so that the upper bend is above the level of the packed drug but the outlet below the percolator orifice, will prevent the drug from becoming dry should the operator fail to pour on additional menstruum.

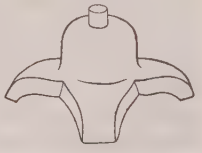
Fig. 398

Imperfect packing

Fig. 399

Proper packing

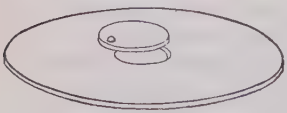
Fig. 400



Percolator weight

Previous Maceration—This is recommended when the structure of the powder is tough, when the soluble principles are not easily extracted by the menstruum, or when a comparatively large quantity of powder is to be exhausted by a small quantity of menstruum. It is obvious that maceration is going on constantly while the menstruum is traversing the powder during its gradual descent, and when the amount of menstruum is more than sufficient to exhaust the drug, previous maceration is merely a waste of time. Nevertheless, the experts of the Pharmacopœia, in order to prevent the possibility of an unskilful or ignorant operator failing to exhaust a drug with the quantity of menstruum directed, have adopted in most cases the precaution of ordering previous maceration for a short time. This is best performed by moistening the drug, introducing it loosely into the percolator, and covering it closely to prevent loss by evaporation. This course has the additional advantage of allowing the drug to swell at the same time. A cover made of sheet rubber (Fig. 401),

Fig. 401



Sheet rubber cover

with a circular opening, is very useful in this connection. No attempt should ever be made to produce fluidextracts on the small scale without previous maceration.

Finishing the Process—The official directions are frequently definite in fixing the quantity of percolate to be received from a given quantity of powder, but the oft repeated direction to "percolate to exhaustion" at once raises the question of when a drug is exhausted of its activity. This question can be properly answered only by knowing beforehand the active principles of the drug. A few examples will sufficiently illustrate this. The activity of nux vomica, opium, and cinchona resides in the bitter alkaloids; hence the *absence of bitterness* in the percolate in such cases indicates exhaustion. Cochineal and saffron are valued in pharmacy for nothing but the coloring matter contained in them; hence the *absence of color* in the percolate shows the close of the process. Nutgall, kino, krameria, etc., contain tannin, and this is the only valuable principle; the *absence of astringency* in the percolate in these cases, therefore, shows the operator that percolation may be stopped. The exhaustion of resinous drugs may be known by the absence of precipitation when the percolate is dropped into water. Where two or more active principles exist in a drug, the latter is not exhausted until the percolate is free from all of them. *The intelligent practice of the process of percolation, therefore, requires an accurate knowledge of the constituents and physical properties of medicinal substances.*

Choice of Menstrua—Much labor has been bestowed by investigators in ascertaining the exact proportions of the usual solvents—water, alcohol, glycerin, etc.—that are best adapted for depriving drugs of such of their soluble principles as are desirable, and at the same time leaving untouched in the residue those principles which are either inert or objectionable. The special menstruum which is exactly adapted to the peculiar characteristics of the drug, and which will cause the retention of the soluble principles in a permanent form under the varying conditions of climate, and at the same time permit exposure to light, heat, and air without injury, can be determined only by experiment and observation. When new galenical preparations are proposed. the menstruum selected must therefore be merely tentative, and general principles must guide until positive knowledge is secured. Alcohol would be indicated for active resinous drugs, diluted alcohol for simple bitter tonics, cathartics, etc., and diluted alcohol with glycerin for astringent drugs, etc. The selection of proper menstrua will be given attention, as occasion demands, in the chapters upon infusions, tinctures, extracts, fluidextracts, etc.

Absorbed Menstruum—The amount of menstruum which a powder will absorb and retain after percolation ceases can never be accurately predetermined. If it is important to know beforehand the percentage of menstruum capable of being absorbed, a practical trial should be made upon the small scale, using the same powder and menstruum.

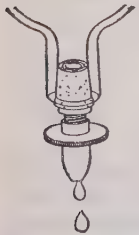
Substances possess very different capacities for retaining menstrua. Those having a light, spongy structure hold more than hard ligneous drugs, and even the same drug will often vary in its capacity in this respect, while the amount of moisture present in the drug before it is percolated is never a constant quantity, varying sometimes as much as from 8 to 20 per cent. The advantages of percolation over maceration are very apparent in respect to the character of the liquid left in the exhausted residue or marc. In maceration the liquid left in the residue is finished tincture. In percolation it is merely menstruum, the active portions of the drug having been dissolved in the preceding percolate. In large operations, from an economical point of view, it is

desirable to recover absorbed menstrua when the residues contain sufficient alcohol to make it worth the necessary time and labor. Distillation is then resorted to, or the residue is treated with weak alcohol and subsequently with water. Where water causes swelling of the substance and a stoppage of the percolation, the residue may be mixed with clean sawdust, rice chaff, or some other inert dry substance, and then percolated with water. Recovered distilled alcohol may be purified by treating it with potassium permanganate; twelve grains dissolved in a gallon of the percolate, and allowed to stand a few days, are usually sufficient. The purified alcohol may be decanted or filtered. Care must always be taken not to use unpurified recovered alcohol which is odorous on account of containing volatile oil obtained from a drug, or which may be otherwise impure.

Controlling the Flow of the Percolate—The necessity for some method of controlling the flow of the percolate is apparent. In simple percolation this is effected by the degree of pressure used in packing the moistened drug. Judgment and experience are absolutely necessary to guide the operator. Various mechanical expedients have been used to accomplish the same purpose. For the control of the flow of percolate by the official method (see Fig. 386) the neck of the funnel-end should be rather short, and should gradually and regularly become wider toward the orifice, so that a perforated cork, bearing a short glass tube, may be tightly wedged into it. The glass tube, which must not project above the inner surface of the cork, should extend from 3 to 4 cm. beyond the outer surface of the cork, and should be provided with a closely fitting rubber tube, at least one-fourth longer than the percolator itself, and ending in another short glass tube, whereby (when it is desired to interrupt the percolation) the rubber tube may be so suspended that its orifice shall be above the surface of the menstruum in the percolator, a rubber band or wire loop holding the tube in position.

In metallic percolators stopcocks or spigots have been employed. It is possible to improvise a control of the flow by employing a narrow homœopathic vial, having a one-eighth inch hole in the side, a half inch from the bottom, and passing it through a perforated cork fitting tightly in the neck of the percolator. By pulling the vial down, the hole is stopped by the encircling cork; by pushing it up, the hole is exposed so that the percolate runs through the vial, and thus the flow may be regulated. Fig. 402 illustrates a very useful method of controlling the flow of a percolate. This "sprinkler controller" was specially made but if not available the well known sprinkler, made of whitemetal, used for liquid dentifrice bottles may be employed. The flow of liquid can be perfectly controlled by its use. In the U. S. P. X the following directions are found:

Fig. 402



Stopper for percolation control

"*Rate of Flow*—The success of the process of percolation largely depends upon the regulation of the flow of the percolate; if this is too rapid, incomplete exhaustion will result, but if too slow, valuable time is wasted and considerable loss of menstruum occurs from evaporation. For fluidextracts using 1000 Gm. of powder, the rate of flow should not exceed ten drops a minute; for official quantities of tinctures and preparations of about the same strength, twenty drops a minute, and the word 'slowly' throughout the text is understood to mean a rate of flow corresponding to this. The proper rate of flow should vary with the quantity and character of the drug employed and the density of the menstruum".

Special Percolators

Well Tube Percolator—An excellent method of percolation which was used by Dr. E. R. Squibb for a number of years, and is still employed, is shown in Fig. 403. It is based upon the principle of drawing water from a well automatically as fast as it accumulates. This is effected by the use of a well tube placed in the center of an ordinary jar or pot and held in its place by the powdered drug which is packed around it. The menstruum is poured upon the drug, and, after percolating through, collects in the well tube, from which it is drawn off by an ingeniously constructed syphon. The illustration clearly shows the method of using this apparatus. It may be used for large or small operations.

Double Tube Percolator—This differs from the well tube percolator just described in the use of an ordinary percolator, the absence of the syphon, and the substitution of a simple, straight tube which is free to move up and down inside of the well tube at the discretion of the operator. Fig. 404 illustrates its mode of action. A central well tube having the lower end irregularly broken

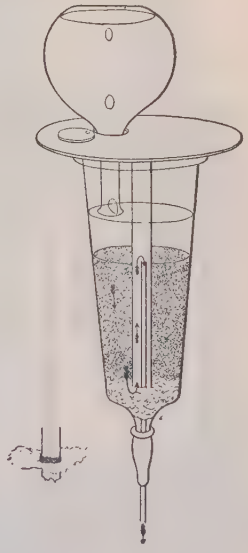
Fig. 404



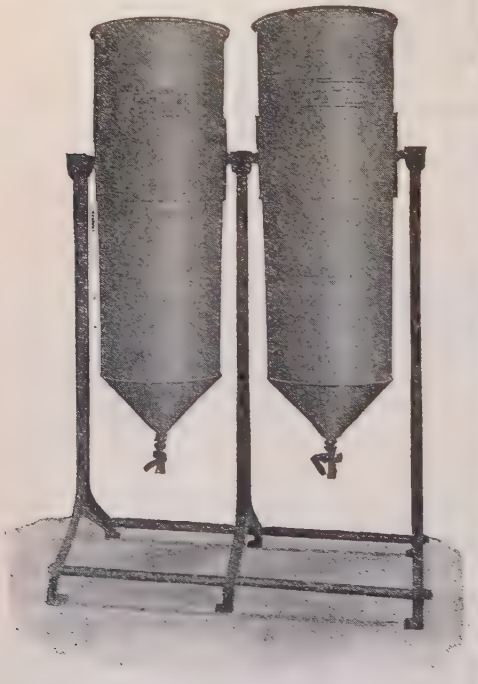
Double tube percolator

is placed in an ordinary glass percolator, upon a tuft of absorbent cotton, or, as in Doctor Squibb's percolator, a circular piece of muslin is securely tied upon the tube a short distance from the bottom, as shown in the small cut in Fig. 404, and the end of the tube rests upon a perforated cork fitting tightly in the neck of the percolator, as proposed by W. S. Thompson in his description of a similar apparatus. The control of the flow of the percolate is effected by raising or lowering the small tube which passes into the well tube, and which is held in place by passing through the perforated cork in the neck of the percolator already mentioned, or through a perforated rubber nipple slipped over the end, as suggested by Windolph, or through a piece of rubber tubing. If previous maceration is directed, the narrow tube may be pushed up until the upper orifice is above the level of the menstruum, and of course above the level of the percolate in the well tube. When it is desirable to begin percolating, the tube is gently rotated with a downward movement until the level of the percolate is reached, and then percolation proceeds regularly, the course of the

menstruum being indicated as shown by the arrows in Fig. 404. The rapidity of the flow is increased by lowering the tube, and decreased by raising it.

Percolation on the Large Scale—Ordinary glass percolators cannot be made of very large size, although well tube percolators are well suited for large operations, but tinned copper or galvanized iron percolators are most frequently employed. Brass stopcocks are mainly depended upon for controlling the flow of the percolate, but these are sometimes objectionable because of the difficulty in cleaning them, and on account of the liability of becoming clogged with evaporated percolate, it is often difficult to start or control the flow accurately. Fig. 407 illustrates a copper percolator, made by Arthur Colton, of Detroit, with diaphragm for supporting the disk of flannel or cloth. It is intended to be placed upon a counter or table.

FIG. 405



Percolators supported from the floor

FIG. 406

Percolator suspended from the ceiling

In large operations it is necessary to employ means to facilitate not only the percolation, but also the packing and emptying, the other subordinate but essential parts of the process. Figs. 405 and 406 show two plans by which this may be accomplished.

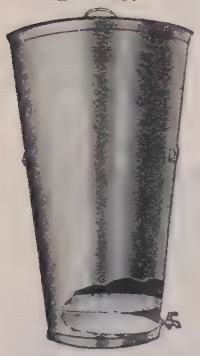
The emptying of the marc from the percolator, at the conclusion of an operation, is the special advantage secured. The entire residue may be dumped into a truck and carried to the still for alcohol recovery.

Fig. 408 illustrates a working model of the Lloyd Extractor and Con-

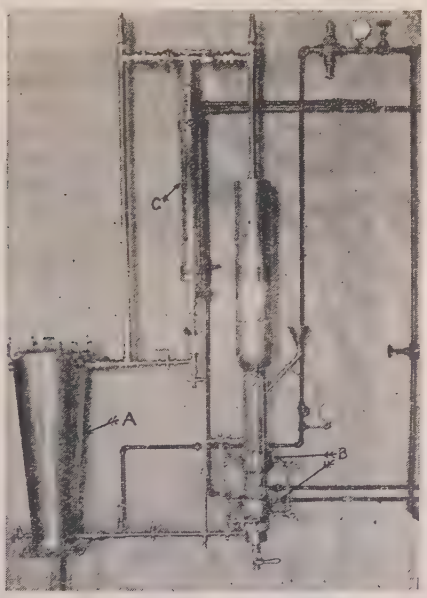
centrator, as used experimentally in the Philadelphia College of Pharmacy and Science. This patented percolating outfit is used on a manufacturing scale in the laboratories of Lloyd Brothers and Johnson and Johnson. All of the extract of belladonna needed for plaster making in the J. and J. laboratory has for years been made with such an outfit. The products obtained from this apparatus are of exceptional interest as contrasted with materials obtained by other processes and other forms of apparatus. The temperature applied to the percolate during evaporation is but for the fraction of a minute, and this permits of the extraction and concentration of the most delicate plant structures with a minimum of change in the product if, indeed, there be any change. The use of excessive heat has long been recognized as one of the

FIG. 408

FIG. 407



Copper percolator (Colton)



Lloyd extractor and concentrator

FIG. 409

Percolate returned as menstruum

weaknesses of many operations involving percolation and concentration and this apparatus seems to point the way to better methods.

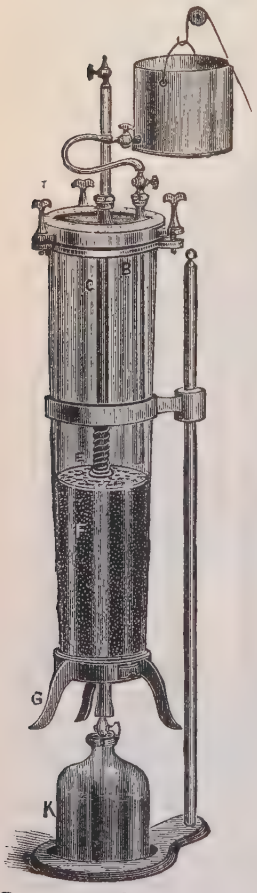
The drug is packed in the percolator *"A"*, the top is clamped on, connections made, the menstruum added, and in due time the percolate flows into one of the concentrators. These consist of narrow, steam-jacketed cylinders marked *"B"*. An adjustment permits the drawing off of the concentrated percolate after heating which is required for but a fraction of a minute. Either concentrator may be used at will. The volatilized menstruum is recondensed at *"C"* and flows back upon the drug for further extraction, thus using a minimum of heat and of menstruum, and ensuring complete drug extraction. Alcohol, ether, or other solvents may be safely employed and the apparatus is tightly closed.

Fig. 409 illustrates a type of percolator now being used on a large scale for the extraction of drugs with a smaller amount of menstruum. It is applicable to some unofficial preparations. The small electric pump returns the percolate to the drug so that it repercolates a number of times and is

finally very fully saturated. The objection to this plan is that valuable percolate remains in the drug at the close of the initial operation which must be removed by washing with fresh menstruum.

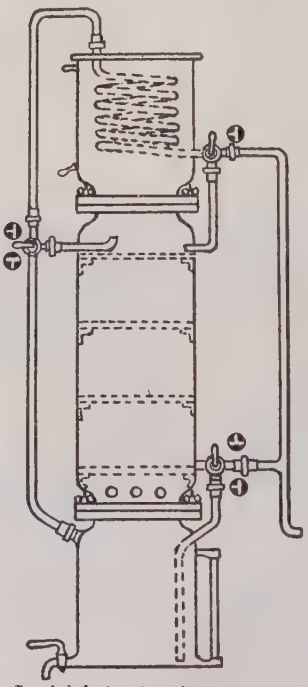
Pressure Percolator—Percolation by pressure was at one time employed. A typical apparatus is shown in Fig. 410. All forms of apparatus were based upon the same principle,—that of forcing the menstruum through the powder at a greater rate of speed than it would pass if it depended alone on the force of gravity. It will be noticed that Count Real's apparatus, invented in 1815, was based upon this principle (see page 233). Joseph P. Remington, after an extended practical trial of percolation by pressure, reached the conclusion, that, while there are some percolating operations in which it can be used advantageously, for the great majority the pressure is unnecessary, just as perfect results being reached by the use of as simple a percolator as a glass funnel or cylinder of the well known form.

Fig. 410



Pressure percolator (Suits)

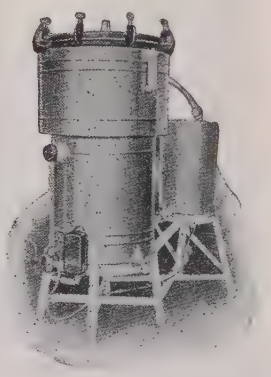
Fig. 411



Lewin's hot extraction apparatus

Percolation with Hot Extraction—In some cases it is desirable to exhaust drugs with hot menstrua. Lewin's extraction apparatus is shown in Fig. 411. The lower vessel is a still; immediately above it is the percolator having three movable sieves for the reception of the substance to be extracted; above the percolator is the condenser. By the use of the three-way stopcocks, the percolation, distillation, and extraction may be controlled at will. Fig. 412 illustrates the Hardesty vanilla percolator in which the principle of hot extraction is used. It is claimed for this outfit that complete exhaustion of the vanilla beans, prevention of loss from evaporation, rapidity of extraction and the avoidance of contamination from other flavors and odors of the laboratory make the adoption of this process of great value to the large manufacturer of flavoring extracts. The menstruum percolates through the drug, the percolate

Fig. 412



Hardesty vanilla percolator

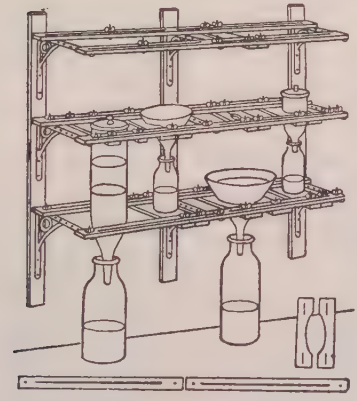
is then heated until vaporized and afterwards recondensed over the drug. This alcoholic liquid again percolates through the drug and the process is continued until complete extraction of flavor is effected, the temperature being carefully regulated throughout so that the aroma is not injured and undesirable constituents removed. This percolator is similar in principle to the Soxhlet extraction apparatus (see Fig. 159).

Methods of Supporting Percolators—The ordinary retort stands are often used to support percolators, but these are generally flimsy and unsatisfactory. The one shown in Fig. 182, particularly if used with split rubber tube sections, as seen in Fig. 187, is much to be preferred. The stand shown in Fig. 413 was devised by Joseph P. Remington in 1875, and because of its adjustability is very useful. Large percolators stand on tables or are suspended as illustrated in Figs. 405 and 406.

Sugar Percolation—The principle of percolation is also extensively applied to the solution of sucrose (sugar) in the preparation of syrups. For this purpose the ordinary percolator may be used but special percolators have also been devised, see Syrups, page 263, Fig. 416.

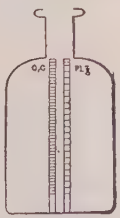
Receiving Bottles—A series of bottles of various sizes should be reserved for use in receiving percolates. Bottles with comparatively wide necks are to

Fig. 413



Percolator stand

Fig. 414



Graduated receiving bottle

Fig. 415

Receiving bottle for percolates

be preferred for receiving bottles. A strip of adhesive plaster may be pasted on the side and accurately measured quantities of water poured in, carefully marking the height of each addition; upon the opposite side corresponding metric quantities may also be placed (Fig. 414). Narrow receiving bottles (metric and old form, and both systems on the same bottle) (Fig. 415) are now available. The graduations are accurately engraved on the glass, to suit the quantities usually made by the pharmacist.

The tin-lined copper can, illustrated in Fig. 406, is used as a receiving vessel in large scale percolation.

Fractional Percolation—This is a term employed by Prof. C. Lewis Diehl and others to define percolation when applied to two successive portions of powder, the principle of action being identical with that of repercolation.

Repercolation—This, as its name indicates, is the process of percolating substances with percolates, or, as defined by Dr. E. R. Squibb, the author of the process, "the successive application of the same percolating menstruum

to fresh portions of the substance to be percolated". The principal object of repercolation is to effect the saving of alcohol and alcoholic menstrua by accomplishing the saturation of the menstrua, as nearly as possible, by passing the unsaturated or weaker percolate from one portion of the drug through another portion, and again passing the unsaturated or weaker percolate from this second portion through a third portion. The fact that no heat is required to concentrate the percolate in the manufacture of fluidextracts is one of the special advantages of repercolation. The weak percolate from this last portion is generally set aside, to be used in succeeding operations upon the same drug in the place of fresh menstruum. This process is useful only in those operations where the relative proportion of menstruum used is small, as in the fluidextracts and similar concentrated preparations. Practical illustrations of the use of this process may be seen by referring to the chapter on Fluidextracts, the principle having been adopted in Type Process C, for Fluidextracts.

PART III

GALENICAL AND OTHER PHARMACEUTICAL PREPARATIONS

MANY of the processes which are used in making the official preparations having been considered in Part II, such as solution, filtration, digestion, percolation, maceration, expression, etc., a natural grouping of the preparations is now considered. This classification presents to the student most of the processes in the order of their simplicity, the more difficult being taken up last. Related groups are of course studied together. Each chapter will begin with a definition and description of the class of preparations of which it treats; then will follow the individual preparations forming the class, with the official processes and explanation. All preparations are arranged alphabetically with those of the U. S. P. first, then those of the N.F. A table of abbreviated unofficial formulas will be found after each class, containing mainly preparations of the older U. S. Pharmacopœias, and also those of the British Pharmacopœia (1914), and others. The following diagram will serve to give a complete view of the classification; it should be carefully examined at the outset, and referred to again after the classes have been studied in detail:

CLASSIFICATION OF OFFICIAL PREPARATIONS

Liquids

MADE WITHOUT PERCOLATION OR MACERATION

Aqueous Solutions

English Title	*Latin Title*	*Genitive or Prescription Form*
Ampuls	Ampulla	Ampullæ
Waters	Aqua	Aquæ
Diluted Acids	Acidum Dilutum	Acidi Diluti
Solutions	Liquor	Liquoris

Aqueous Preparations Containing Sweet, Viscid, or Suspended Substances

Syrups	Syrupus	Syrupi
Honeys	Mel	Mellis
Oxymels	Oxymel	Oxymellis
Mucilages	Mucilago	Mucilaginis
Emulsions	Emulsum	Emulsi
Magmas	Magma	Magmatis
Mixtures	Mistura	Misturæ
Gargles	Gargarisma	Gargarismatis
Lotions	Lotio	Lotionis

Glycerin Solutions

Glycerites	Glyceritum	Glyceriti

Alcoholic and Hydroalcoholic Solutions

Spirits	Spiritus	Spiritus
Elixirs	Elixir	Elixiris
Washes	Lavatio	Lavationis
Dental Liniments	Dentilinimentum	Dentilimenti

Chloroformic Solutions

Chloroformic Solutions	Solutio Chloroformica	Solutionis Chloroformicæ

Ethereal Solutions

Collodions	Collodium	Collodii

Oleaginous Solutions

Liniments	Linimentum	Linimenti
Oleates	Oleatum	Oleati
Petroxolins	Petroxolinum	Petroxolini
Sprays	Nebula	Nebulæ
Medicated Oils	Oleum	Olei

MADE BY PERCOLATION OR MACERATION

LIST OF UNOFFICIAL CLASSES OF PREPARATIONS

Applicati**o-nis**	A preparation for external use
Auristilla-**æ**	A preparation for internal medication of the ear
Bacillula-**æ**	A rod-shaped lozenge
Bacill**um-i**	A bougie
Balne**um-i**	A bath for general application
Bol**us-i**	A large pill (over 5 grains)
Bougi**a-æ**	An instrument or form of medication for insertion into the urethra or other body cavities
Buginari**um-i**	A nasal bougie
Capsul**a-æ**	A capsule
Capsul**a** (æ) amylace**a** (æ)	A cachet or konseal
Carbas**us-i**	Gauze–plain or medicated
Cathet**us-i**	A tubular instrument used for withdrawing urine
Cereol**us-i**	A urethral bougie
Chartul**a-æ**	A folded powder
Chartul**a** (æ) amylace**a** (æ)	A sheet of cachet material
Chrisma-**tis**	A salve
Collunari**um-i**	A nose wash
Collutori**um-i**	A mouth wash
Collyri**um-i**	An eye wash
Conserv**a-æ**	A confection of fresh medicinal agents
Cordiale-**is**	A sweetened alcoholic preparation of high alcohol content
Cremor-**is**	A cream
Electuari**um-i**	A confection of dried medicinal agents
Embrocati**o-nis**	A liniment
Enem**a-tis**	A rectal injection—a clyster
Escharotic**a-æ**	A caustic application

Essentia-æ ..... An essence
Fomentum-i. ..... An aqueous preparation to be applied on a woolen cloth while hot
Fotus-i..... Same as fomentum—a fomentation
Gelatina-æ ..... A semisolid gelatinous preparation for internal or external use
Globule-is ..... A sphere of sugar
Glycerinum-i..... A glycerite
Granula-æ ..... An effervescing granular salt
Granule-is..... A sugar pellet impregnated with medicinal matter
Gutta-æ..... A drop
Haustus-us ..... A draught
Injectio-nis ..... An injection
Injectio hypodermica-æ ... A hypodermic injection
Insufflatio-nis ..... A snuff
Irrigatio-nis ..... A preparation to be applied continuously by means of a special device for the purpose
Jaconettum-i ..... Water-proofed jaconett
Lamella-æ ..... A glycerogelatin disc for use in the eye
Ligamentum-i ..... A bandage
Linctus-us ..... A thick viscid liquid which must be licked from a spoon
Linimentum (i) Exsiccantium (i)..... A drying liniment
Linteum-i ..... Lint—plain or medicated
Litus-i ..... A fluid preparation applied by means of a brush
Lohoch..... A linctus; a syrupy medicine to be administered by licking
Moxa-æ ..... A cone of combustible matter used for cauterization by burning
Oculentum-i ..... An ointment for the eye
Oleinata-æ..... An oleate
Orbicule-is..... A spherical globule of sugar
Parogenum-i ..... Petroxolin
Parvula-æ ..... A small sugar coated pill
Pastillus-i ..... A form of lozenge (chocolate lozenges are called pastillæ in the German Pharmacopœia and tabellæ in the British Pharmacopœia). Also applied to a combustible cone of aromatic drugs used for fumigation
Pellets..... Small spheres of sugar
Pessum-i..... } A pessary
Pessarium-i ..... }
Pigmentum-i ..... A medicinal preparation to be applied by means of a brush
Pilula (æ) comprimata (æ).. A compressed pill, a tablet
Pilula (æ) enterica (æ) .... An enteric pill
Pomatum-i ..... A fat saturated with odorous principles
Plasma-tis ..... A non-fatty unctuous preparation
Potus-us ..... } A draught
Potio-nis..... }
Politzer Plug..... A pledget of cotton, attached to a thread, for insertion in the ear
Rotula-æ ..... A globule or orbicule
Sericum (i) oleatum (i).... Oiled silk
Sinapismus-i ..... A blister
Sindon (i) oleata (æ)..... Oiled cambric
Solvella-æ ..... A soluble tablet
Steatina-æ..... A salve mull
Stilus (i) dissolubilis (is) .. A pencil containing a caustic or an astringent
Stilus (i) unguentis (is)..... A salve pencil; cooling, antiseptic, or astringent
Stupa-æ ..... Tow, plain or medicated
Tabletta-æ..... A tablet
Tela-æ ..... Tissue
Unguenta (æ) extensa (æ) . A mull
Vapor-is..... A vapor, generated by the use of steam or boiling water or by the use of a specially constructed apparatus
Vapor-is Siccus-i ..... A dry inhalation
Vinum-i..... Wines — Preparations similar to tinctures and using wine as the menstruum. These are no longer official and the important ones have been replaced by other preparations

CHAPTER XXIV

AQUEOUS SOLUTIONS

Aquæ—*Waters*

The class of preparations termed *waters* are known also as medicated, aromatic, or distilled waters, and may be simply defined as *aqueous solutions of volatile substances*. The German Pharmacopœia and the French Codex, however, recognize solutions of non-volatile substances as waters.

Waters are mostly saturated solutions and should be clear and free from empyreumatic (smoke-like) or other foreign odors. Strong light, or freezing, hastens their decomposition, and the tendency to form microscopic growths is retarded if purified cotton is used as a stopper for the containers in which they are stored.

The volatile oils from which aromatic waters are to be made should be of the best quality and in perfect condition if the finest flavors are to be obtained. The Pharmacopœia permits most of the aromatic waters to be made by any of the processes, the detailed formulas which follow indicating the exceptions.

The volatile substances used in the preparation of waters are either solid, liquid, or gaseous, and the following methods have been employed in effecting their solution: 1. Simple solution in cold distilled water, with or without filtration through paper. 2. Filtration with the aid of an absorbent powder. 3. Filtration with the aid of pulped or shredded filter paper. 4. Distillation.

Most of the medicated waters are solutions of aromatic volatile oils and are used as pleasant vehicles and solvents for the administration of various remedies.

1. **Simple Solution in Cold Water**—This method is followed when the proportion of the volatile substance is small enough to dissolve easily in the quantity of water required, as in the formerly official Bitter Almond Water. It is also recommended when an excess of a volatile liquid is added and after repeated agitation and standing for about twelve hours, the product is filtered through a paper filter which has been thoroughly washed with distilled water. The method of making medicated waters by agitation with an excess of volatile oil, permitting the excess to remain and drawing off the water as required, is not recommended on account of the liability of the oil to deteriorate through exposure to light and air. In the case of gaseous solutions, the gas is passed through the water until a solution of the desired strength is obtained. (See Solution of Gases, p. 182.)

2. **Filtration with the Aid of an Absorbent Powder** is the process most frequently employed; the object of using the powder is to thoroughly divide the oil, or volatile substance, and thus expose a greater surface, so that the water in filtering through it may become completely saturated. Magnesium carbonate was formerly employed for this purpose, but its slight solubility in water, causing the latter to show a trace of alkalinity, renders it unfit for use. Calcium phosphate, kaolin, powdered glass, silica, powdered pumice-stone, charcoal, precipitated chalk, sugar, etc., have been suggested as substitutes, but there are quite as strong objections to these as to the magnesium carbonate. The Pharmacopœia recommends the use of purified talc, in not finer than a No. 100 powder, for this purpose, with purified siliceous earth as an alternative, although the latter has not proved satisfactory for waters. It is, however, an excellent filtering medium for elixirs.

When solutions of alkaloids or of silver nitrate are prescribed, distilled water alone and not an aromatic water should be used.

3. **Filtration with the Aid of Pulped or Shredded Filter Paper**—This process is permitted by the U. S. P. (10th Revision) and consists in dropping the volatile oil upon white filter paper or filter paper pulp, tearing this into shreds, transferring it to a flask or stoneware jug, adding distilled water in portions, and shaking it thoroughly. The liquid is then filtered through paper and the quantity adjusted by pouring distilled water through the filter.

4. **Distillation**—The process of making waters by distillation is the most ancient of all processes of this class of preparations and in many instances is said to give a better product than any other method.

There is much lack of uniformity however in the directions for preparing even the same water by distillation when different authorities are consulted. For fresh drugs the proportions range from one part of drug to two of distillate, to two parts of drug to one part of distillate. For dried drugs such as cinnamon, anise, dill, caraway and fennel the proportion is one part of the drug to ten parts of distillate. In the case of dried leaf drugs such as peppermint the proportion is three parts of drug to ten parts of distillate. Metallic distillation apparatus is usually employed, sometimes using a current of steam passed through the still from the outside. The drug should be contused or coarsely ground. Most distilled waters acquire an unpleasant empyreumatic odor as soon as they are distilled; this passes off gradually upon exposure to air, if care has been taken not to expose the drug to the action of direct heat during distillation. If no precautions are taken to protect the drug from partial burning, the odor of the carbonized substance will always be noticeable in the distilled water, rendering the product worthless. Fig. 197 shows a copper wire cage suggested by Joseph P. Remington to obviate the difficulty just described; the surface of the cage is hemispherical; it rests, after being partially filled with the drug, upon the flat bottom of the still, and thus the contact of the substance with the heated surface is avoided; the meshes of the cage are coarse enough to permit the free passage of vapors and boiling water through them. In those waters, such as orange flower and rose, in which the flavor and odor are in small amount and delicate, the distillate is returned several times to the still with fresh portions of flowers, thus giving rise to the commercial terms "*double distilled*", "*triple distilled*", or "*quadruple distilled*", according to the number of redistillations. This process is called *cohobation.*

Among the official waters several are directly to be made only by distillation. They are Stronger Rose Water and Orange Flower Water of the Pharmacopœia and Hamamelis Water of the National Formulary.

Preservation—Distilled waters should not be made in larger quantities than can be used within a reasonable time, as they deteriorate when long kept, a flocculent precipitate forming and all traces of their usually agreeable odor disappearing. Should microscopic organisms develop, they render the water unsightly, and when in large proportion they must be regarded as injurious. The use of recently boiled, distilled water is preferable, to avoid as far as possible the presence of micro-organisms in the water used, as it is well known that ordinary distilled water contains many of them. The freshly prepared water may be introduced into a sterilized bottle with a side opening to which a sterilized rubber tube with a pinchcock is attached, and the bottle then closed with a pledget of sterilized cotton. This will materially assist in the preservation of the water. It usually suffices, however, to preserve the medicated water in small bottles, which are completely filled, tightly sealed, and kept in

a cool, dark place. No preservative should be added to medicated waters and if they become cloudy or otherwise deteriorate, they should be discarded.

The U. S. P. X has introduced the following general processes by which most of the official waters are to be made, the choice being left to the pharmacist. Theoretically, all processes produce identical products, but in practice the distillation method yields quite a differently flavored water. However, in pharmacies in the United States one of the other processes is almost universally followed and if care has been taken in the selection of the volatile oil and in the preservation of the product, the waters are satisfactory.

AQUÆ AROMATICÆ. U. S. Aromatic Waters

Official Type Processes for Aromatic Waters

(*a*) *Distillation*—Place the odoriferous portion of the plant or drug from which the Aromatic Water is to be prepared in a suitable still with sufficient water, and distil most of the water, carefully avoiding the development of empyreumatic odors through the burning of the substances. Separate any excess of oil, and preserve or use the clear aqueous portion, which should be saturated with the flavoring or aromatic principles of the plant.

(*b*) *Solution*—

	Metric	Alternative
The Volatile Oil, or Other Specified Volatile Substance	**2 cc. or 2 Gm.**	30 minims or grains
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Shake the volatile substance with 1000 cc. [2 pints] of distilled water in a capacious bottle, and repeat the shaking several times during a period of about fifteen minutes. Set the mixture aside for twelve hours or over night, filter through paper, and pass enough distilled water through the filter to obtain 1000 cc. [2 pints].

If preferred, the Aromatic Water may be prepared by the above formula but with the addition of about 15 Gm. [220 grains], of purified talc, or a sufficient quantity of purified siliceous earth, or pulped filter paper, with which the volatile substance is thoroughly incorporated. Agitate the mixture well, and filter, returning the first portions of the filtrate until it comes through clear.

AQUA ANISI. U. S. Anise Water

[Aq. Anisi]

A saturated solution of oil of anise in distilled water, prepared by one of the processes for aromatic waters (page 252).

Uses—A flavored vehicle, especially pleasing to children.

Average dose—4 fluidrachms (15 cc.).

AQUA AURANTII FLORUM. U. S. Orange Flower Water

[Aq. Aurant. Flor.—Aqua Aurantii Florum Fortior U. S. P. IX, Triple Orange Flower Water, Aqua Naphæ]

Note—This is the former Stronger Orange Flower Water, the weaker water, of one-half strength, having been deleted. This should be remembered in using it in the renewal of old prescriptions.

A saturated solution of the odoriferous principles of the flowers of *Citrus Aurantium* (var. *amara*) Linné (Fam. *Rutaceæ*), prepared by distilling the

fresh flowers with water and separating the clear, saturated portion of the distillate. Its odor is best preserved by allowing a limited access of fresh air to the container.

Description and Physical Properties—Nearly colorless and clear or only faintly opalescent, possessing a strong, pleasant odor and taste of orange blossoms.

It must be free from empyreuma, mustiness, or fungoid growths.

Tests for Purity—Orange Flower Water is neutral or only slightly acid to litmus paper.

Evaporate 100 cc. of the Water on a water bath, and dry the residue to constant weight at 100° C.: not more than 0.001 Gm. of residue remains.

Orange Flower Water shows no reaction with hydrogen sulphide T.S. or with sodium sulphide T.S. (*metallic impurities*).

U. S. P. Preparations—Syrupus Aurantii Florum; Trochisci Acidi Tannici.

N. F. Preparations—Elixir Amygdalæ Compositum; Elixir Aurantii Amari; Elixir Glycyrrhizæ Aquosum; Liquor Hypophosphitum Compositus; Liquor Phosphatum Compositus; Syrupus Calcii Lactophosphatis.

Uses—It is employed as a flavor in syrups, elixirs, and solutions.

Average dose—2 fluidrachms (8 cc.).

AQUA CAMPHORÆ. U. S. Camphor Water

[Aq. Camph.]

A saturated solution of camphor in distilled water, prepared by one of the processes for aromatic waters (page 252), using 2 Gm. [30 grains] of powdered camphor in each 1000 cc. [2 pints].

N. F. Preparations—Mistura Camphoræ Acida; Mistura Camphoræ Aromatica.

Uses—Frequently employed as a vehicle in eye and mouth washes; also as a mild nerve sedative.

Average dose—2½ fluidrachms (10 cc.).

AQUA CHLOROFORMI. U. S. Chloroform Water

[Aq. Chlorof.]

Chloroform,
Distilled Water, each, a sufficient quantity.

To a convenient quantity of distilled water contained in a dark amber-colored bottle, add enough chloroform to maintain a slight excess after the contents have been repeatedly and thoroughly shaken.

When Chloroform Water is required for use, pour off the needed quantity, refill the bottle with distilled water, and saturate it by thorough agitation, taking care that there is always an excess of chloroform present.

Preserve in well-stoppered, amber-colored bottles.

Chloroform water is used as the menstruum in the following preparations:

N. F. Preparations—Extractum Ergotæ Aquosum; the Fluidglycerates.

Uses—It is employed as a sedative in cough mixtures and as a vehicle for administering active remedies. Because of its antiseptic value it frequently replaces water as a menstruum, the chloroform being evaporated during the concentration of the percolate. The saturated water contains about 0.5 per cent of chloroform.

Average dose—4 fluidrachms (15 cc.).

AQUA CINNAMOMI. U.S. Cinnamon Water

[Aq. Cinnam.]

A saturated solution of oil of cinnamon in distilled water, prepared by one of the processes for aromatic waters (page 252).

U. S. P. Preparations—Infusum Digitalis; Mistura Cretæ.
N. F. Preparations—Liquor Ferri Albuminati; Syrupus Cinnamomi; Syrupus Ipecacuanhæ et Opii; Tinctura Ferri Pomata; Tinctura Rhei Aquosa.

Uses—A pleasantly flavored vehicle.

Average dose—4 fluidrachms (15 cc.).

AQUA DESTILLATA. U.S. Distilled Water

[Aq. Dest.]

Water [H_2O] purified by distillation.

The U. S. P. X suggests no method for preparing Distilled Water, simply establishing its degree of purity, but the former official process is copied below. The pharmacist who is preparing sterile solutions, and must therefore have freshly distilled water, may advantageously follow this plan, but he must use "insoluble-glass" flasks for distilling and for receiving the distillate and a block tin, or "insoluble-glass" condenser. If this precaution is not taken, distilled water will contain soluble silicates, and be unfitted for injection. The first 100 volumes are discarded to eliminate foreign volatile substances found in ordinary water and only 750 volumes are collected, since the residue in the still will contain dissolved solids. Distilled water, conforming to the U. S. P. X requirements, may also be prepared by one of the automatic stills described under Distillation (see page 142).

The U. S. P. IX process was as follows:

Water	**1000 Vol.**
To make	**750 Vol.**

Distil the water from a suitable apparatus provided with a block-tin or glass condenser. Collect the first 100 volumes and reject this portion. Then collect 750 volumes and keep the distilled water in glass-stoppered bottles, which have been rinsed with hot distilled water immediately before being filled.

For the U. S. P. X standards and tests for Distilled Water see Part IV.

AQUA DESTILLATA STERILISATA. U.S. Sterilized Distilled Water

[Aq. Dest. Steril.]

The formula for sterilized distilled water and a discussion concerning its manufacture will be found under the Chapter on Sterilization (Part XI).

AQUA FŒNICULI. U.S. Fennel Water

[Aq. Fœnic.]

A saturated solution of oil of fennel in distilled water, prepared by one of the processes for aromatic waters (page 252).

Uses—A flavored vehicle.

Average dose—4 fluidrachms (15 cc.).

AQUA MENTHÆ PIPERITÆ. U.S. Peppermint Water

[Aq. Menth. Pip.]

A saturated solution of oil of peppermint in distilled water, prepared by one of the processes for aromatic waters (page 252).

N. F. Preparation—Liquor Sodæ et Menthæ (alternative with Spearmint Water).

Uses—A flavored vehicle.

Average dose—4 fluidrachms (15 cc.).

AQUA MENTHÆ VIRIDIS. U.S. Spearmint Water

[Aq. Menth. Vir.]

A saturated solution of oil of spearmint in distilled water, prepared by one of the processes for aromatic waters (page 252).

N. F. Preparation—Liquor Sodæ et Menthæ.

Uses—A flavored vehicle.

Average dose—4 fluidrachms (15 cc.).

AQUA ROSÆ. U.S. Rose Water

[Aq. Ros.]

Stronger Rose Water
Distilled Water, each, 1 volume.

Mix them immediately before use.

Rose Water complies with the description and tests under *Aqua Rosæ Fortior*.

Uses—Because of its delightful rose odor it is largely employed for its perfume value in eye and skin lotions.

AQUA ROSÆ FORTIOR. U.S. Stronger Rose Water

[Aq. Ros. Fort.—Triple Rose Water]

A saturated solution of the odoriferous principles of the flowers of *Rosa centifolia* Linné (Fam. *Rosaceæ*), prepared by distilling the fresh flowers with water and separating the clear saturated portion of the distillate. Its odor is best preserved by allowing a limited access of fresh air to the container.

Description and Physical Properties—Rose Water is nearly colorless and clear, possessing a strong, pleasant odor and taste of fresh rose blossoms. It must be free from empyreuma, mustiness, or fungoid growths.

Tests for Purity—It is neutral or only slightly acid to litmus paper.

Evaporate 100 cc. of the Water on a water bath, and dry the residue to constant weight in an oven at 100° C.: not more than 0.001 Gm. of residue remains.

Stronger Rose Water shows no reaction with hydrogen sulphide T.S. or with sodium sulphide T.S. (*metallic impurities*),

U. S. P. Preparations—Aqua Rosæ; Unguentum Aquæ Rosæ.
N. F. Preparation—Confectio Rosæ.

Uses—As a perfume in cold creams and lotions.

AQUA HAMAMELIDIS. N.F. Hamamelis Water

[Aq. Hamam.—Witch Hazel Water, Distilled Extract of Witchhazel]

	Metric	Alternative
Hamamelis Twigs, not less than	**1000 Gm.**	33 oz. av. 167 gr.
Water	**2000 cc.**	4 pints
Alcohol	**150 cc.**	4 fl. oz. 384 min.
To make about	**1000 cc.**	2 pints

Macerate the hamamelis twigs in the water during twenty-four hours, then distil until 850 cc. [27 fl. oz. 96 min.] of distillate are obtained, add the alcohol and mix thoroughly.

Description—Hamamelis Water is clear and colorless, having a characteristic odor and taste. It is neutral, or only faintly acid to litmus paper.

Specific gravity: 0.979 to 0.982 at 25° C.

Tests for Purity—It must be free from mucoid or fungous growths, and must not have an acetous odor.

Evaporate 100 cc. of Hamamelis Water on a water bath: not more than 0.025 Gm. of residue remains (*dissolved impurities*). It contains not less than 14 per cent of absolute alcohol by volume.

Ten cc. of Hamamelis Water gives no test for methanol when subjected to the official test for methanol under *Alcohol.*

A ten cc. portion of Hamamelis Water does not show the presence of acetone when subjected to the official test for acetone under *Alcohol.*

Hamamelis Water does not respond to tests for isopropyl alcohol or diethylphthalate when tested as directed under *Spiritus Frumenti*, U. S. P. X.

Add 8 drops of an aqueous solution of resorcinol (1 in 200) to 5 cc. of Hamamelis Water and carefully superimpose this upon 5 cc. of sulphuric acid, contained in a test tube. After standing for three minutes a rose-red ring does not appear at the line of contact of the liquids, nor does a distinct white layer appear above this zone (*formaldehyde*).

Preserve the product in tightly-closed containers in a cool place.

Approximate alcohol content, by volume, 14 per cent.

Uses—This is practically a solution of alcohol and water, the volatile oil of the bark coming over in such minute amount that it can have no therapeutic value. It is used popularly as an embrocation.

AQUA PHENOLATA. N.F. Phenolated Water

[Aq. Phenol.—Carbolic Acid Water, Solutio Phenoli, P. I.]

	Metric	Alternative
Liquefied Phenol	**22 cc.**	338 min.
Distilled Water	**978 cc.**	31 fl. oz. 142 min.
To make	**1000 cc.**	2 pints

Mix.

Uses—As a disinfectant wash for wounds, and as a local application to relieve itching of the skin.

Unofficial Waters

Title	*Directions*
Aqua Amygdalæ Amaræ, U. S. P. IX	Add 1 cc. oil of bitter almond to 1000 cc. of distilled water Note—This water contains but a trace of hydrocyanic acid and is used only as a flavor. The International Protocol preparation of the same name contains 0.1 per cent of hydrocyanic acid
Aqua Anethi Br. Dill Water	Saturated aqueous distillate from dill fruit [1]
Aqua Carui Br.	Saturated aqueous distillate from caraway fruit [1]
Aqua Creosoti, U. S. P. IX	Add 10 cc. of creosote to 990 cc. of distilled water and filter
Aqua Laurocerasi Br. Cherry Laurel Water	Aqueous distillate from cherry laurel leaves and containing 0.1 per cent, by weight, of hydrocyanic acid

Liquores—*Solutions*

Under this head the U. S. Pharmacopœia places all aqueous solutions of non-volatile substances except such as naturally form separate distinctive classes, as the syrups, infusions, and decoctions.

This classification is adopted only by the U. S. Pharmacopœia, the British standard embracing, in addition, gaseous and saccharine solutions, as Liquor

[1] These waters may be prepared by triturating the corresponding oil with twice its weight of calcium phosphate, adding 500 volumes of distilled water and filtering.

Ammoniæ, Liquor Calcis Saccharatus, etc., while the German Pharmacopœia does not adopt any definite method, solutions of volatile and non-volatile substances both being in the class Aquæ and also in the class Liquores, Aqua Rosæ and Aqua Plumbi together, and Liquor Ammonii Caustici and Liquor Natri Caustici in the same class. Liquor Formaldehydi was added to this class in the U. S. P. (8th Rev.) since paraformaldehyde, a solid substance, is formed upon heating.

The official solutions constitute a most interesting group of preparations. They are usually very active medicinal agents, and some of them are powerful poisons.

As the official solutions all involve individual chemical consideration, and as no general discussion would be of value, they will be taken up in detail under their appropriate classification; the arsenic solutions under arsenic, the ferric solutions under iron, etc. A discussion of the principles and various manipulative methods will be found under *Solution*, page 171. The list of official solutions is as follows:

LIQUORES, U. S. P. X

1. Simple Solutions (aqueous)

Liquor Acidi Arsenosi.....0.975 to 1.025 Gm. As_2O_3 in 100 cc. 5 per cent diluted HCl
Arseni et Hydrargyri Iodidi.....0.95 to 1.05 Gm. AsI_3 and 0.95 to 1.05 Gm. HgI_2 in 100 cc.
Calcii Hydroxidi.....Not less than 0.14 Gm. $Ca(OH)_2$ in 100 cc.
Cresolis Compositus.....50 per cent Cresol with Linseed Oil Soap
Epinephrinæ Hydrochloridi.....0.095 to 0.105 Gm. $C_9H_{13}O_3N$ in 100 cc.
Iodi Compositus.....4.8 to 5.2 Gm. of I and 9.8 to 10.2 Gm. of KI in 100 cc.
Pituitarii.....Water-soluble principles extracted from the posterior lobe of the pituitary body and standardized
Potassii Hydroxidi.....4.5 to 5.5 Gm. of KOH in 100 cc.
Sodii Chloridi Physiologicus.....8.5 Gm. Sodium Chloride in 1000 cc. of freshly distilled water and the solution sterilized
Sodii Hydroxidi.....Not less than 4.5 per cent of NaOH

2. Chemical Solutions (aqueous)

Liquor Ammonii Acetatis.....6.5 to 7.5 Gm. $NH_4C_2H_3O_2$ in 100 cc. (Ammonium Carbonate with Diluted Acetic Acid)
Ferri Chloridi.....Ferric Chloride, corresponding to from 10 to 11 per cent of Iron
Ferri et Ammonii Acetatis.....4 per cent by volume of Tincture of Ferric Chloride in Diluted Acetic Acid, Solution of Ammonium Acetate, Aromatic Elixir, Glycerin, and Water
Ferri Tersulphatis.....Normal Ferric Sulphate, corresponding to from 9.5 to 10.5 per cent of Iron
Formaldehydi.....37 per cent by weight of HCHO
Hydrogenii Dioxidi.....3 per cent by weight H_2O_2
Magnesii Citratis.....Magnesium Citrate, corresponding to not less than 1.5 Gm. of MgO in 100 cc. of Solution (made from Magnesium Carbonate, Citric Acid, Syrup, Oil of Lemon, Sodium or Potassium Bicarbonate, and water)
Plumbi Subacetatis.....Lead Subacetate corresponding to not less than 18 per cent of Lead (made from Lead Acetate, Lead Monoxide and Distilled Water)
Potassii Arsenitis.....Potassium Arsenite corresponding to from 0.975 to 1.025 Gm. of As_2O_3 in each 100 cc. (made from Arsenic Trioxide, Potassium Bicarbonate, Compound Tincture of Lavender, and Distilled Water)
Potassii Citratis.....Not less than 8 per cent $K_3C_6H_5O_7$ (made from Potassium Bicarbonate, Citric Acid, and Distilled Water)
Sodæ Chlorinatæ.....2.5 per cent of available Chlorine (made from Chlorinated Lime, Monohydrated Sodium Carbonate, and Water)
Sodæ Chlorinatæ Chirurgicalis.....0.43 to 0.48 per cent of available chlorine
Zinci Chloridi.....48.5 to 52 per cent of $ZnCl_2$

LIQUORES, N. F. V

1. Simple Solutions (aqueous)

Liquor Antisepticus.....Solution of Boric Acid, Thymol, Eucalyptol, Methyl Salicylate, Oil of Thyme, and Menthol with 30 per cent by volume, of Alcohol
Aromaticus Alkalinus.....Solution of Potassium Bicarbonate, Sodium Borate, Thymol, Eucalyptol, and Methyl Salicylate, with 5 per cent of Alcohol and 10 per cent of Glycerin by volume, the whole colored red with Cudbear

1. Simple Solutions (aqueous)—*Continued*

Liquor Bismuthi	Bismuth and Sodium Tartrate, corresponding to about 1.6 Gm. of Bismuth Oxide in each 100 cc. of Solution (made from Glycerite of Bismuth, Alcohol and Water)
Carmini	6.5 Gm. of Carmine in 100 cc. using Ammonia Water, Glycerin, and Water
Cocci	6.5 Gm. of Cochineal in 100 cc. extracted with the aid of Potassium Carbonate, Alum, Potassium Bitartrate, Glycerin, and Water
Hydrastinæ Compositus	About 0.3 per cent of Hydrastine Hydrochloride with Aluminum Chloride, Calcium Chloride, Magnesium Chloride, Potassium Chloride, Glycerin, and Distilled Water
Hypophosphitum Compositus	Made from Calcium, Potassium, Sodium, Ferric, Manganese, and Quinine Hypophosphites, Strychnine, Potassium Citrate, Hypophosphorous Acid, Orange Flower Water, Glycerin, and Distilled Water
Iodi et Zinci Phenolsulphonatis	Made from Potassium Iodide, Iodine, Zinc Phenolsulphonate, Glycerin, and Distilled Water
Iodi Phenolatus	Made from Compound Solution of Iodine, Liquefied Phenol, Glycerin, and Water
Pancreatini	1.75 Gm. of Pancreatin in 100 cc. with Sodium Bicarbonate, Glycerin, Compound Spirit of Cardamom, Alcohol, Magnesium Carbonate, Sodium Chloride, and Distilled Water, with Chloroform as a preservative
Pepsini	5 per cent by volume of Glycerite of Pepsin with Diluted Hydrochloric Acid, Glycerin, and Distilled Water
Pepsini Antisepticus	5 Gm. of Pepsin in 100 cc. with Menthol, Eucalyptol, Methyl Salicylate, Alcohol, Glycerin, Diluted Hydrochloric Acid, and Distilled Water
Pepsini Aromaticus	1.75 Gm. of Pepsin in 100 cc. with Oils of Cinnamon, Pimenta, and Clove, Alcohol, Diluted Hydrochloric Acid, Glycerin, and Distilled Water
Phosphori	0.07 Gm. of Phosphorus in 100 cc. with Spirit of Peppermint, Glycerin, and Dehydrated Alcohol
Picis Carbonis	Made from Coal Tar, Quillaja, and Alcohol
Plumbi Subacetatis Dilutus	3.5 per cent by volume of Solution of Lead Subacetate in Distilled Water
Potassii Iodidi	From 97 to 103 Gm. of KI in 100 cc. (made from Potassium Iodide, Sodium Thiosulphate, and Distilled Water
Procainæ Hydrochloridi	Made from Procaine Hydrochloride, Sodium Chloride, Thymol, and Sterilized Distilled Water
Sodæ et Menthæ	5 Gm. of Sodium Bicarbonate in 100 cc. with Aromatic Spirit of Ammonia and Spearmint or Peppermint Water
Sodii Arsenatis	1 per cent of Exsiccated Sodium Arsenate in Distilled Water
Sodii Arsenatis, Pearson	0.1 per cent of Exsiccated Sodium Arsenate in Distilled Water. (Note—This is one-tenth the strength of the Solution of Sodium Arsenate)
Sodii Boratis Compositus	Made from Sodium Borate, Sodium Bicarbonate, Liquefied Phenol, Glycerin, and Water
Sodii Phosphatis Compositus	100 Gm. of Sodium Phosphate in 100 cc. with Citric Acid, Glycerin, and Distilled Water

2. Chemical Solutions (aqueous)

Liquor Alumini Acetatis	4.5 to 5.5 Gm. neutral Aluminum Acetate in 100 cc. (made from Lead Acetate, Aluminum Sulphate, and Water)
Alumini Subacetatis	7.5 to 8 Gm. of Basic Aluminum Acetate in 100 cc. (Made from Aluminum Sulphate, Acetic Acid, Precipitated Calcium Carbonate, and Water)
Auri et Arseni Bromidi	Made from Arsenic Trioxide, Bromauric Acid, Bromine, and Water
Calcis Sulphuratæ	Made from Calcium Oxide, Sublimed Sulphur, and Water
Chlori Compositus	0.35 Gm. of available chlorine in 100 cc. (made from Potassium Chlorate, Hydrochloric Acid, and Distilled Water)
Ferri Albuminati	Made from Albuminized Iron, Cinnamon Water, Aromatic Elixir, Alcohol, and Distilled Water
Ferri Citratis	Ferric Citrate, corresponding to not less than 8.75 per cent of Iron (made from Solution of Ferric Sulphate, Citric Acid, Ammonia Water, and Water)
Ferri Peptonati	Made from Peptonized Iron, Sodium Citrate, Alcohol, Syrup, Glycerin, Oil of Orange, Acetic Ether, Vanillin, and Distilled Water
Ferri Peptonati et Mangani	Made from the same ingredients as Solution of Iron Peptonate but with the addition of Soluble Manganese Citrate
Ferri Salicylatis	Made from Sodium Salicylate, Tincture of Ferric Citro-Chloride, Ammonium Carbonate, Citric Acid, Methyl Salicylate, Glycerin and Distilled Water
Ferri Subsulphatis	Basic Ferric Sulphate, corresponding to 20 to 22 Gm. of Fe in 100 cc. (made from Ferrous Sulphate, Sulphuric Acid, Nitric Acid, and Distilled Water)
Phosphatum Acidus	Made from Precipitated Calcium Carbonate, Magnesium Carbonate, Phosphoric Acid and Distilled Water
Phosphatum Compositus	Made from Precipitated Calcium Carbonate, Ferric Phosphate, Ammonium Phosphate, Sodium Citrate, Citric Acid, Glycerin, Phosphoric Acid, Orange Flower Water and Distilled Water
Sodii Citratis	About 2.5 per cent Sodium Citrate (made from Citric Acid, Sodium Bicarbonate, and Distilled Water)

Table of Some Unofficial Solutions

Title	*Directions*
Liquor Acidi Chromici (Br. 1914)	Dissolve 25 Gm. of chromic anhydride in enough distilled water to make 100 cc.
Alumini Acetico-Tartratis (N. F. IV)	Dissolve 75 Gm. of ammonium alum and 30 Gm. of monohydrated sodium carbonate each in 1000 cc. of water. Mix the solutions, wash the precipitate until free from sulphate, drain, add 15 Gm. of glacial acetic acid and 13.5 Gm. of tartaric acid and heat until solution is effected. Evaporate to 100 Gm.
Ammonii Citratis (N. F. IV)	Dissolve 12.5 Gm. of citric acid in 60 cc. of distilled water, add 30 cc. of ammonia water, cautiously neutralize with ammonia water and add distilled water to make 100 cc. Dose: one fluidrachm (4 cc.)
Arsenicalis, Clemens (N. F. IV)	Dissolve 1 Gm. of arsenic trioxide and 4.05 Gm. of potassium bicarbonate in 20 cc. of water, by boiling. Add 50 cc. of water, 0.5 cc. of bromine and water enough to make 100 cc. Stand for twelve hours and filter Dose: three minims (0.2 cc.)
Atropinæ Sulphatis (Br. 1914)	Dissolve 1 Gm. of atropine sulphate in enough recently boiled distilled water to make 100 cc. Prepare freshly as needed Dose: one half minim (0.03 cc.)
Bromi (N. F. IV)	Dissolve 12.5 Gm. of potassium bromide in 80 cc. of water in a bottle, add 8.3 cc. of bromine, shake until solution is effected and add water to make 100 cc.
Epispasticus (Br. 1914)	Dissolve 0.4 Gm. of cantharidin, 2.5 cc. of castor oil and 1.2 gm. of rosin in enough acetone to make 100 cc.
Ferri Acetatis (N. F. IV)	Mix 85 cc. of ammonia water with 300 cc. of cold water, and 80 Gm. of solution of ferric sulphate with 1000 cc. of cold water. Add the iron solution slowly to the ammonia solution, and wash the precipitate by decantation with 600 cc. portions of boiling water, until free from sulphate. Collect the precipitate, concentrate to 70 Gm. by pressure, and add it to 26 Gm. of glacial acetic acid. Add enough water to make 100 Gm., allow to settle and decant the clear solution Dose: five minims (0.3 cc.)
Ferri Hypophosphitis (N. F. IV)	Triturate 16.5 Gm. of ferric hypophosphite with 35 cc. of water, add 21.5 Gm. of potassium citrate, 15 cc. of glycerin, and heat gently until solution is effected. Add water to make 100 cc. and filter Dose: fifteen minims (1 cc.)
Ferri Nitratis (N. F. IV)	Mix 16 cc. of ammonia water with 50 cc. cold water, and 14.5 Gm. of solution of ferric sulphate with 150 cc. cold water. Add the iron sulution to the ammonia solution. Wash the precipitate by decantation with 100 cc. portions of boiling water until free from sulphate. Collect the precipitate, drain thoroughly, transfer to a dish, add 7.1 Gm. of nitric acid, stir until a clear solution is effected and add distilled water to make 100 Gm. Dose: five minims (0.3 cc.)
Ferri Oxychloridi (N. F. IV)	Dilute 30 cc. of solution of ferric chloride with 150 cc. of distilled water, add with constant stirring to 60 cc. of ammonia water diluted with 300 cc. of distilled water. Collect the precipitate and wash with distilled water until free from chloride, drain, express excess of liquid, transfer the precipitate to an evaporating dish, add 3 cc. of hydrochloric acid and stir occasionally during three days. Warm to 40° C., if necessary, to effect solution. Add 12.5 cc. of glycerin, and enough distilled water to make 100 cc. and filter Dose: thirty minims (2 cc.)
Ferri Oxysulphatis (N. F. IV)	Dissolve 16.5 Gm. of ferrous sulphate in 85 cc. of boiling distilled water, add 16.5 Gm. of nitric acid and heat until nitrous odor disappears. Cool and add enough distilled water to make 100 cc.
Ferri Perchloridi (Br. 1914)	Mix 25 cc. of strong solution of ferric chloride with enough distilled water to make 100 cc. Dose: fifteen minims (1 cc.)
Ferri Perchloridi Fortis (Br. 1914)	Place 70 Gm. of iron in a flask, add 250 cc. of hydrochloric acid and 140 cc. of distilled water. Allow to stand until effervescence ceases, boil, filter, rinse with a little distilled water, add 140 cc. of hydrochloric acid to the filtrate, and then pour the solution slowly into 30 cc. of nitric acid. Evaporate until a precipitate begins to form, add 20 cc. of hydrochloric acid and enough distilled water to make 250 cc.
Ferri Protochloridi (N. F. IV)	Place 16 Gm. of iron in a flask, add 35 cc. of distilled water and 62.5 Gm. of hydrochloric acid and heat gently until effervescence ceases. Boil, filter, rinse with a little distilled water, evaporate the filtrate until crystals begin to form and vapors cease to redden moistened blue litmus paper. Add 25 cc. of glycerin and 1 cc. of diluted hypophosphorous acid, heat until crystals are redissolved and add enough distilled water to make 100 cc. Dose: Ten minims (0.6 cc.)
Formaldehydi Saponatus (Br. 1914)	Dissolve 40 Gm. of soft soap in 30 cc. of 90 per cent alcohol and add 20 cc. of solution of formaldehyde and enough distilled water to make 100 cc.
Guttæ Perchæ (N. F. IV)	Shake 15 Gm. of gutta percha with 75 cc. of chloroform in a bottle until dissolved. Mix 17 Gm. of lead carbonate with 25 cc. of chloroform and add to the gutta percha solution. Shake several times at intervals of half an hour, allowing the insoluble matter to settle and decant the clear liquid preserving it in small cork-stoppered bottles
Hydrargyri et Potassii Iodidi (N. F. IV)	Triturate 2.5 Gm. of red mercuric iodide and 2 gm. of potassium iodide with 5 cc. of distilled water until solution is effected. Add enough distilled water to make 250 cc. Dose: three minims (0.2 cc.)
Hydrargyri Nitratis (N. F. IV)	Mix 45 Gm. of nitric acid with 15 Gm. of distilled water and dissolve 40 Gm. of red mercuric oxide in the mixture

Table of Some Unofficial Solutions—*Continued*

Title	*Directions*
Liquor Hydrargyri Nitratis Acidus (Br. 1914)	Dissolve 120 Gm. of mercury in a mixture of 150 cc. of nitric aid and 45 cc. of distilled water without heat, then evaporate by gentle heat to 360 Gm.
Hydrargyri Perchloridi (Br. 1914)	Dissolve 0.1 Gm. of mercuric chloride in enough distilled water to make 100 cc. Dose: thirty minims (2 cc.)
Hypophosphitum	Dissolve 3.5 Gm. of calcium hypophosphite, 2 Gm. of sodium hypophosphite, 1.75 Gm. of potassium hypophosphite, with the aid of 0.6 cc. of hypophosphorous acid, in enough distilled water to make 100 cc. Dose: one fluidrachm (4 cc.)
Magnesii Bicarbonatis (Br. 1914)	Add a solution of 12.5 Gm. of sodium carbonate in 50 cc. of distilled water to a hot solution of 10 Gm. of magnesium sulphate in 50 cc. of distilled water, boil until CO_2 is no longer evolved, collect and wash the precipitate, dissolve it in 100 cc. of distilled water into which carbonic acid gas, under pressure, has been introduced, and store in tightly stoppered bottles Dose: one fluidounce (30 cc.)
Magnesii Sulphatis Effervescens (N. F. IV)	Dissolve 25 Gm. of magnesium sulphate and 4 Gm. of citric acid in 250 cc. of distilled water. Add 60 cc. of syrup of citric acid, filter into a strong 360 cc. bottle, add water to nearly fill the bottle, 2.5 Gm. of potassium bicarbonate, and immediately stopper the bottle Dose: Contents of one bottle
Morphinæ Acetatis (Br. 1914)	Dissolve 1 Gm. of morphine acetate in a mixture of 2 cc. of diluted acetic acid, 25 cc. of 90 per cent alcohol and 25 cc. of distilled water. Add enough distilled water to make 100 cc. Dose: fifteen minims (1 cc.)
Morphinæ Hydrochloridi (Br. 1914)	Dissolve 1 Gm. of Morphine hydrochloride in a mixutre of 2 cc. of diluted hydrochloric acid, 25 cc. of 90 per cent alcohol and 25 cc. of distilled water. Add enough distilled water to make 100 cc. Dose: fifteen minims (1 cc.)
Morphinæ Tartratis (Br. 1914)	Dissolve 1 Gm. of morphine tartrate in a mixture of 25 cc. of 90 per cent alcohol and 25 cc. of distilled water. Add enough distilled water to make 100 cc. Dose: fifteen minims (1 cc.)
Picis Alkalinus	Dissolve 12.5 Gm. of potassium hydroxide in 62.5 cc. of water, add 25 Gm. of tar and dissolve by agitation. Stand for twenty-four hours, strain and add water to make 100 cc.
Potassii Chlorinatæ (Javelle Water)	Mix 8 Gm. of chlorinated lime with 40 cc. of water. Dissolve 5.8 Gm. of potassium carbonate in 30 cc. of boiling water and add to the former mixture. Shake well, cool, add water to make 100 cc. and filter. Keep well stoppered and protect from light
Potassii Permanganatis (Br. 1914)	Dissolve 1 Gm. of potassium permanganate in enough distilled water to make 100 cc. Dose: Two fluidrachms (8 cc.)
Sodii-Citro-Tartratis Effervescens	Dissolve 24 Gm. of sodium bicarbonate in 250 cc. of distilled water, add 24 Gm. of tartaric acid and 2 Gm. of citric acid and when dissolved add 50 cc. of syrup of citric acid. Filter into a strong 360 cc. bottle, and add enough distilled water to make 300 cc. Dissolve 2 Gm. of sodium bicarbonate in 50 cc. of water, filter and pour into a bottle, stoppering immediately Dose: Contents of a bottle
Sodii Silicatis (Water Glass)	A nearly saturated solution
Strychninæ Acetatis	Dissolve 0.178 Gm. of strychnine in 3.5 cc. of diluted acetic acid, add 50 cc, of distilled water, 25 cc. of alcohol, 1 cc. of compound tincture of cardamom, enough distilled water to make 100 cc. and filter Dose: ten minims (0.6 cc.)
Strychninæ Hydrochloridi (Br. 1914)	Dissolve 1 Gm. of strychnine hydrochloride in a mixture of 25 cc. of 90 per cent alcohol and 25 cc. of distilled water and add enough distilled water to make 100 cc. Dose: three minims (0.2 cc.)
Zinci et Alumini Compositus	Dissolve 20 Gm. of zinc sulphate and 20 Gm. of aluminum sulphate in 80 cc. of water, by aid of heat, add 0.06 Gm. of betanaphthol and 0.2 cc. of oil of thyme and shake until cold. Add water to make 100 cc. Mix well, set aside for two days and filter
Zinci et Ferri Compositus	Dissolve 20 Gm. of zinc sulphate, 20 Gm. of ferrous sulphate and 65 Gm. of copper sulphate in 80 cc. of boiling water, add 0.06 Gm. of betanaphthol and 0.2 cc. of oil of thyme, and shake until cold. Add 0.4 cc. of hypophosphorous acid and enough water to make 100 cc. and filter

Ampula—*Ampuls*

This is the class name adopted by the N. F. V for solution in ampuls intended for hypodermic injection. They are also known by the title *Injectio Hypodermica* or simply as *Injections*. A discussion of these and a number of formulas will be found in Part XI.

Collyria—*Eye Lotions, Eye Washes*

Solutions for use on the mucous membrane of the eye should be free from undissolved foreign particles and usually require careful filtration. The use of "hardened" filter paper is desirable to avoid filaments of paper. A 1.4 per cent solution of sodium chloride in distilled water is *isotonic* with tears.

CHAPTER XXV

AQUEOUS SOLUTIONS CONTAINING SWEET OR VISCID SUBSTANCES

Syrupi—*Syrups, Sirups*

Syrups are concentrated solutions of sugar[1] in water or aqueous liquids. The liquids used sometimes contain acetic acid or other organic acids, and occasionally a small quantity of alcohol. When water *alone* is used in making the solution of sugar, the preparation is termed *syrup*, or *simple syrup*. When the water contains soluble principles from various medicinal substances, the syrup is called a *medicated* syrup. A *flavored* syrup is one which is not medicinal in its action, but which is made by the introduction of various aromatic or pleasantly flavored substances. Syrups are useful preparations, because their sweet taste facilitates administration, while the presence of a large percentage of sugar renders them permanent if they are properly made.

Selection of the Sugar—The sugar which should be used exclusively in making syrups is clearly defined by the Pharmacopœia. It is described as "in white, dry, hard, distinctly crystalline granules, permanent in the air, odorless, having a purely sweet taste, and a neutral reaction". This description applies to that known commercially as "granulated sugar", and the official tests should be carefully observed. (See *Sucrosum.*) Sugar must be free from ultramarine, Prussian blue, and insoluble substances, as the presence of impurities, particularly ultramarine, has been proved to interfere with the stability and quality of syrups. The blue dyes mentioned were formerly used to cover the yellow tint of sugar improperly purified, but today the processes and quality of sugar or sucrose have been so improved that they are rarely employed. The direction that the sugar should be dry is all-important, because the permanency of syrups largely depends upon their containing the correct proportion of sugar and water. If an insufficient amount of sugar is present, the syrups will ferment; if they contain too much, crystallization of the excess takes place at first, while the subsequent growth of the crystals is accompanied by an abstraction of sugar from the liquid, and the result is such a weakening of the syrup that fermentation may result, as in the first instance. *Damp sugar* should never be used unless the amount of moisture has been carefully ascertained, and an allowance made for it. Commercial sugars of exceptional purity and whiteness are now offered under such names as "Druggists Standard", "Special Standard Granulated", "Confectioners Granulated", etc. The crystals are unusually large and perfect and are dry, with less tendency to become moist from atmospheric dampness than other sugars. They represent the crystallization from the first running of the filters in the sugar refinery, corresponding to the old "rock candy", and consequently produce a superior syrup, almost entirely free from yellowish tint, even when observed in large volume.

Preparation of Syrups—Syrups are prepared in various ways, and the choice of the proper method must always depend upon the physical and chemical characteristics of the substances entering into the preparation.

[1] The U. S. P. X has adopted the title sucrose for the well-known sugar, as it is the more correct chemical designation, but in this chapter the term sugar will be continued because of its almost universal use in practice.

Five methods are officially recognized, which may be summarized as follows: 1. By solution with heat. 2. By agitation without heat. 3. By the simple addition of a medicating liquid to syrup. 4. By digestion or maceration. 5. By percolation.

1. **By Solution with Heat**—This is the usual method of making syrups when the valuable constituent is neither volatile nor injured by heat, and when it is desirable to make the syrup rapidly. The sugar is usually added to the water or aqueous solution and heated until solution is effected, then skimmed or strained, and sufficient water added to make the desired weight or measure. If the syrup is made from an infusion, a decoction, or an aqueous solution containing organic matter, it is usually proper to heat the syrup to the boiling point in order to coagulate albuminous matter; this is separated subsequently by straining. If the albumin or other impurities were permitted to remain in the syrup, fermentation would probably be induced in warm weather. Saccharometers (see page 63) are very useful in making syrups by the hot process where the proper specific gravity of the finished syrup is known. The saccharometer may be floated in the syrup *while boiling*, and thus the exact degree of concentration determined without waiting to cool the syrup and having to heat it again to concentrate it further.

Excessive heating of syrups at the boiling temperature is undesirable since more or less inversion of the sugar occurs with an increased tendency to ferment.

Syrups cannot be sterilized in an autoclave without some caramelization and discolor resulting from the high temperature.

2. **By Agitation without Heat**—This process is directed by the Pharmacopœia in those cases where heat would cause the loss of valuable volatile constituents. The sugar should be added to the aqueous solution in a bottle of twice the size required for the syrup. This permits active agitation and rapid solution. A "five-pint", glass-stoppered, tincture bottle is well adapted for the making of 1000 cc. of syrup by this process. The stoppering of the bottle is important, as it prevents contamination and loss during the process. The bottle should be allowed to lie upon its side when not being agitated. Glass lined tanks with mechanical agitators, especially adapted to the dissolving of sugar, are used in the large laboratories for the making of syrups on the large scale.

3. **By the Simple Addition of a Medicating Liquid to Syrup**—This method is resorted to in those cases in which fluidextracts, tinctures, or other liquids are added to syrup to medicate it. Syrups made in this way usually develop precipitates since alcohol enters into most of the liquids thus used, and the resinous and oily substances dissolved by the alcohol precipitate when mixed with the syrup, producing unsightly preparations. A modification of this process, frequently adopted, consists of the mixing of the fluidextract or tincture with the water, allowing the mixture to stand to permit the separation of insoluble constituents, filtering, and then dissolving the sugar in the filtrate. This procedure is sometimes resorted to by manufacturing pharmacists to insure permanency in their products, but it is not permissible when the precipitated ingredients are the valuable medicinal agents. In such cases the syrup must be dispensed with the precipitate and a "shake label", or some other form of medication adopted.

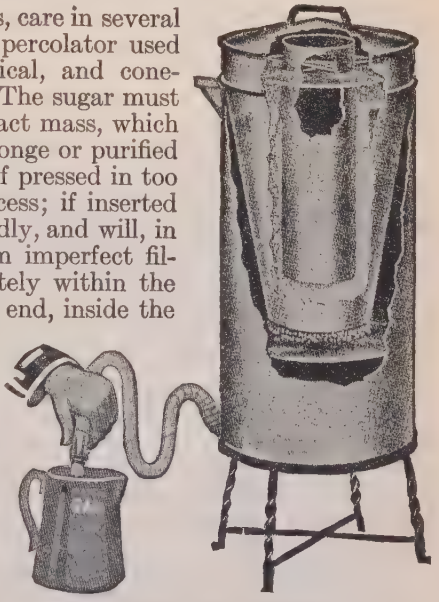
4. **By Maceration or Digestion**—This method is not recommended as either accurate or efficient. A solution of a comparatively insoluble substance can always be effected in a more rapid and thorough manner by dissolving the substance in alcohol, suspending the resinous tincture in a mixture of absorbent powder (especially magnesium carbonate) and water, filtering, and

dissolving sugar in the filtrate, as in the U. S. P. processes for syrups of tolu and ginger.

5. **Percolation in Making Syrups**—This method originated with Orynski, and is conducted as follows: Into the lower orifice of an ordinary percolator is introduced a small piece of sponge or purified cotton; the sugar (granulated) is then poured in, and upon this is added the water, the apparatus being arranged as is usual in the process of percolation. The percolator may be covered loosely, and the operation will proceed without further attention, the syrup coming through drop by drop. If, after the liquid has all passed, there remains a quantity of undissolved sugar in the percolator, enough percolate may be poured back to dissolve it, afterwards adding sufficient water to secure the required measure.

To be successful in using this process, care in several particulars must be exercised: 1. The percolator used should be cylindrical or semi-cylindrical, and cone-shaped as it nears the lower orifice. 2. The sugar must be coarse, else it will form into a compact mass, which the liquid cannot permeate. 3. The sponge or purified cotton must be introduced with care. If pressed in too tightly, it will effectually stop the process; if inserted too loosely, the liquid will pass too rapidly, and will, in consequence, be weak and turbid (from imperfect filtration); it should be inserted completely within the neck of the percolator, as a protruding end, inside the percolator, up through the sugar, will permit the last portions of water to pass out at the lower orifice without dissolving all of the sugar.

Fig. 416



Hardesty sugar percolator

The process of percolation has been applied on a commercial scale for the making of syrup for wholesale distribution or for use at the soda fountain. The Hensel or Hardesty Syrup Percolator, used in this way for making syrup in large quantities (see Fig. 416), consists of an outer galvanized iron syrup reservoir, and an inner vessel, conical in shape, for the sugar, fitting tightly inside of the reservoir and perforated to form a diaphragm, the perforations being covered with a straining medium. A smaller galvanized iron water cylinder fits inside of the sugar vessel and is perforated to permit the water to mix with the sugar and form syrup. If sufficient sugar and water are kept in the several vessels, the action of the percolator is automatic, and brilliantly clear, filtered syrup, saturated at the prevailing temperature, collects in the outer vessel and may be drawn off as desired. A valuable improvement on this percolator is the elimination of the old type of spigot, which was so unsatisfactory, replacing it with a pure gum rubber tubing, which has no shut-off. When not in use, the tube fits under a lip at the top of the percolator, thus protecting it from dust and insects.

An improvised syrup percolator may be made by suspending a galvanized iron can, having a perforated bottom inside of a larger galvanized-iron can to which a brass spigot has been attached. Canton flannel is fastened inside the smaller can and the sugar poured in. So long as an excess of sugar is maintained beneath the water strata, the apparatus will deliver clear, saturated

syrup to the lower can from which it may be drawn at will, by means of the spigot. Cans such as described are available in the form commonly called "ash cans".

Preservation of Syrups—Syrups should not be made in larger quantities than can be used within a few months, except in those cases where special facilities can be employed for their preservation. A low temperature is the best method of preservation for syrups; concentration without supersaturation is also a condition favorable to preservation. The addition of such substances as benzoates, boric acid, salicylic acid, alcohol, fluorides, calcium sulphite, etc., to prevent the fermentation of syrups, is not recommended, for if used in sufficient quantity to act as preservatives they communicate their own flavor to the syrup or are otherwise objectionable and they are usually illegal. The practice of restoring syrups which have been spoiled through fermentation by heating them and "working them over" is a reprehensible one. The practice of good pharmacy demands the possession of sufficient moral courage to find a place for fermented syrups where they will do the least harm—*i. e.*, in the sink and sewer-pipe.

A simple and yet effective method of preserving syrups, especially adapted to fruit syrups, is as follows: A number of bottles are provided holding not more than a pint each, even when the quantity of syrup is large; the bottles are thoroughly cleaned, and kept hot by immersion in boiling water until ready for use; a sufficient number of good corks, which have been thoroughly soaked in hot water, and of the proper size for the bottles, should be at hand. The syrup should be heated to the boiling point (strained, if necessary, and reheated), and poured into the hot bottles until they are filled to the brim. The corks are inserted by forcibly pressing them into the necks of the bottles, thereby displacing a small portion of the syrup, and are tied down with twine in the usual manner. Then, while the necks of the bottles are still hot (and before the syrup can contract in volume through cooling) they are dipped into melted sealing-wax contained in a suitable vessel. By this method the organisms which produce fermentation are destroyed by the heat, and no air, carrying new contamination, can find its way to the syrup, as the bottles are hermetically sealed.

The official syrups should be preserved in well-dried bottles, preferably those which have been sterilized. These bottles should not hold more than is likely to be required during four to six weeks and should be completely filled, carefully stoppered and stored in a cool, dark place.

SYRUPUS ACIDI CITRICI. U.S. Syrup of Citric Acid

[Syr. Acid. Cit.]

	Metric	Alternative
Tincture of Lemon Peel	**10 cc.**	2½ fl. dr.
Citric Acid	**10 Gm.**	146 gr.
Distilled Water	**10 cc.**	2½ fl. dr.
Syrup, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the citric acid in the distilled water and mix the solution with 950 cc. [30 fl. oz.] of syrup. Add the tincture and enough syrup to make the product measure 1000 cc. [2 pints]. Mix thoroughly.

This preparation must not be dispensed if it has a terebinthinate odor or taste or shows other deterioration.

Preserve in containers which have previously been washed with boiling water.

N. F. Preparations—Liquor Magnesii Citratis Effervescens; Liquor Sodii Citro-Tartratis Effervescens.

Uses—It is employed solely as a pleasant vehicle, the formula making it possible to prepare a syrup having the flavor of lemon at all seasons of the year. For soda fountain use, however, *Syrup of Lemon* should always be freshly made from the fruit as the flavor is much more delicate and acceptable.

SYRUPUS. U.S. Syrup

[Sirup, Simple Syrup]

	Metric	Alternative
Sucrose	**850 Gm.**	7 lbs. 1½ oz. av.
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	8 pints

Insert into the neck of a percolator of suitable size a pledget of purified cotton, not too tightly, in such a manner that the cotton shall nearly fill the neck of the percolator, and moisten it with a few drops of distilled water. Place the sucrose in the percolator, make its surface level without shaking or jarring, then carefully pour upon it 450 cc. [58 fl. oz.] of distilled water, and regulate the flow of the liquid, if necessary, so that it will pass out in rapid drops. Collect the liquid in a 1000 cc. [8 pint] graduated container and return portions to the percolator if necessary until all of the sucrose has been dissolved. Then pass enough distilled water through the cotton to make the product measure 1000 cc. [8 pints] and mix thoroughly.

Syrup may also be prepared in the following manner:

Heat 450 cc. [58 fl. oz.] of distilled water to boiling, add the sucrose, and continue the heat cautiously, stirring until the sucrose is dissolved and the syrup has a temperature of 100° C. Then filter it through purified cotton and pass enough distilled water through the cotton to make the product measure 1000 cc. [8 pints] when cold.

Syrup has been discussed in the general article on pages 261 to 264. The quantity of the sugar, the amount of heat used, and the exact degree of concentration are all important factors in the production of a satisfactory syrup, as has already been stated.

Syrup properly prepared has a specific gravity of about 1.313 at 25° C.

U. S. P. and N. F. Preparations—Elixirs, Emulsions, Liquors, Mixtures, Syrups, etc.

Uses—Employed as a sweetening agent, an excipient in pills, and as the basis for many flavored and medicated syrups.

SYRUPUS ACIDI HYDRIODICI. U.S. Syrup of Hydriodic Acid

[Syr. Acid. Hydriod.]

Syrup of Hydriodic Acid contains not less than 1.3 Gm. and not more than 1.5 Gm. of HI in each 100 cc.

	Metric	Alternative
Diluted Hydriodic Acid	**130 cc.**	4 fl. oz. 77 min.
Sucrose	**450 Gm.**	15 oz. av. 9 gr.
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the diluted hydriodic acid with 550 cc. [17 fl. oz. 288 min.] of distilled water and dissolve the sucrose in this mixture by agitation. Add sufficient distilled water to make the product measure 1000 cc. [2 pints] and filter.

(For tests and comments, see page 556.)

Uses—As an alterative in the same class of cases for which potassium iodide is employed.

SYRUPUS AURANTII. U.S. Syrup of Orange

[Syr. Aurant.]

	Metric	Alternative
Tincture of Sweet Orange Peel	**50 cc.**	1 fl. oz. 288 min.
Citric Acid	**5 Gm.**	73 gr.
Purified Talc	**15 Gm.**	219 gr.
Sucrose	**820 Gm.**	27 oz. av. 163 gr.
Distilled Water, a sufficient quantity, To make	**1000 cc.**	2 pints

Triturate the purified talc with the tincture and citric acid, and gradually add 400 cc. [12 fl. oz. 384 min.] of distilled water. Then filter, returning the first portions of the filtrate until it becomes clear, and wash the mortar and filter with enough distilled water to make the filtrate measure 450 cc. [14½ fl. oz.]. Dissolve the sucrose in this filtrate by agitation, and add enough distilled water to make the product measure 1000 cc. [2 pints]. Mix thoroughly and strain.

This preparation must not be dispensed if it has a terebinthinate odor or taste or shows other deterioration.

Alcohol content, by volume, 2 to 5 per cent.

Uses—A pleasant vehicle.

SYRUPUS AURANTII FLORUM. U.S. Syrup of Orange Flowers

[Syr. Aurant. Flor.]

	Metric	Alternative
Orange Flower Water	**225 cc.**	7 fl. oz. 96 min.
Sucrose	**850 Gm.**	28 oz. av. 164 gr.
Distilled Water, a sufficient quantity, To make	**1000 cc.**	2 pints

Mix the orange flower water with 225 cc. [7 fl. oz. 96 min.] of distilled water, dissolve the sucrose in the mixture by agitation, without heat, and add sufficient distilled water to make the product measure 1000 cc. [2 pints]. Mix thoroughly and strain.

Syrup of Orange Flower Water may also be made in the following manner:

Prepare a percolator in the manner described under *Syrupus*. Pour the mixture of orange flower water and water upon the sucrose, return the first portions of percolate until it runs through clear, and when all of the liquid has run through, follow it with distilled water until the sucrose is dissolved and the product measures 1000 cc. [2 pints]. Mix thoroughly.

Uses—A flavored vehicle.

SYRUPUS FERRI IODIDI. U.S. Syrup of Ferrous Iodide

[Syr. Ferr. Iod.—Ferri Iodidi Syrupus P. I.]

Syrup of Ferrous Iodide contains not less than 6.5 Gm. and not more than 7.5 Gm. of FeI_2 in each 100 cc., representing approximately 5 per cent of FeI_2 (309.68), by weight.

	Metric	Alternative
Iron, in the form of fine, bright wire	20 Gm.	292 gr.
Iodine	60 Gm.	2 oz. av. 1 gr.
Hypophosphorous Acid	5 cc.	77 min.
Sucrose	850 Gm.	28 oz. av. 164 gr.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Place the iron in a flask having a capacity of about 500 cc. [1 pint], add the iodine and 200 cc. [6½ fl. oz.] of distilled water, and shake the mixture occasionally, checking the reaction if necessary by placing the flask in cold water. When the liquid has acquired a green color and has lost the odor of iodine, heat it to boiling, and dissolve 100 Gm. [3 oz. av. 148 gr.] of sucrose in the hot liquid. Filter the solution at once into a flask, graduated to 1000 cc. [2 pints] and containing the remainder of the sucrose, and rinse the flask containing the iron with 240 cc. [7½ fl. oz.] of hot distilled water, in divided portions, passing the rinsings successively through the filter. Agitate the mixture until the sucrose is dissolved, warming if necessary, cool to 25° C., add the hypophosphorous acid and enough distilled water to make the product measure 1000 cc. [2 pints]. Mix well and strain.

(For tests and comments, see page 718.)

Uses—As an alterative tonic, especially in scrofulous conditions.

Average dose—15 minims (1 cc.).

SYRUPUS IPECACUANHÆ. U.S. Syrup of Ipecac

[Syr. Ipecac]

	Metric	Alternative
Fluidextract of Ipecac	70 cc.	2 fl. oz. 115 min.
Glycerin	100 cc.	3 fl. oz. 96 min.
Syrup, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the fluidextract with the glycerin, and add enough syrup to make the product measure 1000 cc. [2 pints]. Mix thoroughly.

Alcohol content, by volume, 1.5 to 2 per cent.

Uses—A valuable emetic, especially for children suffering from croup; also used as an expectorant in acute bronchitis. In croup it may be given in repeated doses, appropriate to the age of the child, every fifteen minutes until vomiting is produced.

Average dose—{Expectorant, 12 minims (0.75 cc.).
Emetic, 4 fluidrachms (15 cc.).

SYRUPUS PICIS PINI. U. S. Syrup of Pine Tar

[Syr. Pic. Pin.—Syrupus Picis Liquidæ U. S. P. IX, Syrup of Tar]

	Metric	Alternative
Rectified Oil of Tar	1 cc.	15 minims
Sucrose	850 Gm.	26 oz. av. 164 gr.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the oil with 450 cc. [14½ fl. oz.] of water and agitate the mixture frequently during fifteen minutes. Then set aside for twenty-four hours, shaking it occasionally during that time. Filter, dissolve the sucrose in the clear filtrate, and add sufficient water to make the product measure 1000 cc. [2 pints]. Mix thoroughly and strain.

Uses—A stimulant expectorant in bronchitis.

Average dose—2½ fluidrachms (10 cc.).

SYRUPUS PRUNI VIRGINIANÆ. U. S. Syrup of Wild Cherry

[Syr. Prun. Virg.]

	Metric	Alternative
Wild Cherry, in coarse powder	150 Gm.	5 oz. av.
Sucrose	800 Gm.	26 oz. av. 308 gr.
Glycerin	50 cc.	1 fl. oz. 288 min.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the glycerin with 200 cc. [6 fl. oz. 192 min.] of water, moisten the wild cherry with 100 cc. [3 fl. oz. 96 min.] of this mixture, pack it in a cylindrical percolator and pour the remaining 150 cc. [4 fl. oz. 384 min.] of menstruum upon it. When this has disappeared from the surface of the drug, add enough water to saturate the powder and leave a stratum above it. Close the lower orifice, cover the percolator, and macerate the drug for twenty-four hours. Then allow the percolation to proceed slowly, allowing the percolate to drop into the sucrose contained in a bottle graduated to 1000 cc. [2 pints] and having a capacity of 2000 cc. [4 pints]. Add enough water, to the menstruum, to make the combined sucrose and percolate measure 1000 cc. [2 pints], stopper the bottle, and dissolve the sucrose by agitation without heat. Restore the volume by adding enough water to make the product measure 1000 cc. [2 pints], and strain.

Preserve in tightly-stoppered bottles, in a cool place.

When wild cherry bark is moistened with water and allowed to stand in a warm place, a glucosidal body, known as mandelonitrile, existing normally in the bark, is decomposed by the ferment emulsin, also normally present, resulting in the production of benzaldehyde and hydrocyanic acid. These substances exist only in small amounts and are readily volatilized. The syrup should never be made from the fluidextract as it rarely contains these constituents. Heat must be avoided throughout the process to prevent the destruction of the ferment and the loss of the volatile constituents.

This Syrup should be stored in non-metallic, tightly-closed containers, in a cool place, as it rapidly loses hydrocyanic acid even under the most favorable conditions.

Uses—Employed chiefly as a vehicle for cough syrups. The hydrocyanic acid is so fleeting in its effects and so often absent that its therapeutic value can rarely be depended upon.

Average dose—2½ fluidrachms (10 cc.).

SYRUPUS RHEI. U.S. Syrup of Rhubarb
[Syr. Rhei]

	Metric	Alternative
Fluidextract of Rhubarb	100 cc.	3 fl. oz. 96 min.
Spirit of Cinnamon	4 cc.	1 fl. dr.
Potassium Carbonate	10 Gm.	146 gr.
Water	50 cc.	1 fl. oz. 288 min.
Syrup, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the spirit of cinnamon with the fluidextract, add the potassium carbonate, previously dissolved in the water, and add to this mixture enough syrup to make the product measure 1000 cc. [2 pints].

The potassium carbonate is added to prevent precipitation of the constituents in the fluidextract.

Alcohol content, by volume, 5 to 6 per cent.

Uses—A laxative syrup of special value for children in summer diarrhea because of its combined astringent and laxative action.

Average dose—2½ fluidrachms (10 cc.).

SYRUPUS RHEI AROMATICUS. U.S. Aromatic Syrup of Rhubarb
[Syr. Rhei Arom.]

	Metric	Alternative
Aromatic Tincture of Rhubarb	150 cc.	4 fl. oz. 384 min.
Potassium Carbonate	1 Gm.	15 gr.
Syrup, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the potassium carbonate in the tincture and add to the mixture enough syrup to make the product measure 1000 cc. [2 pints]. Mix thoroughly.

Alcohol content, by volume, 6 to 7 per cent.

Uses—Similar in action to plain syrup of rhubarb. It is especially adapted to the treatment of infants but is too weak for adults. When mixed with an equal volume of castor oil, it makes a palatable laxative which is readily administered, even to children.

Average dose—2½ fluidrachms (10 cc.).

SYRUPUS SARSAPARILLÆ COMPOSITUS. U.S. Compound Syrup of Sarsaparilla
[Syr. Sarsap. Co.]

	Metric	Alternative
Fluidextract of Sarsaparilla	200.0 cc.	6 fl. oz. 192 min.
Fluidextract of Glycyrrhiza	15.0 cc.	230 min.
Oil of Sassafras	0.2 cc.	3 min.
Oil of Anise	0.2 cc.	3 min.
Methyl Salicylate	0.2 cc.	3 min.
Alcohol	19.4 cc.	298 min.
Syrup	765.0 cc.	24 fl. oz. 230 min.
To make about	1000 cc.	2 pints

Mix the fluidextracts and add the alcohol, in which the methyl salicylate and the oils have been dissolved. Gradually add this solution to the syrup, and mix thoroughly.

Alcohol content, by volume, 8.5 to 11 per cent.

N. F. Preparation—Syrupus Bromidorum.

Uses—It is employed chiefly as a vehicle for the alkaline iodides and other saline drugs and in itself possesses little, if any, therapeutic activity as an alterative.

Average dose—4 fluidrachms (15 cc.).

SYRUPUS SCILLÆ. U. S. Syrup of Squill

[Syr. Scill.]

	Metric	Alternative
Vinegar of Squill	450 cc.	14 fl. oz. 192 min.
Sucrose	800 Gm.	26 oz. av. 308 gr.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the sucrose in the vinegar of squill with the aid of a gentle heat, strain the syrup, and, when cold, add enough water through the strainer to make the product measure 1000 cc. [2 pints]. Mix thoroughly.

Uses—Used in bronchitis as a stimulating expectorant.

Average dose—30 minims (2 cc.).

SYRUPUS SCILLÆ COMPOSITUS. U. S. Compound Syrup of Squill

[Syr. Scill. Co.—Hive Syrup, Coxe's Hive Syrup]

	Metric	Alternative
Fluidextract of Squill	80 cc.	2 fl. oz. 4½ fl. dr.
Fluidextract of Senega	80 cc.	2 fl. oz. 4½ fl. dr.
Antimony and Potassium Tartrate	2 Gm.	29 gr.
Sucrose	720 Gm.	24 oz. av. 15 gr.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the antimony and potassium tartrate in 360 cc. [11½ fl. oz.] of distilled water, add the fluidextracts, and allow the mixture to stand for twelve hours with occasional shaking. Filter, dissolve the sucrose in the clear filtrate by agitation, and add sufficient distilled water to make the product measure 1000 cc. [2 pints]. Mix thoroughly and strain.

Alcohol content, by volume, 7 to 8 per cent.

Uses—As an emetic in croup, also as a diaphoretic and expectorant.

Average dose—30 minims (2 cc.).

SYRUPUS SENEGÆ. U. S. Syrup of Senega

[Syr. Seneg.]

	Metric	Alternative
Fluidextract of Senega	200 cc.	6 fl. oz. 192 min.
Ammonia Water	10 cc.	154 min.
Syrup, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the ammonia water with the fluidextract, add the syrup, and mix well.

Alcohol content, by volume, 9 to 10 per cent.

Uses—A nauseating expectorant in bronchitis.

Average dose—1 fluidrachm (4 cc.).

SYRUPUS SENNÆ. U. S. Syrup of Senna

[Syr. Senn.]

	Metric	Alternative
Fluidextract of Senna	250 cc.	8 fl. oz.
Oil of Coriander	5 cc.	77 min.
Sucrose	635 Gm.	22 oz. av. 420 gr.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the oil of coriander with the fluidextract and gradually add 330 cc. [10½ fl. oz.] of water. Allow the mixture to stand for twenty-four hours in a cool place, with occasional shaking, filter, and pass enough water through the filter to obtain 580 cc. [18½ fl. oz.] of filtrate. Dissolve the sucrose in this liquid, and add sufficient water to make the product measure 1000 cc. [2 pints]. Mix well and strain.

Alcohol content, by volume, 5.5 to 6.75 per cent.

Uses—As a laxative; frequently in combination with other drugs. Coriander is usually added to senna on the assumption that it lessens its griping action.

Average dose—2 fluidrachms (8 cc.).

SYRUPUS TOLU. U. S. Syrup of Tolu

[Syr. Tolu—Syrupus Tolutanus U. S. P. IX]

	Metric	Alternative
Tincture of Tolu	50 cc.	1 fl. oz. 288 min.
Magnesium Carbonate	10 Gm.	146 gr.
Sucrose	820 Gm.	27 oz. av. 163 gr.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the tincture intimately with the magnesium carbonate and 60 Gm. [2 oz. av.] of sucrose, in a mortar. Gradually add 430 cc. [13½ fl. oz.] of water, with trituration, and filter. Dissolve the remainder of the sucrose in the clear filtrate with the aid of a gentle heat, strain the syrup while warm, and add sufficient water through the strainer to make the product measure 1000 cc. [2 pints].

Syrup of Tolu may also be made in the following manner:

Prepare a percolator as described under *Syrupus*. Pour the filtrate obtained as directed in the above formula upon the remainder of the sucrose contained in the percolator, return the first portions of the percolate until it runs through clear, and, when all of the liquid has passed, follow with water until the sucrose is dissolved and the product measures 1000 cc. [2 pints]. Mix thoroughly.

Alcohol content, by volume, 3.5 to 4.5 per cent.

U. S. P. Preparation—Trochisci Ammonii Chloridi.
N. F. Preparations—Emulsum Olei Morrhuæ cum Vitello; Mistura Pectoralis.

Uses—Used chiefly for its agreeable flavor in cough syrups.

Average dose—2½ fluidrachms (10 cc.).

SYRUPUS ZINGIBERIS. U. S. Syrup of Ginger

[Syr. Zingib.]

	Metric	Alternative
Fluidextract of Ginger	30 cc.	461 min.
Alcohol	20 cc.	307 min.
Magnesium Carbonate	10 Gm.	146 gr.
Sucrose	820 Gm.	27 oz. av. 163 gr.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the fluidextract and alcohol, and triturate the liquid in a mortar with the magnesium carbonate and 60 Gm. [2 oz. av.] of the sucrose. Then gradually add 430 cc. [13½ fl. oz.] of water with constant trituration, and filter. Dissolve the remainder of the sucrose in the clear filtrate, with the

aid of a gentle heat, strain the syrup while warm, and, when cold, add enough water through the strainer to make the product measure 1000 cc. [2 pints].

Syrup of Ginger may also be made in the following manner:

Prepare a percolator as described under *Syrupus*. Pour the filtrate obtained as directed in the above formula upon the remainder of the sucrose, return the first portions of the percolate, and, when all of the liquid has passed, follow with water until the sucrose is dissolved and the product measures 1000 cc. [2 pints]. Mix thoroughly.

Alcohol content, by volume, 3.5 to 4.5 per cent.

Average dose—2½ fluidrachms (10 cc.).

Uses—As a vehicle, especially in prescriptions for colic and diarrhea.

SYRUPUS ALLII. N.F. Syrup of Garlic
[Syr. Allii]

	Metric	Alternative
Garlic, sliced and bruised	**200 Gm.**	6 oz. av. 296 gr.
Sucrose	**800 Gm.**	26 oz. av. 308 gr.
Diluted Acetic Acid, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Macerate the garlic in 300 cc. [9½ fl. oz.] of diluted acetic acid during four days, and express the liquid, avoiding the use of metallic utensils. Then mix the residue with 200 cc. [6½ fl. oz.] more of diluted acetic acid, and again express. Mix the expressed liquids, and filter. Pour the filtrate upon the sucrose, contained in a suitable vessel, and agitate the mixture until the sucrose is dissolved. Lastly, add sufficient diluted acetic acid to make the product measure 1000 cc. [2 pints], and mix thoroughly.

Average dose—1 fluidrachm (4 cc.).

Uses—A stimulant expectorant, its virtue depending upon the presence of a sulphureted volatile oil.

SYRUPUS ALTHÆÆ. N.F. Syrup of Althea
[Syr. Althea]

	Metric	Alternative
Althea, cut into small pieces	**50 Gm.**	1 oz. av. 293 gr.
Alcohol	**30 cc.**	461 min.
Glycerin	**100 cc.**	3 fl. oz. 96 min.
Sucrose	**700 Gm.**	23 oz. av. 160 gr.
Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Wash the althea with cold water, then macerate it during three hours with 400 cc. [12 fl. oz. 384 min.] of water, previously mixed with the alcohol, at room temperature without stirring, and strain the residue without expressing. In the strained liquid dissolve the sucrose by agitation, without heat, add the glycerin and sufficient water to make the product measure 1000 cc. [2 pints], and mix thoroughly.

Preserve the syrup in well-stoppered, completely filled bottles in a cold place.

Approximate alcohol content, by volume, 2.5 per cent.

Average dose—1 fluidrachm (4 cc.).

Uses—A demulcent.

SYRUPUS AMMONII HYPOPHOSPHITIS. N.F. Syrup of Ammonium Hypophosphite
[Syr. Ammon. Hypophos.]

	Metric	Alternative
Ammonium Hypophosphite	**35 Gm.**	1 oz. av. 74 gr.
Hypophosphorous Acid	**1 cc.**	15 min.
Distilled Water	**100 cc.**	3 fl. oz. 96 min.
Glycerin	**50 cc**	1 fl. oz. 288 min.
Syrup, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the ammonium hypophosphite in the distilled water, add the hypophosphorous acid, filter, and then add the glycerin and sufficient syrup to make the product measure 1000 cc. [2 pints].

Average dose—1 fluidrachm (4 cc.).

Uses—The popularity of this preparation is largely due to the advertising of a proprietary form. It is doubtful if its claim for tonic and alterative properties has any basis in fact.

SYRUPUS ASARI COMPOSITUS. N. F. Compound Syrup of Asarum

[Syr. Asar. Co.]

	Metric	Alternative
Asarum, in moderately coarse powder	62.0 Gm.	2 oz. av. 30 gr.
Cochineal, in fine powder	1.5 Gm.	22 gr.
Potassium Carbonate	2.5 Gm.	37 gr.
Fluidextract of Ipecac	3.0 cc.	46 min.
Sucrose	700.0 Gm.	23 oz. av. 160 gr.
Alcohol	200.0 cc.	6 fl. oz. 192 min.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the asarum intimately with the cochineal and potassium carbonate, previously triturated together. Moisten the powder with a sufficient quantity of a menstruum prepared by mixing the alcohol with 375 cc. [12 fl. oz.] of water, and allow the moistened drugs to macerate, in a covered vessel, for twenty-four hours. Then transfer them to a percolator, and pour on the remainder of the menstruum. Allow the percolation to proceed slowly, and when all of the menstruum has been added follow it with water, until the percolate measures 500 cc [1 pint]. To this add the fluidextract of ipecac, and afterwards the sucrose and dissolve the latter by agitation. Finally, add sufficient water to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 16 per cent.

Average dose—1 fluidrachm (4 cc.).

Uses—A feeble aromatic, used as an adjuvant and flavor in tonic mixtures.

SYRUPUS BROMIDORUM. N. F. Syrup of the Bromides

[Syr. Bromidor.]

	Metric	Alternative
Potassium Bromide	80 Gm.	2 oz. av. 293 gr.
Sodium Bromide	80 Gm.	2 oz. av. 293 gr.
Ammonium Bromide	50 Gm.	1 oz. av. 293 gr.
Calcium Bromide	25 Gm.	365 gr.
Lithium Bromide	8 Gm.	117 gr.
Tincture of Vanilla	32 cc.	1 fl. oz. 12 min.
Compound Tincture of Cubbear	16 cc.	246 min.
Compound Syrup of Sarsaparilla	450 cc.	14 fl. oz. 192 min.
Syrup, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the bromides in the compound syrup of sarsaparilla and 400 cc. [12 fl. oz. 384 min.] of syrup; then add the tinctures, and sufficient syrup to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 5 per cent.

Average dose—1 fluidrachm (4 cc.).

Uses—A nerve sedative.

SYRUPUS CACAO. N. F. Syrup of Cocoa

[Syr. Cacao]

	Metric	Alternative
Cocoa	50 Gm.	1 oz. av. 293 gr.
Tincture of Vanilla	2 cc.	31 min.
Alcohol	50 cc.	1 fl. oz. 288 min.
Sucrose	800 Gm.	26 oz. av. 308 gr.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the cocoa with 400 cc. [12 fl. oz. 384 gr.] of distilled water and heat to boiling. Add the sucrose with stirring and continue the heat until the liquid again boils. Then allow to cool, add the alcohol and tincture of vanilla and sufficient distilled water to make the product measure 1000 cc. [2 pints]. Mix thoroughly.

Approximate alcohol content, by volume, 4 per cent.

Uses—As a vehicle; especially used for administering quinine to young children.

SYRUPUS CALCII ET SODII HYPOPHOSPHITUM. N.F. Syrup of Calcium and Sodium Hypophosphites

[Syr. Calc. et Sod. Hypophos.]

	Metric	Alternative
Calcium Hypophosphite	35.0 Gm.	1 oz. av. 74 gr.
Sodium Hypophosphite	35.0 Gm.	1 oz. av. 74 gr.
Hypophosphorous Acid	1.5 cc.	23 min.
Glycerin	50.0 cc.	1 fl. oz. 288 min.
Sucrose	750.0 Gm.	25 oz. av. 15 gr.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the hypophosphites with the aid of the hypophosphorous acid in 450 cc. [14 fl. oz. 192 min.] of distilled water, filter the solution, add the sucrose to the filtrate and after this has been dissolved by agitation, add the glycerin and sufficient distilled water to make the product measure 1000 cc. [2 pints].

Average dose—1 fluidrachm (4 cc.).

Uses—See Syrupus Hypophosphitum.

SYRUPUS CALCII HYPOPHOSPHITIS. N.F. Syrup of Calcium Hypophosphite

[Syr. Calc. Hypophos.]

	Metric	Alternative
Calcium Hypophosphite	35.0 Gm.	1 oz. av. 74 gr.
Hypophosphorous Acid	1.5 cc.	23 min.
Sucrose	775.0 Gm.	25 oz. av. 380 gr.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the calcium hypophosphite with the aid of the hypophosphorous acid in 500 cc. [1 pint] of distilled water, filter the solution, add the sucrose to the filtrate, and after this has been dissolved by agitation, add sufficient distilled water to make the product measure 1000 cc. [2 pints].

Average dose—1 fluidrachm (4 cc.).

Uses—A convenient form for administering calcium phosphate.

SYRUPUS CALCII IODIDI. N.F. Syrup of Calcium Iodide

[Syr. Calc. Iodid.]

	Metric	Alternative
Iodine	76 Gm.	2 oz. av. 235 gr.
Iron Wire, thin, bright, and finely cut	28 Gm.	409 gr.
Precipitated Calcium Carbonate	34 Gm.	1 oz. av. 59 gr.
Sucrose	700 Gm.	23 oz. av. 160 gr.
Distilled Water,		
Syrup, each, a sufficient quantity,		
To make	1000 cc.	2 pints

Add the iron wire to 57 Gm. [1 oz. av. 395 gr.] of the iodine and 175 cc. [5 fl. oz. 288 min.] of distilled water, and apply a gentle heat, until the iodine is combined, and the liquid has acquired a greenish color. Filter the liquid through a small filter into a flask containing the remainder of the iodine, wash the filter with about 62 cc. [1 fl. oz. 472 min.] of distilled water and then warm the solution gently until the iodine is dissolved, taking care that no iodine is lost by volatilization. Heat to boiling 235 cc. [7 fl. oz. 250 min.] of distilled water

in a capacious dish, and add to it alternately, in small portions, first the precipitated calcium carbonate, then the solution of iron iodide, stirring briskly and waiting until the violence of the reaction moderates before adding a fresh portion. From time to time, add a little distilled water, to replace that lost by evaporation. When all of the iron solution and calcium carbonate have been added, continue heating the mixture until it commences to boil, then filter it through a wetted filter, and wash the filter with sufficient distilled water to make the product, when cold, measure 500 cc. [1 pint]. In this dissolve the sucrose by agitation, then add sufficient syrup to make the product measure 1000 cc. [2 pints], and strain.

Average dose—30 minims (2 cc.).

Uses—An alterative, similar in action to other alkaline iodides.

SYRUPUS CALCII LACTOPHOSPHATIS. N. F. Syrup of Calcium Lactophosphate

(U. S. P. IX)

[Syr. Calc. Lactophos.]

	Metric	Alternative
Precipitated Calcium Carbonate	**25 Gm.**	365 gr.
Lactic Acid	**60 cc.**	1 fl. oz. 442 min.
Phosphoric Acid	**36 cc.**	1 fl. oz. 73 min.
Orange Flower Water	**50 cc.**	1 fl. oz. 288 min.
Sucrose	**650 Gm.**	21 oz. av. 305 gr.
Glycerin	**50 cc.**	1 fl. oz. 288 min.
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

To the lactic acid, mixed with 100 cc. [3 fl. oz. 96 min.] of distilled water, gradually add the calcium carbonate, stirring until solution is effected. Add the phosphoric acid, previously diluted with 50 cc. [1 fl. oz. 288 min.] of distilled water and stir until the precipitate first formed is dissolved. Add 100 cc. [3 fl. oz. 96 min.] of distilled water, filter the solution, mix the orange flower water with the filtrate, add the glycerin and dissolve the sucrose in the mixed liquids by agitation; then add sufficient distilled water to make the product measure 1000 cc. [2 pints], and strain.

N. F. Preparation—Syrupus Calcii Lactophosphatis et Ferri.

Average dose—2½ fluidrachms (10 cc.).

Uses—For those conditions in which lime is indicated, especially diseases of the bones.

SYRUPUS CALCII LACTOPHOSPHATIS ET FERRI. N. F. Syrup of Calcium Lactophosphate and Iron

[Syr. Calc. Lactophos. et Ferr.]

	Metric	Alternative
Ferrous Lactate	**8.5 Gm.**	124 gr.
Potassium Citrate	**8.5 Gm.**	124 gr.
Water	**62.5 cc.**	2 fl. oz.
Syrup of Calcium Lactophosphate, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the ferrous lactate and potassium citrate in the water with the aid of heat, cool, and add sufficient syrup of calcium lactophosphate to make the product measure 1000 cc. [2 pints].

Average dose—1 fluidrachm (4 cc.).

Uses—It combines the virtues of calcium phosphate and a soluble iron salt.

SYRUPUS CINNAMOMI. N. F. Syrup of Cinnamon

[Syr. of Cinnam.]

	Metric	Alternative
Cinnamon, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
Alcohol	**50 cc.**	1 fl. oz. 288 min.
Sucrose	**800 Gm.**	26 oz. av. 309 gr.
Cinnamon Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the alcohol with 450 cc. [14 fl. oz. 192 min.] of cinnamon water, moisten the cinnamon with a sufficient quantity of this menstruum and allow it to macerate for two hours. Then transfer it to a small percolator, and percolate, in the usual manner, using first the remainder of the menstruum above directed, and afterwards, cinnamon water. Collect 480 cc. [15 fl. oz. 173 min.] of the percolate and dissolve the sucrose in this, then add a sufficient quantity of cinnamon water to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 4 per cent.

Average dose—1 fluidrachm (4 cc.).

Uses—A pleasant flavor and vehicle.

SYRUPUS ERIODICTYI AROMATICUS. N. F. Aromatic Syrup of Eriodictyon

[**Syr. Eriodict. Arom.** Aromatic Syrup of Yerba Santa, Syrupus Corrigens]

	Metric	Alternative
Fluidextract of Eriodictyon	**32.0 cc.**	1 fl. oz. 12 min.
Solution of Potassium Hydroxide	**25.0 cc.**	384 min.
Compound Tincture of Cardamom	**65.0 cc.**	2 fl. oz. 38 min.
Oil of Sassafras	**0.5 cc.**	8 min.
Oil of Lemon	**0.5 cc.**	8 min.
Oil of Clove	**1.0 cc.**	15 min.
Alcohol	**32.0 cc.**	1 fl. oz. 12 min.
Sucrose	**800.0 Gm.**	26 oz. av. 309 gr.
Magnesium Carbonate	**5.0 Gm.**	73 gr.
Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the oils in the alcohol, add the fluidextract and the tincture, then the solution of potassium hydroxide and 325 cc. [10 fl. oz. 192 min.] of water. Shake the mixture thoroughly, add the magnesium carbonate, allow it to stand overnight, then filter and add sufficient water through the filter to make the liquid measure 500 cc. [1 pint]. Pour this filtrate upon the sucrose contained in a bottle, and dissolve it by placing the bottle in hot water, agitating the contents frequently. Lastly, cool the solution and add sufficient water to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 7 per cent.

Average dose—2 fluidrachms (8 cc.).

Uses—A pleasantly flavored vehicle, especially adapted to the administration of bitter substances like quinine.

SYRUPUS FERRI, QUININÆ ET STRYCHNINÆ PHOSPHATUM. N. F. Syrup of the Phosphates of Iron, Quinine and Strychnine

[**Syr. Ferr. Quin. et Strych. Phos.** Easton's Syrup]

	Metric	Alternative
Soluble Ferric Phosphate	**20.0 Gm.**	292 gr.
Quinine	**26.0 Gm.**	380 gr.
Strychnine	**0.2 Gm.**	2⅞ gr.
Phosphoric Acid	**50.0 cc.**	1 fl. oz. 288 min.
Glycerin	**100.0 cc.**	3 fl. oz. 96 min.
Water	**50.0 cc.**	1 fl. oz. 288 min.
Syrup, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the soluble ferric phosphate in the water with the aid of heat, then add the phosphoric acid, the quinine and the strychnine, and stir until solution is effected. Filter the liquid into the glycerin, contained in a graduated flask, add sufficient syrup to make the product measure 1000 cc. [2 pints], and mix thoroughly.

This product darkens on standing. Preserve it in amber-colored bottles.

Average dose—1 fluidrachm (4 cc.).

One average dose contains about:

0.0009 Gm. or 1/65 gr. of strychnine phosphate (anhydrous).

Uses—A popular combination employed as a chalybeate tonic.

SYRUPUS FERRI SACCHARATI SOLUBILIS. N.F. Syrup of Soluble Saccharated Iron

[Syr. Ferr. Sacch. Sol. Syrupus Ferri Oxydati Solubilis, Syrup of Saccharated Oxide of Iron, Syrup of Soluble Oxide of Iron]

	Metric	Alternative
Saccharated Ferric Oxide	**415 Gm.**	13 oz. av. 373 gr.
Syrup	**320 cc.**	10 fl. oz. 115 min.
Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the saccharated ferric oxide in 400 cc. [12 fl. oz. 384 min.] of water on a water bath, add the syrup and sufficient water to make the product, when cold, measure 1000 cc. [2 pints].

Average dose—1 fluidrachm (4 cc.).

Uses—A chalybeate tonic.

SYRUPUS FICUS COMPOSITUS. N.F. Compound Syrup of Figs

[Syr. Fic. Co.]

	Metric	Alternative
Figs, cut into small pieces	**300 Gm.**	10 oz. av. 6 gr.
Fluidextract of Senna	**200 cc.**	6 fl. oz. 192 min.
Aromatic Fluidglycerate of Cascara Sagrada	**100 cc.**	3 fl. oz. 96 min.
Oil of Fennel	**1 cc.**	15 min.
Spirit of Peppermint	**3 cc.**	46 min.
Sucrose	**400 Gm.**	13 oz. av. 154 gr.
Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Add 1000 cc. [2 pints] of boiling water to the figs and digest the mixture at a gentle heat, during two hours, replacing the water from time to time as it evaporates, then strain with pressure and set the strained liquid aside. Again digest the residue with 500 cc. [1 pint] of boiling water for one hour, replacing the water as it evaporates, and strain. Mix the strained liquids, evaporate the mixture to 400 cc. [12 fl. oz. 384 min.], and while warm dissolve the sucrose in the liquid. When the solution is cold add it to a mixture of the fluidextract of senna, aromatic fluidglycerate of cascara sagrada, oil of fennel, and spirit of peppermint. Finally add sufficient water to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 5 per cent.

Average dose—1 fluidrachm (4 cc.).

Uses—A laxative.

SYRUPUS GLYCYRRHIZÆ. N.F. Syrup of Glycyrrhiza

[Syr. Glycyrrhiz. Syrup of Licorice]

	Metric	Alternative
Fluidglycerate of Glycyrrhiza	**250 cc.**	8 fl. oz.
Syrup, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix.

Average dose—2 fluidrachms (8 cc.).

Uses—A flavored vehicle, especially adapted to the administration of bitter or nauseous substances.

SYRUPUS HYPOPHOSPHITUM. N.F. Syrup of Hypophosphites

(U. S. P. IX)

[Syr. Hypophos.]

	Metric	Alternative
Calcium Hypophosphite	**45 Gm.**	1 oz. av. 220 gr.
Potassium Hypophosphite	**15 Gm.**	219 gr.
Sodium Hypophosphite	**15 Gm.**	219 gr.
Hypophosphorous Acid	**1 cc.**	15 min.
Glycerin	**50 cc.**	1 fl. oz. 288 min.
Sucrose	**600 Gm.**	20 oz. av. 12 gr.
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Triturate the hypophosphites with 500 cc. [1 pint] of distilled water, until they are dissolved. Add the hypophosphorous acid, filter the liquid and pass sufficient distilled water through the filter to make the filtrate measure 540 cc. [17 fl. oz. 134 min.]. To this add the glycerin and sucrose, dissolve the latter by agitation without heat, and add sufficient distilled water, through the filter, to make the product measure 1000 cc. [2 pints]. Strain if necessary.

Average Dose—2½ fluidrachms (10 cc.).

Uses—The use of preparations of the hypophosphites has largely been stimulated by the advertisement of proprietary forms although their therapeutic value has been repeatedly questioned in medical literature. They have been proposed as alteratives and tonics.

SYRUPUS HYPOPHOSPHITUM COMPOSITUS. N.F. Compound Syrup of Hypophosphites

[Syr. Hypophos. Co.]

	Metric	Alternative
Calcium Hypophosphite	35.000 Gm.	1 oz. av. 74 gr.
Potassium Hypophosphite	17.500 Gm.	255 gr.
Sodium Hypophosphite	17.500 Gm.	255 gr.
Ferric Hypophosphite	2.250 Gm.	33 gr.
Manganese Hypophosphite	2.250 Gm.	33 gr.
Quinine	1.100 Gm.	16 gr.
Strychnine	0.115 Gm.	1⅞ gr.
Sodium Citrate	3.750 Gm.	55 gr.
Hypophosphorous Acid	5.000 cc.	77 min.
Sucrose	700.000 Gm.	23 oz. av. 160 gr.
Glycerin	50.000 cc.	1 fl. oz. 288 min.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Rub the ferric and manganese hypophosphites with the sodium citrate, add 30 cc. [461 min.] of water and warm the mixture with stirring, until a clear greenish solution is obtained. Dissolve the calcium, potassium and sodium hypophosphites in 450 cc. [14 fl. oz. 192 min.] of water, to which 2 cc. [31 min.] of hypophosphorous acid has been added; then dissolve the quinine and strychnine in 30 cc. [461 min.] of water and the glycerin, with the aid of 3 cc. [46 min.] of hypophosphorous acid, mix the solutions, and dissolve the sucrose in them by agitation. Add sufficient water to make the product measure 1000 cc. [2 pints], and filter.

Preserve the Syrup in amber-colored bottles.

Average dose—2 fluidrachms (8 cc.).

One average dose contains about:

0.0009 Gm. or 1/60 grain of Strychnine.

Uses—See Syrupus Hypophosphitum.

SYRUPUS IODOTANNICUS. N.F. Iodotannic Syrup

[Syr. Iodotan.]

	Metric	Alternative
Iodine	2.7 Gm.	39 gr.
Tannic Acid	5.4 Gm.	79 gr.
Sucrose	800.0 Gm.	26 oz. av. 309 gr.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Reduce the iodine to a powder, introduce it into a flask with the tannic acid and 450 cc. [14 fl. oz. 192 min.] of distilled water, and heat the mixture on a water bath, at a temperature not exceeding 50° C., agitating the flask from time to time, until a drop of the liquid ceases to give a blue color with starch T.S. Then add the sucrose, and when this is dissolved remove the flask from the water bath, allow the syrup to cool, and add sufficient distilled water to make the product measure 1000 cc. [2 pints].

Average dose—1 fluidrachm (4 cc.).

Uses—An alterative and astringent.

SYRUPUS IPECACUANHÆ ET OPII. N. F. Syrup of Ipecac and Opium

[Syr. Ipecac. et Opii. Syrup of Dover's Powder]

	Metric	Alternative
Tincture of Ipecac and Opium	85 cc.	2 fl. oz. 346 min.
Spirit of Cinnamon	4 cc.	1 fl. dr.
Cinnamon Water	32 cc.	1 fl. oz. 12 min.
Syrup, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the tincture, spirit and water, add sufficient syrup to make the product measure 1000 cc. [2 pints], and mix thoroughly.

Approximate alcohol content, by volume, 1.4 per cent.

Average dose—1 fluidrachm (4 cc.).

One average dose contains about:

0.34 cc. or 5 minims of Tincture of Ipecac and Opium.

Uses—A diaphoretic and sedative expectorant.

SYRUPUS KRAMERIÆ. N. F. Syrup of Krameria

[Syr. Kramer.]

	Metric	Alternative
Fluidextract of Krameria	450 cc.	14 fl. oz. 192 min.
Syrup, a sufficient quantity		
To make	1000 cc.	2 pints

Mix them.

Approximate alcohol content, by volume, 15 per cent.

Average dose—1 fluidrachm (4 cc.).

Uses—An intestinal astringent.

SYRUPUS MANNÆ. N. F. Syrup of Manna

[Syr. Mann.]

	Metric	Alternative
Manna, in flakes	125 Gm.	4 oz. av. 75 gr.
Sucrose	775 Gm.	25 oz. av. 380 gr.
Alcohol	65 cc.	2 fl. oz. 38 min.
Water, a sufficient quantity		
To make	1000 cc.	2 pints

Dissolve the manna in 400 cc. [12 fl. oz. 384 min.] of hot water, add the alcohol, set the liquid aside for twelve hours in a moderately warm place, and then filter it. Dissolve the sucrose in the filtrate, with the aid of a gentle heat, allow the syrup to cool, and add sufficient water, passed through the filter previously used, to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 6 per cent.

Average dose—2 fluidrachms (8 cc.).

Uses—A feeble laxative usually combined with senna or rhubarb.

SYRUPUS PHOSPHATUM COMPOSITUS. N. F. Compound Syrup of Phosphates

[Syr. Phos. Co. Chemical Food]

	Metric	Alternative
Compound Solution of Phosphates	500 cc.	1 pint
Syrup	334 cc.	10 fl. oz. 330 min.
Glycerin	150 cc.	4 fl. oz. 384 min.
Tincture of Cudbear	16 cc.	246 min.
To make	1000 cc.	2 pints

Mix the tincture of cudbear with the glycerin and add the other ingredients.

Preserve the syrup in amber-colored bottles.

Average dose—1 fluidrachm (4 cc.).

Uses—It has been used as a general tonic, but it is of doubtful value.

SYRUPUS PHOSPHATUM CUM QUININA ET STRYCHNINA. N.F. Syrup of Phosphates with Quinine and Strychnine

[Syr. Phos. c. Quin. et Strych.]

	Metric	Alternative
Compound Solution of Phosphates	**500.00 cc.**	1 pint
Quinine Hydrochloride	**4.40 Gm.**	64 gr.
Strychnine Nitrate	**0.14 Gm.**	2 gr.
Glycerin	**150.00 cc.**	4 fl. oz. 384 min.
Syrup, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the quinine and strychnine salts in the glycerin with the aid of heat and add the other ingredients.

Preserve the syrup in amber-colored bottles.

Average dose—1 fluidrachm (4 cc.).

One average dose contains the equivalent of about:
0.00056 Gm. or $\frac{1}{125}$ grain of Strychnine Nitrate.

Uses—A bitter tonic.

SYRUPUS PINI ALBÆ COMPOSITUS. N.F. Compound Syrup of White Pine

[Syr. Pin. Alb. Co.—Syrupus Pini Strobi Compositus N.F. IV]

	Metric	Alternative
White Pine Bark, in moderately coarse powder	**85.0 Gm.**	2 oz. av. 366 gr.
Wild Cherry, in moderately coarse powder	**85.0 Gm.**	2 oz. av. 366 gr.
Aralia, in moderately coarse powder	**10.0 Gm.**	146 gr.
Balsam Poplar Buds, in moderately coarse powder	**10.0 Gm.**	146 gr.
Sanguinaria, in moderately coarse powder	**8.0 Gm.**	117 gr.
Sassafras, in moderately coarse powder	**7.0 Gm.**	102 gr.
Cudbear	**1.0 Gm.**	15 gr.
Chloroform	**6.0 cc.**	92 min.
Sucrose	**650.0 Gm.**	21 oz. av. 305 gr.
Glycerin	**100.0 cc.**	3 fl. oz. 96 min.
Oil of Sassafras	**0.2 cc.**	3 min.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the vegetable drugs and moisten the powder with a sufficient quantity of a menstruum composed of the glycerin, 100 cc. [3 fl. oz. 96 min.] of alcohol, and 200 cc. [6 fl. oz. 192 min.] of water, pack it in a percolator, and macerate for twelve hours. Then continue the percolation, using first the remainder of the menstruum and then a mixture of one volume of alcohol and three volumes of water until the percolate measures 600 cc. [19 fl. oz. 96 min.]. In this percolate dissolve the sucrose, add the chloroform and oil of sassafras and mix thoroughly. Add sufficient water to make the product measure 1000 cc. [2 pints], and strain.

Approximate alcohol content, by volume, 10 per cent.

N. F. Preparation—Syrupus Pini Albæ Compositus Cum Morphina.

Average dose—1 fluidrachm (4 cc.).

Uses—An expectorant.

SYRUPUS PINI ALBÆ COMPOSITUS CUM MORPHINA. N.F. Compound Syrup of White Pine with Morphine

[Syr. Pin. Alb. c. Morph.—Syrupus Pini Strobi Compositus cum Morphina, N.F. IV]

	Metric	Alternative
Morphine Sulphate	**0.4 Gm.**	$5\frac{1}{2}$ gr.
Compound Syrup of White Pine	**1000.0 cc.**	2 pints

Dissolve the morphine sulphate in the compound syrup of white pine, and mix well.

Approximate alcohol content, by volume, 10 per cent.

Average dose—30 minims (2 cc.).

One average dose contains about:
0.0008 Gm. or $\frac{1}{80}$ grain of Morphine Sulphate.

Uses—An expectorant which should be used only upon the advice of a physician as it contains about $\frac{1}{40}$ grain of morphine to the fluidrachm.

SYRUPUS QUINIDINÆ. N.F. Syrup of Quinidine

[Syr. Quinid.—Bitterless Syrup of Quinidine]

	Metric	Alternative
Quinidine, in fine crystals	33.0 Gm.	1 oz. av. 45 gr.
Oil of Orange	0.2 cc.	3 min.
Syrup, a sufficient quantity,		
To make	1000 cc.	2 pints

Add the oil and the quinidine to 750 cc. [24 fl. oz.] of syrup, contained in a bottle, and shake the mixture thoroughly. Then add sufficient syrup to make the product measure 1000 cc. [2 pints]. Shake it well before dispensing.

Average dose—1 fluidrachm (4 cc.).

Uses—An antiperiodic; especially intended for young children.

SYRUPUS RHAMNI CATHARTICÆ. N.F. Syrup of Rhamnus Cathartica

[Syr. Rham. Cathart.—Syrup of Buckthorn Berry, Syrupus Spinæ Cervinæ]

	Metric	Alternative
Fluidextract of Rhamnus Cathartica	200.0 cc.	6 fl. oz. 192 min.
Oil of Fennel	0.2 cc.	3 min.
Oil of Cinnamon	0.2 cc.	3 min.
Syrup, a sufficient quantity,		
To make	1000 cc.	2 pints

Add the oils to the fluidextract and mix this with sufficient syrup to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 8 per cent.

Average dose—2 fluidrachms (8 cc.).

Uses—A cathartic frequently employed in veterinary practice for dogs.

SYRUPUS ROSÆ. N.F. Syrup of Rose

[Syr. Ros.]

	Metric	Alternative
Fluidextract of Rose	125 cc.	4 fl. oz.
Diluted Sulphuric Acid	10 cc.	154 min.
Sucrose	750 Gm.	25 oz. av. 15 gr.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the fluidextract of rose and diluted sulphuric acid with 300 cc. [9 fl. oz. 288 min.] of water and allow the mixture to stand for two hours; then filter and add sufficient water through the filter to obtain 520 cc. [16 fl. oz. 307 min.] of filtrate. Dissolve the sucrose in the filtrate by agitation and add sufficient water to make the product measure 1000 cc. [2 pints]. Mix thoroughly.

Approximate alcohol content, by volume, 4.5 per cent.

Uses—A mildly astringent flavoring vehicle.

SYRUPUS RUBI. N.F. Syrup of Rubus

[Syr. Rubi]

	Metric	Alternative
Fluidextract of Rubus	250 cc.	8 fl. oz.
Syrup, a sufficient quantity		
To make	1000 cc.	2 pints

Mix them.

Approximate alcohol content, by volume, 9 per cent.

Average dose—1 fluidrachm (4 cc.).

Uses—An astringent; especially for diarrhea.

SYRUPUS RUBI IDÆI. N.F. Syrup of Raspberry
[Syr. Rubi Id.]

Fresh, Ripe Raspberries, any convenient quantity.
Sucrose, a sufficient quantity.

Garble the raspberries, wash them with water, drain, and reduce them to a pulp, and let this stand, at a temperature of about 20° C., until a small portion of the filtered juice produces a clear solution with half of its volume of alcohol. Then separate the juice by straining with pressure, heat it just to the boiling point, remove the scum and filter while hot. Add 200 Gm. [6 oz. av. 96 min.] of sucrose to every 100 cc. [3 fl. oz. 96 min.] of filtered juice and agitate the mixture until the sucrose is dissolved. Preserve the product in well-stoppered bottles in a cool and dark place.

N. F. Preparations—Elixir Bromidorum Quinque, Elixir Gentianæ Glycerinatum.

Uses—A pleasantly flavored vehicle.

SYRUPUS SENNÆ AROMATICUS. N.F. Aromatic Syrup of Senna
[Syr. Senn. Arom.]

	Metric	Alternative
Fluidextract of Senna	**125.0 cc.**	4 fl. oz.
Jalap, in moderately coarse powder	**50.0 Gm.**	1 oz. av. 293 gr.
Rhubarb, in moderately coarse powder	**17.5 Gm.**	255 gr.
Cinnamon, in moderately coarse powder	**4.0 Gm.**	58 gr.
Clove, in moderately coarse powder	**4.0 Gm.**	58 gr.
Myristica, in moderately coarse powder	**2.0 Gm.**	29 gr.
Oil of Lemon	**1.5 cc.**	23 gr.
Sucrose	**500.0 Gm.**	16 oz. av. 302 gr.
Diluted Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the drugs, add the oil of lemon, moisten with sufficient diluted alcohol and, after macerating for twenty-four hours, percolate in the usual manner, using diluted alcohol as the menstruum. Reserve the first 550 cc. [17 fl. oz. 288 min.] of the percolate, add the fluidextract of senna, and dissolve the sucrose in the liquid with the aid of a gentle heat, but avoiding the loss of alcohol by evaporation. Allow the solution to cool, collect a further portion of the percolate, and add a sufficient quantity of it to the syrup to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 26 per cent.

Average dose—2 fluidrachms (8 cc.).

Uses—A pleasant laxative.

SYRUPUS STILLINGIÆ COMPOSITUS. N.F. Compound Syrup of Stillingia
[Syr. Stilling. Co.]

	Metric	Alternative
Compound Fluidextract of Stillingia	**250 cc.**	8 fl. oz.
Glycerin	**100 cc.**	3 fl. oz. 96 min.
Syrup	**650 cc.**	20 fl. oz. 384 min.
To make about	**1000 cc.**	2 pints

Mix the fluidextract with the glycerin, add the syrup and mix well.

Approximate alcohol content, by volume, 9 per cent.

Average dose—1 fluidrachm (4 cc.).

Uses—This syrup is of doubtful value although formerly used as an alterative.

SYRUPUS THYMI. N.F. Syrup of Thyme
[Syr. Thymi]

	Metric	Alternative
Fluidextract of Thyme	**200 cc.**	6 fl. oz. 192 min.
Syrup	**800 cc.**	25 fl. oz. 288 min.
To make about	**1000 cc.**	2 pints

Mix them.

Approximate alcohol content, by volume, 3.5 per cent.

N. F. Preparation—Syrupus Thymi Compositus.

Average dose—1 fluidrachm (4 cc.).

Uses—A carminative and antispasmodic.

SYRUPUS THYMI COMPOSITUS. N.F. Compound Syrup of Thyme

[Syr. Thymi Co.]

	Metric	Alternative
Ammonium Bromide	35 Gm.	1 oz. av. 74 gr.
Distilled Water	50 cc.	1 fl. oz. 288 min.
Syrup of Thyme, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the ammonium bromide in the water and add the syrup of thyme. Mix well.

Approximate alcohol content, by volume, 3 per cent.

Uses—In bronchitis and whooping-cough in a dose of 1 fluidrachm (4 cc.).

SYRUPUS TRIFOLII COMPOSITUS. N.F. Compound Syrup of Trifolium

[Syr. Trifol. Co.]

	Metric	Alternative
Compound Fluidextract of Trifolium	300.0 cc.	9 fl. oz. 288 min.
Powdered Tragacanth	1.0 Gm.	15 gr.
Oil of Sassafras	0.4 cc.	6 min.
Oil of Anise	0.2 cc.	3 min.
Methyl Salicylate	0.2 cc.	3 min.
Sucrose	650.0 Gm.	21 oz. av. 315 gr.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the powdered tragacanth intimately with the fluidextract, add the oils and methyl salicylate and 250 cc. [8 fl. oz.] of distilled water; then add the sucrose and agitate until it is dissolved. Add sufficient distilled water to make the product measure 1000 cc. [2 pints], and mix thoroughly.

Approximate alcohol content, by volume, 4 per cent.

Uses—It is used as an emmenagogue in a dose of 2 fluidrachms (8 cc.).

Table of Some Unofficial Syrups

Title	*Directions*
Syrupus Acaciæ (U. S. P. IX)	Dissolve 10 Gm. of acacia in 43 cc. of distilled water; add 80 Gm. of sucrose and dissolve with the aid of a water bath. Strain while hot and add enough recently boiled distilled water to make 100 cc. Preserve in sterilized bottles
Amygdalæ (U. S. P. 1890) (Orgeat Syrup)	Rub 14 Gm. of blanched sweet almond and 4 Gm. of bitter almond with 10 Gm. of sucrose and 3 cc. of water to a paste, add 10 cc. of orange flower water and 20 cc. of syrup and strain. Add 10 cc. of water to the residue and again strain with strong pressure. Dissolve 10 Gm. of sucrose in the strained liquids and add enough syrup to make 100 cc. This is a flavoring syrup
Aromaticus (Br.1914)	Mix 25 cc. of tincture of orange with 25 cc. of cinnamon water, add a little purified talc, filter and add 50 cc. of syrup
Calcii Hydrochlorophosphatis (N. F. IV)	Triturate 1.75 Gm. of precipitated calcium phosphate with 3 cc. of water and dissolve with the aid of hydrochloric acid, avoiding an excess. Add 2 cc. of tincture of lemon peel, filter, wash the filter with a mixture of 3 cc. each of water and syrup. Add enough syrup to make 100 cc. Dose: one fluidrachm (4 cc.)
Calcis (U. S. P. VIII)	Slake 6.5 Gm. of lime with 3.5 cc. of water with heat and thoroughly mix 35 Gm. of sucrose. Boil the mixture with 50 cc. of water for five minutes, constantly stirring, dilute with enough water through the filter to make 100 cc. Dose: thirty minims (2 cc.)
Cascaræ Aromaticus (Br. 1914)	Mix 40 cc. liquid extract of cascara sagrada, 10 cc. tincture of orange, 5 cc. (90 per cent) alcohol and 15 cc. cinnamon water with enough syrup to make 100 cc.
Chloral (Br. 1914)	Dissolve 20 Gm. of chloral hydrate in 20 cc. of distilled water and add enough syrup to make 100 cc. Dose: one fluidrachm (4 cc.)
Cimicifugæ Compositus (N. F. IV)	Macerate 4 Gm. of wild cherry with 37 cc. of water for one hour. Add 4 cc. of fluidextract of cimicifuga, 2 cc. of fluidextract of glycyrrhiza, 2 cc. of fluidextract of senega, 1 cc. of fluidextract of ipecac, and 1.5 Gm. of purified talc, and agitate frequently and thoroughly during about fifteen minutes. Filter and add enough water to make 50 cc. of filtrate. Add 65 Gm. of sucrose, and dissolve by agitation, and add enough water to make 100 cc. Dose: one fluidrachm (4 cc.)
Codeinæ (N. F. IV)	Dissolve 0.2 Gm. of codeine sulphate in 100 cc. of warm syrup Dose: one fluidrachm (4 cc.)

Table of Some Unofficial Syrups—*Continued*

Title	*Directions*
Syrupus Ferri et Mangani Iodidi (N. F. IV)	Prepare a solution of ferrous iodide in the usual manner from 8.15 Gm. of iodine, 2.8 Gm. of iron and 20 cc. of distilled water. Filter directly upon 80 Gm. of sucrose, rinse the flask and filter with two portions of 2 cc. each of distilled water. Dissolve 2.65 Gm. of manganese sulphate in 10 cc. of distilled alcohol, mix and filter into the iron iodide solution. Wash the filter with 2.5 cc. of cold distilled water, dissolve the sugar by agitation and add enough distilled water to make 100 cc. Dose: fifteen minims (1 cc.)
Ferri Hypophosphitis (N. F. IV)	Dissolve 1.75 Gm. of ferric hypophosphite and 2.5 Gm. of potassium citrate in 23 cc. of distilled water, with the aid of heat, and filter. Mix the filtrate with 9 cc. of orange flower water and add enough distilled water to make 45 cc. Dissolve 85 Gm. of sucrose in this liquid and add enough distilled water to make 100 cc. Dose: one fluidrachm (4 cc.)
Ferri Iodidi, Ruspini	Dissolve 2 Gm. of iron and potassium tartrate and 2 Gm. of potassium iodide in 16 cc. of orange flower water and 100 cc. of syrup Dose: one fluidrachm (4 cc.)
Ferri Lactophosphatis (N. F. IV)	Dissolve 1.75 Gm. of ferrous lactate in 5 cc. of distilled water with the aid of 1.75 cc. of phosphoric acid. Dissolve 8 Gm. of sucrose in the solution and add enough syrup to make 100 cc. Dose: one fluidrachm (4 cc.)
Ferri Phosphatis (Br. 1914)	Dissolve 0.86 Gm. of iron in 6.25 cc. of phosphoric acid (66.3 per cent), previously diluted with 6.25 cc. of distilled water, filter, add 70 cc. of syrup and enough distilled water to make 100 cc. Dose: one fluidrachm (4 cc.)
Ferri Protochloridi (N. F. IV)	Mix 5 cc. of solution of ferrous chloride with 12.5 cc. of glycerin and 12.5 cc. of orange flower water and add enough syrup to make 100 cc. Dose: one fluidrachm (4 cc.)
Glucosi (Br. 1914)	Mix 25 Gm. of liquid glucose with 50 Gm. of syrup with the aid of gentle heat
Lactucarii (U. S. P. IX)	Mix 10 cc. of tincture of lactucarium with 20 cc. of glycerin, add 5 cc. of orange flower water in which 0.1 Gm. of citric acid has been dissolved, filter and add enough syrup to make the product measure 100 cc. Dose: two and one-half fluidrachms (10 cc.)
Limonis (Br. 1914)	Macerate 2 Gm. of fresh grated lemon peel in 3 cc. of alcohol during seven days, filter, adding alcohol to make 4 cc. Dissolve 76 Gm. of sucrose in 50 cc. of lemon juice, add to the alcoholic solution and mix
Morphinæ et Acaciæ (N. F. IV) (Jackson's Pectoral Syrup)	Dissolve 0.055 Gm. of morphine hydrochloride in about 6 cc. of syrup, add 0.05 cc. of oil of sassafras and enough syrup of acacia to make 100 cc. Dose: one fluidrachm (4 cc.)
Papaveris (N. F. IV)	Percolate 100 Gm. of poppy capsules, deprived of seed and powdered, with boiling water until practically exhausted. Heat the percolate to boiling for two minutes, concentrate on a water bath to 450 cc., filter, and dissolve 850 Gm. of sucrose in the concentrated liquid, add enough water to make 1000 cc. and strain Dose: one fluidrachm (4 cc.)
Rhœados (Br. 1914)	Infuse 26 Gm. of red poppy petals in 40 cc. of heated distilled water, allow to stand for twelve hours, frequently stirring, strain, dissolve 72 Gm. of sucrose in the liquid, add 5 cc. of alcohol and enough distilled water to make 100 cc. Dose: thirty minims (2 cc.)
Sanguinariæ (N. F. IV)	Mix 12.5 cc. of acetic acid, with 37 cc. of water, moisten 22.5 Gm. of sanguinaria with part of this menstruum and macerate for two hours. Percolate, first with the remaining menstruum and then with water, to make 75 cc. or to exhaustion, evaporate at moderate heat to 48 cc., filter, dissolve 80 Gm. of sucrose in the filtrate and add water to make 100 cc. Dose: thirty minims (2 cc.)
Sennæ Compositus (N. F. IV)	Dissolve 0.4 cc. of methyl salicylate in 6.5 cc. of alcohol, add 13.5 cc. of fluidextract of senna, 3.5 cc. of fluidextract of rhubarb, 3.5 cc. of fluidextract of frangula and enough syrup to make 100 cc. Dose: two fluidrachms (8 cc.)
Sodii Hypophosphitis (N. F. IV)	Dissolve 3.5 Gm. of sodium hypophosphite in 45 cc. of distilled water, add 0.2 cc. of hypophosphorous acid, filter, dissolve 80 Gm. of sucrose in the filtrate by agitation, and add enough distilled water to make 100 cc. Dose: one fluidrachm (4 cc.)

Mellita—*Honeys*

Official honeys are thick liquid preparations closely allied to the syrups, differing merely in the use of honey, instead of syrup as a base. They are not an important class of preparations today but at one time, before sugar was available, honey was the most common sweetening agent. The National Formulary recognizes a closely related preparation, under the title "Oxymel", which contains acetic acid, the title meaning "acid honey".

MEL ROSÆ. U. S. Honey of Rose

	Metric	Alternative
Fluidextract of Rose	**120 cc.**	440 min.
Honey, a sufficient quantity,		
To make	**1000 Gm.**	8 oz. av.

Mix the fluidextract of rose in a tared vessel with enough honey to make the product weigh 1000 Gm. [8 oz. av.].

U. S. P. Preparation—Massa Hydrargyri.
N. F. Preparation—Mel Rosæ et Sodii Boratis.

Average dose—1 fluidrachm (4 cc.).

Uses—It is used as a mildly astringent adjuvant in gargles and also in mass of mercury as a distributing agent; its action is purely mechanical.

MEL ROSÆ ET SODII BORATIS. N. F. Honey of Rose and Sodium Borate

[**Mel Ros. et Sod. Bor.** Honey of Rose with Borax]

	Metric	Alternative
Sodium Borate, in fine powder	**10 Gm.**	175 gr.
Glycerin	**5 Gm.**	88 gr.
Honey of Rose	**85 Gm.**	3 oz. av. 175 gr.
To make	**100 Gm.**	4 oz. av.

Mix the sodium borate with the glycerin, add the honey of rose, and stir until solution is effected.

Uses—In stomatitis and as an astringent in gargles.

MEL SODII BORATIS. N. F. Honey of Sodium Borate

[**Mel. Sod. Bor.** Mel Boracis, Honey and Borax]

	Metric	Alternative
Sodium Borate, in fine powder	**10 Gm.**	175 gr.
Glycerin	**5 Gm.**	88 gr.
Honey	**85 Gm.**	3 oz. av. 175 gr.
To make	**100 Gm.**	4 oz. av.

Mix the sodium borate with the glycerin, add the honey, and stir until solution is effected.

Uses—Same as Honey of Rose and Borax.

OXYMEL SCILLÆ. N. F. Oxymel of Squill

[**Oxymel Scill.**]

	Metric	Alternative
Vinegar of Squill	**50 Gm.**	2 oz. av.
Honey	**100 Gm.**	4 oz. av.
To make	**100 Gm.**	4 oz. av.

Mix the honey and the vinegar of squill in a tared porcelain dish or enameled iron vessel, and heat on a water bath until the mixture has been reduced to a weight of 100 Gm. [4 oz. av.]. Then strain the preparation, allow it to cool, and transfer it to bottles, which should be well stoppered.

Average dose—1 fluidrachm (4 cc.).

Uses—An expectorant.

Mucilagines—*Mucilages*

The official mucilages are thick, viscid, adhesive liquids, produced by dissolving gum in water, or by extracting with water the mucilaginous principles from vegetable substances. The mucilages are all prone to decomposition, and should never be made in larger quantities than can be used immediately, unless a preservative is added.

MUCILAGO ACACIÆ. U.S. Mucilage of Acacia

[**Mucil. Acac.**—MUCILAGE OF GUM ARABIC]

	Metric	Alternative
Acacia, in small fragments	350 Gm.	1 oz. av. 201 gr.
Sodium Benzoate	1 Gm.	2 gr.
Distilled Water, a sufficient quantity, To make	1000 cc.	4 fl. oz.

Place the acacia in a graduated bottle having a wide mouth and a capacity not exceeding 1000 cc. [4 fl. oz.], wash the drug with cold water, allow it to drain, and add enough warm distilled water, in which the sodium benzoate has been dissolved, to make the product measure 1000 cc. [4 fl. oz.]. After stoppering, lay the bottle on its side, rotating it occasionally, and when the acacia is dissolved, strain the mucilage.

Mucilage of Acacia must not be dispensed if it has become sour or mouldy.

NOTE—Although the Pharmacopœia directs small fragments of acacia in the preparation of this mucilage it is almost universally the custom of the pharmacist to employ granular or powdered acacia, and if this is of finest quality the mucilage is more quickly prepared and equally satisfactory. It is important in using this process to place the acacia in a mortar and quickly add, all at once, at least an equal bulk of the water, and then stir the mixture. If the water is added slowly, a gummy mass results which will dissolve only after hours of standing. If the pharmacist weighs 35 Gm. of acacia, 0.1 Gm. of sodium benzoate, and measures 65 cc. of water (equivalent to 65 Gm.), the product will weigh 100 Gm. without subsequently having to adjust the weight. The sodium benzoate is added to aid in the preservation of the product.

Average dose—4 fluidrachms (15 cc.).

Uses—A demulcent; also employed as an excipient in making pills and troches, and as an emulsifying agent for cod liver oil and other substances.

MUCILAGO TRAGACANTHÆ. U.S. Mucilage of Tragacanth

[**Mucil. Trag.**]

	Metric	Alternative
Tragacanth	6 Gm.	105 gr.
Glycerin	18 Gm.	315 gr.
Water, a sufficient quantity, To make	100 Gm.	4 oz. av.

Mix the glycerin with 75 cc. [2½ fl. oz.] of water in a tared vessel, heat the mixture to boiling, remove the heat, add the tragacanth, and macerate during twenty-four hours, stirring occasionally. Then add enough water to make the mixture weigh 100 Gm. [4 oz. av.], stir actively until of uniform consistence, and strain forcibly through muslin.

Uses—Used almost exclusively as a pill excipient.

MUCILAGO CHONDRI. N.F. Mucilage of Chondrus

[**Mucil. Chondr.** MUCILAGE OF IRISH MOSS]

	Metric	Alternative
Chondrus	30 Gm.	1 oz. av.
Water, a sufficient quantity, To make	1000 cc.	2 pints

Wash the chondrus with cold water, place it in a suitable vessel, add 1000 cc. [2 pints] of water and heat it, on a water bath, for fifteen minutes, stirring frequently. Then strain it through muslin with pressure and pass sufficient water through the strainer to make the product, when cold, measure 1000 cc. [2 pints].

Uses—An emulsifying agent and demulcent.

MUCILAGO SASSAFRAS MEDULLÆ. N. F. Mucilage of Sassafras Pith

[Mucil. Sassaf. Medul.]

	Metric	Alternative
Sassafras Pith	3 Gm.	56 gr.
Recently Boiled Distilled Water	150 cc.	6 fl. oz.
To make about	100 cc.	4 fl. oz.

Macerate the sassafras pith in the water, stirring constantly during ten minutes, and filter through a pledget of wet cotton.

This preparation should not be dispensed unless it has been recently prepared.

Average dose—4 fluidrachms (15 cc.).

Uses—A soothing application in eye inflammation.

Table of Some Unofficial Mucilages

Title	*Directions*
Mucilago Gummi Indici (Br. 1914)	Rapidly rinse 50 Gm. of Indian gum with a little water, then dissolve it in 150 cc. of distilled water in a closed vessel and strain. It should be recently prepared
Ulmi (U. S. P. VIII)	Digest 6 Gm. of bruised elm with 100 cc. of water in a water bath, in a covered vessel, during one hour and strain Dose: four fluidrachms (15 cc.)

Emulsa—*Emulsions*

The U. S. Pharmacopœia of 1890 introduced emulsions as a separate class of preparations; formerly they were included under the general heading of Misturæ. The necessity for differentiation in nomenclature, as preparations of established merit multiply, is apparent. Emulsions are aqueous liquids in which oleaginous substances are suspended by the intervention of gum, yolk of egg, or other viscid matter. Their method of preparation is fully considered under Part XI, Extemporaneous Liquids.

Flavors for Emulsions

The National Formulary suggests the following combinations as flavors for the N. F. Emulsions. Any other suitable flavor may, however, be used, the one considered most appropriate being selected by the prescriber or dispenser. The quantities given below are intended for 1000 cc. [2 pints] of finished product:

		Metric	Alternative
a.	**Oil of Betula**	4.0 cc.	1 fl. dr.
b.	**Oil of Betula**	2.0 cc.	31 min.
	Oil of Sassafras	2.0 cc.	31 min.
c.	**Compound Spirit of Orange**	1.5 cc.	23 min.
d.	**Oil of Betula**	2.00 cc.	31 min.
	Oil of Bitter Almond	0.25 cc.	4 min.
	Oil of Coriander	0.25 cc.	4 min.
e.	**Oil of Betula**	1.50 cc.	23 min.
	Oil of Sassafras	1.50 cc.	23 min.
	Oil of Bitter Almond	0.25 cc.	4 min.
f.	**Oil of Betula**	2.5 cc.	38 min.
	Oil of Bitter Almond	2.5 cc.	38 min.

EMULSUM ASAFŒTIDÆ. U. S. Emulsion of Asafetida

[Emuls. Asafœt. Milk of Asafetida]

	Metric	Alternative
Asafetida, in tears or selected masses	40 Gm.	146 gr.
Water, a sufficient quantity,		
To make	1000 cc.	8 fl. oz.

Rub the asafetida in a mortar with 900 cc. [7 fl. oz.] of water, at first very gradually added, until a uniform emulsion results. Then strain the mixture into a graduated vessel, and rinse the mortar and strainer with enough water to make the product measure 1000 cc. [8 fl. oz.]. Mix thoroughly.

Average dose—4 fluidrachms (15 cc.).

Uses—A carminative frequently administered to infants for colic, either by mouth or by rectum. Powdered asafetida should never be used to replace the gum resin, since the most active constituent, the volatile oil, has been largely driven off in drying before powdering. The addition of the tincture to water, in the preparation of a milk of asafetida, as has been suggested, is also objectionable and should never be practiced, while concentrated glycerites should also be looked upon with suspicion as producing an inferior product. The only proper way to make this emulsion is from asafetida in tears. This preparation may also be made by suspending the tears contained in a muslin bag, in the water in a bottle. In a few hours, the drug will disintegrate and become distributed, producing a very satisfactory product.

This preparation, strictly speaking, is not an emulsion, but conforms to the definition for a true mixture (see page 291).

The use of a little lye solution, followed by soap and water, will assist in cleaning the mortar used in its preparation.

EMULSUM OLEI MORRHUÆ. U.S. Emulsion of Cod Liver Oil
[Emuls. Ol. Morrh.]

	Metric	Alternative
Cod Liver Oil	**500 cc.**	1 pint
Acacia, in very fine powder	**125 Gm.**	4 oz. av. 75 gr.
Syrup	**100 cc.**	3 fl. oz. 96 min.
Methyl Salicylate	**4 cc.**	1 fl. dr.
Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Thoroughly mix the acacia with the cod liver oil in a dry mortar or other suitable vessel, then add at once 250 cc. [8 fl. oz.] of water, and complete the emulsification by trituration or by the aid of a suitable mechanical device. When a thick, white, homogeneous mixture is obtained, add the methyl salicylate and the syrup with sufficient water to make the product measure 1000 cc. [2 pints], and mix thoroughly.

NOTE—The methyl salicylate may be replaced by a suitable quantity of any other flavoring.

This Emulsion is intended to be freshly prepared as required. If it is to be kept for any length of time, 70 cc. of alcohol should be added, replacing a corresponding volume of water. The alcohol should be added last and in small portions, shaking after each addition.

Average dose—4 fluidrachms (15 cc.).

Uses—This is simpl a more palatable form of cod liver oil and possesses identical therapeutic action (see Cod Liver Oil, page 1189).

EMULSUM OLEI TEREBINTHINÆ. U.S. Emulsion of Oil of Turpentine
[Emuls. Ol. Tereb.]

	Metric	Alternative
Rectified Oil of Turpentine	**15 cc.**	288 min.
Acacia, in very fine powder	**5 Gm.**	91 gr.
Water, a sufficient quantity,		
To make	**100 cc.**	4 fl. oz.

Place the powdered acacia in a dry bottle, add the oil of turpentine, mix thoroughly, add exactly 10 cc. [192 min.] of water, and agitate briskly until an emulsion forms. Then add sufficient water to make the product measure 100 cc. [4 fl. oz.], and mix thoroughly.

Average dose—½ fluidrachm (2 cc.).

Uses—The U. S. P. X process is that known for many years as *Forbes'*. If the bottle is dry, the emulsion is quickly formed and is more permanent than when made by the U. S. P. IX process. A carminative in flatulent colic, also a stimulant expectorant in bronchitis. The rectified oil only should be used for internal administration as the crude oil frequently contains rosin.

EMULSUM OLEI MORRHUÆ CUM HYPOPHOSPHITIBUS. N. F. **Emulsion of Cod Liver Oil with Hypophosphites**

[Emuls. Ol. Morrh. c. Hypophos.]

	Metric	Alternative
Cod Liver Oil	**500 cc.**	1 pint
Acacia, in fine powder	**125 Gm.**	4 oz. av. 75 gr.
Calcium Hypophosphite	**10 Gm.**	146 gr.
Potassium Hypophosphite	**5 Gm.**	73 gr.
Sodium Hypophosphite	**5 Gm.**	73 gr.
Syrup	**100 cc.**	3 fl. oz. 96 min.
Flavoring (see page 287),		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Triturate the acacia with the cod liver oil in a dry mortar until uniformly mixed, then add at once 250 cc. [8 fl. oz.] of water and triturate lightly and rapidly until the oil is completely emulsified; add the flavoring and incorporate thoroughly. Dissolve the hypophosphites in 100 cc. [3 fl. oz. 96 min.] of water, mix the solution with the syrup, and add this liquid gradually to the emulsion with continued trituration. Finally add sufficient water to make the product measure 1000 cc. [2 pints], and mix thoroughly.

Average dose—2 fluidrachms (8 cc.).

Uses—The same as for Emulsion of Cod Liver Oil.

EMULSUM OLEI MORRHUÆ CUM MALTO. N. F. **Emulsion of Cod Liver Oil with Malt**

[Emuls. Ol. Morrh. c. Malt. EMULSUM OLEI MORRHUÆ CUM EXTRACTO MALTI]

	Metric	Alternative
Cod Liver Oil	**300 cc.**	9 fl. oz. 288 min.
Tragacanth, in fine powder	**3 Gm.**	44 gr.
Water	**150 cc.**	4 fl. oz. 384 min.
Extract of Malt, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the oil and tragacanth thoroughly in a bottle, add the water and shake the mixture until a homogeneous suspension is formed, finally add the extract of malt in portions, shaking the mixture thoroughly after each addition, until the product measures 1000 cc. [2 pints].

Average dose—4 fluidrachms (15 cc.).

Uses—The same as for Emulsion of Cod Liver Oil. This is a particularly palatable form.

EMULSUM OLEI MORRHUÆ CUM VITELLO. N. F. **Emulsion of Cod Liver Oil with Egg**

[Emuls. Ol. Morrh. c. Vitel.]

	Metric	Alternative
Cod Liver Oil	**500 cc.**	1 pint
Glycerite of Yolk of Egg	**175 cc.**	5 fl. oz. 288 min.
Syrup of Tolu	**100 cc.**	3 fl. oz. 96 min.
Alcohol	**120 cc.**	3 fl. oz. 403 min.
Flavoring (see page 287),		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Triturate the glycerite of yolk of egg in a mortar with the oil, added in small portions at a time, and thoroughly emulsify each portion before adding the next. Then, continuing the trituration, gradually add the syrup of tolu, then the alcohol and the flavoring and sufficient water to make the product measure 1000 cc. [2 pints]. Mix thoroughly.

Approximate alcohol content, by volume, 10 per cent.

Average dose—4 fluidrachms (15 cc.).

Uses—The same as for Emulsion of Cod Liver Oil.

EMULSUM OLEI RICINI. N.F. Emulsion of Castor Oil

[Emuls. Ol. Ricin.]

	Metric	Alternative
Castor Oil	35.0 cc.	2 fl. oz. 384 min.
Acacia, in fine powder	9.0 Gm.	329 gr.
Tincture of Vanilla	2.5 cc.	96 min.
Syrup	20.0 cc.	1 fl. oz. 288 min.
Water, a sufficient quantity, To make	100 cc.	8 fl. oz.

Triturate the acacia with the castor oil in a dry mortar, until uniformly mixed, than add 18 cc. [1 fl. oz. 211 min.] of water and triturate lightly and rapidly until the oil is completely emulsified. Gradually incorporate the syrup and tincture, and finally add sufficient water to make the product measure 100 cc. [8 fl. oz.]. Mix thoroughly.

Average dose—1½ fluidounces (45 cc.).

Uses—An agreeable form for the administration of castor oil, as a cathartic, especially for children.

EMULSUM PETROLATI. N.F. Emulsion of Petrolatum

[Emuls. Petrolat. EMULSUM PETROLEI]

	Metric	Alternative
Petrolatum	225 Gm.	7 oz. av. 224 gr.
Expressed Oil of Almond	225 cc.	7 oz. av. 224 gr.
Acacia, in fine powder	125 Gm.	4 oz. av. 75 gr.
Syrup	100 cc.	3 fl. oz. 96 min.
Tincture of Lemon Peel	15 cc.	230 min.
Water, a sufficient quantity, To make	1000 cc.	2 pints

Triturate the melted petrolatum with the expressed oil of almond in a warm, dry mortar, add the acacia and triturate until it is uniformly mixed. Then add 250 cc. [8 fl. oz.] of warm water and triturate lightly and rapidly until the oil is completely emulsified. Now add the syrup and the tincture, previously mixed, and sufficient water to make the product measure 1000 cc. [2 pints]. Mix thoroughly.

Average dose—4 fluidrachms (15 cc.).

Uses—As originally prepared from crude petroleum it was used as a stimulating expectorant and diaphoretic, but as now made from purified petrolatum from which all volatile constituents have been removed, it possesses no medicinal value beyond that of official petrolatum, taken internally. An emulsion of crude petrolatum is sometimes prescribed and this formula may then be used to advantage (see Emulsion of Terraline).

Table of Some Unofficial Emulsions

Title	*Directions*
Emulsum Ammoniaci (U. S. P. 1890)	Rub 4 Gm. of ammoniac in a warmed mortar, with 90 cc. of water, added very gradually, until emulsified, strain and add enough water to make 100 cc. Dose: four fluidrachms (15 cc.). This is a mixture and not a true emulsion
Amygdalæ (U. S. P. IX)	Blanch 6 Gm. of sweet almonds, add 1 Gm. of acacia and 3 Gm. of sucrose and triturate thoroughly in a mortar. Then rub with 90 cc. of water until uniform, strain and add enough water to make 100 cc. Dose: four fluidounces (120 cc.)
Chloroformi (U. S. P. VIII)	Mix 4 cc. of chloroform and 1 Gm. of tragacanth thoroughly in a dry bottle, add 25 cc. of water and shake vigorously. Then add 6 cc. of expressed oil of almond in portions, shaking after each addition, and afterwards enough water, added in the same manner, to make 100 cc. Dose: two fluidrachms (8 cc.)

Table of Some Unofficial Emulsions—*Continued*

Title	*Directions*
Emulsum Olei Morrhuæ cum Calcii Lactophosphate (N. F. IV)	Mix 50 cc. of cod liver oil and 12.5 Gm. of acacia in a dry mortar, add 25 cc. of water, triturate until emulsified and add 5 Gm. of calcium lactophosphate, dissolved in 6.5 cc. of water and 1.6 cc. of lactic acid. Add flavoring, 10 cc. of syrup of tolu and enough water to make 100 cc. Dose: four fluidrachms (15 cc.)
Olei Morrhuæ cum Calcii Phosphate (N. F. IV)	Mix 12.5 Gm. of acacia with 50 cc. of cod liver oil in a dry mortar and add 25 cc. of water, triturate until emulsified, add flavoring, 10 cc. of syrup of tolu, 3.5 Gm. of precipitated calcium phosphate and enough water to make 100 cc. Dose: four fluidrachms (15 cc.)
Olei Morrhuæ cum Pruno Virginiana (N. F. IV)	Mix 12.5 Gm. of acacia with 50 cc. of cod liver oil in a dry mortar, add 25 cc. of water, triturate until emulsified. Gradually add 6.5 cc. of fluidextract of wild cherry, 10 cc. of syrup of tolu, flavoring and enough water to make 100 cc. Dose: four fluidrachms (15 cc.)
Phosphatic Emulsion of Cod Liver Oil	Add 8 fl. oz. of cod liver oil, in successive portions, to 5 fl. oz. of glycerite of yolk of egg, emulsifying after each addition. When all is fully emulsified, add 1½ fl. oz. of diluted phosphoric acid, 8 fl. oz. of Jamaica rum, 25 min. of oil of bitter almond, and finally enough orange flower water to make 32 fl. oz.

Misturæ—*Mixtures*

Mixtures, in a properly restricted sense, are aqueous liquid preparations intended for internal use, which contain suspended insoluble solid substances. The main object in introducing this class into the Pharmacopœia was to secure uniformity in the formulas of certain well-known and largely used preparations. They are not permanent, as a rule, and it is not wise to keep them on hand for any considerable length of time. They belong properly under the head of Extemporaneous Preparations. (See Mixtures, Part XI.)

MISTURA CRETÆ. U. S. Chalk Mixture

[**Mist. Cret.**]

	Metric	Alternative
Prepared Chalk	6 Gm.	110 gr.
Glycerin	10 cc.	192 min.
Cinnamon Water	40 cc.	1 fl. oz. 288 min.
Distilled Water, a sufficient quantity,		
To make	100 cc.	4 fl. oz.

Gradually add the glycerin to the prepared chalk, in a mortar, triturating until a smooth, uniform mixture is produced. Add the cinnamon water with trituration, transfer the mixture to a graduated vessel, and rinse the mortar with enough distilled water to make the product measure 100 cc. [4 fl. oz.]. Mix thoroughly.

This preparation must not be dispensed unless it has been recently prepared.

The formula of the U. S. P. X omits the sugar and acacia since these are readily fermentable.

Average dose—4 fluidrachms (15 cc.).

Uses—An antacid and mechanical protective agent in the alimentary canal. Used in diarrhea. It is frequently combined with astringents like the tinctures of kino and gambir.

MISTURA GLYCYRRHIZÆ COMPOSITA. U. S. Compound Mixture of Glycyrrhiza

[**Mist. Glycyrrh. Co.**—Brown Mixture]

	Metric	Alternative
Fluidextract of Glycyrrhiza	120.00 cc.	3 fl. oz. 403 min.
Antimony and Potassium Tartrate	0.24 Gm.	3½ gr.
Camphorated Tincture of Opium	120.00 cc.	3 fl. oz. 403 min.
Spirit of Ethyl Nitrite	30.00 cc.	461 min.
Glycerin	120.00 cc.	3 fl. oz. 403 min.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dilute the fluidextract with the glycerin and 500 cc. [1 pint] of water, add the antimony and potassium tartrate, dissolved in 12 cc. [184 minims] of hot water, then the other ingredients, and enough water to make the product measure 1000 cc. [2 pints].

Alcohol content, by volume, 9 to 11 per cent.

The U. S. P. X formula in which the extract of glycyrrhiza is replaced by the fluidextract will contain little precipitate, but it is intended to be dispensed without filtering to retain its universally known classification as a mixture.

Uses—An expectorant frequently used in bronchitis. Often combined with ammonium chloride. *Dose*—1 fluidrachm (4 cc.).

It contains only a minute trace of opium but as the laws of some states do not permit opium in any amount to be sold without a prescription it is customary in these states to omit the opium and state that fact upon the label.

MISTURA ADSTRINGENS. N. F. Astringent Mixture

[Mist. Adstring.]

	Metric	Alternative
Lead Acetate	**42 Gm.**	1 oz. av. 176 gr.
Copper Sulphate	**65 Gm.**	2 oz. av. 74 gr.
Zinc Sulphate	**65 Gm.**	2 oz. av. 74 gr.
Diluted Acetic Acid	**740 cc.**	23 fl. oz. 326 min.
Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the lead acetate in 500 cc. [1 pint] of diluted acetic acid, and filter the solution. Dissolve the copper sulphate and zinc sulphate in the remainder of the diluted acetic acid, add 150 cc. [4 fl. oz. 384 min.] of water, and filter the solution. Pour the lead solution slowly into the other solution, with constant stirring, and add sufficient water to make the product measure 1000 cc. [2 pints].

Shake this preparation well before dispensing so that the precipitate will be uniformly suspended.

Uses—An astringent for external application.

Mistura Carminativa. N. F. Carminative Mixture

[Mist. Carminat.—Dalby's Carminative]

	Metric	Alternative
Magnesium Carbonate	**65.0 Gm.**	2 oz. av. 74 gr.
Potassium Carbonate	**3.0 Gm.**	44 gr.
Tincture of Opium	**25.0 cc.**	384 min.
Oil of Caraway	**0.5 cc.**	8 min.
Oil of Fennel	**0.5 cc.**	8 min.
Oil of Peppermint	**0.5 cc.**	8 min.
Syrup	**160.0 cc.**	5 fl. oz. 58 min.
Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Triturate the oils with the magnesium carbonate and 750 cc. [24 fl. oz.] of water, gradually added. Then add the other ingredients and sufficient water to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 0.4 per cent.

Average dose—8 minims (0.5 cc.) (infants).
One average dose (infants) contains about:
0.0125 cc. or ⅛ minim of Tincture of Opium.

Uses—A mild anodyne, especially for young children. It is improperly named, as its effect is not that of a carminative but chiefly as an opiate.

MISTURA CHLORALIS ET POTASSII BROMIDI COMPOSITA. N. F. Compound Mixture of Chloral and Potassium Bromide

[Mist. Chloral. et Pot. Brom. Co.—Chloral and Bromide Compound]

	Metric	Alternative
Chloral Hydrate	200 Gm.	6 oz. av. 296 gr.
Potassium Bromide	200 Gm.	6 oz. av. 296 gr.
Extract of Cannabis	2 Gm.	29 gr.
Extract of Hyoscyamus	2 Gm.	29 gr.
Pumice, in fine powder and well washed	20 Gm.	292 gr.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Triturate the extracts in a mortar with the pumice, gradually added, until they are thoroughly mixed. Dissolve the chloral hydrate in 250 cc. [8 fl. oz.] of water, and gradually add this solution to the extracts and pumice with constant trituration. Dissolve the potassium bromide in 500 cc. [1 pint] of water and gradually add to the previous mixture. Set the mixture aside during twenty-four hours, shaking it occasionally, then filter and add sufficient water through the filter to make the product measure 1000 cc. [2 pints].

This is a clear preparation and is not a "mixture" in the strict interpretation of that term.

Average dose—1 fluidrachm (4 cc.).

Uses—A sedative and hypnotic.

MISTURA CHLOROFORMI ET MORPHINÆ COMPOSITA. N. F. Compound Mixture of Chloroform and Morphine

[Mist. Chlorof. et Morph. Co.—Chloroform Anodyne]

	Metric	Alternative
Chloroform	125.0 cc.	4 fl. oz.
Ether	32.5 cc.	1 fl. oz. 19 min.
Fluidextract of Cannabis	18.5 cc.	284 min.
Tincture of Capsicum	25.0 cc.	384 min.
Morphine Sulphate	2.5 Gm.	36 ½ gr.
Oil of Peppermint	2.0 cc.	31 min.
Glycerin	125.0 cc.	4 fl. oz.
Water	65.0 cc.	2 fl. oz. 38 min.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the oil of peppermint in 400 cc. [12 fl. oz. 384 min.] of alcohol, add the chloroform, ether and the tinctures and mix well. Then add the morphine sulphate, previously dissolved in the water and glycerin, to this solution, and sufficient alcohol to make the product measure 1000 cc. [2 pints].

This is a clear preparation and is not a "mixture" in the strict interpretation of that term.

Approximate alcohol content, by volume, 58 per cent.

Average dose—30 minims (2 cc.).

One average dose contains about:

0.005 Gm. or 1/13 grain of Morphine Sulphate.

Uses—An anodyne, useful in severe diarrhea and cholera morbus.

MISTURA COPAIBÆ. N. F. Copaiba Mixture

[Mist. Copaib.—Lafayette Mixture]

	Metric	Alternative
Copaiba	125 cc.	4 fl. oz.
Spirit of Ethyl Nitrite	125 cc.	4 fl. oz.
Compound Tincture of Lavender	125 cc.	4 fl. oz.
Solution of Potassium Hydroxide	30 cc.	461 min.
Syrup	300 cc.	9 fl. oz. 288 min.
Powdered Acacia	35 Gm.	1 oz. av. 74 gr.
Water, a sufficient quantity,		
To make about	1000 cc.	2 pints

Mix the copaiba intimately with the powdered acacia in a mortar, add 70 cc. [2 fl. oz. 115 min.] of water and triturate rapidly until a smooth emulsion is formed. Gradually add 200 cc. [6 fl. oz. 192 min.] of water, then the solution of potassium hydroxide, the spirit of ethyl nitrite, the compound spirit of lavender and the syrup, and mix well. Lastly, add sufficient water to make the product measure 1000 cc. [2 pints].

Shake the mixture well before dispensing.

Approximate alcohol content, by volume, 20 per cent.

Average dose—2 fluidrachms (8 cc.).

Uses—In gonorrhea.

MISTURA COPAIBÆ ET OPII. N.F. Mixture of Copaiba and Opium

[**Mist. Copaib. et Opii.** CHAPMAN'S MIXTURE]

	Metric	Alternative
Copaiba	**250 cc.**	8 fl. oz.
Spirit of Ethyl Nitrite	**250 cc.**	8 fl. oz.
Compound Tincture of Lavender	**65 cc.**	2 fl. oz. 38 min.
Tincture of Opium	**32 cc.**	1 fl. oz. 12 min.
Powdered Acacia	**65 Gm.**	2 oz. av. 74 gr.
Water, a sufficient quantity		
To make about	**1000 cc.**	2 pints

Mix the copaiba intimately in a mortar with the powdered acacia, add 130 cc. [4 fl. oz. 77 min.] of water, and triturate rapidly until a smooth emulsion is obtained. Gradually add 200 cc. [6 fl. oz. 192 min.] of water, the tincture of opium, the compound tincture of lavender and the spirit of ethyl nitrite, mix well and add sufficient water to make the product measure 1000 cc. [2 pints].

Shake the mixture well before dispensing.

Approximate alcohol content, by volume, 27 per cent.

Average dose—1 fluidrachm (4 cc.).
One average dose contains about:
0.125 cc. or 2 minims of Tincture of Opium.

Uses—In gonorrhea.

MISTURA MAGNESIÆ, ASAFŒTIDÆ ET OPII. N.F. Mixture of Magnesia, Asafetida and Opium

[**Mist. Mag., Asafœt. et Opii** DEWEES' CARMINATIVE]

	Metric	Alternative
Magnesium Carbonate	**50 Gm.**	1 oz. av. 293 gr.
Tincture of Asafetida	**75 cc.**	2 fl. oz. 192 min.
Tincture of Opium	**10 cc.**	154 min.
Sucrose	**100 Gm.**	3 oz. av. 148 gr.
Water, a sufficient quantity		
To make	**1000 cc.**	2 pints

Rub the magnesium carbonate and sucrose in a mortar, with the tincture of asafetida and the tincture of opium. Then gradually add sufficient water to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 6 per cent.

Average dose—2 fluidrachms (8 cc.).
One average dose contains about:
0.08 cc. or 1⅓ minims of Tincture of Opium.

Uses—A mild anodyne and carminative, intended especially for infants.

MISTURA OLEO-BALSAMICA. N.F. Oleo-Balsamic Mixture

[Mist. Ol.-Balsam. HOFFMANN'S BALSAM]

	Metric	Alternative
Oil of Lavender	4 cc.	61 min.
Eugenol	4 cc.	61 min.
Oil of Cinnamon	4 cc.	61 min.
Oil of Thyme	4 cc.	61 min.
Oil of Lemon	4 cc.	61 min.
Oil of Myristica	4 cc.	61 min.
Balsam of Peru	16 cc.	246 min.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the oils, eugenol and balsam of Peru in 900 cc. [29 fl. oz.] of alcohol, filter, and add sufficient alcohol, through the filter, to make the product measure 1000 cc. [2 pints].

History—This preparation was originated as a secret nostrum by the celebrated Dr. Friedrich Hoffmann, in the early part of the eighteenth century, under the name *Balsamum Vitæ Hofmannii*.

Approximate alcohol content, by volume, 90 per cent.

This is strictly speaking not a mixture.

MISTURA OPII ET CHLOROFORMI COMPOSITA. N.F. Compound Mixture of Opium and Chloroform

[Mist. Opii et Chlorof. Co. SQUIBB'S DIARRHŒA MIXTURE]

	Metric	Alternative
Tincture of Opium	200 cc.	6 fl. oz. 192 min.
Spirit of Camphor	200 cc.	6 fl. oz. 192 min.
Tincture of Capsicum	100 cc.	3 fl. oz. 96 min.
Chloroform	80 cc.	2 fl. oz. 269 min.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix them.

Approximate alcohol content, by volume, 70 per cent.

Average dose—30 minims (2 cc.).

One average dose contains about:

0.40 cc. or 6 minims of Tincture of Opium.

Uses—In severe diarrheas.

MISTURA OPII ET RHEI COMPOSITA. N.F. Compound Mixture of Opium and Rhubarb

[Mist. Opii et Rhei Co. SUN CHOLERA MIXTURE]

	Metric	Alternative
Tincture of Capsicum	100 cc.	3 fl. oz. 96 min.
Tincture of Rhubarb	100 cc.	3 fl. oz. 96 min.
Tincture of Opium	200 cc.	6 fl. oz. 192 min.
Spirit of Camphor	200 cc.	6 fl. oz. 192 min.
Spirit of Peppermint	200 cc.	6 fl. oz. 192 min.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix them.

Approximate alcohol content, by volume, 70 per cent.

Average dose—30 minims (2 cc.).

One average dose contains about:

0.40 cc. or 6 minims of Tincture of Opium.

Uses—In serous diarrhea. This formula was given much publicity many years ago in the *New York Sun* as a cholera cure, hence its name.

MISTURA PECTORALIS. N.F. Expectorant Mixture

[**Mist. Pect.**—MISTURA PECTORALIS, STOKES', N.F. IV, STOKES' EXPECTORANT]

	Metric	Alternative
Ammonium Carbonate	**17.5 Gm.**	256 gr.
Fluidextract of Senega	**35.0 cc.**	1 fl. oz. 58 min.
Fluidextract of Squill	**35.0 cc.**	1 fl. oz. 58 min.
Camphorated Tincture of Opium	**175.0 cc.**	5 fl. oz. 288 min.
Water	**85.0 cc.**	2 fl. oz. 346 min.
Syrup of Tolu, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the fluidextracts with the camphorated tincture of opium and add the ammonium carbonate, previously dissolved in the water; then add sufficient syrup of tolu to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 10 per cent.

Average dose—1 fluidrachm (4 cc.).

One average dose contains about:

0.70 cc. or 10 minims of Camphorated Tincture of Opium.

Uses—An expectorant for acute bronchitis.

MISTURA RHEI ALKALINA. N.F. Alkaline Mixture of Rhubarb

[**Mist. Rhei Alk.**—ELIXIR RHEI ALKALINUM NEUTRALIZING CORDIAL]

	Metric	Alternative
Fluidextract of Rhubarb	**16 cc.**	246 min.
Fluidextract of Hydrastis	**8 cc.**	123 min.
Potassium Carbonate	**16 Gm.**	234 gr.
Tincture of Cinnamon	**64 cc.**	2 fl. oz. 23 min.
Spirit of Peppermint	**8 cc.**	123 min.
Syrup	**250 cc.**	8 fl. oz.
Diluted Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the potassium carbonate in the syrup, and add the solution to the fluidextracts, tincture, and spirit, previously mixed with 500 cc. [1 pint] of diluted alcohol. Mix well, add sufficient diluted alcohol to make the product measure 1000 cc. [2 pints], and filter.

This is a clear preparation and not a "mixture" in the strict interpretation of that term.

Approximate alcohol content, by volume, 36 per cent.

Average dose—1 fluidrachm (4 cc.).

Uses—A laxative and antacid, also a carminative for children.

MISTURA RHEI COMPOSITA. N.F. Compound Mixture of Rhubarb

[**Mist. Rhei Co.**—MISTURA RHEI ET SODÆ, MIXTURE OF RHUBARB AND SODA]

	Metric	Alternative
Fluidextract of Rhubarb	**15 cc.**	230 min.
Fluidextract of Ipecac	**3 cc.**	46 min.
Sodium Bicarbonate	**35 Gm.**	1 oz. av. 74 gr.
Spirit of Peppermint	**35 cc.**	1 fl. oz. 58 min.
Glycerin	**200 cc.**	6 fl. oz. 192 min.
Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the sodium bicarbonate in about 500 cc. [1 pint] of water, and add the fluidextracts, the glycerin, the spirit of peppermint, and sufficient water to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 3 per cent.

Average dose—1 fluidrachm (4 cc.)

Uses—A laxative, antacid and carminative.

Table of Some Unofficial Mixtures

Title	*Directions*
Mistura Ammonii Chloridi (N. F. IV)	Dissolve 2.5 Gm. of ammonium chloride and 2.5 Gm. of pure extract of glycyrrhiza in enough water to make 100 cc. Dose: two fluidrachms (8 cc.)
Camphoræ Acida (N. F. IV)	Mix 1.75 cc. of nitric acid and 1.2 cc. of tincture of opium in enough camphor water to make 100 cc. Dose: two fluidrachms (8 cc.)
Camphoræ Aromatica (N. F. IV)	Dissolve 3.5 Gm. of sucrose in a mixture of 25 cc. of compound tincture of lavender and 50 cc. of camphor water, and add enough camphor water to make 100 cc. Dose: two fluidrachms (8 cc.)
Ferri Composita (N. F. IV)	Rub 1.8 Gm. of myrrh, 1.8 Gm. of sucrose and 0.8 Gm. of potassium carbonate with 70 cc. of rose water, added very slowly at first, until uniform. Then add 6 cc. of spirit of lavender and 0.6 Gm. of ferrous sulphate dissolved in 5 cc. of rose water, and enough rose water to make 100 cc. Dose: four fluidrachms (15 cc.)
Guaiaci (N. F. IV)	Add 12.5 cc. of tincture of guaiac slowly to 25 cc. of honey with brisk trituration, and then add enough cinnamon water to make 100 cc. Dose: four fluidrachms (15 cc.)
Olei Picis (N. F. IV)	Add 6.5 Gm. of pure extract of glycyrrhiza and 25 Gm. of sugar to 50 cc. of water and heat until dissolved. Cool and add 3.5 cc. of rectified oil of tar, 1 cc. of chloroform, 0.3 cc. of oil of peppermint dissolved in 16 cc. of alcohol, and enough water to make 100 cc. Dose: two fluidrachms (8 cc.)
Opii et Sassafras (N. F. IV)	Mix 3.5 cc. of tincture of opium with 0.1 cc. of oil of sassafras and 5 cc. of alcohol. Dissolve 0.8 Gm. of potassium carbonate in 50 cc. of water, add 33 cc. of syrup, the alcoholic solution just prepared and enough water to make 100 cc., and filter Dose: five minims (0.3 cc.)
Sennæ Composita (Br. 1914)	Dissolve 25 Gm. of magnesium sulphate in 50 cc. of infusion of senna, add 5 cc. of liquid extract of liquorice, 10 cc. of compound tincture of cardamom, 5 cc. of aromatic spirit of ammonia and enough infusion of senna to make 100 cc. Dose: one fluidounce (30 cc.)

Magmæ—*Magmas*

This title, for a class of preparations, has been introduced into the U. S. P. and N. F., as applying to a class of preparations closely related to the mixtures. The suspended, insoluble constituents are of inorganic chemical origin and are freshly precipitated in a fine state of subdivision. The titles of the official magmas are given below but the formulas, uses, and dosage of each will be found under the corresponding inorganic chemicals in Part IV.

Magmas of the U. S. P. and N. F.

Magma Magnesiæ, U. S. P. (see page 664).
Magma Bismuthi, N. F. (see page 774).

Unofficial Magma

Magma Ferri Hydroxidi (see page 732).

Cremor—*Cream*

A class of preparations under this title are recognized in the British Pharmaceutical Codex. They consist of creamy suspensions for external application. *Zinc cream, compound ammoniated mercury cream, and surgical shaving cream* are representative titles.

Gargarismæ—*Gargles*

Only one representative of this class of preparations is found in the official books. It is as follows:

GARGARISMA GUAIACI COMPOSITUM. N. F. **Compound Gargle of Guaiac**
[Garg. Guaiac. Co.]

	Metric	Alternative
Ammoniated Tincture of Guaiac	**100 cc.**	3 fl. oz. 96 min.
Compound Tincture of Cinchona	**100 cc.**	3 fl. oz. 96 min.
Honey	**200 cc.**	6 fl. oz. 192 min.
Potassium Chlorate	**40 Gm.**	1 oz. av. 147 gr.
Oil of Peppermint	**2 cc.**	31 min.
Water, a sufficient quantity, To make	**1000 cc.**	2 pints

Place the honey in a flask graduated to 1000 cc. [2 pints] and gradually add the previously mixed oil of peppermint and the tinctures, shaking the flask after each addition. Dissolve the potassium chlorate in 500 cc. [1 pint] of warm water, and add this solution to the honey mixture in divided portions, shaking continuously, then add sufficient water to make the product measure 1000 cc. [2 pints]. Mix thoroughly.

Approximate alcohol content, by volume, 12 per cent.

Uses—A stimulant gargle in sore throat.

Lotiones—*Lotions*

Representatives of this class of preparations are official only in the N. F., *four* being recognized. They are largely aqueous, usually contain insoluble, suspended matter, and are intended for use as washes or injections.

LOTIO ALBA VETERINARIA. N. F. Veterinary White Lotion

[Lot. Alba Vet.]

	Metric	Alternative
Zinc Sulphate	**23 Gm.**	336 gr.
Lead Acetate	**30 Gm.**	1 oz. av.
Water, a sufficient quantity		
To make about	**1000 cc.**	2 pints

Dissolve the zinc sulphate and lead acetate, each in 475 cc. [15 fl. oz. 96 min.] of water, and filter the two solutions. Pour the lead acetate solution slowly into the zinc sulphate solution with constant stirring, and add sufficient water to make the product measure 1000 cc. [2 pints]. Shake the Lotion well before dispensing.

Caution—This lotion must not be confused with the "Lotio Alba" so largely used in regular medical practice (see page 598).

Uses—A sedative for local application.

LOTIO AMMONIACALIS CAMPHORATA. N. F. Ammoniated Camphor Wash

[Lot. Ammon. Camph. Aqua Sedativa, Sedative Water, Eau Sedative de Raspail]

	Metric	Alternative
Sodium Chloride	**60 Gm.**	2 oz. av. 1 gr.
Ammonia Water	**60 cc.**	1 fl. oz. 442 min.
Spirit of Camphor	**10 cc.**	154 min.
Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the sodium chloride in about 900 cc. [28 fl. oz. 384 min.] of water, add the spirit of camphor, then the ammonia water and finally sufficient water to make the product measure 1000 cc. [2 pints].

Preserve it in well-stoppered bottles and shake the Lotion before dispensing.

Approximate alcohol content, by volume, 0.9 per cent.

Uses—A rubefacient.

LOTIO CALAMINÆ. N. F. Calamine Lotion

[Lot. Calam.]

	Metric	Alternative
Prepared Calamine, in very fine powder,	**80 Gm.**	2 oz. av. 293 gr.
Zinc Oxide, in very fine powder	**80 Gm.**	2 oz. av. 293 gr.
Glycerin	**20 cc.**	307 gr.
Solution of Calcium Hydroxide, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the powders intimately with the glycerin and about 100 cc. [3 fl. oz. 96 min.] of solution of calcium hydroxide and gradually add sufficient solution of calcium hydroxide to make the product measure 1000 cc. [2 pints]. Shake the Lotion thoroughly before dispensing.

N. F. Preparation—Lotio Calaminæ Composita.

Uses—Employed in skin diseases.

LOTIO CALAMINÆ COMPOSITA. N.F. Compound Calamine Lotion

[Lot. Calam. Co.]

	Metric	Alternative
Liquefied Phenol	10 cc.	154 min.
Calamine Lotion	990 cc.	31 fl. oz. 326 min.
To make	1000 cc.	2 pints

Mix them.

Shake the Lotion thoroughly before dispensing.

Uses—Employed in skin diseases.

LOTIO FLAVA. N.F. Yellow Lotion

[Lot. Flav. Yellow Wash, Aqua Phagedænica Flava]

	Metric	Alternative
Corrosive Mercuric Chloride	3 Gm.	44 gr.
Boiling Water	35 cc.	1 fl. oz. 58 min.
Solution of Calcium Hydroxide, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the corrosive mercuric chloride in the boiling water, and add the solution gradually, with constant agitation, to sufficient solution of calcium hydroxide to make the product measure 1000 cc. [2 pints].

Shake the Lotion thoroughly before dispensing.

Uses—Applied as a stimulant antiseptic application to syphilitic sores, and in some forms of eczema.

LOTIO NIGRA. N.F. Black Lotion

[Lot. Nigr. Black Wash, Aqua Phagedænica Nigra]

	Metric	Alternative
Mild Mercurous Chloride	8.75 Gm.	128 gr.
Water	15.00 cc.	219 min.
Solution of Calcium Hydroxide, a sufficient quantity,		
To make	1000 cc.	2 pints

Triturate the mild mercurous chloride with the water, and gradually add sufficient solution of calcium hydroxide, with trituration, to make the product measure 1000 cc. [2 pints].

Shake the Lotion thoroughly before dispensing.

Uses—Similar to yellow wash, but is not so active a stimulant.

LOTIO PLUMBI ET OPII. N.F. Lotion of Lead and Opium

[Lot. Plumb. et Opii. Lead and Opium Wash]

	Metric	Alternative
Lead Acetate	17.5 Gm.	255 gr.
Tincture of Opium	35.0 cc.	1 fl. oz. 58 min.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the lead acetate in about 650 cc. [20 fl. oz. 384 min.] of water, add the tincture of opium and sufficient water to make the product measure 1000 cc. [2 pints].

Shake the Lotion thoroughly before dispensing.

Approximate alcohol content, by volume, 0.6 per cent.

Uses—Applied externally as an astringent and sedative, for sprains and bruises.

Unofficial Lotions

Title	*Directions*
Lotio Alba	(See page 598)
Lotio Delphinii (Larkspur Lotion)	Boil 100 Gm. of ground delphinium with 800 cc. of water to which 50 cc. of acetic acid and 50 cc. of glycerin have been added, for ten minutes in a covered vessel. Set aside till cold, then add 100 cc. of alcohol and allow to macerate overnight. Then filter and add sufficient water through the filter to make the product measure 1000 cc.

CHAPTER XXVI

GLYCERIN SOLUTIONS

Glycerita—*Glycerites*

Glycerites are mixtures of medicinal substances with glycerin. Glycerin is a valuable solvent, and one of the principal advantages of the glycerites is that they afford a rapid and simple method of making aqueous solutions of substances which are not otherwise easily soluble. The solutions of phenol, tannic acid, tar, etc., in glycerin are permanent preparations, and they can be made very concentrated if necessary; the ease with which they can be diluted with water or alcohol, without precipitation, renders such glycerites especially useful at the prescription counter. This class of preparations is called "*glycerins*" in Great Britain.

GLYCERITUM ACIDI TANNICI. U.S. Glycerite of Tannic Acid

[Glycer. Acid. Tan.—Glycerite of Tannin]

	Metric	Alternative
Tannic Acid	**20 Gm.**	2 oz. av.
Sodium Citrate	**1 Gm.**	44 gr.
Glycerin	**79 Gm.**	7 oz. av. 394 gr.
To make	**100 Gm.**	10 oz. av.

Weigh the glycerin into a tared wide-mouthed bottle, having a capacity of 125 cc. [1 pint]. Suspend the tannic acid and sodium citrate, in a gauze bag, in the glycerin, place the bottle and contents in a water bath containing boiling water and continue the heat, stirring the mixture occasionally until solution results.

The sodium citrate is added to prevent the darkening which frequently occurs because of minute amounts of iron in the glycerin.

Uses—An astringent, especially useful as a local application in sore throat and in sore mouth, due to stomatitis. It is also used to harden the nipples to prevent soreness during nursing, and as a general astringent.

Average dose—40 minims (2.5 cc.).

GLYCERITUM AMYLI. U.S. Glycerite of Starch

[Glycer. Amyl.—"Plasma"]

	Metric	Alternative
Starch	**10 Gm.**	150 gr.
Water	**20 cc.**	5½ fl. dr.
Glycerin	**70 cc.**	2½ fl. oz.

Triturate the starch with the water until a homogeneous mixture is produced. Then gradually add this to the glycerin, contained in a porcelain dish, and heated to about 140° C. Continue the heat, keeping it below 144° C., constantly stirring the mixture until a translucent jelly is formed. Transfer the product to suitable vessels provided with well-fitting covers.

Uses—Used as a substitute for fatty ointment vehicles, also as a pill excipient, and as a basis for enemas.

GLYCERITUM BOROGLYCERINI. U.S. Glycerite of Boroglycerin

[Glycer. Boroglyc.—Glycerite of Glyceryl Borate, 50 per cent Boroglycerin]

	Metric	Alternative
Boric Acid, in fine powder	310 Gm.	4 oz. av. 420 gr.
Glycerin, a sufficient quantity,		
To make	1000 Gm.	16 oz. av.

Heat 460 Gm. [7 oz. av. 158 gr.] of glycerin in a tared porcelain dish on a sand bath to a temperature between 140° and 150° C. and add the boric acid in portions, constantly stirring. When all is added and dissolved, continue the heat at the same temperature, frequently stirring, and breaking up the film which forms on the surface until the mixture has been reduced to 500 Gm. [8 oz. av.], then add 500 Gm. [8 oz. av.] of glycerin, mix thoroughly, and immediately transfer the product to bottles and stopper them tightly.

When glycerin and boric acid are heated together in the proportion given in the formula, water is given off, and a new compound is formed as shown by the following equation:

$$\underset{\text{boric acid}}{H_3BO_3} + \underset{\text{glycerin}}{C_3H_5(OH)_3} = \underset{\text{boroglycerin}}{C_3H_5BO_3} + \underset{\text{water}}{3H_2O}$$

As the reaction proceeds, the product thickens, requiring frequent stirring to break up the film which forms, and finally produces a hard, partially transparent, and very hygroscopic mass. This substance is called "boroglycerin", and when dissolved in an equal weight of glycerin constitutes the official Glycerite of Boroglycerin. Care must be observed throughout the operation to avoid an excess of heat which causes a yellowish or brownish color.

Uses—A mild antiseptic, offering boric acid in soluble form. It is often used in washing out the bladder. If water is added in proportions larger than 1 part of the glycerite to 18 parts of water, boric acid will be reprecipitated, so that if weaker solutions than 1 to 18 are required, glycerin should be used as the diluent.

N. F. Preparation—Suppositoria Boroglycerini.

GLYCERITUM PHENOLIS. U.S. Glycerite of Phenol

[Glycer. Phenol.—Glycerite of Carbolic Acid]

	Metric	Alternative
Liquefied Phenol	20 cc.	384 min.
Sodium Citrate	1 Gm.	18 gr.
Boiling Distilled Water	1 cc.	19 min.
Glycerin	79 cc.	3 oz. av. 76 min.
To make	100 cc.	4 oz. av.

Dissolve the sodium citrate in 1 cc. [19 minims] of boiling distilled water, and add this solution to the mixture of glycerin and phenol, previously prepared. The sodium citrate is added to prevent discoloration due to traces of iron in the glycerin. Phenol in the presence of iron salts produces a red color.

Uses—For preparing antiseptic solutions of phenol. It mixes in any proportion with water. It is used also as an addition to gargles and mouth washes.

Average dose—5 minims (0.3 cc.).

GLYCERITUM BISMUTHI. N.F. Glycerite of Bismuth

[Glycer. Bism.]

One hundred cc. of Glycerite of Bismuth yields not less than 12.5 Gm. and not more than 13.5 Gm. of bismuth oxide (Bi_2O_3).

	Metric	Alternative
Bismuth Subnitrate	**180 Gm.**	6 oz. av.
Nitric Acid	**160 cc.**	5 fl. oz. 58 min.
Tartaric Acid	**238 Gm.**	7 oz. av. 414 gr.
Sodium Bicarbonate	**334 Gm.**	11 oz. av. 65 gr.
Glycerin,		
Water, Distilled, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the nitric acid with 250 cc. [8 fl. oz.] of distilled water in a bottle having a capacity of about 4000 cc. [8 pints] and dissolve the bismuth subnitrate in the mixture. Then slowly add 600 cc. [19 fl. oz.] of distilled water and dissolve 135 Gm. [4 oz. av. 222 gr.] of tartaric acid in the mixture. Now add, in small portions, 215 Gm. [7 oz. av. 78 gr.] of sodium bicarbonate, shaking frequently, and avoiding loss by effervescence; when all is added fill the bottle with distilled water and mix well.

Allow the magma to settle and decant the clear liquid. Again fill the bottle with distilled water and wash the magma by decantation as before, repeating the process until the wash-liquor has but a slight saline taste. Then pour the magma upon a filter and allow it to drain, rinsing the bottle with a little distilled water.

Transfer the moist magma to a porcelain evaporating dish, add 103 Gm. [3 oz. av. 192 gr.] of tartaric acid and then slowly, and in small portions, 119 Gm. [3 oz. av. 425 gr.] of sodium bicarbonate. Heat the mixture on a steam bath until solution is effected and the total volume is reduced to 475 cc. [15 fl. oz. 96 min.]. Then add 475 cc. [15 fl. oz. 96 min.] of glycerin, and, if necessary, enough distilled water to make the solution measure 950 cc. [30 fl. oz. 192 min.], and filter.

Determine the amount of bismuth oxide in the liquid by the process given below, and from the result thus obtained adjust the strength by evaporation, or the addition of equal volumes of glycerin and distilled water so that each 100 cc. [3 fl. oz. 193 min.] of the finished Glycerite will yield 13 Gm. of bismuth oxide.

A colorless or pale yellow liquid, having a slight odor, and a sweet, followed by a saline, taste. Specific gravity: about 1.378 at 25° C.

Assay—Dilute 5 cc. of Glycerite of Bismuth, accurately measured, with 100 cc. of distilled water, in a flask, add two drops of hydrochloric acid, and pass a current of hydrogen sulphide through the solution until it is saturated. Allow the precipitate to settle and decant the supernatant liquid (which should be clear and colorless) through a Gooch crucible or filter, retaining the precipitate in the flask. Wash the precipitate a few times by decantation, then transfer it completely to the filter and wash with water until the washings give no test for chloride. Now wash twice with alcohol, then with warm carbon tetrachloride and again with alcohol. Try at 100° C. and weigh. The weight of bismuth sulphide multiplied by 0.903 represents its equivalent in Bi_2O_3.

N. F. Preparations—Elixir Bismuthi; Elixir Cinchonæ Alkaloidorum, Ferri et Bismuthi; Elixir Pepsini et Bismuthi; Liquor Bismuthi.

Uses—A glycerin solution of bismuth and sodium tartrate used in preparation of elixirs and solutions of bismuth. Like other soluble forms of bismuth it does not represent the therapeutic value of the basic salts, but is employed in diarrhea.

GLYCERITUM PEPSINI. N.F. Glycerite of Pepsin

[Glycer. Pepsin.]

	Metric	Alternative
Pepsin (see note on page 303)	**87.5 Gm.**	2 oz. av. 403 gr.
Diluted Hydrochloric Acid	**5.0 cc.**	77 min.
Glycerin	**500.0 cc.**	1 pint
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the diluted hydrochloric acid with 350 cc. [11 fl. oz. 96 min.] of cold, distilled water, add the pepsin and stir very gently until the latter is dissolved. Filter the solution and pass enough distilled water through the filter to obtain 500 cc. [1 pint] of filtrate. To this

add the glycerin and sufficient distilled water to make the product measure 1000 cc. [2 pints].

NOTE—Pepsin solutions are reduced in proteolytic activity by agitation and storage, particularly when at or above normal room temperature. To insure the dispensing of the Glycerite at standard strength it is strongly recommended that the quantity of pepsin directed in the formula be increased to 125 Gm. [4 oz. av. 75 gr.] to allow for such loss in activity and that the Glycerite be stored in a cool place.

N. F. Preparations—Elixir Pepsini, Liquor Pepsini.

Average dose—45 minims (3 cc.).

Uses—A concentrated liquid form of pepsin for making other preparations.

GLYCERITUM PICIS PINI. N. F. Glycerite of Tar

[Glycer. Pic. Pin.—GLYCERITUM PICIS LIQUIDÆ, N. F. IV]

	Metric	Alternative
Pine Tar	63 Gm.	2 oz. av. 45 gr.
Magnesium Carbonate	125 Gm.	4 oz. av. 75 gr.
Glycerin	250 cc.	8 fl. oz.
Alcohol	125 cc.	4 fl. oz.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Pour 200 cc. [6 fl. oz. 192 min.] of cold water upon the pine tar, contained in a mortar, mix them thoroughly, allow the mixture to settle, and pour off the water. Repeat this operation until the washings show only a slightly acid reaction with litmus paper. Now triturate the washed tar with the alcohol, gradually incorporate the magnesium carbonate and glycerin, and add 625 cc. [20 fl. oz.] of water. Pour the mixture upon a filter of loose texture, and, after the liquid portion has passed through, wash the residue on the filter with a mixture of one volume of alcohol and seven volumes of water, sufficient to make the product measure 1000 cc. [2 pints].

Uses—An expectorant.

Average dose—1 fluidrachm (4 cc.).

GLYCERITUM TRAGACANTHÆ. N. F. Glycerite of Tragacanth

[Glycer. Trag.]

	Metric	Alternative
Tragacanth, in fine powder	125 Gm.	4 oz. av. 179 gr.
Glycerin	775 cc.	26 fl. oz. 98 min.
Water	185 cc.	6 fl. oz. 123 min.

Mix the tragacanth and glycerin thoroughly, add the water and stir the mixture until a homogeneous, thick paste results.

Uses—An excellent pill excipient.

GLYCERITUM VITELLI. N. F. Glycerite of Egg Yolk

[Glycer. Vitell.—GLYCONIN]

	Metric	Alternative
Fresh Egg Yolk	45 Gm.	1 oz. av. 350 gr.
Glycerin	55 Gm.	2 oz. av. 88 gr.
To make	100 Gm.	4 oz. av.

Rub the fresh egg yolk in a mortar, with the glycerin, gradually added, until they are thoroughly mixed, and then strain the product.

N. F. Preparation—Emulsum Olei Morrhuæ cum Vitello.

Uses—It offers a permanent form of egg yolk for use as an emulsifying agent.

Table of Some Unofficial Glycerites

Title	*Directions*
Glyceritum Ferri Quininæ et Strychninæ (Phosphatum, U. S. P. VIII)	(Dilute with three volumes of syrup to make syrupus ferri, quininæ et strychninæ, phosphatum U. S. P. VIII.) Dissolve 8 Gm. of soluble ferric phosphate in 20 cc. of hot water, add 20 cc. of phosphoric acid, 0.08 Gm. of strychnine, 10.4 Gm. of quinine and enough water to make 50 cc. Stir until solution is effected and add 50 cc. of glycerin Dose: fifteen minims (1 cc.)
Guaiaci (N. F. IV)	Add 8.5 Gm. of powdered guaiac to 6.5 cc. of solution of potassium hydroxide and macerate during twenty-four hours. Filter, add 60 cc. of glycerin and enough water to make 100 cc. Dose: thirty minims (2 cc.)
Glycerinum Aluminis (Br. 1914) (The British Pharmacopœia (1914) uses the class title Glycerinum for preparations of this character)	Dissolve 20 Gm. of purified alum in 7.5 cc. of distilled water and glycerin enough to make 120 cc., warming slightly if necessary, set aside and pour off the clear liquid
Plumbi Subacetatis (Br. 1914)	Evaporate 50 cc. of strong solution of lead subacetate to dryness on a water bath, add 50 cc. of glycerin, warm gently until dissolved. Cool, add enough distilled water to make the specific gravity 1.48 and filter if necessary
Talbot's Iodoglycerole	Prepared by dissolving 15 parts of zinc iodide and 25 parts of iodine in a mixture of 10 parts of distilled water with 50 parts of glycerin Used by dentists in cleansing gums and mucous membranes before operating. It is diluted with water before use to suit varying conditions

CHAPTER XXVII

ALCOHOLIC SOLUTIONS

Spiritus—*Spirits*

Spirits, from a pharmaceutical point of view, are simply *alcoholic* solutions of volatile substances. They are popularly known as *essences*. Like the medicated waters, the active ingredient may be solid, liquid, or gaseous. None are made by percolation, but there are four different methods represented in the preparation of this official group: 1. By simple solution. 2. By solution with maceration. 3. By chemical reaction. 4. By distillation.

1. **By Simple Solution**—This is the method by which the majority of spirits are prepared; the official preparations of this class are merely solutions of volatile oils in alcohol of appropriate strength. No skill is required to make these, but a great deal of conscientious care must be used in the selection of the volatile oils, that they be of the best quality, and recently distilled. Filtration is usually unnecessary.

2. **By Solution with Maceration**—This method is employed when it is desirable to introduce the coloring matter of the drug into the preparation. This has been done in order to bestow individuality, and in deference to popular feeling in favor of colored preparations. It is very doubtful whether either object is worthy of consideration.

3. **By Chemical Reaction**—There is but *one* spirit in the Pharmacopœia made by chemical reaction, namely, Spirit of Nitrous Ether. As explained elsewhere (page 919), it is the product resulting from a reaction between sodium nitrite, sulphuric acid and alcohol, and the ethyl nitrite so produced is dissolved in alcohol. This spirit is now ordinarily made by simple solution of concentrated ethyl nitrite which is supplied in sealed tubes.

4. **By Distillation**—This method of making spirits is the oldest and in many respects the best in use. When the desirable volatile principles which are present in the finished preparation can be vaporized at the temperature of boiling alcohol or diluted alcohol, distillation is preferred. Two spirits of the U. S. P. are made by distillation. They are Whisky and Brandy.

SPIRITUS ÆTHYLIS NITRITIS. U. S. Spirit of Ethyl Nitrite

[**Sp. Æth. Nitrit.**—Spiritus Ætheris Nitrosi U. S. P. IX, Spirit of Nitrous Ether, Sweet Spirit of Nitre]

Spirit of Ethyl Nitrite is an alcoholic solution of ethyl nitrite containing not less than 3.5 per cent and not more than 4.5 per cent of $C_2H_5NO_2$. (75.06).

The U. S. P. X does not give a method for the preparation of this spirit, but the process of the U. S. P. IX is as follows:

	Metric	Alternative
Sodium Nitrite	**100.0 Gm.**	3 oz. av. 148 gr.
Sulphuric Acid	**40.0 cc.**	1 fl. oz. 134 min.
Monohydrated Sodium Carbonate	**0.6 Gm.**	9 gr.
Potassium Carbonate, completely deprived of water by heating	**3.0 Gm.**	44 gr.
Alcohol,		
Water, each, a sufficient quantity.		

Mix the sulphuric acid with 120 cc. [4 fl. oz.] of water, cool the liquid, add 85 cc. [2 fl. oz. 6 fl. dr.] of alcohol previously diluted with an equal

volume of water, and introduce the solution into a 1000 cc. flask, surrounded by a mixture of ice and water. Dissolve the sodium nitrite in 280 cc. [9 fl. oz.] of water, filter, and, having poured the filtrate into a separatory funnel, allow the liquid to drop slowly into the flask containing the acid mixture. When all has been added and the reaction is complete, allow any crystals which may have formed to settle at the bottom of the flask, and decant the cold mixture of ethyl nitrite and aqueous solution quickly to the previously cooled separatory funnel, and draw off and discard the aqueous liquid. Wash the separated ethyl nitrite, first, with 20 cc. [5 fl. dr. 7 minims] of ice-cold water, and then remove any traces of acid by washing it with 15 cc. [4 fl. dr.] of ice-cold water, in which the monohydrated sodium carbonate has previously been dissolved. Carefully separate the ethyl nitrite from the aqueous liquid, and agitate it in a well-stoppered bottle with the potassium carbonate to remove traces of water. Then cool the liquid, decant and pour the ethyl nitrite immediately into a tared bottle containing 500 Gm. [16 oz. av. 302 grains] of alcohol. Ascertain the weight of the ethyl nitrite poured into the alcohol by noting the increase in weight of the tared bottle and contents, and then add enough alcohol to make the mixture weigh *twenty-two times* the weight of the ethyl nitrite added. Lastly, transfer the product to small, well-stoppered, dark amber-colored bottles, and keep these in a cool place, remote from fire.

(For tests and comments see page 920.)

It is so generally the custom to prepare this Spirit by diluting the concentrated ethyl nitrite that manufacturing processes have been omitted from the U. S. P. Both the distillation method, formerly universally used for its manufacture on the large scale, and the U. S. P. IX method, depending upon its immiscibility with water, have been inserted here.

If the Spirit is to be prepared by diluting the concentrated ethyl nitrite, the latter must be thoroughly chilled in ice-water whether in bulk or in a hermetically sealed tube, before attempting to open or measure it. If in a tube, wrap the tube well with a towel dipped in ice-water before opening, as at times the tube explodes violently, especially if more than six months old. The tubes usually contain the exact volume of ethyl nitrite to make one pint of the official Spirit, but considerable skill is required to avoid loss of the very volatile ester during the mixing. It is preferable to open the tube under the surface of the alcohol, contained in a large graduate or jar, or, if possible, in a bottle.

The 1890 U. S. P. directed ethyl nitrite to be made by a distillation process as follows:

	Metric	Alternative
Sodium Nitrite	**95.0 Gm.**	3 oz. av. 153 gr.
Water	**150.0 cc.**	5 fl. oz. 33 min.
Alcohol	**90.0 cc.**	3 fl. oz. 20 min.

Dissolve the sodium nitrite in the water, in a suitable flask. Add the alcohol. Connect the flask to a condenser and when the joints are tight, the condenser cooled, and a small receiving flask arranged in an ice bath, add the following mixture, in portions and very gradually, through a funnel tube:

	Metric	Alternative
Sulphuric Acid	**45.0 cc.**	1 fl. oz. 250 min.
Water	**150.0 cc.**	5 fl. oz. 33 min.

If necessary toward the end of the reaction, warm the flask gently until all of the ethyl nitrite has been volatilized.

Wash the distillate in the receiving flask, first with 15 cc. [4 fl. dr.] of ice-cold water, to remove any alcohol, then with 15 cc. [4 fl. dr.] of a 4 per cent

solution of sodium carbonate, to remove any acid, and carefully separate the ethyl nitrite from the aqueous liquid.

To prepare Spirit of Ethyl Nitrite from the ethyl nitrite, the ester should be agitated in a well-stoppered bottle with potassium carbonate to remove traces of water. Pour the ethyl nitrite into a tared bottle containing about 500 Gm. [17½ oz. av.] of alcohol. Determine the weight of ethyl nitrite added by noting the increase in weight of the bottle and contents and add enough alcohol to make the mixture weigh 22 times the weight of ethyl nitrite added.

U. S. P. Preparation—Mistura Glycyrrhizæ Composita.
N. F. Preparations—Mistura Copaibæ; Mistura Copaibæ et Opii.

History—The first record of this preparation is found in the writings of Raymond Lully in the thirteenth century. It was also discussed by Basil Valentine in the following century. It was first introduced into medical practice by Doctor Silvius of Leyden, who sold it for a very high price. In the P. L. 1746 it was officially recognized as *Spiritus Nitri Dulcis*, which was changed in 1788 to *Spiritus Aetheris Nitrosi* and in 1809 to *Spiritus Aetheris Nitrici*. It has been made by various formulas and processes.

Uses—Chiefly employed as a diaphoretic in mild fevers and as a diuretic, especially for children. The official directions to keep in small, tightly-stoppered, dark colored bottles should be observed, as it quickly deteriorates when kept in a partially-filled flint bottle on the shelf.

Average dose—30 minims (2 cc.).

SPIRITUS AMMONIÆ AROMATICUS. U.S. Aromatic Spirit of Ammonia
[Sp. Ammon. Arom.]

	Metric	Alternative
Ammonium Carbonate, in translucent pieces	34 Gm.	1 oz. av. 59 gr.
Ammonia Water	90 cc.	2 fl. oz. 7 fl. dr.
Oil of Lemon	10 cc.	2½ fl. dr.
Oil of Lavender	1 cc.	15 min.
Oil of Myristica	1 cc.	15 min.
Alcohol	700 cc.	22 fl. oz. 3 fl. dr.
Distilled Water, a sufficient quantity, To make	1000 cc.	2 pints

Dissolve the ammonium carbonate in the ammonia water and 140 cc. [4½ fl. oz.] of distilled water by gentle agitation, and allow the solution to stand for twelve hours. Dissolve the oils in the alcohol, contained in a 1000 cc. [2 pint] volumetric flask or cylinder, gradually add the ammonium carbonate solution, and enough distilled water to make the product measure 1000 cc. [2 pints]. Set it aside in a cool place for twenty-four hours, occasionally agitating, and filter, using a covered funnel.

(For tests see Part 651.)

The ammonium carbonate in this preparation must be in translucent pieces. The soft, chalky variety is chiefly ammonium bicarbonate, a deteriorated product.

U. S. P. Preparation—Tinctura Valerianæ Ammoniata.
N. F. Preparations—Liquor Sodæ et Menthæ; Tinctura Guaiaci Ammoniata.

History—This first found an official place in the London Pharmacopœia of 1721 under the name *Spiritus Salis Volatilis Oleosus*. The present name was first adopted in the P. L. of 1809. The formula and process have changed repeatedly during the several centuries in which the preparation has been used.

Uses—For hyperacidity of the stomach, especially when accompanied by nausea and sick headache. Also employed for faintness.

Average dose—30 minims (2 cc.).

SPIRITUS ANISI. U.S. Spirit of Anise

[Sp. Anisi]

	Metric	Alternative
Oil of Anise	100 cc.	1 fl. oz.
Alcohol, a sufficient quantity,		
To make	1000 cc.	10 fl. oz.

Mix the oil with sufficient alcohol to make the product measure 1000 cc. [10 fl. oz.].

Alcohol content, by volume, 80 to 87 per cent.

Uses—A stomachic and carminative.

Average dose—30 minims (1 cc.).

SPIRITUS AURANTII COMPOSITUS. U.S. Compound Spirit of Orange

[Sp. Aurant. Co.]

	Metric	Alternative
Oil of Orange	200 cc.	6 fl. oz. 3 fl. dr.
Oil of Lemon	50 cc.	1 fl. oz. 5 fl. dr.
Oil of Coriander	20 cc.	5 fl. dr.
Oil of Anise	5 cc.	77 min.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the oil with sufficient alcohol to make the product measure 1000 cc. [2 pints].

Preserve in dark amber-colored bottles.
Alcohol content, by volume, 65 to 70 per cent.

U. S. P. Preparation—Elixir Aromaticum.
N. F. Preparations—Elixir Aletridis Compositum; Elixir Calcii Lactophosphatis; Elixir Carnis et Ferri; Elixir Chloridorum; Elixir Ferri, Quininæ et Strychninæ; Elixir Heloniadis Compositus; Elixir Hydrangeæ et Lithii; Elixir Phosphori; Elixir Sabal et Santali Compositus; Elixir Terpini Hydratis et Creosoti Compositus; Elixir Tongæ et Salicylatum; Emulsions.

Uses—A flavor for elixirs. An alcoholic solution of this kind permits the uniform introduction of small proportions of oils and also preserves such oils as orange and lemon from rapid oxidation. These two oils should be bought in small quantities by the retail pharmacist, and this spirit is most satisfactorily made from oils taken from bottles not previously opened. This will insure that delicacy of flavor which should always be characteristic of elixirs.

SPIRITUS CAMPHORÆ. U.S. Spirit of Camphor

[Sp. Camph.]

Spirit of Camphor contains not less than 9.5 Gm. and not more than 10.5 Gm. of camphor in each 100 cc.

	Metric	Alternative
Camphor	100 Gm.	3 oz. av. 148 gr.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the camphor in about 800 cc. [25½ fl. oz.] of alcohol and add enough alcohol to make the product measure 1000 cc. [2 pints]. Filter if necessary.

Tests for Purity—Specific gravity: from 0.824 to 0.826 at 25° C.
Add 0.05 Gm. of anhydrous potassium carbonate to 5 cc. of Spirit of Camphor: the potassium carbonate does not liquefy or adhere to the bottom of the vessel (*added water*).

Assay—Fill a 200 mm. polariscope tube with the Spirit of Camphor and take the mean of four or more readings of the rotation, setting the instrument at zero each time. The temperature correction for each degree of temperature is half minute, added if above, subtracted if below, 25° C. Evaporate 60 cc. or more of the Spirit of Camphor in a dish, on a water bath, and when the camphor begins to solidify stir it with a glass rod until dry. Then transfer the camphor to a watch glass, cover it with an inverted funnel and place the watch glass on wire gauze 10 cm. above a Bunsen burner having a flame 4 cm. high. When the camphor has all sublimed, dissolve 2.5 Gm. of the sublimate in sufficient alcohol to make exactly 25 cc., and take the mean of four or more polariscope readings in a 200 mm. tube as before. The minutes of rotation of the Spirit of Camphor divided by the minutes of rotation of the control test, and this multiplied by 10, shows the number of Gm. of camphor in 100 cc. of the Spirit of Camphor.

Alcohol content, by volume, 80 to 87 per cent.

N. F. Preparations—Lotio Ammoniacalis Camphorata; Mistura Opii et Chloroformi Composita; Mistura Opii et Rhei Composita; Tinctura Opii et Gambir Composita.

Uses—Used as a sedative and antispasmodic in diarrhea, and also in hysteria, headache and other forms of nervous excitement. A stimulant in small doses.

Average dose—15 minims (1 cc.).

SPIRITUS CHLOROFORMI. U.S. Spirit of Chloroform

[Sp. Chlorof.—Chloric Ether]

	Metric	Alternative
Chloroform	**60 cc.**	1 fl. oz. 7½ fl. dr.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the chloroform with sufficient alcohol to make the product measure 1000 cc. [2 pints].

Preserve in dark amber-colored bottles.

Alcohol content, by volume, 85 to 91 per cent.

Uses—A sedative in cough mixtures and in flatulence.

Average dose—30 minims (2 cc.).

SPIRITUS CINNAMOMI. U.S. Spirit of Cinnamon

[Sp. Cinnam.]

	Metric	Alternative
Oil of Cinnamon	**100 cc.**	1 fl. oz.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	10 fl. oz.

Mix the oil with sufficient alcohol to make the product measure 1000 cc. [10 fl. oz.].

Alcohol content, by volume, 80 to 87 per cent.

U. S. P. Preparation—Syrupus Rhei.

N. F. Preparations—Syrupus Ipecacuanhæ et Opii; Tabellæ Phenolphthaleini.

Uses—A pleasantly flavored cordial.

Average dose—15 minims (1 cc.).

SPIRITUS FRUMENTI. U.S. Whisky

Whisky is discussed under alcohol (see page 914).

SPIRITUS GLYCERYLIS NITRATIS. U.S. Spirit of Glyceryl Trinitrate

[Sp. Glyceryl. Nit.—Spirit of Glonoin, Spirit of Nitroglycerin]

Spirit of Glyceryl Trinitrate is an alcoholic solution containing not less than 1 per cent and not more than 1.1 per cent of $C_3H_5(NO_3)_3$(227.08).

Caution—Great care must be exercised in dispensing, handling, packing, transporting, and storing this Spirit, since a dangerous explosion may result if any considerable quantity of it is spilled, and the alcohol wholly or partly lost by evaporation. If, through accident, it is spilled, a solution of potassium or sodium hydroxide must be poured over it at once to effect decomposition.

Description and Physical Properties—A clear, colorless liquid, having the odor of alcohol. *Caution must be exercised in tasting it*, since even a small quantity is liable to produce a violent headache. The same effect is produced when it is applied to the skin.

Tests for Identity and Purity—Specific gravity: 0.814 to 0.820 at 25° C.

It is neutral to litmus paper.

Heat about 10 cc. of Spirit of Glyceryl Trinitrate on a water bath with 1 cc. of potassium hydroxide T.S. until the alcohol is evaporated, and then heat a portion of the residue with about 1.5 Gm. of potassium bisulphate: the pungent odor of acrolein is evolved. Dissolve the remainder of the residue in 2 cc. of distilled water acidulated with diluted sulphuric acid, add a few drops of diphenylamine T.S., and pour the solution upon 2 cc. of sulphuric acid in a test tube so as to form a separate layer: a dark blue color is produced at the zone of contact.

On mixing 10 cc. of the Spirit with 11 cc. of distilled water, both previously cooled to 15° C., a clear solution results. On now adding 2 cc. more of distilled water, the mixture becomes turbid at 15° C.

Assay—Transfer about 5 cc. of the Spirit, accurately weighed, to a tared dish, protect it from dust, allow it to evaporate spontaneously, and dry the residue to constant weight over sulphuric acid. The weight of the residue corresponds to not less than 1 per cent and not more than 1.1 per cent of the weight of Spirit taken.

Preserve in well-stoppered bottles, in a cool, dark place, remote from fire.

Alcohol content, by volume, 88 to 95 per cent.

Uses—Employed in angina pectoris, threatened apoplexy, and other severe circulatory disorders. It is not a heart stimulant but lowers blood pressure.

Average dose—1 minim (0.05 cc.).

SPIRITUS LAVANDULÆ. U.S. Spirit of Lavender

[Sp. Lavand.]

	Metric	Alternative
Oil of Lavender	**50 cc.**	**½ fl. oz.**
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	**10 fl. oz.**

Mix the oil with sufficient alcohol to make the product measure 1000 cc. [10 fl. oz.].

Alcohol content, by volume, 85 to 92 per cent.

Uses—A stimulant and carminative.

Average dose—30 minims (2 cc.).

SPIRITUS MENTHÆ PIPERITÆ. U.S. Spirit of Peppermint

[Sp. Menth. Pip.—Essence of Peppermint]

	Metric	Alternative
Oil of Peppermint	**100 cc.**	**3 fl. oz. 96 min.**
Peppermint, bruised	**10 Gm.**	**146 gr.**
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	**2 pints**

Macerate the peppermint leaves, freed as much as possible from stems, during one hour in 500 cc. [1 pint] of water, and then strongly express them.

Mix 800 cc. [25 fl. oz. 288 min.] of alcohol with the oil, add the moist, macerated leaves, and allow to stand during six hours with frequent agitation. Filter and pass sufficient alcohol through the filter to make the product measure 1000 cc. [2 pints].

Preserve in amber-colored bottles.
Alcohol content, by volume, 79 to 85 per cent.

N. F. Preparations—Elixir Catharticum Compositum; Liquor Phosphori; Mistura Opii et Rhei Composita; Mistura Rhei Alkalina; Mistura Rhei Composita; Syrupus Ficorum Compositus.

Uses—A valuable carminative and gastric stimulant in flatulence, and nausea. The oil is usually employed for flavoring.

Average dose—15 minims (1 cc.).

SPIRITUS MENTHÆ VIRIDIS. U.S. Spirit of Spearmint

[Sp. Menth. Vir.]

	Metric	Alternative
Oil of Spearmint	100 cc.	3 fl. oz. 96 min.
Spearmint, bruised	10 Gm.	146 gr.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Macerate the spearmint leaves, freed as much as possible from stems, during one hour in 500 cc. [1 pint] of water, and then strongly express them. Mix 800 cc. [25 fl. oz. 288 min.] of alcohol with the oil, add the moist macerated leaves, and allow to stand during six hours with frequent agitation. Filter, and pass sufficient alcohol through the filter to make the product measure 1000 cc. [2 pints].

Preserve in amber-colored bottles.
Alcohol content, by volume, 79 to 85 per cent.

N. F. Preparation—Elixir Manacæ Compositus.

Uses—As a carminative.

Average dose—15 minims (1 cc.).

SPIRITUS VINI VITIS. U.S. Brandy

Brandy is discussed under alcohol (see page 916).

SPIRITUS ACIDI FORMICI. N.F. Spirit of Formic Acid

[Sp. Ac. Formic.—Spiritus Formicarum, Spirit of Ants]

	Metric	Alternative
Formic Acid	40 cc.	1 fl. oz. 134 min.
Distilled Water	225 cc.	7 fl. oz. 96 min.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the formic acid with the distilled water, and add sufficient alcohol to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 70 per cent.

Uses—Externally a counterirritant, internally a diuretic.

Average dose—1 fluidrachm (4 cc.).

SPIRITUS ÆTHERIS. N.F. Spirit of Ether
(U.S.P. IX)

[Sp. Æth.—Hoffmann's Drops]

	Metric	Alternative
Ether	325 cc.	10 fl. oz. 192 min.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the ether with a sufficient quantity of alcohol to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 63 per cent.

Uses—A carminative in flatulence.

Average dose—1 fluidrachm (4 cc.).

SPIRITUS ÆTHERIS COMPOSITUS. N.F. Compound Spirit of Ether

[Sp. Æth. Co.—Hoffmann's Anodyne]

	Metric	Alternative
Ether	325 cc.	10 fl. oz. 192 min.
Alcohol	650 cc.	20 fl. oz. 384 min.
Ethereal Oil	25 cc.	384 min.
To make about	1000 cc.	2 pints

Mix them.

Approximate alcohol content, by volume, 61 per cent.

History—Compound spirit of ether was based upon a secret preparation of Dr. Friedrich Hoffmann of the early eighteenth century, called *Liquor Anodynus Hoffmannii.*

Uses—A carminative in flatulent colic.

Average dose—1 fluidrachm (4 cc.).

SPIRITUS AMMONIÆ ANISATUS. N.F. Anisated Spirit of Ammonia

[Sp. Ammon. Anis.—Liquor Ammoniæ Anisatus, Anisated Solution of Ammonia]

	Metric	Alternative
Anethol	30 cc.	461 min.
Ammonia Water	200 cc.	6 fl. oz. 192 min.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the anethol in 770 cc. [24 fl. oz. 307 min.] of alcohol, gradually add the ammonia water and then sufficient alcohol to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 73 per cent.

Uses—A carminative, antacid and stimulant.

Average dose—15 minims (1 cc.).

SPIRITUS AMYGDALÆ AMARÆ. N.F. Spirit of Bitter Almond
[U.S.P. IX]

[Sp. Amygd. Amar.]

	Metric	Alternative
Oil of Bitter Almond	10 cc.	154 min.
Alcohol	800 cc.	25 fl. oz. 288 min.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the oil in the alcohol, and add enough distilled water to make the product measure 1000 cc. [2 pints].

NOTE—This Spirit is intended for medicinal use; it must not be used for flavoring foods.

Approximate alcohol content, by volume, 75 per cent.

N. F. Preparations—Elixir Anisi; Elixir Terpini Hydratis.

Uses—As a flavoring agent. It contains enough prussic acid to exert a deleterious effect if used too freely.

Average dose—8 minims (0.5 cc.).

SPIRITUS CARDAMOMI COMPOSITUS. N. F. Compound Spirit of Cardamom

[Sp. Card. Co.]

	Metric	Alternative
Oil of Cardamom	20.0 cc.	384 min.
Oil of Orange	20.0 cc.	384 min.
Oil of Cinnamon	2.0 cc.	38 min.
Oil of Clove	1.0 cc.	19 min.
Anethol	1.0 cc.	19 min.
Oil of Caraway	0.1 cc.	2 min.
Alcohol, a sufficient quantity,		
To make	200 cc.	8 fl. oz.

Mix the oils with 150 cc. [4 fl. oz. 384 min.] of alcohol, and add sufficient alcohol to make the product measure 200 cc. [6 fl. oz. 192 min.].

Approximate alcohol content, by volume, 72 per cent.

N. F. Preparations—Elixir Cardamomi Compositum; Elixir Gentianæ; Elixir Gentianæ et Ferri; Elixir Gentianæ et Ferri Phosphatis; Elixir Glycerophosphatum Compositum; Elixir Glycyrrhizæ Aquosum; Liquor Pancreatini.

Uses—The flavor for a vehicle elixir of the same name (also see Spiritus Aurantii Compositus).

SPIRITUS MYRCIÆ COMPOSITUS. N. F. Compound Spirit of Myrcia

[Sp. Myrciæ Co.]

	Metric	Alternative
Oil of Myrcia	8.0 cc.	123 min.
Oil of Orange	0.5 cc.	8 min.
Oil of Pimenta	0.5 cc.	8 min.
Alcohol	610.0 cc.	19 fl. oz. 250 min.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the oils with the alcohol, and gradually add water until the product measures 1000 cc. [2 pints]. Set the mixture aside, in a well-stoppered bottle, for eight days and then filter it through paper in a covered funnel.

Approximate alcohol content, by volume, 57 per cent.

Uses—Commonly sold for *Bay Rum*. Genuine Bay Rum is a distillation of bay-leaf and Demerara rum. It is used to give perfume to external applications, also as a lotion after shaving and, since unmedicated alcohol is not available, often employed for an alcohol rub.

SPIRITUS ODORATUS. N. F. Perfumed Spirit

[Sp. Odorat.—AQUA COLONIENSIS]

	Metric	Alternative
Oil of Bergamot	15 cc.	230 min.
Oil of Lemon	8 cc.	123 min.
Oil of Rosemary	7 cc.	108 min.
Oil of Lavender	4 cc.	61 min.
Oil of Orange Flowers	4 cc.	61 min.
Acetic Ether	2 cc.	31 min.
Water	120 cc.	3 fl. oz. 403 min.
Alcohol	840 cc.	26 fl. oz. 422 min.
To make about	1000 cc.	2 pints

Dissolve the oils and the acetic ether in the alcohol, and add the water. Set the mixture aside, in a stoppered bottle, during eight days and then filter it through paper in a covered funnel.

Approximate alcohol content, by volume, 78 per cent.

Uses—A refreshing perfume, often employed in the sick room. It is a typical formula for the preparation known as *Cologne Water*.

Genuine Cologne Water (Eau de Cologne) is so called from having been first manufactured in Cologne, Germany. The preparations made by various firms differ considerably in their odor, but the oil of orange flowers or neroli is universally recognized as the dominant odor.

SPIRITUS OLEORUM VOLATILIUM. N.F. Spirits of Volatile Oils

Any spirit of a volatile oil, for which no formula is provided, may be prepared by the following general formula:

	Metric	Alternative
The Volatile Oil	**65 cc.**	2 fl. oz. 38 min.
Alcohol	**935 cc.**	29 fl. oz. 442 min.
To make about	**1000 cc.**	2 pints

Dissolve the volatile oil in the alcohol.

SPIRITUS SINAPIS. N.F. Spirit of Mustard

[Sp. Sinap.]

	Metric	Alternative
Volatile Oil of Mustard	**2 cc.**	38 min.
Alcohol, a sufficient quantity,		
To make	**100 cc.**	4 fl. oz.

Mix them.

Approximate alcohol content, by volume, 92 per cent.

Uses—A counterirritant.

SPIRITUS VANILLINI COMPOSITUS. N.F. Compound Spirit of Vanillin

[Sp. Vanil. Co.]

	Metric	Alternative
Vanillin	**40 Gm.**	1 oz. av. 293 gr.
Oil of Orange	**10 cc.**	192 min.
Oil of Cardamom	**2 cc.**	38 min.
Oil of Cinnamon	**1 cc.**	19 min.
Alcohol, a sufficient quantity,		
To make	**200 cc.**	8 fl. oz.

Dissolve the vanillin and the oils in 150 cc. [6 fl. oz.] of alcohol and add sufficient alcohol to make the product measure 200 cc. [8 fl. oz.].

Preserve the spirit in tightly stoppered, amber-colored bottles, in a cool place.

Approximate alcohol content, by volume, 15 per cent.

N. F. Preparation—Elixir Vanillini Compositum.

Uses—The flavor for a vehicle elixir of the same name. (See also Spiritus Aurantii Compositus.)

Table of Some Unofficial Spirits

Title	*Directions*
Spiritus Ammoniæ (U. S. P. VIII)	Heat 50 cc. of stronger ammonia water, not above 60° C., in a flask, connected by means of a glass condenser, with a well-cooled receiver containing 100 cc. of alcohol, the delivery tube reaching nearly to the bottom of the condenser. When all the ammonia has been distilled, adjust the volume of the spirit to contain 10 per cent by weight, of ammonia gas Dose: fifteen minims (1 cc.)
Ammoniæ Fetidus (Br. 1914)	Macerate 7.5 Gm. of asafetida in 75 cc. of alcohol for twenty-four hours and then distil off the alcohol. Mix the distillate with 10 cc. of strong solution of ammonia (32.5 per cent) and enough alcohol to make 100 cc. Dose: thirty minims (2 cc.)

Table of Some Unofficial Spirits—*Continued*

Title	*Directions*
Spiritus Armoraciæ Compositus (Br. 1914)	Macerate 12.5 Gm. of horseradish root, scraped, 12.5 Gm. of dried bitter orange peel and 0.3 Gm. of nutmeg with 62.5 cc. of alcohol and 75 cc. of distilled water for one hour, and distil 100 cc. Dose: two fluidrachms (8 cc.)
Cajuputi (Br. 1914)	Mix 10 cc. of oil of cajuput with enough alcohol to make 100 cc. Dose: ten minims (0.6 cc.)
Juniperi Compositus (U. S. P. IX)	Dissolve 0.8 cc. of oil of juniper, 0.1 cc. of oil of caraway and 0.1 cc. of oil of fennel in 140 cc. of alcohol and add enough water to make 200 cc. Dose: two and one-half fluidrachms (10 cc.)
Limonis (U. S. P. 1890)	Mix 5 cc. of oil of lemon with 90 cc. of alcohol, add 5 Gm. of freshly grated lemon peel and macerate for twenty-four hours. Filter and add enough alcohol to make 100 cc.
Phosphori (U. S. P. 1890)	Add 0.12 Gm. of phosphorus, carefully weighed, to 100 cc. of dehydrated alcohol contained in a flask, connect with an upright condenser and boil the liquid until the phosphorus is dissolved; then, if necessary, add enough dehydrated alcohol to make 100 cc. and preserve in small, tightly-stoppered bottles
Rosmarini (Br. 1914)	Mix 10 cc. of oil of rosemary with enough alcohol to make 100 cc.

Elixiria—*Elixirs*

Elixirs are aromatic, sweetened, spiritous preparations, frequently used as flavors and adjuvants in prescriptions and sometimes containing active medicinal substances. Although they are largely employed throughout the United States, but two are official in the U. S. P. X. These are intended as vehicles for the administration of active remedies in small doses. The National Formulary, however, has recognized a large number of preparations of this class; in the group are *ten* intended for use as vehicles or adjuvants, and the remainder are medicated. Elixirs, when dispensed, should always be brilliantly clear, filtration through purified talc, or preferably through purified siliceous earth, being resorted to, if necessary. The utmost care should be taken in the selection of the flavoring ingredients. Especially is this necessary with volatile oils, and only those which are of finest quality and entirely free from evidences of deterioration should be employed.

ELIXIR AROMATICUM. U. S. Aromatic Elixir

[Elix. Arom.—Simple Elixir]

	Metric	Alternative
Compound Spirit of Orange	**12 cc.**	184 min.
Syrup	**375 cc.**	12 fl. oz.
Purified Talc	**30 Gm.**	1 oz. av.
Alcohol,		
Distilled Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

To the compound spirit of orange add enough alcohol to make 250 cc. [8 fl. oz.]. To this solution add the syrup in several portions, agitating after each addition, and afterwards add, in the same manner, 375 cc. [12 fl. oz.] of distilled water. Mix the purified talc intimately with the liquid, and filter through a wetted filter, returning the first portions of the filtrate until a clear liquid is obtained. Lastly, wash the filter with a mixture of 1 volume of alcohol and 3 volumes of distilled water until the product measures 1000 cc. [2 pints].

The compound spirit is used to insure a uniform proportion of the several oils (*i.e.* orange, lemon, coriander, and anise), in every lot of the elixir. The alcoholic solution also preserves the delicate flavor of the orange and lemon for a considerable time.

Alcohol content, by volume, 22 to 24 per cent.

U. S. P. Preparations—Elixir Glycyrrhizæ; Liquor Ferri et Ammonii Acetatis.

N. F. Preparations—Elixir Aromaticum Rubrum; also in many medicated elixirs; Liquor Ferri Albuminati.

Uses—A pleasantly flavored vehicle, employed in the preparation of many other elixirs. The chief objection to its extensive use is the high alcohol content (about 22 per cent) which at times counteracts the effect of other medicines. The N.F. offers several vehicle elixirs of low alcoholic strength, among them being the compound elixir of almond (about 5 per cent alcohol), aqueous elixir of glycyrrhiza (about 1 per cent alcohol), and the compound elixirs of cardamom and vanillin (both with about 10 per cent alcohol).

ELIXIR GLYCYRRHIZÆ. U.S. Elixir of Glycyrrhiza

[Elix. Glycyrrh.—Elixir Adjuvans, Elixir of Licorice]

	Metric	Alternative
Fluidextract of Glycyrrhiza	**125 cc.**	4 fl. oz.
Aromatic Elixir	**875 cc.**	28 fl. oz.
To make	**1000 cc.**	2 pints

Mix and filter.

Alcohol content, by volume, 21 to 23 per cent.

Uses—A flavored vehicle and adjuvant.

ELIXIR ALETRIDIS COMPOSITUM. N.F. Compound Elixir of Aletris

[Elix. Aletrid. Co.]

	Metric	Alternative
Fluidextract of Aletris, **Fluidextract of Mitchella,** **Fluidextract of Helonias,** **Fluidextract of Caulophyllum,** each	**65.50 cc.**	2 fl. oz. 46 min.
Fluidextract of Viburnum Opulus	**32.75 cc.**	1 fl. oz. 23 min.
Compound Spirit of Orange	**10.00 cc.**	154 min.
Alcohol	**125.00 cc.**	4 fl. oz.
Syrup	**300.00 cc.**	9 fl. oz. 288 min.
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the compound spirit of orange in the alcohol, add the fluidextracts, then the syrup, and sufficient distilled water to make the product measure 1000 cc. [2 pints]. Filter.

Approximate alcohol content, by volume, 27 per cent.

Uses—In dysmenorrhea.

Average dose—1 fluidrachm (4 cc.).

ELIXIR AMMONII BROMIDI. N.F. Elixir of Ammonium Bromide

[Elix. Ammon. Brom.]

	Metric	Alternative
Ammonium Bromide	**85 Gm.**	2 oz. av. 366 gr.
Syrup	**200 cc.**	6 fl. oz. 192 min.
Distilled Water	**460 cc.**	14 fl. oz. 346 min.
Aromatic Elixir, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the ammonium bromide in the distilled water, add the syrup and sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

It will be observed that all elixirs containing bromides are made with only a small percentage of aromatic elixir, water serving as the main solvent. This is for the purpose of reducing the alcohol content which, if present in large amount, would interfere with the action of the bromide.

Approximate alcohol content, by volume, 6 per cent.

Uses—A sedative containing 5 grains of bromide in a fluidrachm.

Average dose—1 fluidrachm (4 cc.).

ELIXIR AMMONII VALERATIS. N.F. Elixir of Ammonium Valerate

[Elix. Ammon. Valer.—Elixir Ammonii Valerianatis]

	Metric	Alternative
Ammonium Valerate	35.0 Gm.	1 oz. av. 74 gr.
Chloroform	1.5 cc.	23 min.
Tincture of Vanilla	16.0 cc.	246 min.
Compound Tincture of Cudbear	16.0 cc.	246 min.
Ammonia Water,		
Aromatic Elixir, each, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the ammonium valerate in about 65 cc. [2 fl. oz. 38 min.] of aromatic elixir and add ammonia water, in drops, until a faint excess of it is perceptible in the liquid, using litmus paper as an indicator. Then add the chloroform, tincture of vanilla and compound tincture of cudbear, and sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

If the ammonia is not in excess, free valeric acid is present and renders the preparation offensive in odor and taste.

Approximate alcohol content, by volume, 21 per cent.

Uses—In nervousness and hysteria.

Average dose—1 fluidrachm (4 cc.).

ELIXIR AMYGDALÆ COMPOSITUM. N.F. Compound Elixir of Almond

[Elix. Amygdal. Co.]

	Metric	Alternative
Oil of Bitter Almond	0.5 cc.	8 min.
Vanillin	1.0 Gm.	15 gr.
Orange Flower Water	150.0 cc.	4 fl. oz. 384 min.
Alcohol	50.0 cc.	1 fl. oz. 288 min.
Syrup	400.0 cc.	12 fl. oz. 384 min.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the oil of bitter almond and the vanillin in the alcohol, add the syrup, the orange flower water and sufficient distilled water, in several portions, shaking the mixture thoroughly after each addition, to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 4 per cent.

N. F. Preparation—Elixir Trium Bromidorum.

Uses—A vehicle elixir offering low-alcoholic content (about 5 per cent) where such is desired.

ELIXIR ANISI. N.F. Elixir of Anise

[Elix. Anis.]

	Metric	Alternative
Anethol	3.5 cc.	54 min.
Oil of Fennel	0.5 cc.	8 min.
Spirit of Bitter Almond	12.0 cc.	184 min.
Alcohol	50.0 cc.	1 fl. oz. 288 min.
Syrup	625.0 cc.	20 fl. oz.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the anethol, oil of fennel, spirit of bitter almond and alcohol, add the syrup and sufficient distilled water to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 4 per cent.

Uses—A carminative for infants; also a flavored vehicle.

Average dose—For infants, 15 minims (1 cc.).

ELIXIR AROMATICUM RUBRUM. N.F. Red Aromatic Elixir

[Elix. Arom. Rub.—Red Elixir]

	Metric	Alternative
Cudbear	2 Gm.	29 gr.
Aromatic Elixir	1000 cc.	2 pints
To make	1000 cc.	2 pints

Add the cudbear to the aromatic elixir, allow the mixture to stand for six or more hours with occasional agitation, then filter.

Approximate alcohol content, by volume, 22 per cent.

Uses—A red-colored, flavored vehicle.

ELIXIR AURANTII AMARI. N.F. Elixir of Bitter Orange

[Elixir Curassao]

	Metric	Alternative
Oil of Bitter Orange	4 cc.	60 min.
Tincture of Bitter Orange Peel	20 cc.	307 min.
Alcohol	300 cc.	9 fl. oz. 288 min.
Orange Flower Water	20 cc.	307 min.
Syrup	400 cc.	12 fl. oz. 384 min.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the oil of bitter orange and the tincture of bitter orange peel with the alcohol, add the syrup, the orange flower water and then sufficient distilled water, in several portions, shaking the mixture after each addition, to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 28 per cent.

History—Under the name *Elixir Aurantii Compositum* the celebrated Dr. Friedrich Hoffmann of the early part of the eighteenth century introduced a similar preparation which he also called *Elixir Viscerale Hoffmannii.*

Uses—A pleasantly flavored vehicle.

ELIXIR BISMUTHI. N.F. Elixir of Bismuth

[Elix. Bism.]

	Metric	Alternative
Glycerite of Bismuth	125 cc.	4 fl. oz.
Glycerin	125 cc.	4 fl. oz.
Distilled Water	250 cc.	8 fl. oz.
Aromatic Elixir, a sufficient quantity		
To make	1000 cc.	2 pints

Mix the ingredients in the order given and filter the product.

Approximate alcohol content, by volume, 11 per cent.

Uses—An intestinal astringent.

Average dose—1 fluidrachm (4 cc.).

ELIXIR BROMIDORUM QUINQUE. N.F. Elixir of Five Bromides

[Elix. Bromid. Quinq.]

	Metric	Alternative
Sodium Bromide	87.5 Gm.	2 oz. av. 403 gr.
Potassium Bromide	70.0 Gm.	2 oz. av. 147 gr.
Calcium Bromide	52.5 Gm.	1 oz. av. 329 gr.
Lithium Bromide	35.0 Gm.	1 oz. av. 74 gr.
Ammonium Bromide	17.5 Gm.	256 gr.
Fluidglycerate of Glycyrrhiza	80.0 cc.	2 fl. oz. 269 min.
Syrup of Raspberry	150.0 cc.	4 fl. oz. 384 min.
Syrup	150.0 cc.	4 fl. oz. 384 min.
Aromatic Elixir	200.0 cc.	6 fl. oz. 192 min.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the bromides with 250 cc. [8 fl. oz.] of distilled water, add the syrups, the fluidglycerate of glycyrrhiza and the aromatic elixir, and agitate until the bromides are completely dissolved. Then add enough distilled water to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 4 per cent.

Uses—A nerve sedative.

Average dose—1 fluidrachm (4 cc.).

ELIXIR BROMIDORUM TRIUM. N.F. Elixir of Three Bromides

[**Elix. Brom. Tri.**—ELIXIR TRIUM BROMIDORUM, N.F. IV]

	Metric	Alternative
Ammonium Bromide	**80 Gm.**	2 oz. av. 293 gr.
Potassium Bromide	**80 Gm.**	2 oz. av. 293 gr.
Sodium Bromide	**80 Gm.**	2 oz. av. 293 gr.
Cudbear	**2 Gm.**	29 gr.
Compound Elixir of Almond, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the bromides in 800 cc. [25 fl. oz.] of compound elixir of almond, add the cudbear and allow the mixture to macerate in a stoppered bottle for six or more hours, with occasional shaking; then add sufficient compound elixir of almond to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 4 per cent.

Uses—A nerve sedative.

Average dose—1 fluidrachm (4 cc.).

ELIXIR BUCHU. N.F. Elixir of Buchu

[**Elix. Buchu**]

	Metric	Alternative
Fluidextract of Buchu	**125 cc.**	4 fl. oz.
Alcohol	**50 cc.**	1 fl. oz. 288 min.
Aromatic Elixir, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the fluidextract of buchu with the alcohol, add sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 32 per cent.

N. F. Preparation—Elixir Buchu et Potassii Acetatis.

Uses—A sedative to genito-urinary tract.

Average dose—1 fluidrachm (4 cc.).

ELIXIR BUCHU COMPOSITUM. N.F. Compound Elixir of Buchu

[**Elix. Buchu Co.**]

	Metric	Alternative
Compound Fluidextract of Buchu	**250 cc.**	8 fl. oz.
Aromatic Elixir, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the compound fluidextract of buchu with sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 31 per cent.

Uses—For chronic inflammations of genito-urinary organs.

Average dose—1 fluidrachm (4 cc.).

ELIXIR BUCHU ET POTASSII ACETATIS. N. F. Elixir of Buchu and Potassium Acetate

[Elix. Buchu et Pot. Acet.]

	Metric	Alternative
Potassium Acetate	**85 Gm.**	2 oz. av. 366 gr.
Elixir of Buchu, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the potassium acetate in sufficient elixir of buchu to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 31 per cent.

Uses—For hyperacidity of urine and irritated bladder.

Average dose—1 fluidrachm (4 cc.).

ELIXIR BUCHU, JUNIPERI ET POTASSII ACETATIS. N. F. Elixir of Buchu, Juniper and Potassium Acetate

[Elix. Buchu, Junip. et Pot. Acet.]

	Metric	Alternative
Fluidextract of Buchu	**150 cc.**	4 fl. oz. 384 min.
Fluidextract of Juniper	**75 cc.**	2 fl. oz. 192 min.
Potassium Acetate	**50 Gm.**	1 oz. av. 293 gr.
Alcohol	**50 cc.**	1 fl. oz. 288 min.
Aromatic Elixir, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the fluidextracts with the alcohol, and add 750 cc. [24 fl. oz.] of aromatic elixir in which the potassium acetate has been previously dissolved. Add sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 35 per cent.

Uses—Chronic inflammation of genito-urinary tract and as a diuretic.

Average dose—1 fluidrachm (4 cc.).

ELIXIR CALCII ET SODII GLYCEROPHOSPHATUM. N. F. Elixir of Calcium and Sodium Glycerophosphates

[Elix. Calc. et Sod. Glycerophos.—Elixir Glycerophosphatum]

	Metric	Alternative
Sodium Glycerophosphate	**17.50 Gm.**	256 gr.
Calcium Glycerophosphate	**8.75 Gm.**	128 gr.
Phosphoric Acid	**8.00 cc.**	123 min.
Glycerin	**300.00 cc.**	9 fl. oz. 288 min.
Aromatic Elixir	**300.00 cc.**	9 fl. oz. 288 min.
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the glycerophosphates in the acid and 300 cc. [9 fl. oz. 288 min.] of distilled water, add the glycerin and aromatic elixir, and sufficient distilled water to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 6 per cent.

Uses—For conditions in which lime and phosphates are indicated, especially diseases of the bones.

Average dose—1 fluidrachm (4 cc.).

ELIXIR CALCII LACTOPHOSPHATIS. N. F. Elixir of Calcium Lactophosphate

[Elix. Calc. Lactophos.]

	Metric	Alternative
Precipitated Calcium Carbonate	**10 Gm.**	146 gr.
Lactic Acid	**30 cc.**	461 min.
Phosphoric Acid	**15 cc.**	230 min.
Compound Spirit of Orange	**10 cc.**	154 min.
Syrup	**350 cc.**	11 fl. oz. 96 min.
Alcohol	**200 cc.**	6 fl. oz. 192 min.
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the precipitated calcium carbonate in the lactic acid, which has been previously mixed with 200 cc. [6 fl. oz. 192 min.] of distilled water, and then add the phosphoric acid, diluted with 50 cc. [1 fl. oz. 288 min.] of distilled water. To this solution add the syrup and then, in divided portions, the mixture of alcohol and compound spirit of orange. Now add sufficient distilled water to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 19 per cent.

Uses—See Syrupus Calcii Lactophosphatis, page 275.

Average dose—2 fluidrachms (8 cc.).

ELIXIR CARDAMOMI COMPOSITUM. N. F. Compound Elixir of Cardamom

[Elix. Card. Co.]

	Metric	Alternative
Compound Spirit of Cardamom	**10 cc.**	154 min.
Alcohol	**90 cc.**	2 fl. oz. 422 min.
Syrup	**400 cc.**	12 fl. oz. 384 min.
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the compound spirit of cardamom with the alcohol, add the syrup and sufficient distilled water, in several portions, shaking the mixture thoroughly after each addition, to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 8 per cent.

Uses—An elixir of pleasant flavor, but of low alcoholic content.

ELIXIR CARNIS ET FERRI. N. F. Elixir of Beef and Iron

(Replacing Vinum Carnis et Ferri N. F. IV)

[Elix. Carn. et Ferr.]

	Metric	Alternative
Extract of Beef	**35.00 Gm.**	1 oz. av. 74 gr
Iron and Ammonium Citrate	**8.75 Gm.**	128 gr.
Alcohol	**200.00 cc.**	6 fl. oz. 192 min.
Compound Spirit of Orange	**5.00 cc.**	77 min.
Syrup	**100.00 cc.**	3 fl. oz. 96 min.
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the iron and ammonium citrate and the extract of beef in 200 cc. [6 fl. oz. 192 min.] of distilled water by the aid of heat. Cool the solution and add 400 cc. [12 fl. oz. 384 min.] of distilled water and the syrup. Gradually add the alcohol in which the compound spirit of orange has been dissolved, then sufficient distilled water to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 19 per cent.

Preserve it in amber-colored bottles in a cool place.

Uses—Used as a tonic.

Average dose—2 fluidrachms (8 cc.).

ELIXIR CASCARÆ SAGRADÆ. N. F. Elixir of Cascara Sagrada

[Elix. Casc. Sagr.]

	Metric	Alternative
Aromatic Fluidextract of Cascara Sagrada	**500 cc.**	1 pint
Aqueous Elixir of Glycyrrhiza	**500 cc.**	1 pint
To make about	**1000 cc.**	2 pints

Mix them, and filter if necessary.

Approximate alcohol content, by volume, 12 per cent.

Uses—A laxative.

Average dose—1 fluidrachm (4 cc.).

ELIXIR CASCARÆ SAGRADÆ COMPOSITUM. N.F. Compound Elixir of Cascara Sagrada

[Elix. Casc. Sagr. Co.—Elixir Rhamni Purshianæ Compositum, Laxative Elixir]

	Metric	Alternative
Aromatic Fluidextract of Cascara Sagrada	125 cc.	4 fl. oz.
Fluidextract of Senna	75 cc.	2 fl. oz. 192 min.
Fluidextract of Juglans	65 cc.	2 fl. oz. 38 min.
Aromatic Elixir, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix them, and filter.

Approximate alcohol content, by volume, 23 per cent.

Uses—A laxative.

Average dose—1 fluidrachm (4 cc.).

ELIXIR CATARIÆ ET FŒNICULI. N.F. Elixir of Catnep and Fennel

[Elix. Catar. et Fœnic.]

	Metric	Alternative
Fluidextract of Catnep	100.0 cc.	3 fl. oz. 96 min.
Sodium Bicarbonate	17.5 Gm.	256 gr.
Oil of Fennel	2.0 cc.	31 min.
Oil of Spearmint	1.0 cc.	15 min.
Alcohol	150.0 cc.	4 fl. oz. 384 min.
Syrup	200.0 cc.	6 fl. oz. 192 min.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the oils in the alcohol, add the fluidextract and syrup. Dissolve the sodium bicarbonate in 500 cc. [1 pint] of distilled water by very gentle agitation and add this solution to the first mixture. Then add sufficient distilled water to make the product measure 1000 cc. [2 pints], mix well and filter.

Approximate alcohol content, by volume, 17 per cent.

Uses—A carminative.

Average dose—For infants, 8 minims (0.5 cc.).

ELIXIR CATHARTICUM COMPOSITUM. N.F. Compound Cathartic Elixir

[Elix. Cathart. Co.]

	Metric	Alternative
Fluidextract of Frangula	125.0 cc.	4 fl. oz.
Fluidextract of Senna	100.0 cc.	3 fl. oz. 96 min.
Fluidextract of Rhubarb	62.0 cc.	1 fl. oz. 472 min.
Spirit of Peppermint	14.0 cc.	215 min.
Solution of Potassium Hydroxide	4.5 cc.	69 min.
Aromatic Elixir, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix 600 cc. [19 fl. oz. 96 min.] of aromatic elixir with the solution of potassium hydroxide; then add the fluidextracts, the spirit of peppermint, and sufficient aromatic elixir to make the product measure 1000 cc. [2 pints]. Allow the mixture to stand twenty-four hours, and filter.

Approximate alcohol content, by volume, 25 per cent.

Uses—A laxative.

Average dose—Aperient, 1 fluidrachm (4 cc.); Cathartic, 3 fluidrachms (12 cc.).

ELIXIR CHLORIDORUM. N. F. Elixir of Chlorides

[Elix. Chlorid.—Elixir of Four Chlorides]

	Metric	Alternative
Corrosive Mercuric Chloride	0.275 Gm.	4 gr.
Solution of Arsenous Acid	16.500 cc.	253 min.
Tincture of Ferric Chloride	83.000 cc.	2 fl. oz. 315 min.
Diluted Hydrochloric Acid	83.000 cc.	2 fl. oz. 315 min.
Compound Spirit of Orange	10.000 cc.	154 min.
Syrup	250.000 cc.	8 fl. oz.
Alcohol	200.000 cc.	6 fl. oz. 192 min.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the corrosive mercuric chloride in the diluted hydrochloric acid, add the solution of arsenous acid and the tincture of ferric chloride. Mix the compound spirit of orange with the alcohol, add the syrup, the aqueous solution, then sufficient distilled water to make the product measure 1000 cc. [2 pints], and filter.

Preserve the Elixir in dark amber-colored bottles.

Approximate alcohol content, by volume, 24 per cent.

Uses—An alterative.

Average dose—1 fluidrachm (4 cc.).

One average dose contains about:

0.0011 Gm. or 1/54 grain of Corrosive Mercuric Chloride.

0.00065 Gm. or 1/100 grain of Arsenic Trioxide.

ELIXIR CINCHONÆ ALKALOIDORUM. N. F. Elixir of Cinchona Alkaloids

[Elix. Cinchon. Alk.—Elixir Calisaya, Alkaloidal]

	Metric	Alternative
Quinine Sulphate	2 Gm.	29 gr.
Cinchonidine Sulphate	1 Gm.	15 gr.
Cinchonine Sulphate	1 Gm.	15 gr.
Compound Tincture of Cudbear	50 cc.	1 fl. oz. 288 min.
Aromatic Elixir, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the alkaloidal salts in 900 cc. [28 fl. oz. 384 min.] of aromatic elixir; add the compound tincture of cudbear and sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

This elixir replaces a former elixir of cinchona or calisaya which was made directly from the bark. This formula is preferable because tannin is absent and this permits its admixture with iron preparations without darkening.

Approximate alcohol content, by volume, 23 per cent.

N. F. Preparation—Elixir Cinchonæ Alkaloidorum et Ferri.

Uses —As a bitter tonic intended especially for combining with iron salts.

Average dose—2 fluidrachms (8 cc.).

ELIXIR CINCHONÆ ALKALOIDORUM ET FERRI. N. F. Elixir of Cinchona Alkaloids and Iron

[Elix. Cinchon. et Ferr.—Ferrated Elixir of Calisaya, Alkaloidal]

	Metric	Alternative
Soluble Ferric Phosphate	35 Gm.	1 oz. av. 74 gr.
Distilled Water	60 cc.	1 fl. oz. 442 gr.
Elixir of Cinchona Alkaloids, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the soluble ferric phosphate in the distilled water with the aid of heat, add a sufficient quantity of the elixir to make the product measure 1000 cc. [2 pints], and filter.

Preserve the Elixir in amber-colored bottles.

Approximate alcohol content, by volume, 21 per cent.

N. F. Preparations—Elixir Cinchonæ Alkaloidorum, Ferri et Bismuthi; Elixir Cinchonæ Alkaloidorum, Ferri et Strychninæ.

Uses—A chalybeate tonic.

Average dose—2 fluidrachms (8 cc.).

ELIXIR CINCHONÆ ALKALOIDORUM, FERRI, BISMUTHI ET STRYCHNINÆ. N. F. Elixir of Cinchona Alkaloids, Iron, Bismuth and Strychnine

[**Elix. Cinchon. Ferr. Bism. et Strych.**—Elixir Cinchonæ, Ferri, Bismuthi et Strychninæ; Elixir of Calisaya, Alkaloidal, with Iron, Bismuth and Strychnine]

	Metric	Alternative
Strychnine Sulphate	**0.175 Gm.**	2½ gr.
Distilled Water	**10.000 cc.**	154 min.
Elixir of Cinchona Alkaloids, Iron and Bismuth, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the strychnine sulphate in the distilled water, and add sufficient of the elixir to make the product measure 1000 cc. [2 pints].

Preserve the Elixir in amber-colored bottles.
Approximate alcohol content, by volume, 18 per cent.

Uses—Employed as a tonic.

Average dose—1 fluidrachm (4 cc.).
One average dose contains about:
0.0007 Gm. or 1/100 grain of Strychnine Sulphate.

ELIXIR CINCHONÆ ALKALOIDORUM, FERRI ET BISMUTHI. N. F. Elixir of Cinchona Alkaloids, Iron and Bismuth

[**Elix. Cinchon. Ferr. et Bism.**—Elixir of Calisaya, Alkaloidal, with Iron and Bismuth]

	Metric	Alternative
Glycerite of Bismuth	**65 cc.**	2 fl. oz. 38 min.
Distilled Water	**65 cc.**	2 fl. oz. 38 min.
Elixir of Cinchona Alkaloids and Iron, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dilute the glycerite with the distilled water, add sufficient of the elixir to make the product measure 1000 cc. [2 pints], mix thoroughly and filter.

Preserve the Elixir in dark amber-colored bottles.
Approximate alcohol content, by volume, 18 per cent.

N. F. Preparation—Elixir Cinchonæ Alkaloidorum, Ferri, Bismuthi et Strychninæ.

Uses—Employed as a tonic.

Average dose—2 fluidrachms (8 cc.).

ELIXIR CINCHONÆ ALKALOIDORUM, FERRI ET STRYCHNINÆ. N. F. Elixir of Cinchona Alkaloids, Iron and Strychnine

[**Elix. Cinchon. Ferr. et Strych.**—Elixir of Calisaya, Alkaloidal, with Iron and Strychnine]

	Metric	Alternative
Strychnine Sulphate	**0.175 Gm.**	2½ gr.
Distilled Water	**10.000 cc.**	154 min.
Elixir Cinchona Alkaloids and Iron, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the strychnine sulphate in the distilled water, add sufficient of the elixir to make the product measure 1000 cc. [2 pints], and filter.

Preserve the Elixir in dark amber-colored bottles.
Approximate alcohol content, by volume, 21 per cent.

Uses—Employed as a bitter chalybeate tonic.

Average dose—1 fluidrachm (4 cc.).
One average dose contains about:
0.0007 Gm. or 1/100 grain of Strychnine Sulphate.

ELIXIR CORYDALIS COMPOSITUM. N.F. Compound Elixir of Corydalis

[Elix. Coryd. Co.]

	Metric	Alternative
Fluidextract of Corydalis	60 cc.	1 fl. oz. 442 min.
Fluidextract of Stillingia	60 cc.	1 fl. oz. 442 min.
Fluidextract of Xanthoxylum	30 cc.	461 min.
Fluidextract of Blue Flag	90 cc.	2 fl. oz. 422 min.
Alcohol	125 cc.	4 fl. oz.
Potassium Iodide	50 Gm.	1 oz. av. 293 gr.
Aromatic Elixir, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the fluidextracts, add the alcohol and dissolve the potassium iodide in the mixture. Then add sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 40 per cent.

Uses—As an alterative; its most important therapeutic ingredient is the potassium iodide.

Average dose—1 fluidrachm (4 cc.).

ELIXIR ERIODICTYI AROMATICUM. N.F. Aromatic Elixir of Eriodictyon

[Elix. Eriodict. Arom.—Aromatic Elixir of Yerba Santa, Elixir Corrigens]

	Metric	Alternative
Fluidextract of Eriodictyon	60 cc.	1 fl. oz. 442 min.
Syrup	500 cc.	1 pint
Pumice, in fine powder	30 Gm.	1 oz. av.
Magnesium Carbonate	10 Gm.	146 gr.
Compound Elixir of Taraxacum	440 cc.	14 fl. oz. 38 min.
To make	1000 cc.	2 pints

Triturate the fluidextract with the pumice and the magnesium carbonate and gradually add the elixir, followed by the syrup. Shake the mixture frequently during two hours, allow it to stand 12 or more hours, and filter.

Approximate alcohol content, by volume, 15 per cent.

Uses—A peculiar but pleasantly flavored vehicle, especially adapted for bitter substances like quinine.

Average dose—1 fluidrachm (4 cc.).

ELIXIR EUPHORBIÆ COMPOSITUM. N.F. Compound Elixir of Euphorbia

[Elix. Euphorb. Co.—Anti-asthmatic Elixir]

	Metric	Alternative
Fluidextract of Euphorbia	52.50 cc.	1 fl. oz. 326 min.
Fluidextract of Lobelia	7.00 cc.	108 min.
Sodium Bromide	35.00 Gm.	1 oz. av. 74 gr.
Sodium Iodide	35.00 Gm.	1 oz. av. 74 gr.
Spirit of Glyceryl Trinitrate	8.75 cc.	134 min.
Compound Tincture of Cardamom	50.00 cc.	1 fl. oz. 288 min.
Oil of Peppermint	1.00 cc.	15 min.
Glycerin	125.00 cc.	4 fl. oz.
Alcohol	200.00 cc.	6 fl. oz. 192 min.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the spirit of glyceryl trinitrate and oil of peppermint with the alcohol, add the glycerin, then the fluidextracts and compound tincture of cardamom. Dissolve the sodium bromide and sodium iodide in 400 cc. [12 fl. oz. 384 min.] of distilled water and add this gradually to the alcoholic solution. Mix thoroughly and add sufficient distilled water to make the product measure 1000 cc. [2 pints]. Filter if necessary.

Approximate alcohol content, by volume, 24 per cent.

Uses—In chronic bronchitis.

Average dose—1 fluidrachm (4 cc.).

ELIXIR FERRI PYROPHOSPHATIS, QUININÆ ET STRYCHNINÆ. N. F.
Elixir of Ferric Pyrophosphate, Quinine and Strychnine

[Elix. Ferr. Pyrophos. Quin. et Strych.]

	Metric	Alternative
Soluble Ferric Pyrophosphate	**35.00 Gm.**	1 oz. av. 74 gr.
Quinine Sulphate	**8.75 Gm.**	128 gr.
Strychnine	**0.14 Gm.**	2 gr.
Citric Acid	**0.70 Gm.**	10 gr.
Oil of Orange	**0.70 cc.**	10 gr.
Alcohol	**225.00 cc.**	7 fl. oz. 96 min.
Syrup	**375.00 cc.**	12 fl. oz.
Ammonia Water		
Distilled Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Triturate the quinine sulphate, strychnine and citric acid together, until minutely divided, then add the alcohol and oil of orange. Warm the syrup to about 65° C., add it to the turbid alcoholic mixture, and stir until it becomes clear. To this add the ferric pyrophosphate, previously dissolved in 320 cc. [10 fl. oz. 115 min.] of distilled water, and then ammonia water, drop by drop, until the liquid is neutral to litmus paper. Finally add sufficient distilled water to make the product measure 1000 cc. [2 pints], and filter.

Preserve the Elixir in dark amber-colored bottles.
Approximate alcohol content, by volume, 21 per cent.

Uses—Employed as a tonic. This preparation soon assumes a darker shade of green, becoming brown or almost black.

Average dose—1 fluidrachm (4 cc.).
One average dose contains about:
0.00056 Gm. or $\frac{1}{125}$ grain of Strychnine.

ELIXIR FERRI, QUININÆ ET STRYCHNINÆ. N. F. Elixir of Iron, Quinine and Strychnine

[Elix. Ferr. Quin. et Strych.—Elixir I., Q. & S.]

	Metric	Alternative
Tincture of Ferric Citrochloride	**125.000 cc.**	4 fl. oz.
Quinine Hydrochloride	**8.750 Gm.**	128 gr.
Strychnine Sulphate	**0.175 Gm.**	2½ gr.
Compound Spirit of Orange	**10.000 cc.**	154 min.
Alcohol	**240.000 cc.**	7 fl. oz. 326 min.
Glycerin	**300.000 cc.**	9 fl. oz. 288 min.
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the quinine hydrochloride in the alcohol, add the compound spirit of orange, then the strychnine sulphate previously dissolved in 10 cc. [154 min.] of distilled water. Then add successively the glycerin, the tincture of ferric citrochloride, and sufficient distilled water to make the product measure 1000 cc. [2 pints]. Filter.

Preserve the Elixir in dark amber-colored bottles.

Note—An elixir containing these ingredients as phosphates was formerly official in the Pharmacopœia (see page 338), but because of its lack of stability and absence of therapeutic advantage, as compared with the more stable N. F. Elixir, it has been omitted.

If the solution of ferric chloride from which the tincture of ferric citrochloride is made, is not excessively acid and if the tincture has been allowed to stand a few weeks before filtering, this Elixir is permanent as to color and absence of precipitate.

Approximate alcohol content, by volume, 24 per cent.

Uses—A general tonic.

Average dose—1 fluidrachm (4 cc.).
One average dose contains about:
0.0007 Gm. or $\frac{1}{100}$ grain of Strychnine Sulphate.

ELIXIR GENTIANÆ. N.F. Elixir of Gentian

[Elix. Gent.]

	Metric	Alternative
Fluidextract of Gentian	**35 cc.**	1 fl. oz. 58 min.
Compound Spirit of Cardamom	**15 cc.**	230 min.
Sodium Citrate	**30 Gm.**	1 oz. av.
Glycerin	**50 cc.**	1 fl. oz. 288 min.
Syrup	**250 cc.**	8 fl. oz.
Alcohol	**150 cc.**	4 fl. oz. 384 min.
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the sodium citrate in 350 cc. [11 fl. oz. 96 min.] of distilled water, add this solution to the alcohol with which the compound spirit of cardamom has been mixed, then add the fluidextract of gentian, the syrup, the glycerin, and sufficient distilled water to make the product measure 1000 cc. [2 pints], and filter.

The presence of sodium citrate in this elixir permits the addition of ferric salts without the production of a black color. In former revisions this preparation was treated with ferric hydroxide to precipitate the tannin-like constituents of the gentian so that the elixir could be mixed with ferric salts, but this treatment was laborious and also removed much of the bitterness of the gentian.

Approximate alcohol content, by volume, 16 per cent.

N. F. Preparations—Elixir Gentianæ et Ferri; Elixir Gentianæ et Ferri Phosphatis.

Uses—A vehicle and bitter tonic adjuvant.

Average dose—1 fluidrachm (4 cc.).

ELIXIR GENTIANÆ ET FERRI. N.F. Elixir of Gentian and Iron

[Elix. Gent. et Ferr.—Elixir of Gentian with Tincture of Ferric Citrochloride]

	Metric	Alternative
Tincture of Ferric Citrochloride	**100 cc.**	3 fl. oz. 96 min.
Elixir of Gentian, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix and filter.

Preserve the Elixir in amber-colored bottles.
Approximate alcohol content, by volume, 16 per cent.

Uses—A bitter tonic.

Average dose—1 fluidrachm (4 cc.).

ELIXIR GENTIANÆ ET FERRI PHOSPHATIS. N.F. Elixir of Gentian and Ferric Phosphate

[Elix. Gent. et Ferr. Phos.—Elixir Gentianæ Ferratum]

	Metric	Alternative
Soluble Ferric Phosphate	**17.5 Gm.**	256 gr.
Distilled Water	**35.0 cc.**	1 fl. oz. 58 min.
Elixir of Gentian, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the soluble ferric phosphate in the distilled water with the aid of heat, and add sufficient elixir of gentian to make the product measure 1000 cc. [2 pints].

Preserve the Elixir in amber-colored bottles.
Approximate alcohol content, by volume, 15 per cent.

Uses—A bitter tonic and chalybeate.

Average dose—1 fluidrachm (4 cc.).

ELIXIR GENTIANÆ GLYCERINATUM. N.F. Glycerinated Elixir of Gentian

[Elix. Gentian. Glycerin.]

	Metric	Alternative
Fluidextract of Gentian	**10.0 cc.**	154 min.
Fluidextract of Taraxacum	**15.0 cc.**	230 min.
Compound Tincture of Cardamom	**60.0 cc.**	1 fl. oz. 442 min.
Syrup of Raspberry	**60.0 cc.**	1 fl. oz. 442 min.
Tincture of Sweet Orange Peel	**15.0 cc.**	230 min.
Phosphoric Acid	**5.0 cc.**	77 min.
Acetic Ether	**0.5 cc.**	8 min.
Glycerin	**400.0 cc.**	12 fl. oz. 384 min.
Sucrose	**200.0 Gm.**	6 oz. av. 296 gr.
Alcohol	**100.0 cc.**	3 fl. oz. 96 min.
Distilled Water, a sufficient quantity		
To make	**1000 cc.**	2 pints

Dissolve the sucrose in 250 cc. [8 fl. oz.] of distilled water, add the glycerin and the tincture of sweet orange peel previously dissolved in the alcohol. Then add the other ingredients and sufficient distilled water to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 14 per cent.

Uses—Said to be the original formula for the *Glycerin Tonic Compound* of Doctor Gray of Boston, which has been popularized as a tonic by advertising.

Average dose—2 fluidrachms (8 cc.).

ELIXIR GLYCEROPHOSPHATUM COMPOSITUM. N.F. Compound Elixir of Glycerophosphates

[Elix. Glycerophos. Co.—Compound Solution of Glycerophosphates]

	Metric	Alternative
Sodium Glycerophosphate	**35.000 Gm.**	1 oz. av. 74 gr.
Calcium Glycerophosphate	**16.000 Gm.**	234 gr.
Ferric Glycerophosphate	**3.000 Gm.**	44 gr.
Soluble Manganese Glycerophosphate	**2.000 Gm.**	29 gr.
Quinine Hydrochloride	**0.900 Gm.**	13 gr.
Strychnine Nitrate	**0.115 Gm.**	1⅞ gr.
Lactic Acid	**10.000 cc.**	154 min.
Compound Spirit of Cardamom	**2.000 cc.**	31 min.
Alcohol	**125.000 cc.**	4 fl. oz.
Glycerin	**350.000 cc.**	11 fl. oz. 96 min.
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the calcium and sodium glycerophosphates and the quinine and strychnine salts in 400 cc. [12 fl. oz. 384 min.] of distilled water containing the lactic acid, and add the glycerin. Dissolve the ferric and manganese glycerophosphates in 50 cc. [1 fl. oz. 288 min.] of distilled water by aid of heat, and add to the first solution. Mix the compound spirit of cardamom and alcohol and add to the mixture, then add sufficient distilled water to make the product measure 1000 cc. [2 pints], and filter.

Preserve the Elixir in amber-colored bottles.

Approximate alcohol content, by volume, 11 per cent.

Uses—A general tonic.

Average dose—2 fluidrachms (8 cc.).
One average dose contains about:
0.0009 Gm. or 1/60 grain of Strychnine Nitrate.

ELIXIR GLYCYRRHIZÆ AQUOSUM. N.F. Aqueous Elixir of Glycyrrhiza

[Elix. Glycyrrh. Aq.—Aqueous Elixir of Licorice]

	Metric	Alternative
Fluidextract of Glycyrrhiza	150 cc.	4 fl. oz. 384 min.
Compound Spirit of Cardamom	5 cc.	77 min.
Orange Flower Water	200 cc.	6 fl. oz. 192 min.
Glycerin	150 cc.	4 fl. oz. 384 min.
Syrup	150 cc.	4 fl. oz. 384 min.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix and filter.

Approximate alcohol content, by volume, 3 per cent.

N. F. Preparation—Elixir Cascaræ Sagradæ.

Uses—A vehicle of low alcoholic strength (about 3 per cent).

Average dose—2 fluidrachms (8 cc.).

ELIXIR GUARANÆ. N.F. Elixir of Guarana

[Elix. Guar.]

	Metric	Alternative
Fluidextract of Guarana	200 cc.	6 fl. oz. 192 min.
Aromatic Elixir	200 cc.	6 fl. oz. 192 min.
Compound Elixir of Taraxacum, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix them and filter.

Approximate alcohol content, by volume, 32 per cent.

Uses—A nerve stimulant, used chiefly for headaches.

Average dose—1 fluidrachm (4 cc.).

ELIXIR GUARANÆ ET APII. N.F. Elixir of Guarana and Celery

[Elix. Guaran. et Apii]

	Metric	Alternative
Fluidextract of Guarana	150 cc.	4 fl. oz. 384 min.
Fluidextract of Celery Fruit	150 cc.	4 fl. oz. 384 min.
Fluidglycerate of Glycyrrhiza	30 cc.	461 min.
Glycerin	60 cc.	1 fl. oz. 442 min.
Aromatic Elixir, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the fluidextracts, fluidglycerate and glycerin and add sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 35 per cent.

Uses—In headache.

Average dose—2 fluidrachms (8 cc.).

ELIXIR HELONIADIS COMPOSITUM. N.F. Compound Elixir of Helonias

[Elix. Heloniad. Co.]

	Metric	Alternative
Fluidextract of Helonias	32 cc.	1 fl. oz. 12 min.
Fluidextract of Caulophyllum	32 cc.	1 fl. oz. 12 min.
Fluidextract of Viburnum Opulus	32 cc.	1 fl. oz. 12 min.
Fluidextract of Mitchella	125 cc.	4 fl. oz.
Compound Spirit of Orange	10 cc.	154 min.
Alcohol	125 cc.	4 fl. oz.
Syrup	300 cc.	9 fl. oz. 288 min.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the compound spirit of orange with the alcohol, add the syrup, then the fluidextracts. Then add sufficient distilled water to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 22 per cent.

Uses—In dysmenorrhea.

Average dose—1 fluidrachm (4 cc.).

ELIXIR HYDRANGEÆ ET LITHII, N. F. Elixir of Hydrangea and Lithium

[Elix. Hydrang. et Lith.]

	Metric	Alternative
Hydrangea, in moderately coarse powder	400 Gm.	13 oz. av. 154 gr.
Lithium Benzoate	26 Gm.	380 gr.
Lithium Salicylate	26 Gm.	380 gr.
Compound Spirit of Orange	4 cc.	61 min.
Sucrose	50 Gm.	1 oz. av. 293 gr.
Alcohol,		
Distilled Water, each, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the compound spirit of orange in 300 cc. [9 fl. oz. 288 min.] of alcohol and add 600 cc. [19 fl. oz. 96 min.] of distilled water. Moisten the hydrangea with 250 cc. [8 fl. oz.] of this menstruum, and allow it to stand well covered for six hours. Pack it in a percolator, saturate with the menstruum and allow to macerate for twenty-four hours. Then allow percolation to proceed slowly and collect 940 cc. [30 fl. oz.] of percolate, using as the second menstruum a mixture of one volume of alcohol and two volumes of water. Dissolve the sucrose and lithium salts in the percolate and add enough of the menstruum to make the product measure 1000 cc. [2 pints]. Mix well, and filter.

Approximate alcohol content, by volume, 25 per cent.

Uses—In rheumatism.

Average dose—1 fluidrachm (4 cc.).

ELIXIR HYDRASTIS COMPOSITUM. N.F. Compound Elixir of Hydrastis

[Elix. Hydrast. Co.—Alkaline Elixir]

	Metric	Alternative
Fluidextract of Hydrastis	17.50 cc.	269 min.
Fluidextract of Oat	17.50 cc.	269 min.
Fluidextract of Xanthoxylum	17.50 cc.	269 min.
Fluidextract of Gentian	8.75 cc.	134 min.
Fluidextract of Ginger	8.75 cc.	134 min.
Sodium Bicarbonate	8.75 Gm.	128 gr.
Aromatic Elixir, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the sodium bicarbonate in 250 cc. [8 fl. oz.] of aromatic elixir, add the fluidextracts and sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 23 per cent.

Uses—In indigestion.

Average dose—1 fluidrachm (4 cc.)

ELIXIR MANACÆ COMPOSITUM. N. F. Compound Elixir of Manaca

[Elix. Manac. Co.]

	Metric	Alternative
Fluidextract of Manaca	165.0 cc.	5 fl. oz. 134 min.
Sodium Salicylate	140.0 Gm.	4 oz. av. 295 gr.
Lithium Salicylate	17.5 Gm.	256 gr.
Potassium Bicarbonate	39.7 Gm.	1 oz. av. 142 gr.
Salicylic Acid	55.0 Gm.	1 oz. av. 366 gr.
Honey	125.0 cc.	4 fl. oz.
Spirit of Spearmint	15.0 cc.	230 min.
Aromatic Elixir, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the fluidextract, spirit of spearmint and honey. Dissolve the salicylates and salicylic acid in 600 cc. [19 fl. oz. 96 min.] of aromatic elixir and add, gradually, the potassium bicarbonate. Then add this gradually with constant shaking, to the previous mixture, and add enough aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 20 per cent.

Uses—An antirheumatic.

Average dose—1 fluidrachm (4 cc.).

ELIXIR PEPSINI. N.F. Elixir of Pepsin

[Elix. Pepsin.]

	Metric	Alternative
Glycerite of Pepsin (see note below)	200 cc.	6 fl. oz. 192 min.
Glycerin	100 cc.	3 fl. oz. 96 min.
Diluted Hydrochloric Acid	4 cc.	61 min.
Aromatic Elixir, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the glycerite of pepsin, glycerin and diluted hydrochloric acid with sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], avoiding strong agitation.

Note—Pepsin solutions are reduced in proteolytic activity by agitation and storage, particularly when at or above normal room temperature. To insure the dispensing of this Elixir at standard strength it is strongly recommended that an excess of 25 to 50 per cent of glycerite of pepsin be used in preparing this Elixir to allow for such loss in activity, and that the Elixir be stored in a cool place.

Approximate alcohol content, by volume, 15 per cent.

Uses—A liquid form of pepsin. It is very doubtful how much of enzymic activity will survive the effect of the alcohol in the Elixir.

Average dose—2 fluidrachms (8 cc.).

ELIXIR PEPSINI, BISMUTHI ET STRYCHNINÆ. N.F. Elixir of Pepsin, Bismuth and Strychnine

[Elix. Pepsin. Bism. et Strych.]

	Metric	Alternative
Strychnine	0.175 Gm.	2½ gr.
Tartaric Acid	0.175 Gm.	2½ gr.
Elixir of Pepsin and Bismuth, a sufficient quantity,		
To make	1000 cc.	2 pints

Triturate the strychnine and tartaric acid with about 30 cc. [460 min.] of the elixir, until dissolved, then add sufficient of the elixir to make the product measure 1000 cc. [2 pints], and mix well.

Preserve the Elixir in a cool place.

Approximate alcohol content, by volume, 10 per cent.

Uses—Proposed for a tonic, but does not comply with modern therapeutic ideas.

Average dose—1 fluidrachm (4 cc.).

One average dose contains about:

0.0007 Gm. or $\frac{1}{100}$ grain of Strychnine.

ELIXIR PEPSINI COMPOSITUM. N.F. Compound Elixir of Pepsin

[Elix. Pepsin. Co.—Compound Digestive Elixir]

	Metric	Alternative
Pepsin (see note below)	17.5 Gm.	256 gr.
Lactic Acid	1.0 cc.	15 min.
Glycerin	250.0 cc.	8 fl. oz.
Alcohol	200.0 cc.	6 fl. oz. 192 min.
Oil of Orange	2.0 cc.	31 min.
Cudbear	1.0 Gm.	15 gr.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the lactic acid with 500 cc. [1 pint] of cold water and dissolve the pepsin in this liquid with very gentle stirring; then add the glycerin. Macerate the cudbear in the alcohol for two hours, add the oil of orange and gradually add this liquid to the pepsin solution with gentle stirring. Add sufficient distilled water to make the product measure 1000 cc. [2 pints], allow to stand twenty-four hours with occasional gentle agitation, and filter.

Note—Pepsin solutions are reduced in proteolytic activity by agitation and storage, particularly when at or above normal room temperature. To insure the dispensing of this Elixir at standard strength it is strongly recommended that the quantity of pepsin directed in the formula be increased to 25 Gm. [365 gr.] to allow for such loss in activity, and that the Elixir be stored in a cool place.

Approximate alcohol content, by volume, 18 per cent.

Uses—A vehicle for nauseating remedies.

Average dose—2 fluidrachms (8 cc.).

ELIXIR PEPSINI ET BISMUTHI. N. F. Elixir of Pepsin and Bismuth

[Elix. Pepsin. et Bism.]

	Metric	Alternative
Pepsin (see note below)	8.75 Gm.	128 gr.
Glycerite of Bismuth	125.00 cc.	4 fl. oz.
Glycerin	125.00 cc.	4 fl. oz.
Distilled Water	250.00 cc.	8 fl. oz.
Caramel	0.50 cc.	8 min.
Aromatic Elixir, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the pepsin in the cold distilled water by very gentle stirring, add the glycerin and glycerite of bismuth, then 490 cc. [15 fl. oz. 326 min.] of aromatic elixir. If the mixture is strongly acid, nearly neutralize it with solution of sodium hydroxide but do not make even faintly alkaline. Lastly add the caramel and sufficient aromatic elixir to make the product measure 1000 cc. [2 pints].

NOTE—Pepsin solutions are reduced in proteolytic activity by agitation and storage, particularly when at or above normal room temperature. To insure the dispensing of this Elixir at standard strength it is strongly recommended that the quantity of pepsin directed in the formula be increased to 12 Gm. [175 gr.] to allow for such loss in activity, and that the Elixir be stored in a cool place.

Approximate alcohol content, by volume, 10 per cent.

N. F. Preparation—Elixir Pepsini, Bixmuthi et Strychninæ.

Uses—Another irrational combination frequently prescribed by physicians.

Average dose—2 fluidrachms (8 cc.).

ELIXIR PEPSINI ET RENNINI COMPOSITUM. N. F. Compound Elixir of Pepsin and Rennin

[Elix. Pepsin. et Rennin. Co.—ESSENCE OF PEPSIN]

	Metric	Alternative
Pepsin (see note below)	22.5 Gm.	328 gr.
Rennin	17.5 Gm.	256 gr.
Lactic Acid	2.0 cc.	31 min.
Glycerin	150.0 cc.	4 fl. oz. 384 min.
Alcohol	165.0 cc.	5 fl. oz. 134 min.
Tincture of Sweet Orange Peel	50.0 cc.	1 fl. oz. 288 min.
Oil of Myristica	0.1 cc.	1½ min.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the lactic acid with 300 cc. [9 fl. oz. 288 min.] of cold distilled water and dissolve the pepsin and rennin in this liquid by very gentle stirring, then add the glycerin. Dissolve the tincture of sweet orange peel and oil of myristica in the alcohol and gradually add to the aqueous solution with gentle stirring. Then add sufficient distilled water to make the product measure 1000 cc. [2 pints], and mix thoroughly. Finally filter.

NOTE—Pepsin solutions are reduced in proteolytic activity by agitation and storage, particularly when at or above normal room temperature. To insure the dispensing of this Elixir at standard strength it is strongly recommended that the quantity of pepsin directed in the formula be increased to 34 Gm. [1 oz. av. 59 gr.] to allow for such loss in activity, and that the Elixir be stored in a cool place.

Approximate alcohol content, by volume, 19 per cent.

Uses—Chiefly as a vehicle for nauseating drugs.

Average dose—2 fluidrachms (8 cc.).

ELIXIR PHOSPHORI. N. F. Elixir of Phosphorus

[Elix. Phosphor.]

	Metric	Alternative
Phosphorus	0.25 Gm.	4 gr.
Chloroform	5.00 cc.	77 min.
Alcohol	340.00 cc.	10 fl. oz. 422 min.
Glycerin	300.00 cc.	9 fl. oz. 288 min.
Compound Spirit of Orange	10.00 cc.	154 min.
Oil of Anise	2.00 cc.	31 min.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Weigh the phosphorus in a tared watch-crystal containing water, dry it carefully and quickly with blotting paper, and introduce it into a strong flask or bottle of 100 cc. [3 fl. oz.] capacity containing the chloroform. Stopper the container, warm it on a water bath until the phosphorus melts into a globule and agitate it gently, repeating the operation if necessary, until the phosphorus is all dissolved. Add the chloroform solution to the alcohol, which has been warmed to from 55° to 60° C., in a flask graduated to 1000 cc. [2 pints], shake it thoroughly, add the oil of anise, the compound spirit of orange and the glycerin in divided portions, shaking the mixture after each addition, then add sufficient distilled water to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 31 per cent.

N. F. Preparation—Elixir Phosphori et Nucis Vomicæ.

Uses—To overcome nervous exhaustion and stimulate bone development. An excellent form for the administration of phosphorus.

Average dose—1 fluidrachm (4 cc.).

ELIXIR PHOSPHORI ET NUCIS VOMICÆ. N. F. Elixir of Phosphorus and Nux Vomica

[Elix. Phosphor. et Nuc. Vom.]

	Metric	Alternative
Tincture of Nux Vomica	**35 cc.**	1 fl. oz. 58 min.
Elixir of Phosphorus, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix them.

Approximate alcohol content, by volume, 31 per cent.

Uses—Same as Elixir of Phosphorus.

Average dose—1 fluidrachm (4 cc.).

ELIXIR POTASSII BROMIDI. N. F. Elixir of Potassium Bromide

[Elix. Pot. Brom.]

	Metric	Alternative
Potassium Bromide	**175 Gm.**	5 oz. av. 368 gr.
Syrup	**200 cc.**	6 fl. oz. 192 min.
Distilled Water	**460 cc.**	14 fl. oz. 346 min.
Aromatic Elixir, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the potassium bromide in the distilled water, add the syrup and sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

NOTE—If a colored elixir is preferred add 15 cc. [230 min.] of compound tincture of cudbear in place of the same quantity of aromatic elixir.

Approximate alcohol content, by volume, 6 per cent.

Uses—A nerve sedative; it contains 10 grains of bromide in each fluidrachm.

Average dose—2 fluidrachms (8 cc.).

ELIXIR SABAL ET SANTALI COMPOSITUM. N. F. Compound Elixir of Sabal and Sandalwood

[Elix. Sabal et Santal. Co.—COMPOUND ELIXIR OF SAW PALMETTO AND SANDALWOOD]

	Metric	Alternative
Sabal, in moderately coarse powder	**260 Gm.**	8 oz. av. 297 gr.
Triticum, in moderately coarse powder	**260 Gm.**	8 oz. av. 297 gr.
Fluidextract of Zea	**260 cc.**	8 fl. oz. 154 min.
Fluidextract of Sandalwood	**65 cc.**	2 fl. oz. 38 min.
Compound Spirit of Orange	**5 cc.**	77 min.
Glycerin	**150 cc.**	4 fl. oz. 384 min.
Alcohol,		
Distilled Water, each, a sufficient quantity,		
To make about	**1000 cc.**	2 pints

Mix 265 cc. [8 fl. oz. 230 min.] of alcohol with 360 cc. [11 fl. oz. 250 min.] of distilled water. Mix the powdered drugs, add the fluidextracts and the compound spirit of orange and enough of the alcohol-water mixture to thoroughly moisten the powder and maintain it in a damp condition for six hours. Pack it in a cylindrical percolator, saturate with the menstruum and macerate for twenty-four hours. Then allow the percolation to proceed slowly adding more menstruum, consisting of a mixture of three volumes of alcohol and four volumes of water, as needed, and collect 850 cc. [27 fl. oz. 96 min.] of percolate. To this add the glycerin and mix well.

Approximate alcohol content, by volume, 30 per cent.

Uses—A urinary antiseptic.

Average dose—1 fluidrachm (4 cc.).

ELIXIR SODII BROMIDI. N.F. Elixir of Sodium Bromide

[Elix. Sod. Brom.]

	Metric	Alternative
Sodium Bromide	175 Gm.	5 oz. av. 368 gr.
Syrup	200 cc.	6 fl. oz. 192 min.
Distilled Water	460 cc.	14 fl. oz. 346 min.
Aromatic Elixir, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the sodium bromide in the distilled water, add the syrup and sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 6 per cent.

Uses—A nerve sedative; it contains 10 grains of bromide in each fluidrachm.

Average dose—2 fluidrachms (8 cc.).

ELIXIR SODII SALICYLATIS. N.F. Elixir of Sodium Salicylate

[Elix. Sod. Salicyl.]

	Metric	Alternative
Sodium Salicylate	85 Gm.	2 oz. av. 366 gr.
Syrup	200 cc.	6 fl. oz. 192 min.
Distilled Water	460 cc.	14 fl. oz. 346 min.
Aromatic Elixir, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the sodium salicylate in the distilled water, add the syrup and sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 6 per cent.

Uses—In rheumatism.

Average dose—1 fluidrachm (4 cc.).

ELIXIR SODII SALICYLATIS COMPOSITUM. N.F. Compound Elixir of Sodium Salicylate

[Elix. Sod. Salicyl. Co.]

	Metric	Alternative
Sodium Salicylate	80 Gm.	2 oz. av. 293 gr.
Fluidextract of Cimicifuga	32 cc.	1 fl. oz. 12 min.
Fluidextract of Gelsemium	16 cc.	246 min.
Potassium Iodide	15 Gm.	219 gr.
Aromatic Elixir, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the sodium salicylate and potassium iodide in 800 cc. [25 fl. oz. 288 min.] of aromatic elixir, add the fluidextracts and then sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

Preserve the Elixir in dark amber-colored bottles.

Approximate alcohol content, by volume, 22 per cent.

Uses—In chronic forms of rheumatism.

Average dose—1 fluidrachm (4 cc.).

ELIXIR TARAXACI COMPOSITUM. N. F. Compound Elixir of Taraxacum

[Elix. Tarax. Co.]

	Metric	Alternative
Fluidextract of Taraxacum	35 cc.	1 fl. oz. 58 min.
Fluidextract of Wild Cherry	20 cc.	307 min.
Fluidextract of Glycyrrhiza	60 cc.	1 fl. oz. 442 min.
Tincture of Sweet Orange Peel	60 cc.	1 fl. oz. 442 min.
Tincture of Cinnamon	30 cc.	461 min.
Compound Tincture of Cardamom	30 cc.	461 min.
Aromatic Elixir, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the fluidextracts, add the tinctures and then sufficient aromatic elixir to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 27 per cent.

N. F. Preparations—Elixir Eriodictyi Aromaticum; Elixir Guaranæ; Elixir Viburni Opuli Compositum.

Uses—A vehicle, especially useful for disguising bitter substances.

Average dose—2 fluidrachms (8 cc.).

ELIXIR TERPINI HYDRATIS. N. F. Elixir of Terpin Hydrate

[Elix. Terpin. Hyd.]

	Metric	Alternative
Terpin Hydrate	17.5 Gm.	256 gr.
Tincture of Sweet Orange Peel	20.0 cc.	307 min.
Spirit of Bitter Almond	5.0 cc.	77 min.
Alcohol	425.0 cc.	13 fl. oz. 288 min.
Glycerin	400.0 cc.	12 fl. oz. 384 min.
Syrup	100.0 cc.	3 fl. oz. 96 min.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the terpin hydrate in the alcohol, add successively the tincture, spirit, glycerin, syrup and sufficient distilled water to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 40 per cent.

The high alcoholic content in this elixir is required for the solution of the terpin hydrate.

N. F. Preparation—Elixir Terpini Hydratis et Codeinæ.

Uses—A stimulant for secretions in bronchitis.

Average dose—1 fluidrachm (4 cc.).

ELIXIR TERPINI HYDRATIS ET CODEINÆ. N. F. Elixir of Terpin Hydrate and Codeine

[Elix. Terpin. Hyd. et Codein.—Elixir Terpini Hydratis cum Codeinæ]

	Metric	Alternative
Codeine	2 Gm.	29 gr.
Elixir of Terpin Hydrate, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the codeine in sufficient of the elixir to measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 40 per cent.

Uses—An expectorant, and to allay excessive cough.

Average dose—1 fluidrachm (4 cc.).
One average dose contains about:
0.008 Gm. or ⅛ grain of Codeine.

ELIXIR TERPINI HYDRATIS ET CREOSOTI COMPOSITUM. N.F. Compound Elixir of Terpin Hydrate and Creosote

[Elix. Terpin. Hyd. et Creosot. Co.]

	Metric	Alternative
Terpin Hydrate	4.4 Gm.	64 gr.
Creosote	4.4 cc.	68 min.
Calcium Glycerophoshate	8.75 Gm.	129 gr.
Sodium Glycerophosphate	8.75 Gm.	129 gr.
Chloroform	2.2 cc.	34 min.
Lactic Acid	6.0 cc.	92 min.
Glycerin	320.0 cc.	10 fl. oz. 115 min.
Alcohol	200.0 cc.	6 fl. oz. 192 min.
Gluside	0.2 Gm.	3 gr.
Acetic Ether	2.0 cc.	31 min.
Compound Spirit of Orange	10.0 cc.	154 min.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the terpin hydrate, creosote, gluside, chloroform, acetic ether and compound spirit of orange in the alcohol, add the glycerin and mix well. Dissolve the calcium and sodium glycerophosphates and lactic acid in 100 cc. [3 fl. oz. 96 min.] of distilled water, and add 300 cc. [9 fl. oz. 288 min.] of distilled water to this solution. Gradually add the aqueous solution to the first solution, with constant stirring, then add sufficient distilled water to make the product measure 1000 cc. [2 pints]. Filter if necessary.

Approximate alcohol content, by volume, 18 per cent.

Uses—In chronic bronchitis.

Average dose—1 fluidrachm (4 cc.).

ELIXIR TONGÆ ET SALICYLATUM. N.F. Elixir of Tonga and Salicylates

[Elix. Tong. et Salicyl.]

	Metric	Alternative
Tonga, in moderately coarse powder	140.00 Gm.	4 oz. av. 295 gr.
Cimicifuga, in moderately coarse powder	35.00 Gm.	1 oz. av. 74 gr.
Sodium Salicylate	70.00 Gm.	2 oz. av. 147 gr.
Pilocarpine Nitrate	0.175 Gm.	2½ gr.
Colchicine	0.035 Gm.	½ gr.
Compound Spirit of Orange	12.00 cc.	184 min.
Sucrose	325.00 Gm.	10 oz. av. 371 gr.
Glycerin	60.00 cc.	1 fl. oz. 442 min.
Alcohol,		
Distilled Water, each, a sufficient quantity,		
To make	1000 cc.	2 pints.

Mix the powdered drugs with the compound spirit of orange; moisten the mixture with a menstruum composed of two volumes of alcohol and five volumes of water, pack it in a percolator, saturate it with the above menstruum, and macerate twenty-four hours. Then percolate slowly until 700 cc. [22 fl. oz. 192 min.] of percolate are obtained. In this dissolve the sodium salicylate, pilocarpine nitrate, colchicine and sucrose, and add the glycerin. Finally add enough menstruum to make the product measure 1000 cc. [2 pints], and mix well.

Approximate alcohol content, by volume, 16 per cent.

Uses—In neuralgia and as an antirheumatic.

Average dose—1 fluidrachm (4 cc.).

ELIXIR VANILLINI COMPOSITUM. N.F. Compound Elixir of Vanillin

[Elix. Vanillin. Co.]

	Metric	Alternative
Compound Spirit of Vanillin	20 cc.	307 min.
Alcohol	80 cc.	2 fl. oz. 269 min.
Glycerin	25 cc.	384 min.
Syrup	300 cc.	9 fl. oz. 288 min.
Caramel	2 cc.	31 min.
Distilled Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the compound spirit of vanillin with the alcohol, add the glycerin, the syrup and 570 cc. [18 fl. oz. 115 min.] of distilled water, in several portions, shaking the mixture thoroughly after each addition. Then add the caramel and sufficient distilled water to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 8 per cent.

Uses—A pleasantly flavored vehicle of low alcoholic content.

ELIXIR VIBURNI OPULI COMPOSITUM. N. F. Compound Elixir of Viburnum Opulus

[Elix. Viburn. Opul. Co.]

	Metric	Alternative
Fluidextract of Viburnum Opulus	**75 cc.**	2 fl. oz. 192 min.
Fluidextract of Trillium	**150 cc.**	4 fl. oz. 384 min.
Fluidextract of Aletris	**75 cc.**	2 fl. oz. 192 min.
Compound Elixir of Taraxacum, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the fluidextracts with the elixir and filter.

Approximate alcohol content, by volume, 33 per cent.

Uses—Employed in dysmenorrhea, but of doubtful value.

Average dose—1 fluidrachm (4 cc.).

ELIXIR VIBURNI PRUNIFOLII. N. F. Elixir of Viburnum Prunifolium

[Elix. Viburn. Prun.—ELIXIR OF BLACK HAW]

	Metric	Alternative
Fluidextract of Viburnum Prunifolium	**125 cc.**	4 fl. oz.
Compound Tincture of Cardamom	**75 cc.**	2 fl. oz. 192 min.
Aromatic Elixir, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix them.

Approximate alcohol content, by volume, 27 per cent.

Uses—Employed in dysmenorrhea, but of doubtful value.

Average dose—1 fluidrachm (4 cc.).

Table of Some Unofficial Elixirs

Title	*Directions*
Elixir Calcii Bromidi (N. F. IV)	Dissolve 8.5 Gm. of calcium bromide in 46 cc. of distilled water to which has been added 0.4 cc. of diluted hydrobromic acid. Add 20 cc. of syrup and enough aromatic elixir to make 100 cc. Filter Dose: one fluidrachm (4 cc.)
Calcii Hypophosphitis (N. F. IV)	Dissolve 3.5 Gm. of calcium hypophosphite in 75 cc. of aromatic elixir, to which has been added 0.4 cc. of hypophosphorous acid, and add enough aromatic elixir to make 100 cc. Dose: two fluidrachms (8 cc.)
Cinchonæ Alkaloidorum et Hypophosphitum (N. F. IV)	Dissolve 1.75 Gm. of calcium hypophosphite, 1.75 Gm. of sodium hypophosphite in 12.5 cc. of distilled water and 0.8 cc. of hypophosphorous acid and add enough elixir of cinchona alkaloids to make 100 cc. Filter Dose: two fluidrachms (8 cc.)
Cinchonæ Alkaloidorum Ferri et Calcii Lactophosphatis (N. F. IV)	Dissolve 3 Gm. of potassium citrate in 45 cc. of elixir of cinchona alkaloids and iron, add 50 cc. of syrup of calcium lactophosphate and enough elixir of cinchona alkaloids and iron to make 100 cc. Dose: two fluidrachms (8 cc.)
Cinchonæ Alkaloidorum Ferri et Pepsini (N. F. IV)	Mix 20 cc. of glycerite of pepsin with enough elixir of cinchona alkaloids and iron to make 100 cc. Filter Dose: two fluidrachms (8 cc.)
Ferri Hypophosphitis (N. F. IV)	Dissolve 1.65 Gm. of ferric hypophosphite and 2.15 Gm. of potassium citrate in 3.5 cc. of distilled water, with the aid of heat, and then add enough aromatic elixir to make 100 cc. Filter Dose: one fluidrachm (4 cc.)
Ferri Lactatis (N. F. IV)	Dissolve 1.75 Gm. of ferrous lactate and 5.25 Gm. of potassium citrate in 12 cc. of distilled water, with the aid of heat, and then add enough aromatic elixir to make 100 cc. Filter Dose: one fluidrachm (4 cc.)
Ferri Phosphatis (N. F. IV)	Dissolve 3.5 Gm. of ferric phosphate in 6 cc. of distilled water, with the aid of heat, and then add enough aromatic elixir to make 100 cc. Filter Dose: one fluidrachm (4 cc.)

Table of Some Unofficial Elixirs—*Continued*

Title	*Directions*
Elixir Ferri Pyrophosphatis (N. F. IV)	Dissolve 3.5 Gm. of ferric pyrophosphate in 6 cc. of distilled water with the aid of heat and add enough aromatic elixir to make 100 cc. Filter Dose: one fluidrachm (4 cc.)
Ferri, Quininæ et Strychninæ Phosphatum (U. S. P. VIII)	Dissolve 0.875 Gm. of quinine and 0.027 Gm. of strychnine in 6 cc. of alcohol, add 0.2 cc. of phosphoric acid and 35 cc. of aromatic elixir. Dissolve 0.9 Gm. of ammonium carbonate in 2.865 Gm. of acetic acid, neutralize with ammonia water, and add enough water to make 5 cc. Mix the two solutions just prepared and add enough aromatic elixir to make 85 cc. Dissolve 1.75 Gm. of soluble ferric phosphate in 3 cc. of water with a gentle heat, neutralize to litmus with ammonia water and add enough aromatic elixir to make 15 cc. Finally mix the two solutions and filter Dose: one fluidrachm (4 cc.)
Formatum (N. F. IV)	Dissolve 4.1 Gm. of potassium carbonate and 3.6 Gm. of monohydrated sodium carbonate in 22.5 cc. of formic acid and add enough aromatic elixir to make 100 cc. Dose: two fluidrachms (8 cc.)
Formatum Compositum (N. F. IV)	Dissolve 2.3 Gm. of monohydrated sodium carbonate, 2.0 Gm. of magnesium carbonate, 2.5 Gm. of strontium carbonate, 0.8 Gm. of lithium carbonate and then 0.77 Gm. of quinine in 20 cc. of formic acid mixed with 30 cc. of distilled water. Add a mixture of 30 cc. of glycerin, 10 cc. of alcohol, 0.5 cc. of compound spirit of cardamom, and 0.2 cc. of acetic ether. Mix thoroughly, add enough water to make 100 cc. Incorporate 4 Gm. of purified talc and filter Dose: two fluidrachms (8 cc.)
Glycyrrhizæ Aromaticum (N. F. IV)	Triturate 0.075 cc. of oil of clove, 0.075 cc. of oil of cinnamon and 0.05 cc. of oil of myristica with 4 Gm. of purified talc, gradually add 12.5 cc. of fluidextract of glycyrrhiza and enough distilled water to make 100 cc. Filter after standing twelve hours Dose: two fluidrachms (8 cc.)
Humuli (N. F. IV)	Incorporate 12.5 cc. of fluidextract of hops with 4 Gm. of purified talc, then gradually add 12.5 cc. of compound elixir or taraxacum, 3 cc. of tincture of vanilla and enough aromatic elixir to make 100 cc. Filter after standing twelve hours Dose: two fluidrachms (8 cc.)
Hypophosphitum (N. F. IV)	Dissolve 5.25 Gm. of calcium hypophosphite and 1.75 Gm. of sodium hypophosphite and 1.75 Gm. of potassium hypophosphite in a mixture of 0.4 cc. of hypophosphorous acid and 42 cc. of distilled water, then add 3 cc. of glycerin, 0.06 cc. of compound spirit of cardamom and enough aromatic elixir to make 100 cc. Dose: two fluidrachms (8 cc.)
Hypophosphitum et Ferri (N. F. IV)	Dissolve 0.875 Gm. of ferric hypophosphite and 1.1 Gm. of potassium citrate in 5 cc. of warm distilled water and add 25 cc. of syrup. Dissolve 1.75 Gm. of calcium hypophosphite, 1.75 Gm. of sodium hypophosphite and 0.875 Gm. of potassium hypophosphite in 20 cc. of distilled water and mix the two solutions. Finally add 0.4 cc. of hypophosphorous acid and enough aromatic elixir to make 100 cc. and filter Dose: two fluidrachms (8 cc.)
Lithii Bromidi (N. F. IV)	Dissolve 8.5 Gm. of lithium bromide in 46 cc. of distilled water, add 20 cc. of syrup and enough aromatic elixir to make 100 cc., and filter Dose: two fluidrachms (8 cc.)
Lithii Citratis (N. F. IV)	Dissolve 8.5 Gm. of lithium citrate in enough aromatic elixir to make 100 cc., and filter Dose: two fluidrachms (8 cc.)
Lithii Salicylatis (N. F. IV)	Dissolve 8.5 Gm. of lithium salicylate in enough aromatic elixir to make 100 cc., and filter Dose: two fluidrachms (8 cc.)
Pepsini et Ferri (N. F. IV)	Mix 7.5 cc. of tincture of ferric citrochloride with enough elixir of pepsin to make 100 cc., and filter Dose: two fluidrachms (8 cc.)
Potassii Acetatis (N. F. IV)	Dissolve 8.5 Gm. of potassium acetate in enough aromatic elixir to make 100 cc., and filter Dose: four fluidrachms (15 cc.)
Potassii Acetatis et Juniperi (N. F. IV)	Mix 12.5 cc. of fluidextract of juniper with 75 cc. of aromatic elixir in which 8.5 Gm. of potassium acetate has been dissolved and then add enough aromatic elixir to make 100 cc. Incorporate 4 Gm. of purified talc and filter after standing twelve hours Dose: four fluidrachms (15 cc.)
Quininæ Valeratis et Strychninæ (N. F. IV)	Dissolve 0.0175 Gm. of strychnine sulphate in 0.5 cc. of distilled water; add to 80 cc. of aromatic elixir and dissolve 1.75 Gm. of quinine valerate in the liquid. Then add 1.5 cc. of compound tincture of cudbear and enough aromatic elixir to make 100 cc., and filter Dose: one fluidrachm (4 cc.)
Rubi Compositum (N. F. IV)	Percolate 16 Gm. rubus, 16 Gm. nutgall, 16 Gm. saigon cinnamon, 4 Gm. clove, 2 Gm. mace and 2 Gm. of ginger with diluted alcohol, until the percolate measures 250 cc. Add 750 cc. of syrup of blackberry fruit to the percolate and filter after standing several days Dose: four fluidrachms (15 cc.)
Sodii Hypophosphitis (N. F. IV)	Dissolve 3.5 Gm. of sodium hypophosphite in 82 cc. of aromatic elixir, add 0.4 cc. of hypophosphorous acid and enough aromatic elixir to make 100 cc. Filter Dose: one fluidrachm (4 cc.)
Sodii Salicylatis Compositum (N. F. IV)	Dissolve 8 Gm. of sodium salicylate and 1.5 Gm. of potassium iodide in 80 cc. of aromatic elixir, add 3.2 cc. of fluidextract of cimicifuga, 1.6 cc. of fluidextract of gelsemium, and enough aromatic elixir to make 100 cc. Incorporate 4 Gm. of purified talc and filter Dose: one fluidrachm (4 cc.)
Strychninæ Valeratis (N. F. IV)	Dissolve 0.0175 Gm. of strychnine valerate in 0.5 cc. of distilled water, with the aid of heat; add 90 cc. of aromatic elixir, then 1.5 cc. tincture of vanilla, 1.5 cc. of compound tincture of cudbear and enough aromatic elixir to make 100 cc. Filter Dose: one fluidrachm (4 cc.)

Table of Some Unofficial Elixirs—*Continued*

Title	*Directions*
Elixir Terpini Hydratis et Diacetylmorphinæ (N. F. IV)	Dissolve 0.027 Gm. of diacetylmorphine hydrochloride and enough elixir of terpin hydrate to make 100 cc., and filter Dose: one fluidrachm (4 cc.)
Zinci Valeratis (N. F. IV)	Neutralize 5.6 Gm. citric acid with stronger ammonia water and add enough distilled water to make 10 cc. Add 25 cc. of aromatic elixir and 12.5 cc. of alcohol and dissolve 1.75 Gm. of zinc valerate in the mixture. Add 1 cc. of spirit of bitter almond, 15 cc. of compound tincture of cudbear and enough aromatic elixir to make 100 cc. Filter Dose: one fluidrachm (4 cc.)

Cordialia—*Cordials*

Cordials as a class are closely related to the elixirs, being pleasantly flavored preparations intended for internal administration. There is no longer a representative of this class official. The N. F. IV recognized one formula, that for Blackberry Cordial which has been employed for diarrhea, but which may no longer be dispensed, under the Volstead Act, except upon physicians' prescriptions.

Lavationes—*Washes*

A class of preparations under this title were introduced into the N. F. V. As represented officially they include chiefly mouth or nasal washes. The Antiseptic Solution and Alkaline Aromatic Solution of the N. F. have also been included here as they belong to this class.

LAVATIO ORI. N. F. Mouth Wash

[Lavat. Ori]

	Metric	Alternative
Soap, dried and granulated	**60.00 Gm.**	2 oz. av.
Gluside	**2.00 Gm.**	29 gr.
Fuchsin, basic	**0.02 Gm.**	⅓ gr.
Oil of Cinnamon	**5.00 cc.**	77 min.
Oil of Peppermint	**5.00 cc.**	77 min.
Oil of Clove	**10.00 cc.**	154 min.
Alcohol	**750.00 cc.**	24 fl. oz.
Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the soap and fuchsin in the alcohol by aid of a gentle heat, add the gluside and oils, and then sufficient water to make the product measure 1000 cc. [2 pints].

Allow it to stand in a cool place during twenty-four hours, then filter.

Approximate alcohol content, by volume, 69 per cent.

Uses—A few drops to be used on a moistened tooth brush. It corresponds closely to the commercial liquid dentifrices.

LIQUOR ANTISEPTICUS. N. F. Antiseptic Solution

Replacing N. F. IV

[Liq. Antisept.]

	Metric	Alternative
Boric Acid	**25.0 Gm.**	365 gr.
Thymol	**1.0 Gm.**	15 gr.
Eucalyptol	**5.0 cc.**	77 min.
Methyl Salicylate	**1.2 cc.**	18.5 min.
Oil of Thyme	**0.3 cc.**	4.5 min.
Menthol	**1.0 Gm.**	15 gr.
Alcohol	**300.0 cc.**	9 fl. oz. 288 min.
Purified Talc	**20.0 Gm.**	292 gr.
Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the boric acid in 600 cc. [19 fl. oz. 96 min.] of water and the other ingredients in 200 cc. [6 fl. oz. 192 min.] of alcohol. Pour the aqueous solution into the alcoholic solution, add the talc and allow the mixture to stand, with occasional agitation, during forty-eight hours. Then filter, returning the first portions of the filtrate until it passes through clear. Add 100 cc. [3 fl. oz. 96 min.] of alcohol to the filtrate and then sufficient water to make the product measure 1000 cc. [2 pints].

NOTE—The final addition of alcohol is for the purpose of increasing the alcoholic per cent of the finished product. The filtrate, before this addition, is saturated, and if the alcoholic per cent were not increased, the solution, if cooled below the temperature at which it was filtered, would precipitate or become cloudy, chiefly due to the separation of thymol.

Description and Physical Properties—Antiseptic solution is a clear, colorless liquid, having a characteristic taste and an aromatic odor. It is acid to litmus.

Specific gravity: about 0.976 at 25° C.

Tests for Identity and Purity—Evaporate 10 cc. of the solution at a temperature not exceeding 100° C.: it leaves not more than 0.184 Gm. of a white crystalline residue.

Incinerate the residue from 10 cc. of the solution; it leaves not more than 0.42 Gm. of ash.

Ten cc. of alcohol added to the residue and ignited, exhibits a flame enveloped with a green mantle.

Approximate alcohol content, by volume, 28 per cent.

Uses—This is used chiefly as a mouth wash and for halitosis.

Average dose—1 fluidrachm (4 cc.).

LIQUOR AROMATICUS ALKALINUS. N. F. Alkaline Aromatic Solution

[**Liq. Aromat. Alk.**—LIQUOR ANTISEPTICUS ALKALINUS N. F. IV, ALKALINE ANTISEPTIC SOLUTION]

	Metric	Alternative
Potassium Bicarbonate	**20.0 Gm.**	292 gr.
Sodium Borate	**20.0 Gm.**	292 gr.
Thymol	**0.5 Gm.**	7 gr.
Eucalyptol	**1.0 cc.**	15 min.
Methyl Salicylate	**0.5 cc.**	8 min.
Cudbear	**2.0 Gm.**	29 gr.
Alcohol	**50.0 cc.**	1 fl. oz. 288 min.
Glycerin	**100.0 cc.**	3 fl. oz. 96 min.
Magnesium Carbonate	**10.0 Gm.**	146 gr.
Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the potassium bicarbonate and sodium borate with 100 cc. [3 fl. oz. 96 min.] of water, add the glycerin, and when the effervescence has ceased add the mixture to 500 cc. [1 pint] of water. Dissolve the thymol, eucalyptol, and methyl salicylate in the alcohol, add the solution of the salts, the cudbear, and sufficient water to make the product measure 1000 cc. [2 pints]. Incorporate the magnesium carbonate and allow the mixture to stand with occasional shaking during three days. Then filter the solution, returning the first portions until the filtrate passes through clear.

Description and Physical Properties—Alkaline Aromatic Solution is a clear bright red liquid, with an aromatic odor and taste. It is alkaline to litmus.

Specific gravity: about 1.0519 at 25° C.

Tests for Identity and Purity—Evaporate 10 cc. of the solution at a temperature not exceeding 100° C.; it leaves a viscous residue, not exceeding 1.82 Gm.

Incinerate the residue from 10 cc. of the solution; it leaves not more than 0.179 Gm. of ash.

Barium chloride T.S. produces a white precipitate soluble in acids.

Approximate alcohol content, by volume, 4 per cent.

Uses—The name of this solution has been changed. It was formerly known as Alkaline Antiseptic Solution but this was inappropriate. Its chief value lies in the fact that it is approximately isotonic with the body fluids and is therefore not irritant to mucous membranes. The Alkaline Aromatic Solution is extensively used as a nasal douche and throat gargle.

In addition to the official preparations mentioned above there are a number of unofficial groups, employed in medicine, as special washes. These are briefly listed on the following page:

Title	*Directions*
Balneum Bath	The British Pharmaceutical Codex (B. P. C.) offers suggestions for a number of baths. About 30 gallons of liquid is required. A *cold bath* is to begin at 35° C. and be lowered to 15° C. by the addition of ice; a *tepid bath* is to be from 30° to 35° C.; a *hot bath* from 37° to 43° C.; a *mustard bath* is to contain 12 ozs. of mustard to 30 gallons; a *salt bath* is to contain 12 ozs. of sea salt to 30 gallons; a *sulphur bath* is to be made from 5 ozs. of sodium sulphate and 5 ozs. of sodium thiosulphate in 30 gallons of water. Other formulas are also given
Collunarium A nasal wash	The official alkaline aromatic solution, properly diluted, and Dobell's solution are typical representatives of this class
Collutorium A mouth wash	Antiseptic solution and alkaline aromatic solution, when properly diluted, are typical preparations. *Hydrogen dioxide* and *formaldehyde mouth washes* are English preparations
Collyrium An eye wash	In the B. P. C. are found formulas for a number of eye washes including *boric acid eye wash* (2 per cent); *boric acid* (1 per cent) and *zinc sulphate* (0.1 per cent) *eye wash*; *borax eye wash* (2 per cent); *zinc sulphate eye wash* (0.2 per cent) and many others
Enemata Enema	Rectal injections employed to evacuate the bowel, or to influence the general system by absorption or to effect locally the seat of disease. They are usually given at body temperature in quantities of from 1 to 2 pints injected slowly with a syringe. Enemas to be retained in the intestine should not be used in larger quantities than 5 fl. oz. for an adult. The B. P. C. gives a number of formulas including *magnesium sulphate enema* (½ to 2 ozs. to the pint); *compound peptone enema* (beef peptone and extract of malt, each 12.5 Gm., brandy 25 cc., beef tea to make 100 cc.). Many other formulas are given in the Codex
Guttæ Eye drops	These are made by dissolving the medicament in freshly sterilized and cooled distilled water. In the B. P. C. will be found many formulas including *silver nitrate eye drops* (0.5 per cent); *atropine eye drops* (1 per cent atropine sulphate); *cocaine eye drops* (2 per cent); *copper sulphate eye drops* (0.5 per cent; *homatropine eye drops* (1 per cent homatropine hydrobromide); *physostigmine eye drops* (1 per cent physostigmine sulphate), and others
Irrigatio An irrigation	A preparation to be applied continuously by means of a special device for the purpose as in the treatment of wounds with Dakin's solution

Dentilinimenta—*Dental Liniments*

This is a new class of preparations in the N. F. V. As the ingredients were the same as those already used in well-known liniments, but in a much higher proportion, it was considered necessary to give them a distinctive title, hence "Dentilinimentum". These are very poisonous liniments and should only be used under the direction of a dentist.

DENTILINIMENTUM ACONITI COMPOSITUM. N. F. Compound Dental Liniment of Aconite

[Dentilin. Aconit. Co.]

	Metric	Alternative
Menthol	**36.0 Gm.**	1 oz. av. 219 gr.
Chloroform	**13.5 cc.**	259 min.
Tincture of Aconite, a sufficient quantity, To make	**100 cc.**	4 fl. oz.

Dissolve the menthol in the chloroform and add sufficient tincture of aconite to make the product measure 100 cc. [4 fl. oz.]. Preserve the Liniment in tightly stoppered, amber-colored bottles.

Approximate alcohol content, by volume, 45 per cent.

Uses—For dental treatment.

DENTILINIMENTUM ACONITI ET IODI COMPOSITUM. N. F. Compound Dental Liniment of Aconite and Iodine

[Dentilin. Aconit. et Iod. Co.—Refrigerant Counterirritant]

	Metric	Alternative
Menthol	**2.2 Gm.**	40 gr.
Iodine	**2.2 Gm.**	40 gr.
Chloroform	**16.5 cc.**	317 min.
Tincture of Aconite, a sufficient quantity, To make	**100 cc.**	4 fl. oz.

Dissolve the menthol and iodine in the chloroform, and add sufficient tincture of aconite to make the product measure 100 cc. [4 fl. oz.]. Preserve the Liniment in amber-colored, tightly stoppered bottles.

Approximate alcohol content, by volume, 54 per cent.

Uses—For dental treatment.

CHAPTER XXVIII

CHLOROFORM SOLUTIONS

Solutiones Chloroformicæ—*Chloroformic Solutions*

THIS is a new class of preparations added to the N. F. V. They are varnishes used in dental work to protect a surface from contact with aqueous liquids.

SOLUTIO MASTICHES CHLOROFORMICA COMPOSITA. N. F. Compound Chloroformic Solution of Mastic

[Sol. Mastic. Chlorof. Co.—PULP CAPPING VARNISH]

	Metric	Alternative
Mastic	**30 Gm.**	1 oz. av. 110 gr.
Balsam of Peru	**30 cc.**	1 fl. oz. 96 min.
Chloroform, a sufficient quantity,		
To make	**100 cc.**	4 fl. oz.

Dissolve the mastic and Peru balsam in about 50 cc. [2 fl. oz.] of chloroform, and add sufficient chloroform to make the product measure 100 cc. [4 fl. oz.].

Preserve the Solution in small, well-stoppered bottles.

Uses—A protective coating in dental work.

SOLUTIO RESINÆ CHLOROFORMICA. N. F. Chloroformic Solution of Rosin

[Sol. Resin. Chlorof.]

	Metric	Alternative
Rosin	**20 Gm.**	309 gr.
Chloroform	**100 cc.**	3 fl. oz. 183 min.

Dissolve the rosin in the chloroform, and filter the solution.

Preserve in amber-colored, cork-stoppered bottles.

Uses—A protective coating in dental work.

CHAPTER XXIX

ETHEREAL SOLUTIONS

Collodia—*Collodions*

Collodions are liquid preparations intended for external use, having for their base a solution of pyroxylin, or gun-cotton, in a mixture of ether and alcohol. (For a description of the properties of pyroxylin see Part IV.) Collodions are applied to the skin by means of a soft brush, and when the ether and alcohol evaporate, a film is left on the surface, which either acts simply as a protection or, in some instances, brings a medicating agent into contact with the epidermis.

COLLODIUM. U. S. Collodion

[Collod.]

	Metric	Alternative
Pyroxylin	**40 Gm.**	1 oz. av. 147 gr.
Ether	**750 cc.**	24 fl. oz.
Alcohol	**250 cc.**	8 fl. oz.
To make about	**1000 cc.**	2 pints

Add the alcohol to the pyroxylin, contained in a suitable bottle, shake the mixture thoroughly, add the ether, and again shake the mixture until the pyroxylin is dissolved. Cork the bottle well, and set it aside until the liquid becomes clear. Fina ly decant the clear portion from any sediment which may have deposited, and transfer it to containers which must be well closed.

Description and Physical Properties—A clear, or slightly opalescent, syrupy liquid. It is colorless, or slightly yellowish and has the odor of ether. *It is highly inflammable.*

Tests for Identity and Purity—Specific gravity: 0.765 to 0.775 at 25° C.

When exposed to the air in a thin layer, it leaves a transparent, tenacious film. When mixed with an equal volume of distilled water, a viscid, stringy mass of pyroxylin separates. The aqueous liquid is not acid to litmus paper.

Assay—Pour quickly about 10 cc. of Collodion into a tared flask, stopper, and weigh accurately, then warm it on a water bath, and add 10 cc. of distilled water, drop by drop, with constant stirring. Evaporate the mixture on a water bath, and dry the residue to constant weight at 110° C. The pyroxylin so obtained corresponds to not less than 5.1 per cent of the Collodion taken, corresponding to about 4 Gm. of pyroxylin in 100 cc. of Collodion at 25° C. The pyroxylin obtained burns rapidly, with a yellow flame.

Preserve in well-closed containers, in a cool place, remote from fire.

Alcohol content, by volume, 22 to 24 per cent.

U. S. P. Preparation—Collodium Flexile.

History—In 1847 a German chemist named Schönbein discovered pyroxylin and within a year or two thereafter an American medical student at Boston, Mass., showed how a solution of the substance in ether and alcohol could be utilized in surgery, and the collodions came into use soon thereafter.

Uses—Chiefly employed to seal small wounds or for the preparation of medicated collodions.

COLLODIUM FLEXILE. U. S. Flexible Collodion

[Collod. Flex.]

	Metric	Alternative
Camphor	**20 Gm.**	292 gr.
Castor Oil	**30 Gm.**	1 oz. av.
Collodion, a sufficient quantity,		
To make	**1000 Gm.**	33 oz. av. 167 gr.

Weigh the ingredients, successively, into a dry, tared bottle, stopper, and shake the mixture until the camphor is dissolved. Keep the product in well-closed containers, in a cool place, remote from fire.

Alcohol content, by volume, 21 to 23 per cent.

N. F. Preparations—Collodium Bituminis Sulphonati; Collodium Salicylicum Compositum; Collodium Stypticum.

Uses—Applied externally as a covering to cuts and small burns. Its application is accompanied by considerable pain, but is effective as an antiseptic and for excluding air from open wounds.

COLLODIUM BITUMINIS SULPHONATI. N. F. Collodion of Sulphonated Bitumen

[Collod. Bitum. Sulphon.]

	Metric	Alternative
Sulphonated Bitumen	10 Gm.	183 gr.
Flexible Collodion, a sufficient quantity,		
To make	100 cc.	4 fl. oz.

Dissolve the sulphonated bitumen in the flexible collodion.

Preserve in tightly-closed containers, in a cool place.

Uses—Sulphonated Bitumen is the N. F. title for preparations of the ichthyol type (see page 866).

COLLODIUM SALICYLICUM COMPOSITUM. N. F. Compound Salicylic Collodion

[Collod. Salicyl. Co.]

	Metric	Alternative
Salicylic Acid	10 Gm.	183 gr.
Fluidextract of Cannabis	10 cc.	192 min.
Flexible Collodion, a sufficient quantity,		
To make	100 cc.	4 fl. oz.

Dissolve the salicylic acid in about 75 cc. [3 fl. oz.] of flexible collodion, add the fluidextract of cannabis and sufficient flexible collodion to make the product measure 100 cc. [4 fl. oz.].

Preserve the Collodion in tightly-stoppered bottles, in a cool place.

Uses—For the removal of corns.

COLLODIUM STYPTICUM. N. F. Styptic Collodion

[Collod. Stypt.]

	Metric	Alternative
Tannic Acid	16 Gm.	293 gr.
Flexible Collodion, a sufficient quantity,		
To make	100 cc.	4 fl. oz.

Dissolve the tannic acid in about 80 cc. [3¼ fl. oz.] of flexible collodion and add sufficient flexible collodion to make the product measure 100 cc. [4 fl. oz.].

Preserve the Collodion in tightly-stoppered bottles, in a cool place.

Uses—A styptic for small cuts.

Table of Some Unofficial Collodions

Title	*Directions*
Collodium Cantharidatum (U. S. P. IX)	Macerate 60 Gm. of powdered cantharides with 55 cc. of acetone and 5 cc. of glacial acetic acid during twenty-four hours, in a closely covered container. Then percolate with acetone to exhaustion, evaporate the percolate on a water bath to 15 Gm. and mix with 85 Gm. of flexible collodion. Decant the clear liquid after the sediment has deposited
Iodi (N. F. IV)	Dissolve 5 Gm. of iodine in 95 Gm. of flexible collodion, in a bottle, by agitation
Iodoformi (N. F. IV)	Dissolve 5 Gm. of iodoform in 95 Gm. of flexible collodion, in a bottle, by agitation
Tiglii (N. F. IV)	Mix 10 Gm. of croton oil with 90 Gm. of flexible collodion

CHAPTER XXX

OLEAGINOUS SOLUTIONS OR EXTERNAL APPLICATIONS

Linimenta—*Liniments*

THESE are solutions or mixtures of various substances in oily or alcoholic liquids, intended for external application, and usually applied with friction and rubbing of the skin. They are sometimes spoken of as *embrocations*. The official liniments are as follows:

LINIMENTUM CALCIS. U.S. Lime Liniment

[Lin. Calc.—CARRON OIL]

	Metric	Alternative
Solution of Calcium Hydroxide	500 cc.	1 pint
Linseed Oil	500 cc.	1 pint
To make	1000 cc.	2 pints

Mix them by agitation.

Uses—A useful application to fresh burns and scalds. It restores the alkalinity to the burned area and excludes air, thus relieving the pain.

LINIMENTUM CAMPHORÆ. U.S. Camphor Liniment

[Lin. Camph.—CAMPHORATED OIL]

Camphor Liniment yields not less than 19 per cent and not more than 21 per cent of camphor.

Caution—This preparation is not intended for hypodermic use.

	Metric	Alternative
Camphor, in coarse powder	200 Gm.	2 oz. av.
Cottonseed Oil	800 Gm.	8 oz. av.
To make	1000 Gm.	10 oz. av.

Pour the cottonseed oil into a suitable dry flask or bottle, heat it on a water bath, introduce the camphor, and stopper the container securely. Dissolve the camphor by agitation without the further application of heat.

This liniment should never be made in an open dish, as much of the camphor will be volatilized. The assay is based upon this principle.

Assay—Place 5 cc. of Camphor Liniment in a tared porcelain dish, having a diameter of about 75 mm., weigh accurately, heat at about 110° C. for ninety minutes, or until the odor of camphor is no longer discernible, cool, and weigh: the loss in weight is not less than 19 per cent and not more than 21 per cent.

N. F. Preparation—Ceratum Camphoræ.

Uses—A mild counterirritant for inflamed joints, sprains, rheumatism and in other inflamed conditions, such as colds in throat and chest, in infants and children.

Although the synonym "camphorated oil" is often applied to this liniment, the term is also frequently used by physicians to indicate a sterile, ten per cent solution of camphor in olive or other fixed oil. (See Ampullæ Camphoræ, Part XI.) This is used hypodermatically as a stimulant. The two products must not be confused.

LINIMENTUM CHLOROFORMI. U.S. Chloroform Liniment
[Lin. Chlorof.]

	Metric	Alternative
Chloroform	300 cc.	9½ fl. oz.
Soap Liniment	700 cc.	22½ fl. oz.
To make	1000 cc.	2 pints

Mix them by agitation.

Alcohol content, by volume, 43 to 47 per cent.

Uses—A stimulating liniment for sore and stiff muscles, and a local anesthetic in neuralgia.

LINIMENTUM SAPONIS. U.S. Soap Liniment
[Lin. Sapon.—Liquid Opodeldoc]

	Metric	Alternative
Soap, dried and granulated, or powdered	60 Gm.	2 oz. av.
Camphor, in small pieces	45 Gm.	1 oz. av. 220 gr.
Oil of Rosemary	10 cc.	154 min.
Alcohol	700 cc.	22½ fl. oz.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the camphor and the oil of rosemary in the alcohol, add the soap, and then sufficient water to make the product measure 1000 cc. [2 pints]. Agitate the mixture until the soap is dissolved, set it aside in a cool place for twenty-four hours, and filter.

Only the official Castile soap should be used; soaps made from animal oils will cause gelatinization. If soap shavings from bar soap are used, dry thoroughly and then run through a mill or grater, if the U. S. P. process is to be followed.

Alcohol content, by volume, 62 to 66 per cent.

U. S. P. Preparation—Linimentum Chloroformi.
N. F. Preparation—Linimentum Aconiti et Chloroformi.

History—The term *opodeldoc* sometimes applied to this preparation was first used by Paracelsus in connection with a plaster which had no connection with soap whatever. In the Edinburgh Pharmacopœia of 1722 was a formula for an *Unguentum Opodeldoch* which contained soap in addition to a large number of other ingredients. This was undoubtedly the basis for Steer's Opodeldoc which was a solid preparation of soap, the *Linimentum Saponato-camphoratum* of the N. F.

Uses—An anodyne and mild rubefacient, for sprains, bruises, and rheumatism. It also forms the basis for other liniments.

LINIMENTUM SAPONIS MOLLIS. U.S. Liniment of Soft Soap
[Lin. Sapon. Moll.—Tincture of Green Soap]

	Metric	Alternative
Soft Soap	650 Gm.	21½ oz. av.
Oil of Lavender	20 cc.	5 fl. dr.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the oil of lavender with 300 cc. [9½ fl. oz.] of alcohol, dissolve in this the soft soap by stirring or by agitation, and set the solution aside for twenty-four hours. Then filter it through paper, adding sufficient alcohol to make the product measure 1000 cc. [2 pints].

Alcohol content, by volume, 28 to 32 per cent.

Uses—Used largely as a soap for cleansing the area for an operation, also for washing the surgeon's hands, for washing the scalp, and for other detergent purposes.

The limit of free alkali should be carefully maintained, a small amount being helpful for antiseptic and cleansing purposes, but an excess rendering the soap caustic.

LINIMENTUM ACONITI ET CHLOROFORMI. N. F. Liniment of Aconite and Chloroform

[Lin. Aconit. et Chlorof.]

	Metric	Alternative
Fluidextract of Aconite	45 cc.	1 fl. oz. 211 min.
Alcohol	80 cc.	2 fl. oz. 269 min.
Chloroform	125 cc.	4 fl. oz.
Soap Liniment	750 cc.	24 fl. oz.
To make	1000 cc.	2 pints

Mix them.

Approximate alcohol content, by volume, 59 per cent.

Uses—Externally to relieve pain.

LINIMENTUM AMMONIÆ. N. F. Ammonia Liniment

(U. S. P. IX)

[Lin. Ammon.—Volatile Liniment, Hartshorn Liniment]

	Metric	Alternative
Ammonia Water	250 cc.	8 fl. oz.
Sesame Oil	750 cc.	24 fl. oz.
To make about	1000 cc.	2 pints

Agitate the ammonia water with the sesame oil until a uniform mixture is obtained.

LINIMENTUM BELLADONNÆ. N. F. Belladonna Liniment

(U. S. P. IX)

[Lin. Bellad.]

	Metric	Alternative
Camphor	50 Gm.	1 oz. av. 293 gr.
Fluidextract of Belladona Root, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the camphor in about 800 cc. [25½ fl. oz.] of the fluidextract, and then add enough of the latter to make the product measure 1000 cc. [2 pints]. Mix thoroughly.

Approximate alcohol content, by volume, 68 per cent.

Uses—An external counterirritant.

LINIMENTUM CALAMINÆ. N. F. Calamine Liniment

[Lin. Calam.]

	Metric	Alternative
Prepared Calamine, in very fine powder	80 Gm.	2 oz. av. 293 gr.
Zinc Oxide, in very fine powder	80 Gm.	2 oz. av. 293 gr.
Olive Oil	500 cc.	1 pint
Solution of Calcium Hydroxide, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the prepared calamine and zinc oxide with the olive oil and gradually add the solution of calcium hydroxide, with constant agitation.

Shake the Liniment thoroughly before dispensing.

Uses—In skin diseases.

LINIMENTUM OPII COMPOSITUM. N. F. Compound Liniment of Opium

[Lin. Opii. Co.—Canada Liniment]

	Metric	Alternative
Tincture of Opium	100.0 cc.	3 fl. oz. 96 min.
Camphor	17.5 Gm.	256 gr.
Oil of Peppermint	25.0 cc.	384 min.
Alcohol	250.0 cc.	8 fl. oz.
Fresh Egg Albumen	50.0 cc.	1 fl. oz. 288 min.
Ammonia Water	350.0 cc.	11 fl. oz. 96 min.
Oil of Turpentine	220.0 cc.	7 fl. oz. 19 min.
To make about	1000 cc.	2 pints

Mix the albumen with the ammonia water and gradually add the oil of turpentine. Shake it thoroughly and add the camphor and oil of peppermint previously dissolved in the alcohol, then the tincture of opium.

Shake the Liniment well before dispensing.

Approximate alcohol content, by volume, 25 per cent.

Uses—A stimulating anodyne.

LINIMENTUM SAPONATO-CAMPHORATUM. N. F. Camphorated Soap Liniment

[Lin. Sapon. Camph.—Solid Opodeldoc, Steer's Opodeldoc]

	Metric	Alternative
Monohydrated Sodium Carbonate	10 Gm.	146 gr.
Stearic Acid	50 Gm.	1 oz. av. 293 gr.
Water	100 cc.	3 fl. oz. 96 min.
Camphor, in coarse powder,	25 Gm.	365 gr.
Oil of Thyme	3 cc.	46 min.
Oil of Rosemary	6 cc.	92 min.
Ammonia Water	50 cc.	1 fl. oz. 288 min.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the monohydrated sodium carbonate in the water with the aid of heat, add 200 cc. [6 fl. oz. 192 min.] of alcohol and the stearic acid and warm the mixture until effervescence has ceased and solution results. Add the oils and camphor, dissolved in 500 cc. [1 pint] of alcohol, then the ammonia water and sufficient alcohol to make the product measure 1000 cc. [2 pints]. Filter the liniment while hot.

Pour the filtered liquid into dry, wide-mouthed bottles, stopper these and set them aside to cool.

Approximate alcohol content, by volume, 73 per cent.

Uses—A mild stimulating liniment.

LINIMENTUM SAPONIS MOLLIS COMPOSITUM. N. F. Compound Liniment of Soft Soap

[Lin. Sapon. Mol. Co.—Tinctura Saponis Viridis Composita]

	Metric	Alternative
Soft Soap	150 Gm.	5 oz. av. 3 gr.
Oil of Cade	20 cc.	307 min.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Soften the soap by warming it in a dish on a water bath; remove it from the heat, mix it with 750 cc. [24 fl. oz.] of alcohol, and, when it has dissolved, add the oil of cade. Then filter the liquid, and wash the filter with sufficient alcohol to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 78 per cent.

Uses—Employed in treating skin and scalp diseases.

LINIMENTUM SINAPIS COMPOSITUM. N. F. Compound Liniment of Mustard

[Lin. Sinap. Co.]

	Metric	Alternative
Volatile Oil of Mustard	**30 cc.**	461 min.
Fluidextract of Mezereum	**200 cc.**	6 fl. oz. 192 min.
Camphor	**60 Gm.**	2 oz. av.
Menthol	**20 Gm.**	292 gr.
Castor Oil	**150 cc.**	4 fl. oz. 384 min.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the camphor and menthol in 500 cc. [1 pint] of alcohol, add the fluidextract of mezereum, then the oil of mustard and castor oil, and sufficient alcohol to make the product measure 1000 cc. [2 pints]. Mix thoroughly.

Approximate alcohol content, by volume, 65 per cent.

Uses—An active rubefacient.

LINIMENTUM TEREBINTHINÆ. N. F. Turpentine Liniment

(U. S. P. IX)

[Lin. Terebinth.—Kentish Ointment]

	Metric	Alternative
Rosin Cerate	**650 Gm.**	13 oz. av.
Oil of Turpentine	**350 Gm.**	7 oz. av.
To make	**1000 Gm.**	20 oz. av.

Dissolve the rosin cerate, previously melted in a dish on a water bath, in the oil of turpentine, and mix them thoroughly.

Uses—An application for burns. It should be applied as soon after the accident as possible, but discontinued when the pain has been relieved. Sometimes used as a stimulant application in erysipelas.

LINIMENTUM TEREBINTHINÆ ACETICUM. N. F. Acetic Turpentine Liniment

[Lin. Terebinth. Acet.—Linimentum Album, Stokes' Liniment, St. John Long's Liniment]

	Metric	Alternative
Oil of Turpentine	**400 cc.**	12 fl. oz. 384 min.
Oil of Lemon	**16 cc.**	246 min.
Acetic Acid	**80 cc.**	2 fl. oz. 269 min.
Fresh Eggs,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Triturate the contents of two fresh eggs and the yolks of two others with the oil of turpentine and the oil of lemon in a mortar until they are thoroughly mixed. Then incorporate the acetic acid and sufficient water to make the product measure 1000 cc. [2 pints].

Shake the Liniment before dispensing.

History—John St. John Long, an Irish physician of prominence in London about a century ago used this preparation as a secret remedy in his very extensive practice and at his death the rights to its manufacture were sold for $50,000 and the preparation was continued as a proprietary remedy. The formula now in use is based upon one devised by Doctor Fownes, the famous English chemist.

Uses—A strong counterirritant.

Table of Some Unofficial Liniments

Title	*Directions*
Linimentum Aconiti (Br. 1914)	100 cc. contains 0.2 Gm. of ether-soluble alkaloids of aconite root and 3 Gm. of camphor. Percolate 50 Gm. of aconite root with 90 per cent alcohol until exhausted. Reserve the first 75 cc. of percolate, evaporate the remainder, dissolve the evaporated portion in the reserve and assay. Then add sufficient camphor and alcohol to produce a liniment of the required standard
Ammonii Iodidi (N. F. IV)	Dissolve 0.4 Gm. of iodine, 1.5 cc. of oil of rosemary, 1.5 cc. of oil of lavender and 3.2 Gm. of camphor in 75 cc. of alcohol. Add 11 cc. of ammonia water and enough alcohol to make 100 cc. Filter

Table of Some Unofficial Liniments—*Continued*

Title	*Directions*
Linimentum Camphoræ Ammoniatum (Br. 1914)	Dissolve 12.5 Gm. of camphor and 0.5 cc. of oil of lavender in 60 cc. of alcohol; gradually add 25 cc. of strong solution of ammonia (32.5 per cent) and enough alcohol to make 100 cc. Shake until a clear solution is formed
Hydrargyri (Br. 1914)	Add 40 cc. of solution of ammonia to 80 cc. of liniment of camphor and then triturate 50 Gm. of ointment of mercury with the mixture
Opii (Br. 1914)	Mix 50 cc. of tincture of opium with 50 cc. of soap liniment. Set aside for a few days and filter
Potassii Iodidi cum Saponis (Br. 1914)	Dissolve 20 Gm. of curd soap with the aid of a gentle heat in 10 cc. of glycerin and 100 cc. of distilled water, restoring any water lost through evaporation; add the solution to 15 Gm. of powdered potassium iodide in a mortar and triturate until cold. Set aside for an hour and then incorporate 1 cc. of oil of lemon
Tiglii (N. F. IV)	Mix 13 cc. of croton oil and 43 cc. of oil of cajuput with 44 cc. of alcohol
Tiglii Compositum (N. F. IV)	Mix together 20 cc. of croton oil, 20 cc. of oil of sassafras, 20 cc. of oil of turpentine and 40 cc. of olive oil

Linimentum Exsiccans—*Drying Liniment*

This is a class of preparations which, when smeared on the skin, will dry, forming a medicated film removable by washing with water. A typical formula is as follows:

Tragacanth, 5 parts, glycerin, 2 parts, distilled water, 93 parts. To this base may be added such substances as the following: ichthyol, 30 per cent; boric acid, 10 per cent; chrysarobin, 5 per cent; betanaphthol, 5 per cent; resorcinol, 30 per cent; salicylic acid, 5 per cent.

Oleata—*Oleates*

The official oleates are mainly liquid preparations made by dissolving alkaloids in oleic acid; however, oleate of mercury, the only oleate retained in the U. S. P., is prepared by dissolving mercuric oxide in oleic acid to form a product of ointment-like consistence.

The N. F. oleates are solutions of alkaloids, which are not intended to be definite chemical compounds; the oleic acid is present in large excess and they must be regarded as solutions of the medicating agent in oleic acid, the latter having special advantages as a basis for administering external remedies, being more readily absorbed than most of the fatty substances used in making ointments.

OLEATUM HYDRARGYRI. U. S. Oleate of Mercury

[Oleat. Hydrarg.]

	Metric	Alternative
Yellow Mercuric Oxide, in very fine powder	**25 Gm.**	1 oz. av.
Oleic Acid, a sufficient quantity,		
To make	**100 Gm.**	4 oz. av.

Mix the yellow mercuric oxide with 75 Gm. [3 oz. av.] of oleic acid, warm the mixture to a temperature not exceeding 50° C., stir constantly for five minutes, and then continue the heat, stirring frequently, until the mercuric oxide is dissolved. Add sufficient oleic acid to make the product weigh 100 Gm. [4 oz. av.] and mix thoroughly. In the preparation of this Oleate avoid all contact with metallic utensils.

Preserve Oleate of Mercury in tightly-closed containers, protected from strong light, and do not dispense it if globules of mercury are visible at the bottom of the container.

U. S. P. Preparation—Massa Hydrargyri, Unguentum Hydrargyri Fortius.

Uses—Chiefly for preparation of mass and ointment of mercury. Occasionally as a parasiticide application to the skin.

OLEATUM QUININÆ. N. F. Oleate of Quinine

[Oleat. Quin.]

	Metric	Alternative
Quinine	**25 Gm.**	1 oz. av.
Oleic Acid	**75 Gm.**	3 oz. av.
To make	**100 Gm.**	4 oz. av.

Triturate the quinine in a warm mortar with a small quantity of the oleic acid to a smooth paste. Add the remainder of the oleic acid, previously warmed, and stir frequently until the quinine is dissolved.

Uses—A local anesthetic.

OLEATUM VERATRINÆ. N. F. Oleate of Veratrine

[Oleat. Veratrin.]

	Metric	Alternative
Veratrine	**2 Gm.**	35 gr.
Oleic Acid	**50 Gm.**	2 oz. av.
Olive Oil, a sufficient quantity,		
To make	**100 Gm.**	4 oz. av.

Triturate the veratrine in a tared mortar with about 5 Gm. [87 gr.] of olive oil, and, after warming the mortar, add the oleic acid, and continue stirring until the veratrine is dissolved; then add sufficient olive oil to make the product weigh 100 Gm. [4 oz. av.].

Uses—An anodyne over neuralgic nerves and a rubefacient in rheumatic conditions in joints and muscles. Must be used with great caution as it is highly poisonous.

Table of Some Unofficial Oleates

Title	*Directions*
Oleatum Aconitinæ (N. F. IV)	Triturate 2 Gm. of aconitine in a mortar with 50 Gm. of oleic acid, added slowly until dissolved, and add enough olive oil to make 100 Gm.
Atropinæ (N. F. IV)	Triturate 2 Gm. of atropine in a tared mortar with 2 cc. of alcohol, add an equal volume of oleic acid, warm the mortar and stir until the alcohol evaporates. Then add 48 Gm. of oleic acid, stir until the alcohol dissolves and add enough olive oil to make 100 Gm.
Cocainæ (N. F. IV)	Prepare as directed for oleatum atropinæ, using 5 Gm. of cocaine, 5 cc. of alcohol, 50 Gm. of oleic acid and olive oil to make 100 Gm.
Zinci (U. S. P. 1890)	Mix 50 Gm. of zinc oxide with 950 Gm. of oleic acid in a porcelain dish, set aside for three hours, then heat on a water bath, frequently stirring, until dissolved

Petroxolina—*Petroxolins*

These preparations are intended for external application, and the value of liquid petroxolin depends upon its being an excellent solvent for many substances used externally, combined with its ready absorption through the skin. The British Pharmaceutical Codex title for this class of preparations is *Parogenum* (*Parogen*).

PETROXOLINUM HYDRARGYRI. N. F. Mercury Petroxolin

[Petrox. Hydrarg.—Mercury Petrox]

	Metric	Alternative
Mercury	**30 Gm.**	1 oz. av. 87½ gr.
Hydrous Wool Fat	**13 Gm.**	227½ gr.
Oleic Acid	**2 Gm.**	35 gr.
Solid Petroxolin	**55 Gm.**	2 oz. av. 87½ gr.
To make	**100 Gm.**	4 oz. av.

Triturate the mercury with the mixture of hydrous wool fat and oleic acid until globules of mercury are no longer visible when examined with a lens magnifying ten diameters; then add the solid petroxolin and mix thoroughly.

Uses—An antiparasitic and antisyphilitic.

PETROXOLINUM LIQUIDUM. N. F. Liquid Petroxolin

[Petrox. Liq.—Petrolatum Saponatum Liquidum, Liquid Petrox]

	Metric	Alternative
Light Liquid Petrolatum	580 cc.	18 fl. oz. 269 min.
Oleic Acid	300 cc.	9 fl. oz. 288 min.
Stronger Ammonia Water	50 cc.	1 fl. oz. 288 min.
Oil of Lavender	5 cc.	77 min.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the light liquid petrolatum and oleic acid, add the stronger ammonia water and 60 cc. [1 fl. oz. 442 min.] of alcohol, previously mixed, and agitate the mixture frequently until a clear liquid results. Then add the oil of lavender and sufficient alcohol to make the product measure 1000 cc. [2 pints].

Note—Difficulty is sometimes experienced in obtaining a clear solution and this is usually remedied by the further addition of a few drops of oleic acid.

A clear, dark amber-colored liquid, having a specific gravity of about 0.870 at 25° C.

It is miscible with ether, chloroform, acetone, and petroleum benzin, and forms an emulsion-like mixture when added to twice its volume of water.

Approximate alcohol content, by volume, 5 per cent.

N. F. Preparations—Petroxolina Medicata.

Uses—As a vehicle for the liquid petroxolins.

PETROXOLINA MEDICATA. Medicated Petroxolins

The following Medicated Liquid Petroxolins are prepared by dissolving the active medicinal substance in a sufficient quantity of Liquid Petroxolin to make the product measure 100 cc. [4 fl. oz.]:

PETROXOLINUM BETANAPHTHOLIS. N. F. Betanaphthol Petroxolin

Betanaphthol 10 Gm. [182 gr.] in 100 cc. [4 fl. oz.] of product.

Uses—An antiseptic used in skin diseases.

PETROXOLINUM BITUMENIS SULPHONATI. N. F. Sulphonated Bitumen Petroxolin

Sulphonated Bitumen 10 Gm. [182 gr.] in 100 cc. [4 fl. oz.] of product.

Uses—In skin diseases.

PETROXOLINUM CADINUM. N. F. Cade Petroxolin

Oil of Cade 25 cc. [1 fl. oz.] in 100 cc. [4 fl. oz.] of product.

Uses—Employed in skin diseases as an antiparasitic.

PETROXOLINUM CHLOROFORMI CAMPHORATUM. N. F. Camphorated Chloroform Petroxolin

Chloroform 20 cc. [384 min.] and Camphor 20 Gm. [182 gr.] in 100 cc. [4 fl. oz.] of product.

Uses—An anodyne and rubefacient.

PETROXOLINUM EUCALYPTOLIS. N. F. Eucalyptol Petroxolin

Eucalyptol 20 cc. [384 min.] in 100 cc. [4 fl. oz.] of product.

Uses—An antiseptic and rubefacient.

PETROXOLINUM GUAIACOLIS. N. F. Guaiacol Petroxolin

Guaiacol 20 Gm. [182 gr.] and Oleic Acid 5 cc. [96 min.] in 100 cc. [4 fl. oz.] of product.

Uses—An antipyretic when applied in neuralgia and in sciatica.

PETROXOLINUM IODI. N. F. Iodine Petroxolin

Iodine 10 Gm. [182 gr.] in 100 cc. [4 fl. oz.] of product.

Uses—A counterirritant and discutient. Also used for endermic absorption of iodine.

PETROXOLINUM IODI DILUTUM. N. F. Diluted Iodine Petroxolin

Iodine 5 Gm. [91 gr.] in 100 cc. [4 fl. oz] of product.

Uses—A counterirritant and discutient.

PETROXOLINUM MENTHOLIS. N. F. Menthol Petroxolin

Menthol 10 Gm. [182 gr.] in 100 cc. [4 fl. oz.] of product.

Uses—A local anesthetic.

PETROXOLINUM METHYLIS SALICYLATIS. N. F. Methyl Salicylate Petroxolin

Methyl Salicylate 20 cc. [384 min.] in 100 cc. [4 fl. oz.] of product.

Uses—Applied locally for rheumatism.

PETROXOLINUM PHENOLIS. N. F. Phenol Petroxolin

Phenol 5 Gm. [91 gr.] in 100 cc. [4 fl. oz.] of product.

Uses—An antiseptic and local anesthetic.

PETROXOLINUM PHENOLIS CAMPHORATUM. N. F. Camphorated Phenol Petroxolin

Phenol 12.5 Gm. [228 gr.] and Camphor 37. 5 Gm. [1 oz. av. 246½ gr.] in 100 cc. [4 fl. oz.] of product.

Uses—An analgesic.

PETROXOLINUM SULPHURATUM. N. F. Sulphurated Petroxolin

Sublimed Sulphur 3 Gm. [55 gr.], Linseed Oil 37 cc. [1 fl. oz. 230 min.], and Oleic Acid 30 cc. [1 fl. oz. 96 min.] in 100 cc. [4 fl. oz.] of product. Dissolve the sulphur in the linseed oil and oleic acid by the aid of heat before mixing with the liquid petroxolin.

N. F. Preparation—Petroxolinum Sulphuratum Compositum.

Uses—A parasiticide.

PETROXOLINUM SULPHURATUM COMPOSITUM. N. F. Compound Sulphurated Petroxolin

Sulphurated Petroxolin 10 cc. [192 min.], Oil of Cade 10 cc. [192 min.], Thymol 0.3 Gm. [5½ gr.], Eucalyptol 3 cc. [57 min.], and Oil of Turpentine 30 cc. [1 fl. oz. 96 min.] in 100 cc. [4 fl. oz.] of product.

Uses—A parasiticide.

PETROXOLINUM SPISSUM. N. F. Solid Petroxolin

[**Petrox. Spiss.**—Petrolatum Saponatum Spissum, Solid Petrox]

	Metric	Alternative
White Wax	**35 Gm.**	1 oz. av. 175 gr.
Light Liquid Petrolatum	**20 Gm.**	350 gr.
Oleic Acid	**32 Gm.**	1 oz. av. 122½ gr.
Oil of Lavender	**3 Gm.**	52½ gr.
Alcohol	**5 Gm.**	87½ gr.
Stronger Ammonia Water	**5 Gm.**	87½ gr.
To make	**100 Gm.**	4 oz. av.

Melt the white wax with the liquid petrolatum on a water bath, add the oleic acid and transfer the mixture at once to a warm mortar; immediately add the mixed alcohol and stronger ammonia water and stir continuously until cool. Finally add the oil of lavender.

N. F. Preparation—Petroxolinum Hydrargyri.

Approximate alcohol content, by volume, 5 per cent.

Uses—Used as a vehicle in the solid petroxolins.

Nebulæ—*Sprays*

These consist of liquids intended for spraying from an atomizer or nebulizer and may be aqueous or oily in character. Light Liquid Petrolatum is usually employed as the vehicle for oily sprays.

NEBULA AROMATICA. N.F. Aromatic Oil Spray

[**Nebul. Arom.**—AROMATOL]

	Metric	Alternative
Phenol	0.2 Gm.	29 gr.
Menthol	0.2 Gm.	29 gr.
Thymol	0.1 Gm.	15 gr.
Camphor	0.3 Gm.	44 gr.
Benzoic Acid	0.3 Gm.	44 gr.
Eucalyptol	0.2 cc.	31 min.
Oil of Cinnamon	0.2 cc.	31 min.
Oil of Clove	0.2 cc.	31 min.
Methyl Salicylate	0.5 cc.	77 min.
Light Liquid Petrolatum, a sufficient quantity,		
To make	100 cc.	2 pints

Mix the phenol, menthol, thymol and camphor in a flask and warm on a water bath until liquefied, then add the aromatic oils, eucalyptol, methyl salicylate, and benzoic acid and thoroughly mix with sufficient light liquid petrolatum to make the product measure 100 cc. [2 pints]. Filter if necessary.

Uses—An antiseptic and soothing inhalant, for catarrh of the nose and throat.

NEBULA EUCALYPTOLIS. N.F. Eucalyptol Spray

[**Nebul. Eucalyptol.**]

	Metric	Alternative
Eucalyptol	5 cc.	1 fl. oz. 288 min.
Light Liquid Petrolatum	95 cc.	30 fl. oz. 192 min.
To make	100 cc.	2 pints

Mix them.

Uses—A mildly antiseptic inhalant.

NEBULA MENTHOLIS. N.F. Menthol Spray

[**Nebul. Menthol.**]

	Metric	Alternative
Menthol	2 Gm.	292 gr.
Light Liquid Petrolatum, a sufficient quantity,		
To make	100 cc.	2 pints

Dissolve the menthol in the light liquid petrolatum which has been warmed to about 70° C., and filter if necessary.

Uses—A soothing inhalant for catarrh of nose and throat.

NEBULA MENTHOLIS COMPOSITA. N.F. Compound Menthol Spray

[Nebul. Menthol. Co.]

	Metric	Alternative
Menthol	1.0 Gm.	146 gr.
Camphor	1.0 Gm.	146 gr.
Methyl Salicylate	0.5 cc.	77 min.
Eucalyptol	0.2 cc.	31 min.
Oil of Cinnamon	0.2 cc.	31 min.
Light Liquid Petrolatum, a sufficient quantity,		
To make	100 cc.	2 pints

Triturate the menthol, camphor, eucalyptol, methyl salicylate and oil together in a dry mortar, add 75 cc. [24 fl. oz.] of light liquid petrolatum and continue trituration until solution is effected. Then add sufficient light liquid petrolatum to make the product measure 100 cc. [2 pints], and filter if necessary.

Uses—An antiseptic inhalant.

NEBULA THYMOLIS. N.F. Thymol Spray

[Nebul. Thymol.]

	Metric	Alternative
Thymol	1 Gm.	146 gr.
Light Liquid Petrolatum, a sufficient quantity,		
To make	100 cc.	2 pints

Dissolve the thymol in the light liquid petrolatum.

Uses—An antiseptic, stimulating inhalant.

Medicated Oils

Three preparations of the National Formulary belong to this class. They consist in two instances of a bland, fixed oil, to which an active medicinal substance has been added, and in the third preparation, of an active oil, castor oil, which is rendered palatable by the addition of aromatics.

OLEUM PHENOLATUM. N.F. Phenolated Oil

[Ol. Phenol.—Oleum Carbolatum, Carbolized Oil]

	Metric	Alternative
Phenol	5 Gm.	87½ gr.
Olive Oil	95 Gm.	3 oz. av. 350 gr.
To make	100 Gm.	4 oz. av.

Melt the phenol with a gentle heat, and mix it with the olive oil.

Uses—An antiseptic oil for external use.

OLEUM PHOSPHORATUM. N.F. Phosphorated Oil

[Ol. Phosphorat.]

	Metric	Alternative
Phosphorus	1 Gm.	17½ gr.
Expressed Oil of Almond,		
Ether, each, a sufficient quantity,		
To make	100 Gm.	4 oz. av.

Pour a sufficient quantity of expressed oil of almond into a flask, heat it on a sand bath to 250° C. and keep it at that temperature for fifteen minutes. Then allow it to cool, and filter it. Introduce 90 Gm. [3 oz. av. 262 gr.] of the filtered oil together with the phosphorus, previously well dried, into a dried, tared bottle of about 120 cc. [4 fl. oz.] capacity, insert the

stopper and heat the bottle in a water bath until the phosphorus melts. Agitate it until the phosphorus is dissolved, allow the oil to cool before opening the bottle, add sufficient ether to make the mixture weigh 100 Gm. [4 oz. av.] and agitate it again. Lastly, transfer the solution to small, glass-stoppered bottles, which should be completely filled, and kept in a cool, dark place.

A clear, yellowish liquid, having the odor of phosphorus and of ether, and free from undissolved particles.

Uses—For the internal administration of phosphorus.

Average dose—1 minim (0.05 cc.).

OLEUM RICINI AROMATICUM. N.F. Aromatic Castor Oil

[**Ol. Ricin. Arom.**]

	Metric	Alternative
Gluside	**0.5 Gm.**	7 gr.
Oil of Cinnamon	**3.0 cc.**	46 min.
Oil of Clove	**1.0 cc.**	15 min.
Vanillin	**1.0 Gm.**	15 gr.
Coumarin	**0.1 Gm.**	1½ gr.
Alcohol	**30.0 cc.**	461 min
Castor Oil, a sufficient quantity,		
To make about	**1000 cc.**	2 pints

Dissolve the volatile oils and the solids in the alcohol, add the castor oil and mix thoroughly.

Approximate alcohol content, by volume, 2 per cent.

Uses—A cathartic. The aromatics assist in its administration by covering the disagreeable taste of the castor oil.

Average dose—4 fluidrachms (15 cc.).

Toothache Drops

Temporary relief is often obtained when toothache is due to cavities, by the application of an aromatic oil or a mixture of oils and phenol. Oil of clove, usually applied on absorbent cotton, is probably the most frequently used toothache remedy, although mixtures of phenol with camphor or creosote are often employed. When phenol, creosote or volatile oils are dissolved in paraffin, a few filaments of cotton added and the mixture moulded into sticks, it constitutes what is known as *dental wax.*

The National Formulary has introduced the following formula for toothache drops:

ODONTALGICUM. U.S. Toothache Remedy

[**Odontalg.**]

Oil of Cinnamon	**10 cc.**
Phenol	**20 Gm.**
Methyl Salicylate	**30 cc.**

Dissolve the phenol in the oils.

CHAPTER XXXI

AQUEOUS LIQUIDS MADE BY PERCOLATION OR MACERATION

Infusa—*Infusions*

Infusions are liquid preparations made by treating vegetable substances with either hot or cold water. *The drug is not subjected to the boiling process,* although it is common to pour boiling water over it; the mixture is allowed to stand in a closed vessel until cold. While the use of hot water has the advantage of saving time in some cases, it is often objectionable because the *inert* principles in the drug are dissolved by the hot water, and as the infusion cools, they are precipitated in such a very finely divided condition that they cannot be readily separated by colation or filtration. Cold water should be selected as the menstruum when the drug contains a valuable volatile principle, when the active agent is injured by heat, or when the desirable principles are readily soluble in water of ordinary temperature. The time required to make the infusion must also be considered, for in warm weather it is quite possible for an infusion to ferment or decompose before it is finished.

Pure water should be used in making infusions, and they should not be made in large quantities unless demanded for immediate use, as, without special precautions to preserve them, they soon decompose.

Of the inert principles found in plants, starch is extracted by hot water and albumen by cold water, while gum, sugar, and extractive are dissolved by both.

In making infusions the drug is usually coarsely comminuted, sliced, or bruised. Very fine powders should be avoided because it is difficult to separate the fine particles from the infusion and if percolation is resorted to, so much time is consumed in the operation, owing to the swelling of the powder, that decomposition may set in before the preparation is finished. Infusions are usually made by one of the following methods: 1. By maceration. 2. By digestion. 3. By percolation. 4. By diluting concentrated preparations.

1. **By Maceration**—This is the process which is most frequently used. The general formula of the U. S. Pharmacopœia, which is here appended, furnishes a model.

Official General Process for Infusions

Infusions must be freshly made, and, when their strength is not otherwise directed, they are to be prepared by the following general formula:

	Metric	Alternative
The Drug, coarsely comminuted	**50 Gm.**	365 gr.
Water, a sufficient quantity,		
To make	**1000 cc.**	1 pint

Introduce the drug into a suitable vessel provided with a cover, pour upon it 1000 cc. [1 pint] of boiling water, cover the vessel tightly, and allow it to stand for half an hour. Then strain with pressure, and pass enough water through the strainer to make the Infusion measure 1000 cc. [1 pint]. If the activity of the Infusion is affected by heat, cold water only should be used.

Caution—The strength of infusions of energetic or powerful drugs should be specially directed by the physician.

It will be found most convenient to provide special apparatus for making infusions by maceration. One of the oldest and most efficient forms is known as *Alsop's Infusion Jar*. It consists of an earthen-ware mug, illustrated by Fig. 417. The material to be submitted to infusion is placed on the perforated plate, and the hot water poured in so as to cover it, the vessel having been previously warmed so as not to chill the liquid. As the water becomes impregnated, the liquid acquires an increased specific gravity, and sinks to the bottom, its place being supplied by the unsaturated portion; and this circulation goes on until the whole of the soluble matter is extracted.

Tinned iron or metallic vessels are unsuited for infusions; they are particularly objectionable when the drug used for making the preparation contains tannin, gallic acid, or an astringent substance.

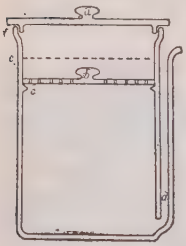
Squire's Infusion Mug differs from the preceding in having a colander of queen's-ware, which is closely covered with a lid, and descends into the jar so as to form a diaphragm for the support of the substance to be infused (see Fig. 418).

A very convenient and quite inexpensive apparatus may be made by the pharmacist, by selecting a queen's-ware or porcelain tea- or coffee-pot, as in Fig. 419, and if a hole is drilled through the top, close to the handle, a copper wire may be passed

Fig. 419

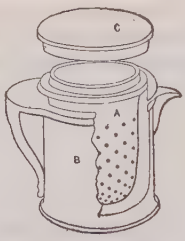
Infusion mug (home-made)

Fig. 417



Alsop's infusion jar

Fig. 418



Squire's infusion mug

through the hole and around the handle, and made to terminate in a hook. The material to be infused is loosely tied up in a square piece of cheesecloth (coarse, thin muslin) and suspended from the hook; the hot water dissolves out the soluble principles by circulatory displacement. This method has the great advantage that no further straining is needed, as the bag retains the marc. The bag may be pressed and the contents then thrown away.

Some drugs are now supplied in accurately weighed amounts in muslin bags ready for the making of specific amounts of infusion. This is especially applied to digitalis and also to the preparation of tea as a beverage.

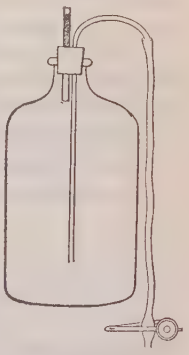
2. **By Digestion**—The process of *digestion* consists in subjecting the substance to the continued action of moderate heat below the boiling temperature. In making infusions, digestion is often very useful, although it may not be directed in the formula. It generally suffices to place the infusion vessel upon a moderately hot portion of the stove plate, or near some other source of heat.

3. **By Percolation**—This method of making infusions is by far the most satisfactory, and should be used whenever possible. It should be selected when the desirable principles are easily dissolved in water, and when the amount of menstruum is amply sufficient to exhaust the drug thoroughly. Percolation presents the advantages of furnishing a finished preparation, straining being

unnecessary. Again, precipitation from the deposition of inert principles after the infusion has been strained, due to the principles being soluble in hot water but insoluble in cold water, is avoided. The chief drawback to the adoption of percolation in making infusions is the difficulty of maintaining heat when that is desirable and length of time required to exhaust the drug with water. Infusions are generally extemporaneous preparations, and they are frequently desired quickly; hence the process of maceration is often selected in preference.

4. **Infusions from Concentrated Preparations**—The habit of making infusions from concentrated alcoholic tinctures or fluidextracts is improper and unjustifiable, except in those few cases in which the active and desirable principles of the drug are equally soluble in alcohol and in water, or in the menstrua used for both fluidextract and infusion. This is well illustrated in those preparations in which the activity of the drug is due to resinous bodies. Alcoholic menstrua here are necessary to dissolve the resins, and if such a fluidextract is added to water, precipitation takes place and the filtered infusion is worthless. If the precipitate is inert or does not carry down with it any portion of the active principle, and is readily separated, the only objection to the infusion is the presence of the alcohol, which may or may not seriously interfere with the therapeutic action, according as the quantity present is large or small. The saving in time and labor by making infusions in this way is the cause of the frequent employment of this method, but it should never be used if the therapeutic action of the drug is weakened thereby. The substitution of a fluidextract-made infusion in a prescription for one directed to be made by an official process is reprehensible and inexcusable.

FIG. 420



Infusion bottle

Preservation of Infusions—The difficulty in preserving infusions arises from the decomposition of fermentable principles which are extracted and retained in the preparation. If sufficient alcohol is added to prevent decomposition, the therapeutic action of the infusion is usually interfered with owing to the comparatively large proportion of spirit contained in the dose. Alcohol is successfully used in preparations like infusion of gentian, orange peel, etc., or simple tonics. If an antiseptic, like boric acid, salicylic acid, sodium benzoate, or phenol is used, the same objection exists—the interference due to the therapeutic action of the ant septic.

It has been proved that infusions may be preserved for a long time if they are protected from the microscopic organisms which float in the air (see chapter on Sterilization). A simple method is to heat the infusion gradually, in a flask of hard glass, to the boiling point in order to destroy any organisms that may be present, and then to transfer it at once, under proper precautions, to small bottles, which have been sterilized, filling them to the brim; the sterilized stoppers are then forced in and tied over, and the stoppers, lip, and neck of each bottle dipped into hot paraffin or sealing wax. A useful modification of Almen's method consists in heating the infusion to the boiling point in a bottle, on a water bath. The rubber stopper of the bottle is perforated so as to admit a long bent tube and a short tube; the short tube is loosely filled with cotton, the long limb of the bent tube is passed through the cork, and a rubber tube with a pinchcock attached, as shown in Fig. 420. The cotton permits the admission of air into the bottle, but excludes organisms, spores, and dust. The infusion may be drawn from the bottle as wanted by the rubber tube and syphon, the flow being controlled by the pinchcock.

INFUSUM DIGITALIS. U.S. Infusion of Digitalis

[Inf. Digit.—Withering's Infusion]

	Metric	Alternative
Digitalis, in fine powder	**15 Gm.**	½ oz. av.
Alcohol	**100 cc.**	3 fl. oz. 96 min.
Cinnamon Water	**150 cc.**	4 fl. oz. 384 min.
Boiling Water	**700 cc.**	22½ fl. oz.
Cold Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Upon the digitalis, contained in a suitable vessel, pour the boiling water, tightly cover, and allow it to macerate for one hour. Filter, add the alcohol and cinnamon water to the filtrate, and pass enough cold water through the residue on the filter to make the product measure 1000 cc. [2 pints]. Mix well.

The U.S.P. X directs a fine powder corresponding to about a No. 60, for the digitalis, instead of the "bruised leaves", since so often the stems or midribs constituted the larger part of the drug, due to the softer parts of the leaf having broken away and sifted to the bottom of the container. Very fine powder must not be employed, however, or filtration is greatly retarded. Alcohol has again been added as a preservative. The infusion is not to be made up for stock, however, but should be freshly prepared from the assayed leaves and should never be made from the fluidextract or tincture.

It is very important to use a vessel for the infusion which will not quickly lose the heat, and to macerate for the full hour, otherwise the drug will not be completely extracted.

Alcohol content, by volume, 8.5 to 9.5 per cent.

Uses—In various heart and kidney diseases.

Average dose—1½ fluidrachms (6 cc.).

INFUSUM BRAYERÆ. N.F. Infusion of Brayera

[Inf. Brayer.]

	Metric	Alternative
Brayera, in coarse powder	**60 Gm.**	2 oz. av.
Boiling Water	**1000 cc.**	2 pints

Pour the boiling water upon the brayera, and allow it to macerate in a covered vessel until cool.

Dispense this Infusion without straining, and only when recently prepared.

Uses—A vermifuge, especially used against tape worm.

Average dose—8 fluidounces (250 cc.).

INFUSUM GENTIANÆ COMPOSITUM. N.F. Compound Infusion of Gentian

[Inf. Gentian. Co.]

	Metric	Alternative
Gentian, in moderately coarse powder	**30 Gm.**	1 oz. av.
Coriander, in moderately coarse powder	**8 Gm.**	117 gr.
Bitter Orange Peel, in moderately coarse powder	**8 Gm.**	117 gr.
Diluted Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Moisten the powdered drugs with diluted alcohol, pack in a percolator, and percolate with diluted alcohol until the product measures 250 cc. [8 fl. oz.]. To this add sufficient water to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 11 per cent.

Uses—A bitter tonic and vehicle.

Average dose—4 fluidrachms (15 cc.).

INFUSUM ROSÆ COMPOSITUM. N. F. Compound Infusion of Rose

[Inf. Ros. Co.]

	Metric	Alternative
Rose	13 Gm.	190 gr.
Diluted Sulphuric Acid	9 cc.	138 min.
Sucrose	40 Gm.	1 oz. av. 147 gr.
Boiling Water	1000 cc.	2 pints

Pour the boiling water upon the rose in a glass or porcelain vessel, add the acid, cover the vessel; and digest the drug during one hour. Then dissolve the sucrose in the liquid and strain the infusion.

Uses—A mild astringent.

Average dose—3 fluidounces (100 cc.).

INFUSUM SENNÆ COMPOSITUM. N. F. Compound Infusion of Senna

(U. S. P. IX)

[Inf. Senn. Co.]

	Metric	Alternative
Senna	60 Gm.	2 oz. av.
Manna	120 Gm.	4 oz. av.
Magnesium Sulphate	120 Gm.	4 oz. av.
Fennel, bruised	20 Gm.	292 gr.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Pour 800 cc. [25½ fl. oz.] of boiling water upon the senna, manna, and fennel contained in a suitable vessel, and allow the mixture to macerate for half an hour. Then strain, express, and dissolve the magnesium sulphate in the infusion and again strain. Lastly, add sufficient water through the strainer to make the Infusion measure 1000 cc. [2 pints].

This preparation must not be dispensed unless it has been recently prepared.

History—*Black Draught* as this preparation is commonly called in some sections and which name has been confused with serious results, with *"black drop"* which is *vinegar of opium* or *Quaker Laudanum*, originated in a preparation devised by an Italian physician in 1600 at the court of Emperor Rudolph II of Germany. The original preparation was known variously as *Aqua, Potio* or *Elixir Laxativa Viennensis* and was popularly known as *"Wiener trank"*. The formula of the earlier preparation was more complicated than the present one.

Uses—A laxative.

Average dose—4 fluidounces (120 cc.).

Table of Some Unofficial Infusions

Unless otherwise stated use the following directions for the unofficial infusions listed below. Infuse the drug for fifteen minutes with 100 cc. of boiling distilled water in a covered vessel and strain.

Title	*Directions*
Infusum Alstoniæ (Br. 1914)	5 Gm. alstonia, bruised. Infuse for thirty minutes Dose: four fluidrachms (15 cc.)
Aurantii (Br. 1914)	5 Gm. of dried, bitter orange peel Dose: four fluidrachms (15 cc.)
Aurantii Compositum (Br. 1914)	2.5 Gm. dried, bitter orange peel, 1 Gm. lemon peel, 0.5 Gm. cloves, bruised Dose: four fluidrachms (15 cc.)
Buchu (Br. 1914)	5 Gm. buchu leaves Dose: one fluidounce (30 cc.)
Calumbæ (Br. 1914)	5 Gm. calumba root. Infuse for thirty minutes Dose: one fluidounce (30 cc.)
Caryophylli (Br. 1914)	2.5 Gm. cloves, bruised Dose: one fluidounce (30 cc.)
Cascarillæ (Br. 1914)	5 Gm. cascarilla Dose: one fluidounce (30 cc.)
Chiratæ (Br. 1914)	5 Gm. chiretta Dose: four fluidrachms (15 cc.)
Cinchonæ (N. F. IV)	Mix 10 cc. of aromatic sulphuric acid with 500 cc. of water and percolate 60 Gm. of cinchona (No. 40 powder) first with this mixture and then with enough water to make 1000 cc. Dose: twelve fluidrachms (50 cc.)
Ergotæ (Br. 1914)	5 Gm. of ergot, freshly crushed Dose: two fluidounces (60 cc.)
Krameriæ (Br. 1914)	5 Gm. of krameria root, bruised Dose: one fluidounce (30 cc.)

Table of Some Unofficial Infusions—*Continued*

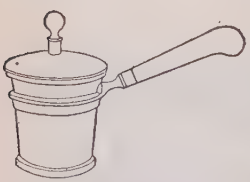
Title	*Directions*
Infusum Pruni Virginianæ (N. F. IV)	Macerate 40 Gm. of Wild Cherry in No. 20 powder in a percolator with 900 cc. of cold water for three hours. Then percolate into 50 cc. of glycerin and after pressing the drug, pour on enough water to make the percolate measure 1000 cc. Mix well Dose: two fluidounces (60 cc.)
Quassiæ (Br. 1914)	1 Gm. quassia wood, rasped Dose: two fluidounces (60 cc.)
Rhei (Br. 1914)	5 Gm. rhubarb root, sliced Dose: one fluidounce (30 cc.)
Salviæ	3.2 Gm. sage. Infuse for thirty minutes
Scoparii (Br. 1914)	10 Gm. broom tops, bruised Dose: one fluidounce (30 cc.)
Senegæ (Br. 1914)	5 Gm. of senega root, No. 10 powder. Infuse for thirty minutes Dose: one fluidounce (30 cc.)
Sennæ (Br. 1914)	10 Gm. of senna; 0.5 Gm. ginger, sliced Dose: two fluidounces (60 cc.)
Uvæ Ursi (Br. 1914)	5 Gm. bearberry leaves, bruised Dose: one fluidounce (30 cc.)

Decocta—*Decoctions*

Decoctions are liquid preparations made by *boiling* vegetable substances with water. The object sought in preparing decoctions is to secure, in aqueous solution, the soluble active principles of drugs which are not injured by heat. It is obvious that very few drugs are suited to this form of administration, and decoctions are rapidly declining in favor. Hot infusion will generally afford a means of obtaining all the benefits that are derived from boiling the drug with water, while the prolonged action of boiling water generally exercises a dissociating effect upon the active principles. The disadvantages of hot infusions are possessed in a more marked degree by decoctions (see page 357). In compound decoctions the ingredients are preferably added at different periods of the operation, the hard, ligneous drugs being added first, and the aromatics, or those containing volatile oils, at the close of the process, so that loss of activity of the latter may not ensue.

The earthenware or porcelain vessels used in preparing infusions are preferred for decoctions (see page 358), as they will bear the heat of boiling water, if heated gradually. Fig. 421 shows a block-tin vessel employed for preparing decoctions, used largely in Germany and to some extent here. It is preferably used in connection with the brass water bath, *R* (see Fig. 422). The rim, *F*, is somewhat flexible, while a small aperture permits the escape of steam. The empyreumatic odor which many decoctions possess when made over a naked fire, and caused by particles adhering to the bottom of the vessel and becoming charred, is avoided by the use of the water bath.

Fig. 421



Block-tin decoction vessel

Fig. 422

Brass water bath

The use of iron vessels is not advisable, because of the discoloration which is caused by the tannin of astringent drugs reacting with the iron, but the white enameled, double boilers are admirably suited for the making of decoctions.

A general formula for decoctions is given in the U. S. P. X as follows:

Official General Process for Decoctions

Decoctions must be freshly made, and when their strength is not otherwise directed, they are to be prepared by the following general formula:

	Metric	Alternative
The Drug, coarsely comminuted	**50 Gm.**	365 gr.
Water, a sufficient quantity,		
To make	**1000 cc.**	1 pint

Place the drug in a suitable vessel provided with a cover, pour upon it 1000 cc. [1 pint] of cold water, cover it well, and boil for fifteen minutes. Then allow it to cool to about 40° C., express, strain the expressed liquid, and pass enough cold water through the strainer to make the product measure 1000 cc. [1 pint].

Caution—The strength of decoctions of energetic or powerful drugs should be specially directed by the physician.

Table of Some Unofficial Decoctions

Title	*Directions*
Decoctum Acaciæ Corticis (Br. 1914)	Boil 6 Gm. of bruised acacia bark with 120 cc. of distilled water for ten minutes, strain and add enough distilled water to make 100 cc. Dose: four fluidrachms (15 cc.)
Agropyri (Br. 1914)	Boil 5 Gm. of cut couch grass with 120 cc. of distilled water for ten minutes, strain and add enough distilled water to make 100 cc. Dose: four fluidrachms (15 cc.)
Aloes Compositum (Br. 1914)	Coarsely powder 1 Gm. of extract of aloes and 0.5 Gm. of myrrh and boil them with 0.5 Gm. of potassium carbonate and 4 Gm. of extract of liquorice in 40 cc. of water for five minutes. When cold, add 30 cc. of compound tincture of cardamom, set aside for two hours, strain and add enough distilled water to make 100 cc. Dose: four fluidrachms (15 cc.)
Cetrariæ (U. S. P. 1890)	Macerate 5 Gm. of cetraria with 40 cc. of cold water for thirty minutes, express and throw the liquid away. Boil the residue with 100 cc. of water for thirty minutes, strain and add water to make 100 cc.
Gossypii Radicis Corticis (Br. 1914)	Boil 20 Gm. of bruised cotton root bark with 200 cc. of distilled water until reduced to about 100 cc. Strain and add enough water to make 100 cc. Dose: four fluidrachms (15 cc.)
Hæmatoxyli (Br. 1914)	Boil 5 Gm. of logwood with 120 cc. of water for ten minutes, adding 1 Gm. of cinnamon bark toward the end of the time, strain, and add enough water to make 100 cc. Dose: two fluidounces (60 cc.)
Ispaghulæ (Br. 1914)	Boil 1.5 Gm. of bruised ispaghula with 120 cc. of distilled water for ten minutes, strain and add enough distilled water to make 100 cc. Dose: four fluidrachms (15 cc.)
Sappan (Br. 1914)	Boil 5 Gm. of sappan, in chips, with 120 cc. of water for ten minutes, adding 1 Gm. of bruised cinnamon bark toward the end of the time. Strain and add water to make 100 cc. Dose: four fluidrachms (15 cc.)
Sarsaparillæ Compositum (N. F. IV)	Boil 10 Gm. of sarsaparilla, cut and bruised and 2 Gm. of guaiac wood, rasped, with 100 cc. of water for thirty minutes, replacing any water lost by evaporation. Then add 2 Gm. of sassafras, No. 20 powder, 2 Gm. of glycyrrhiza (cut and bruised) and 1 Gm. of mezereum and macerate in a covered vessel for two hours. Strain and add enough cold water to make 100 cc. Dose: four fluidounces (120 cc.)
Sarsaparillæ Compositum Fortius (Zittmann's Decoction Stronger)	Macerate 20 Gm. of cut sarsaparilla in 520 cc. of water for twenty-four hours, add 1 Gm. of sucrose and 1 Gm. of alum and digest on a water bath for three hours Add 1 Gm. of bruised anise, 1 Gm. of bruised fennel, 5 Gm. of cut senna and 2 Gm. of cut liquorice root and digest for 15 minutes. Strain and add enough water to make 500 cc.
Sarsaparillæ Compositum Mitius (Zittmann's Decoction Milder)	Macerate 10 Gm. of cut sarsaparilla in 480 cc. of water for twenty-four hours, then digest on a water bath for three hours and afterwards add 1 Gm. cut lemon peel, 1 Gm. bruised cinnamon, 1 Gm. bruised cardamom and 1 Gm. of cut liquorice root, digest for fifteen minutes, strain and add enough water to make 500 cc.

CHAPTER XXXII

ALCOHOLIC LIQUIDS MADE BY PERCOLATION OR MACERATION

Tincturæ—*Tinctures*

Tinctures are liquid preparations made by extracting the useful principles from drugs by the use of appropriate menstrua or solvents containing alcohol. There are, however, several exceptions, in which chemical substances are dissolved in alcoholic liquids. Tinctures differ from spirits in being made from *non-volatile* bodies, the tinctures containing iodine being the only exception to this rule. They are made by percolation, maceration, solution, or dilution and the menstrua employed in the official tinctures are alcohol, dilute alcohol of various strengths, aromatic spirit of ammonia, ether, ammonia water, or mixtures of alcohol, water, and glycerin. In some unofficial tinctures, spirit of ether, ammoniated alcohol, and spirit of nitrous ether are used. The use of alcohol as a solvent for the active or useful principles in drugs has been practiced for many years, but it has required a long time and much experience to determine the proper proportion of water to add to the alcohol. The menstrua should dissolve the therapeutically valuable constituents of the drugs without extracting the inert principles, and yet contain sufficient alcohol to secure permanent preparations that will not in time deposit a portion of their active constituents. The advantages of alcohol as a menstruum have been proved so thoroughly, that the use of aqueous preparations has greatly declined in this country; and yet there are some instances, particularly in the case of the weak tinctures and those requiring a large dose, in which the therapeutic action of the menstruum almost equals that of the drug. In these cases, however, the physician may prefer the fluidextract when he does not desire the stimulating action of the alcohol in the tincture.

In selecting the menstrua the proportion of water in each case is made as high as possible without endangering the permanency of the preparation, one especial advantage being that such tinctures may be added in small proportions to aqueous preparations without serious precipitation. In this respect tinctures have usually a great advantage over fluidextracts, and weaker alcoholic menstrua are often used successfully for tinctures when they would be entirely unsuitable for fluidextracts. This may be explained by the fact that tinctures, on account of their comparative weakness, have a much larger proportion of menstruum than fluidextracts with which to exhaust the drug, and may therefore have the excess over the proportion of alcohol used in the fluidextract made up with water. It has been proved that a pint of diluted alcohol will extract by percolation a larger proportion of the soluble principles of a drug than half a pint of alcohol and half a pint of water percolated separately through the drug. The properties of *alcohol* are considered under another head (page 905), yet it seems desirable to note here the solvent properties of this valuable preservative. It mixes freely with water, ether, acetic acid, a number of volatile oils, and castor oil; it dissolves resins, stearoptens, tannins, organic acids, chlorophyll, alkaloids, balsams, iodine, ferric chloride, ammonium carbonate, etc. *Diluted alcohol* extracts from drugs, gum, extractive, chlorophyll, albumin, coloring matter, resins, volatile oils, alkaloids, sugar, tannin, etc. *Glycerin* is used in tinctures to prevent precipitation by retaining in solution principles which would otherwise in time be deposited.

The Strength of Tinctures—For many years there was no uniformity in the proportion of drug to finished tincture but the Brussels Protocol of 1902 established a general principle which has brought about international uniformity. The Protocol agreement provided for 10 per cent drug strength in tinctures of potent or therapeutically active drugs and 20 per cent strength for other tinctures. There is practical conformity to this agreement in the U. S. P., the strength, however, being slightly differently expressed, *i.e.* 10 Gm. of potent drug represented by 100 cc. of tincture, instead of 10 per cent, by weight, and 20 Gm. per 100 cc. for others. The difference is negligible, simply meeting the conditions in this country where finished products are usually measured instead of weighed.

There are several exceptions to this general rule, as in tincture of iodine (7 Gm. per 100 cc.) and in the tinctures of orange peel and lemon peel (50 Gm. per 100 cc.), but special conditions governed the decisions in these cases.

A number of tinctures are to be assayed and the final volume adjusted to conform with the rubrics, but the standard of strength adopted represents an average drug in an amount equivalent to the International agreement.

Preparation—There are three different methods represented in the processes for making tinctures: 1. By percolation. 2. By maceration. 3. By solution or dilution.

1. **By Percolation**—This is the best method for making tinctures, when the drugs are capable of being readily comminuted and extracted, and it is always directed by the Pharmacopœia when practicable. The special advantages of percolation over maceration and expression are seen in the saving of time and labor, and in the greater efficiency of the product if the process has been carefully and skilfully performed. The U. S. P. has provided a Type Process for tinctures which are to be made by *Percolation*. In the text under the title only the drug, the size of the powder, and the menstruum are given, and reference is then made to the Type Process which is as follows:

Type Process P—Percolation

Moisten the powdered drug or mixed drugs designated in the formula with a sufficient quantity of the prescribed menstruum to render it evenly and distinctly damp and to maintain it so after macerating for six hours in a tightly-covered container. Transfer it to a percolator, pack it firmly, unless otherwise directed, and pour on enough of the menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for twenty-four hours. Then allow the percolation to proceed slowly, gradually adding sufficient of the menstruum to make the finished tincture measure 1000 cc. and mix thoroughly.

Modification for Assayed Tinctures—In tinctures that are directed to be assayed, allow the percolation to proceed until the percolate measures 950 cc. Assay a portion of this percolate as directed and from the alkaloidal content thus determined, or from the biological activity, ascertain by calculation the strength of the remainder of the liquid, and make the finished tincture conform to the required standard, adding sufficient of the menstruum if necessary, and mix thoroughly.

2. **By Maceration**—This method of making tinctures is officially used in the case of resins, balsams, gums, soap, etc., where the practical difficulties likely to be encountered in percolation would offset any advantages that the latter process might possess (see page 231). The U. S. P. also provides a Type

Process for tinctures to be made by *Maceration*, only giving the title, drug, size of powder, and the menstruum, with reference to the Type Process, which is as follows:

Type Process M—Maceration

Macerate the drug or mixed drugs designated in the formula in a stoppered container, in a moderately warm place, with 750 cc. of the prescribed solvent (unless a different amount is specified in the formula). Continue the maceration with frequent agitation during three days or until the active constituents of the drug are practically extracted. Transfer the mixture to a filter, and, when the liquid has drained off, gradually wash the residue on the filter with enough of the solvent directed to make the filtrate measure 1000 cc., and mix thoroughly.

3. **By Solution or Dilution**—A few tinctures are made in this way, such as tincture of iodine, by dissolving iodine in a solution of potassium iodide and adding alcohol; tincture of ferric chloride, by diluting the solution of ferric chloride with alcohol, etc.

TINCTURA ACONITI. U.S. Tincture of Aconite

[Tr. Aconit.—Aconiti Tinctura P. I.]

Tincture of Aconite, administered subcutaneously to guinea pigs, has a minimum lethal dose of not less than 0.00,035 cc. and not more than 0.00,045 cc. for each Gm. of body weight of guinea pig.

	Metric	Alternative
Aconite, in fine powder	**100 Gm.**	3 oz. av. 148 gr.
To make about	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P, as modified for assayed tinctures (page 365), using a mixture of 7 volumes of alcohol and 3 volumes of water as the menstruum. Adjust the volume of the finished Tincture to conform to the above biological standard.

Assay—Use guinea pigs weighing from 275 Gm. to 325 Gm. each and in good health. Dilute the Tincture with distilled water to make the dose about 1 cc., and inject into the guinea pig under the skin of the abdomen. The standard dose must kill within six hours at least two of every three guinea pigs injected.

This assay is explained on page 1506.

Alcohol content, by volume, 61 to 65 per cent.

An assayed tincture only should be dispensed, as aconite is easily rendered inert through the decomposition of the aconitine.

In the U. S. P. 1890 Tincture of Aconite, each 100 cc. represented 35 Gm. of drug, so that the tincture was three and one-half times stronger than the present official tincture. In the renewal of old prescriptions this former strength may be required.

N. F. Preparations—Dentilinimentum Aconiti Compositum; Dentilinimentum Aconiti et Iodi Compositum.

Uses—A cardiac, circulatory sedative, used in fevers and heart disease. It must be used with caution.

Average dose—10 minims (0.6 cc.).

TINCTURA ASAFŒTIDÆ. U.S. Tincture of Asafetida

[Tr. Asafœt.]

	Metric	Alternative
Asafetida, bruised	**200 Gm.**	6 oz. av. 296 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process M (page 366), using alcohol as the solvent.

Alcohol content, by volume, 78 to 85 per cent.

N. F. Preparation—Mistura Magnesii, Asafœtidæ et Opii.

Uses—Employed as a carminative and for flatulence. Also used in hysteria and as an expectorant in bronchitis.

Average dose—15 minims (1 cc.).

TINCTURA AURANTII AMARI. U. S. Tincture of Bitter Orange Peel

[Tr. Aurant. Amar.]

	Metric	Alternative
Bitter Orange Peel, in moderately coarse powder	**200 Gm.**	6 oz. av. 296 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (page 365), using a mixture of 3 volumes of alcohol and 2 volumes of water as the menstruum.

Alcohol content, by volume, 53 to 56 per cent.

N. F. Preparation—Elixir Aurantii Amari.

Uses—An adjuvant; used for its flavor and bitterness.

Average dose—1 fluidrachm (4 cc.).

TINCTURA AURANTII DULCIS. U. S. Tincture of Sweet Orange Peel

[Tr. Aurant. Dulc.]

	Metric	Alternative
Sweet Orange Peel, the outer yellow rind, grated from the fresh fruit	**500 Gm.**	16 oz. av. 302 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process M (page 366), macerating the drug in 1000 cc. [2 pints] of alcohol and completing the preparation with alcohol. Use purified cotton as the filtering medium.

The white portion of the rind must not be used, as the proportion of oil, which is only in the yellow rind, is reduced and the bitter principle hesperidin is introduced.

Alcohol content, by volume, 73 to 76 per cent.

U. S. P. Preparation—Syrupus Aurantii.

N. F. Preparations—Elixir Gentianæ Glycerinatum; Elixir Pepsini et Rennini Compositum; Elixir Taraxaci Compositum; Elixir Terpini Hydratis.

Uses—A flavor, used almost exclusively in syrups and elixirs. This tincture was introduced to insure a delicate orange flavor direct from the fruit instead of depending upon the oil of orange which so frequently is terebinthinate and unfit for use. The tincture keeps well.

Average dose—1 fluidrachm (4 cc.).

TINCTURA BELLADONNÆ. U. S. Tincture of Belladonna

[Tr. Bellad.—Tinctura Belladonnæ Foliorum U. S. P. IX, Belladonnæ Tinctura P. I.]

Tincture of Belladonna yields, from each 100 cc., not less than 0.027 Gm. and not more than 0.033 Gm. of the alkaloids of belladonna leaves.

	Metric	Alternative
Belladonna Leaves, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
To make about	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P, as modified for assayed tinctures (page 365), using diluted alcohol as the menstruum, and adjust the volume of the finished Tincture by the addition of diluted alcohol to make each 100 cc. contain 0.03 Gm. of the alkaloids of belladonna leaves.

Assay—Proceed by Type Process D, taking 100 cc. of Tincture of Belladonna, use chloroform as the solvent, and determine the alkaloids volumetrically. Each cc. of tenth-normal sulphuric acid corresponds to 0.02893 Gm. of the alkaloids of belladonna leaves (Proximate Assays, pages 1496 and 1499).

Alcohol content, by volume, 44 to 47 per cent.

Uses—To check excessive secretion (as sweat), to relieve local spasms, especially of the bowel, as a circulatory and respiratory stimulant, etc.

Average dose—10 minims (0.6 cc.).

TINCTURA BENZOINI. U.S. Tincture of Benzoin

[Tr. Benz.]

	Metric	Alternative
Benzoin, in moderately coarse powder	**200 Gm.**	6 oz. av. 296 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process M (page 366), using alcohol as the solvent.

Alcohol content, by volume, 75 to 83 per cent.

N. F. Preparation—Unguentum Picis Compositum.

Uses—Chiefly employed in the preparation of toilet lotions when combined with rose water and glycerin. The Sumatra benzoin is preferable for this purpose, the Siam variety not containing sufficient gum to produce a satisfactory suspension.

Average dose—15 minims (1 cc.).

TINCTURA BENZOINI COMPOSITA. U.S. Compound Tincture of Benzoin

[Tr. Benz. Co.]

	Metric	Alternative
Benzoin, in moderately coarse powder	**100 Gm.**	1 oz. av. 148 gr.
Aloe, in moderately coarse powder	**20 Gm.**	292 gr.
Storax	**80 Gm.**	2 oz. av. 293 gr.
Tolu	**40 Gm.**	1 oz. av. 147 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process M (page 366), using alcohol as the solvent.

Alcohol content, by volume, 74 to 80 per cent.

Average dose—30 minims (2 cc.).

Uses—Especially valuable in acute laryngitis, as in croup, when added to hot water and the vapor inhaled. By adding a teaspoonful of the tincture to boiling water in a teapot, and drawing the vapor through the spout into the throat, very effective results may be obtained. Also administered, in sugar, for throat and bronchial inflammation and as a local application, when mixed with glycerin and water, for ulcers, bedsores, cracked nipples, and the fissures of the lips and anus.

History—This popular preparation has had more different Latin titles and synonyms since its origin in the fifteenth or sixteenth century than any other official preparation. Many of these are significant of its uses or its originators, introducers or patrons, for it has figured as a nostrum as well as in the pharma-

copœias of the past three hundred years. Among these names are: *Balsamum Equitis Sancti Victoris, Balsamum Commendatoris, Balsamum Catholicum, Balsamum Traumaticum, Balsamum Vulnerarium, Balsamum Persicum, Balsamum Suecium, Balsamum Friari, Balsamum Vervaini, Guttæ Nader, Guttæ Jesuitarum, Tinctura Balsamica, Balsam of the Holy Victorious Knight, Commander's Balsam, Turlington's Drops, Persian Balsam, Swedish Balsam, Vervain Balsam, Turlington's Balsam of Life, Balsam de Maltha, Ward's Balsam, Jerusalem Balsam, Saint Victor's Balsam, Wade's Drops, Wound Elixir,* and *Balsamic Tincture.* Some of the older formulas contained myrrh, olibanum, angelica root and St. John's-wort flowers in addition to the present ingredients. Peruvian balsam sometimes replaced the tolu.

TINCTURA CALUMBÆ. U.S. Tincture of Calumba
[Tr. Calumb.]

	Metric	Alternative
Calumba, in coarse powder	200 Gm.	6 oz. av. 296 gr.
To make	1000 cc.	2 pints

Prepare a Tincture by Type Process P (page 365), packing the moistened drug moderately and using a mixture of 3 volumes of alcohol and 2 volumes of water as the menstruum.

Alcohol content, by volume, 53 to 56 per cent.

Uses—A bitter tonic, especially useful in lack of tone in the gastrointestinal tract. *Average dose*—1 fluidrachm (4 cc.).

TINCTURA CANTHARIDIS. U.S. Tincture of Cantharides
[Tr. Canthar.—Cantharidis Tinctura P. I.]

	Metric	Alternative
Cantharides, in fine powder	100 Gm.	3 oz. av. 148 gr.
Glacial Acetic Acid	50 Gm.	1 fl. oz. 288 min.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Moisten the cantharides with a mixture of the glacial acetic acid and 50 cc. [1 fl. oz. 288 min.] of alcohol. Transfer it to a covered percolator and allow to macerate for twenty-four hours, then percolate slowly, using alcohol as the menstruum, until the Tincture measures 1000 cc. [2 pints].

Alcohol content, by volume, 82 to 87 per cent.

The preliminary digestion is necessary to insure the complete extraction of the cantharidin.

Uses—In amenorrhea and as a uterine stimulant. It must be used with caution as it is a powerful irritant to the urinary and genital organs. It frequently is employed as a stimulant in hair tonics.

Average dose—1½ minims (0.1 cc.).

TINCTURA CAPSICI. U.S. Tincture of Capsicum
[Tr. Capsic.]

	Metric	Alternative
Capsicum, in moderately coarse powder	100 Gm.	3 oz. av. 148 gr.
To make	1000 cc.	2 pints

Prepare a Tincture by Type Process P (page 365), using a mixture of 95 volumes of alcohol and 5 volumes of water as the menstruum.

Tincture of Capsicum should meet the requirements of the following test: Mix 10 cc. of the tincture with 40 cc. of alcohol in a stoppered flask, and dilute 0.1 cc. of the clear liquid with 140 cc. of distilled water containing 10 per cent of sucrose. Five cc. of this dilution swallowed at one time will produce a distinct sensation of pungency in the mouth and throat of at least two out of three individuals.

The organoleptic test has been introduced to insure the selection of the true cayenne peppers, which possess the pungency and irritant quality expected of this Tincture.

Alcohol content, by volume, 84 to 88 per cent.

N. F. Preparations—Mistura Chloroformi et Morphinæ Compositа; Mistura Opii et Chloroformi Composita; Mistura Opii et Rhei Composita.

Uses—A gastro-intestinal stimulant. Also employed as a local counter-irritant by applying it on blotting paper.

Average dose—8 minims (0.5 cc.).

TINCTURA CARDAMOMI. U.S. Tincture of Cardamom
[Tr. Cardam.]

	Metric	Alternative
Cardamom Seed, in moderately coarse powder	**200 Gm.**	6 oz. av. 296 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (page 365), using diluted alcohol as the menstruum.

Alcohol content, by volume, 44 to 46 per cent.

N. F. Preparation—Vinum Rhei Compositum.

Uses—A tonic and aromatic.

Average dose—30 minims (2 cc.).

TINCTURA CARDAMOMI COMPOSITA. U.S. Compound Tincture of Cardamom
[Tr. Cardam. Co.]

	Metric	Alternative
Cardamom Seed, in moderately coarse powder	**20 Gm.**	292 gr.
Cinnamon, in fine powder	**25 Gm.**	365 gr.
Caraway, in moderately coarse powder	**12 Gm.**	175 gr.
Cochineal, in fine powder	**5 Gm.**	73 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process M (page 366), macerating the mixed powders in 750 cc. [24 fl. oz.] of a mixture of 50 cc. [1 fl. oz. 288 min.] of glycerin and 950 cc. [30 fl. oz. 192 min.] of diluted alcohol and completing the preparation by using first the remainder of the mixture prepared as directed above, and then diluted alcohol.

Alcohol content, by volume, 45 to 47 per cent.

N. F. Preparations—Elixir Euphorbiæ Compositum; Elixir Gentianæ Glycerinatum; Elixir Viburni Prunifolii; Syrupus Eriodictyi Aromaticus.

Uses—An agreeable aromatic and carminative; also used as a vehicle because of its pleasant flavor and beautiful color.

Average dose—1 fluidrachm (4 cc.).

TINCTURA CINCHONÆ. U.S. Tincture of Cinchona
[Tr. Cinch.]

Tincture of Cinchona yields, from each 100 cc., not less than 0.8 Gm. and not more than 1 Gm. of the alkaloids in cinchona.

	Metric	Alternative
Cinchona, in moderately coarse powder	**200 Gm.**	6 oz. av. 296 gr.
To make about	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P, as modified for assayed tinctures (page 365), using as the first menstruum a mixture of 75 cc. [2 fl. oz. 192 min.] of glycerin, 675 cc. [21 fl. oz. 288 min.] of alcohol, and 250 cc. [8 fl. oz.] of water, and completing the percolation with a mixture of 2 volumes of alcohol and 1 volume of water. Adjust the volume of the finished Tincture to make each 100 cc. contain 0.9 Gm. of the alkaloids of cinchona.

Assay—Proceed by Type Process C, taking 25 cc. of Tincture of Cinchona to which is added 5 cc. of diluted hydrochloric acid before evaporation, use 200 cc. of ether-chloroform mixture, and decant an aliquot portion of 160 cc. of the ethereal solution, representing 20 cc. of Tincture. Use chloroform for the final extraction and determine the alkaloids gravimetrically (Proximate Assays, pages 1497 and 1499).

Alcohol content, by volume, 60 to 64 per cent.

Uses—A bitter tonic, too weak in alkaloids to be of value in malaria.

Average dose—1 fluidrachm (4 cc.).

TINCTURA CINCHONÆ COMPOSITA. U.S. Compound Tincture of Cinchona

[Tr. Cinch. Co.]

Compound Tincture of Cinchona yields, from each 100 cc., not less than 0.4 Gm. and not more than 0.5 Gm. of the alkaloids of cinchona.

	Metric	Alternative
Cinchona, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
Bitter Orange Peel, in moderately coarse powder	**80 Gm.**	2 oz. av. 293 gr.
Serpentaria, in fine powder	**20 Gm.**	292 gr.
To make about	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P as modified for assayed tinctures (page 365), using as the first menstruum a mixture of 75 cc. [2 fl. oz. 192 min.] of glycerin, 675 cc. [21 fl. oz. 288 min.] of alcohol, and 250 cc. [8 fl. oz.] of water, and complete the percolation with a mixture of 2 volumes of alcohol and 1 volume of water. Adjust the volume of the finished Tincture to make each 100 cc. contain 0.45 Gm. of the alkaloids of cinchona.

This has been known for many years as *Huxham's tincture* or *Tincture of Bark* and was always made from red cinchona. The latter is no longer distinguishable from yellow cinchona, due to extensive hybridizing, so that the U. S. P. X permits any cinchona bark to be used.

Assay—Proceed by Type Process C, taking 50 cc. of Compound Tincture of Cinchona, to which is added 5 cc. of diluted hydrochloric acid before evaporation, use 200 cc. of ether-chloroform mixture, and decant an aliquot portion of 160 cc., representing 40 cc., of the Tincture. Use chloroform for the final extraction and determine the alkaloids gravimetrically (Proximate Assays, pages 1497 and 1499).

Alcohol content, by volume, 58 to 64 per cent.

N. F. Preparation—Gargarisma Guaiaci Composita.

History—This preparation was devised by Dr. John Huxham and published in his essay on Fevers in 1755 and was first adopted in the London Pharmacopœia of 1788 as an official preparation.

Uses—An excellent bitter tonic but not suitable for malarial treatment. It should not be dispensed with forms of iron which combine with tannin to form inky products.

Average dose—1 fluidrachm (4 cc.).

TINCTURA COLCHICI. U.S. Tincture of Colchicum

[Tr. Colch.—Tinctura Colchici Seminis U.S.P. IX, Colchici Tinctura P. I.]

Tincture of Colchicum yields, from each 100 cc., not less than 0.036 Gm. and not more than 0.044 Gm. of colchicine.

	Metric	Alternative
Colchicum Seed, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
To make about	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P, as modified for assayed tinctures (page 365), using a mixture of 3 volumes of alcohol and 2 volumes of water as the menstruum, and adjust the volume of the finished Tincture to make each 100 cc. contain 0.04 Gm. of colchicine.

This tincture is of the same drug strength as the N. F. IV *Wine of Colchicum Seed* which has been deleted. It is understood that this tincture is to be dispensed if the wine is prescribed. The Wine of Colchicum Corm was four times this strength and a 40 per cent tincture has been introduced into the N. F. to take its place (see Tinctura Colchici Cormi Fortior, page 388).

Assay—Evaporate 150 cc. of Tincture of Colchicum on a water bath to about 15 cc., cool, and dissolve the residue in sufficient distilled water to make 290 cc. Add 10 cc. of solution of lead subacetate, and agitate the mixture frequently during one hour. Filter off 200 cc. and proceed as directed under *Colchici Semen*, pages 1497 and 1499, line of the assay, beginning with the word "Add".

Alcohol content, by volume, 54 to 57 per cent.

Uses—In chronic rheumatism and gout.

Average dose—30 minims (2 cc.).

TINCTURA DIGITALIS. U.S. Tincture of Digitalis

[Tr. Digit.—Digitalis Tinctura P. I.]

Tincture of Digitalis, injected into the ventral lymph sac of a frog, has a minimum systolic dose of not less than 0.0055 cc. and not more than 0.0065 cc. equivalent to not less than 0.00,000,046 Gm. and not more than 0.00,000,054 Gm. of ouabain, for each Gm. of body weight of frog.

	Metric	Alternative
Digitalis, in fine powder	**100 Gm.**	3 oz. av. 148 gr.
To make about	**1000 cc.**	2 pints

Pack the Digitalis firmly in a cylindrical glass percolator, provided with a stop-cock, and arranged with a cover and a receptacle suitable for volatile liquids, and percolate slowly with purified petroleum benzin until a few drops of the percolate evaporated from filter paper leave no greasy stain. Reject the benzin percolate. Remove the drug from the percolator and expose it to the air until the odor of benzin is no longer noticeable. Prepare from this a tincture by Type Process P, as modified for assayed tinctures (page 365), using a mixture of 4 volumes of alcohol and 1 volume of water as the menstruum. Adjust the volume of the finished Tincture to conform to the above biological standard.

Alcohol content, by volume, 67 to 72 per cent.

Assay—Proceed as directed on page 1504.

Uses—Employed as a stimulant in acute circulatory failure, as a diuretic in dropsical conditions, and as a cardiac tonic in heart disease. Only the physiologically assayed tincture should be dispensed.

Caution—It is sometimes prescribed in much larger doses than that mentioned. In such cases the pharmacist should assure himself that the dose prescribed is intended.

Average dose—15 minims (1 cc.).

TINCTURA FERRI CHLORIDI. U. S. Tincture of Ferric Chloride
[Tr. Ferr. Chlor.—Tincture of Iron]

A hydro-alcoholic solution containing about 13 per cent of ferric chloride [$FeCl_3$], corresponding to not less than 4.48 per cent of Fe.

	Metric	Alternative
Solution of Ferric Chloride	**350 cc.**	11 fl. oz. 96 min.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the solution with enough alcohol to make 1000 cc. [2 pints].

The requirement of many years standing, to age for at least three months, has been omitted from the U. S. P. X. This was for the purpose of developing ethyl chloride, the value of which has been questioned.

The description, tests and assay will be found on page 716.

Preserve in amber-colored, glass-stoppered bottles, protected from light.
Alcohol content, by volume, 58 to 64 per cent.

N. F. Preparation—Elixir Chloridorum.

Uses—A chalybeate in anemia, locally as an astringent in hemorrhages, and when mixed with glycerin, a local application for pharyngitis.

Average dose—10 minims (0.6 cc.).

TINCTURA GAMBIR COMPOSITA. U. S. Compound Tincture of Gambir
[Tr. Gambir Co.—Compound Tincture of Pale Catechu]

	Metric	Alternative
Gambir, in moderately coarse powder	**50 Gm.**	1 oz. av. 293 gr.
Cinnamon, in fine powder	**25 Gm.**	365 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process M (page 366), using diluted alcohol as the solvent.

Alcohol content, by volume, 44 to 47 per cent.

N. F. Preparation—Tinctura Opii et Gambir Composita.

Uses—An astringent, chiefly employed in diarrhea mixtures. This preparation replaces the former *Compound Tincture of Catechu*, catechu no longer being available. The two drugs are similar in character and constituents.

Average dose—1 fluidrachm (4 cc.).

TINCTURA GENTIANÆ COMPOSITA. U. S. Compound Tincture of Gentian
[Tr. Gentian. Co.]

	Metric	Alternative
Gentian, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
Bitter Orange Peel, in moderately coarse powder	**40 Gm.**	1 oz. av. 147 gr.
Cardamom Seed, in moderately coarse powder	**10 Gm.**	146 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (page 365), packing the mixed drugs moderately, using as the first menstruum a mixture of 100 cc. [3 fl. oz. 96 min.] of glycerin, 500 cc. [1 pint] of alcohol and 400 cc. [12 fl. oz. 384 min.] of water, and completing the percolation with diluted alcohol.

Alcohol content, by volume, 43 to 47 per cent.

History—This was originally a patent medicine in England in 1712 under the name of *Stoughton's Great Cordial Elixir*, later shortened to *Stoughton's Elixir*.

Uses—A bitter tonic, much used in dyspepsia.

Average dose—1 fluidrachm (4 cc.).

TINCTURA HYOSCYAMI. U.S. Tincture of Hyoscyamus

[Tr. Hyosc.—Tincture of Henbane, Hyoscyami Tinctura P. I.]

Tincture of Hyoscyamus yields, from each 100 cc., not less than 0.0055 Gm. and not more than 0.0075 Gm. of the alkaloids of hyoscyamus.

	Metric	Alternative
Hyoscyamus, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
To make about	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P, as modified for assayed tinctures (page 365), using diluted alcohol as the menstruum. Adjust the volume of the finished Tincture to make each 100 cc. contain 0.0065 Gm. of the alkaloids of hyoscyamus.

Assay—Proceed by Type Process D, taking 250 cc. of Tincture of Hyoscyamus, evaporate to about 25 cc., use chloroform as the solvent, and determine the alkaloids volumetrically. Each cc. of tenth-normal sulphuric acid corresponds to 0.02893 Gm. of the alkaloids of hyoscyamus (Proximate Assays, pages 1498 and 1499).

Alcohol content, by volume, 44 to 46 per cent.

Uses—Employed to allay nervous irritation, particularly in nervous cough, whooping-cough, and colic. Also, to relieve local spasms, to check excessive secretion, and to give relief in urinary incontinence due to irritated bladder.

Average dose—30 minims (2 cc.).

TINCTURA IODI. U.S. Tincture of Iodine

[Tr. Iodi]

An alcoholic solution of iodine and potassium iodide, containing, in each 100 cc., not less than 6.5 Gm. and not more than 7.5 Gm. of I, and not less than 4.5 Gm. and not more than 5.5 Gm. of KI.

	Metric	Alternative
Iodine	**70 Gm.**	1 oz. av. 74 gr.
Potassium Iodide	**50 Gm.**	365 gr.
Distilled Water	**50 cc.**	384 min.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	1 pint

Dissolve the potassium iodide in the distilled water contained in a bottle graduated to 1000 cc. [1 pint], add the iodine, and agitate the mixture until solution is effected. Then add sufficient alcohol to make 1000 cc. [1 pint] of Tincture, and mix thoroughly.

The water has been added to this formula to assist in the solution of the iodine, which, in the presence of the potassium iodide, is rendered readily soluble. The potassium iodide was not introduced, however, to increase the iodine solubility, although advantage is taken of its presence to aid in the rapidity of solution, but it is added as a preservative and when present prevents the rapid change of iodine to hydriodic acid. It is, therefore, important not to omit it from the formula.

See also Iodum, page 575.

Assay for Potassium Iodide—Measure exactly 5 cc. of Tincture of Iodine, evaporate in a tared dish or watch glass on a water bath, and then add several small successive portions of water, drop by drop, until all of the iodine has volatilized and a white residue remains. The residue should weigh not less than 0.225 Gm. and not more than 0.275 Gm. and should respond to the tests for identity under *Potassii Iodidum.*

This assay is explained on page 1476.

Assay for Iodine—Measure exactly 5 cc. of the Tincture, dilute with 25 cc. of distilled water, and titrate the solution with tenth-normal sodium thiosulphate, starch T.S. being used as indicator. Each cc. of tenth-normal sodium thiosulphate corresponds to 0.01269 Gm. of I.

This assay is explained on page 1469.

Preserve in tightly-stoppered bottles, using only glass or rubber stoppers.

Alcohol content, by volume, 82 to 84 per cent.

Uses—Applied locally as a counterirritant, and also for its effect in sprains, chronic rheumatism, gout, chilblains, enlarged glands, and lymph-nodes, and under many other conditions.

It is extensively used to sterilize the skin before minor operations or injections, for disinfecting wounds, and in treating erysipelas, although for this purpose a half strength preparation (3.5 per cent) is usually employed. In this strength it is frequently available in ampuls for first aid treatment (see Ampullæ Iodi, Part XI). The International Protocol (P.I.) Tincture of Iodine contains 10 per cent of iodine in 95 per cent alcohol.

Average dose—1½ minims (0.1 cc.).

TINCTURA KINO. U.S. Tincture of Kino

[Tr. Kino]

	Metric	Alternative
Kino	**100 Gm.**	365 gr.
To make	**1000 cc.**	8 fl. oz.

Place the kino in a capacious flask, and pour on it 500 cc. [4 fl. oz.] of boiling water. Agitate the mixture thoroughly, and heat it for one hour on a water bath containing boiling water, shaking it frequently. Allow the liquid to cool, add enough recently boiled water to make the product measure 500 cc. [4 fl. oz.], and add 500 cc. [4 fl. oz.] of alcohol. Stopper the flask, set it aside in a cool place for twenty-four hours, and then decant the mixture through cheesecloth.

The preliminary heating in the process of manufacture for this tincture is to destroy an enzyme, naturally existent in the drug, which if present would soon cause gelatinization of the tincture.

Preserve in a cool, dark place in small bottles, tightly stoppered.
Alcohol content, by volume, 45 to 47 per cent.

N. F. Preparation—Tinctura Kino et Opii Composita.

Uses—Employed as an astringent, especially in diarrhea.

Average dose—1 fluidrachm (4 cc.).

TINCTURA KRAMERIÆ. U.S. Tincture of Krameria

[Tr. Kramer.]

	Metric	Alternative
Krameria, in moderately coarse powder	**200 Gm.**	6 oz. av. 296 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (page 365), using diluted alcohol as the menstruum.

Alcohol content, by volume, 40 to 45 per cent.

Uses—An astringent, employed in diarrhea mixtures.

Average dose—1 fluidrachm (4 cc.).

TINCTURA LAVANDULÆ COMPOSITA. U.S. Compound Tincture of Lavender

[Tr. Lavand. Co.—Compound Spirit of Lavender]

	Metric	Alternative
Oil of Lavender	**8 cc.**	123 min.
Oil of Rosemary	**2 cc.**	31 min.
Cinnamon, in moderately coarse powder	**20 Gm.**	292 gr.
Clove, in moderately coarse powder	**5 Gm.**	73 gr.
Myristica, in moderately coarse powder	**10 Gm.**	146 gr.
Red Saunders, in moderately coarse powder	**10 Gm.**	146 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process M (page 366), macerating the mixed drugs in a mixture of 750 cc. [24 fl. oz.] of alcohol, in which the oils have been dissolved, and 250 cc. [8 fl. oz.] of water. Complete the preparation with a menstruum of 3 volumes of alcohol and 1 volume of water.

Alcohol content, by volume, 67 to 72 per cent.

U. S. P. Preparation—Liquor Potassii Arsenitis.
N. F. Preparations—Mistura Copaibæ; Mistura Copaibæ et Opii.

History—This was at first a very complex preparation, containing more than 25 ingredients, in the London Pharmacopœia of 1721. It was at one time called *Palsy Drops*.

Uses—Employed in nausea and flatulence.

Average dose—30 minims (2 cc.).

TINCTURA LIMONIS. U. S. Tincture of Lemon

[**Tr. Limon.**—TINCTURA LIMONIS CORTICIS U. S. P. IX]

	Metric	Alternative
Lemon Peel (the outer yellow rind, grated from the fresh fruit)	**500 Gm.**	16 oz. av. 302 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process M (page 366), macerating the drug in 1000 cc. [2 pints] of alcohol, and complete the preparation with alcohol. Use purified cotton as the filtering medium.

The white portion of the rind must not be used, as the proportion of oil, which is only in the yellow rind, is reduced and the bitter principle, hesperidin, introduced.

Alcohol content, by volume, 70 to 75 per cent.

U. S. P. Preparation—Syrupus Acidi Citrici.
N. F. Preparation—Emulsum Petrolati.

Uses—It is intended to replace oil of lemon as a flavor, its fineness of flavor being assured as it comes from the fresh fruit, and being in alcoholic solution it is more stable than the oil.

TINCTURA LOBELIÆ. U. S. Tincture of Lobelia

[**Tr. Lobel.**—LOBELIÆ TINCTURA P. I.]

	Metric	Alternative
Lobelia, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (page 365), using diluted alcohol as the menstruum.

Alcohol content, by volume, 44 to 47 per cent.

Uses—An anti-asthmatic and nauseating expectorant.

Average dose—15 minims (1 cc.).

TINCTURA MYRRHÆ. U. S. Tincture of Myrrh

[**Tr. Myrrh.**]

	Metric	Alternative
Myrrh, in moderately coarse powder	**200 Gm.**	6 oz. av. 296 gr
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process M (page 366), using alcohol as the solvent.

Alcohol content, by volume, 83 to 88 per cent.

Uses—A local stimulant application to indolent ulcers, sore gums, sore mouth, and ulcerated sore throat.

Average dose—30 minims (2 cc.).

TINCTURA NUCIS VOMICÆ. U.S. Tincture of Nux Vomica

[**Tr. Nuc. Vom.**—Strychni Tinctura P. I.]

Tincture of Nux Vomica yields, from each 100 cc., not less than 0.237 Gm. and not more than 0.263 Gm. of the alkaloids of nux vomica.

	Metric	Alternative
Nux Vomica, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
To make about	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P, as modified for assayed tinctures (page 365), using a mixture of 10 cc. [154 min.] of acetic acid, 750 cc. [24 fl. oz.] of alcohol, and 240 cc. [7 fl. oz. 326 min.] of water as the first menstruum, and completing the percolation with a mixture of 3 volumes of alcohol and 1 volume of water. Adjust the volume of the finished tincture by the addition of sufficient of the second menstruum to make each 100 cc. contain 0.25 Gm. of the alkaloids of nux vomica. Cool the Tincture in a proper container by exposure to a temperature of 5° C., and filter.

Assay—Proceed by Type Process D, taking 50 cc. of Tincture of Nux Vomica, use chloroform as the solvent, and determine the alkaloids volumetrically. Each cc. of tenth-normal sulphuric acid corresponds to 0.0364 Gm. of the alkaloids of nux vomica (Proximate Assays, pages 1498 and 1499).

Alcohol content, by volume, 67 to 72 per cent.

N. F. Preparation—Elixir Phosphori et Nucis Vomicæ.

Uses—A bitter tonic, useful in lack of tone in the gastro-intestinal area.

Average dose—15 minims (1 cc.).

TINCTURA OPII. U.S. Tincture of Opium

[**Tr. Opii.**—Tinctura Opii Deodorati U.S.P. IX, Laudanum, Tincture of Deodorized Opium, Denarcotized Tincture of Opium, Opii Tinctura P. I.]

Tincture of Opium yields, from each 100 cc., not less than 0.95 Gm. and not more than 1.05 Gm. of anhydrous morphine.

	Metric	Alternative
Granulated Opium	**100 Gm.**	3 oz. av. 148 gr.
Paraffin	**50 Gm.**	1 oz. av. 293 gr.
Alcohol	**200 cc.**	6 fl. oz. 192 min.
Water, a sufficient quantity,		
To make about	**1000 cc.**	2 pints

Heat 500 cc. [1 pint] of water to boiling, pour it on the granulated opium contained in a suitable vessel, and stir the mixture frequently during twenty-four hours. Transfer the mixture to a percolator, and, when the original menstruum has ceased to drop, continue the percolation slowly, gradually adding water until the opium is exhausted.

Concentrate the percolate by evaporation on a water bath until it measures 150 cc. [4 fl. oz. 384 min.], add the paraffin, and continue the heating until this is entirely melted. Beat the mixture thoroughly and set it aside to cool.

When cool, pierce a hole through the top layer of paraffin and drain off the liquid, add to this 600 cc. [19 fl. oz.] of water, and filter, add the alcohol to the filtered liquid, and wash the residual paraffin and the filter with small portions of water until the combined liquids measure 950 cc. [30½ fl. oz.].

Assay a portion of this liquid as directed below, and, from the morphine content thus determined, ascertain by calculation the amount of anhydrous morphine in the remainder of the liquid, and adjust the volume of the finished Tincture by the addition of a mixture of 1 volume of alcohol and 4 volumes of water, to make each 100 cc. contain 1 Gm. of anhydrous morphine.

The U. S. P. X dropped the old formula for Laudanum and recognizes but one Tincture of Opium, which meets every need. The treatment with paraffin denarcotizes the preparation, making it less likely to produce nausea than the older tincture.

Assay—Evaporate 80 cc. of Tincture of Opium on a water bath until the alcohol is removed. Then proceed as directed in the assay under *Opium*, pages 1498 and 1499, thirteenth line of the Assay, beginning with the word "transfer". The result of the assay indicates the amount of morphine obtained from 40 cc. of the Tincture of Opium.

Alcohol content, by volume, 17 to 19 per cent.

N. F. Preparations—Linimentum Opii Compositum; Lotio Plumbi et Opii; Mistura Carminativa; Mistura Copaibæ et Opii; Mistura Magnesiæ, Asafœtidæ et Opii; Mistura Opii et Chloroformi Composita; Mistura Opii et Rhei Composita; Tinctura Ipecacuanhæ et Opii; Tinctura Opii et Gambir Composita.

History—The name Laudanum was invented by Paracelsus who applied it to a solid preparation of secret composition. The Laudanum of the early editions of the London Pharmacopœia (17th century) were solid preparations of Opium.

The first liquid preparation of opium to be called Laudanum was the crocated tincture of opium now official in the N. F. and originated by Doctor Sydenham about 1670.

Black Drop or *Quaker Laudanum* were the synonyms for Vinegar of Opium which is no longer official, but which was originally three times the strength of ordinary laudanum.

The word laudanum, according to Quercetanus who wrote a pharmacopœia in 1619, is derived from the Latin *laudo* to praise, on account of the praiseworthy character of the remedy.

The original deodorized tincture of opium had its origin in a secret preparation made by a London druggist named Battley, under the name Liquor Opii Sedativus.

Uses—Employed whenever opium is indicated. It relieves violent pain, produces sleep, allays inflammation and irritation, and reduces secretions. The latter property explains its use in many diarrhea mixtures.

Average dose—10 minims (0.6 cc.).

Caution—This tincture is subject to the rules and regulations of the Narcotic Act and should never be used or dispensed without a physician's advice. (See Part VII.)

TINCTURA OPII CAMPHORATA. U.S. Camphorated Tincture of Opium

[Tr. Opii Camph.—Paregoric, Paregoric Elixir, Opii Tinctura Benzoici P. I.]

	Metric	Alternative
Powdered Opium	**4 Gm.**	**58 gr.**
Benzoic Acid	**4 Gm.**	**58 gr.**
Camphor	**4 Gm.**	**58 gr.**
Oil of Anise	**4 cc.**	**1 fl. dr.**
To make	**1000 cc.**	**2 pints**

Prepare a Tincture by Type Process M (page 366), macerating the ingredients in a mixture of 40 cc. [1 fl. oz. 134 min.] of glycerin and 950 cc. [30½ fl. oz.] of diluted alcohol, completing the preparation with diluted alcohol.

Alcohol content, by volume, 43 to 46 per cent.

U. S. P. Preparation—Mistura Glycyrrhizæ Composita.
N. F. Preparation—Mistura Pectoralis, Stoke's.

History—This preparation was originated by Professor LeMort of the University of Leyden about 1715. It was official in the 1721 edition of the London Pharmacopœia under the name *Elixir Asthmaticum*, which name was changed to *Elixir Paregoricum*, meaning soothing elixir, in 1746. It has also been known as *Tinctura Camphoræ Composita* and *Tinctura Opii Benzoica*, and the formula has changed in minor details many times since its introduction into medicine. The word Paregoric was used by the ancient writers on pharmacy and medicine in a generic sense to denote an anodyne or soothing preparation.

Uses—A mild anodyne in cough, nausea, and abdominal pains. It should never be used to quiet restless infants, as a habit may be induced. It contains 0.4 to 1 per cent of opium. Paregoric is one of the exempted preparations under the Narcotic Act, but its sale is subject to strict regulations under the Act, and the pharmacist is held strictly accountable for its legitimate distribution (see Part VII).

Average dose—1 fluidrachm (4 cc.).

TINCTURA RHEI. U. S. Tincture of Rhubarb

[Tr. Rhei]

	Metric	Alternative
Rhubarb, in moderately coarse powder	200 Gm.	6 oz. av. 296 gr.
Cardamom Seed, in moderately coarse powder	30 Gm.	1 oz. av.
To make	1000 cc.	2 pints

Prepare a Tincture by Type Process P (page 365), using a mixture of 100 cc. [3 fl. oz. 96 min.] of glycerin, 500 cc. [1 pint] of alcohol, and 400 cc. [12 fl. oz. 384 min.] of water as the first menstruum, completing the percolation with diluted alcohol.

Alcohol content, by volume, 43 to 46 per cent.

N. F. Preparation—Mistura Opii et Rhei Composita.

Uses—It is employed in constipation and diarrhea but rhubarb is usually administered in some other form than the tincture.

Average dose—1 fluidrachm (4 cc.).

TINCTURA RHEI AROMATICA. U. S. Aromatic Tincture of Rhubarb

[Tr. Rhei Arom.]

	Metric	Alternative
Rhubarb, in moderately coarse powder	200 Gm.	6 oz. av. 296 gr.
Cinnamon, in moderately coarse powder	40 Gm.	1 oz. av. 147 gr.
Clove, in moderately coarse powder	40 Gm.	1 oz. av. 147 gr.
Myristica, in moderately coarse powder	20 Gm.	292 gr.
To make	1000 cc.	2 pints

Prepare a Tincture by Type Process P (page 365), using a mixture of 100 cc. [3 fl. oz. 96 min.] of glycerin, 500 cc. [1 pint] of alcohol, and 400 cc.

[12 fl. oz. 384 min.] of water as the first menstruum, completing the percolation with diluted alcohol.

Alcohol content, by volume, 43 to 46 per cent.

U. S. P. Preparation—Syrupus Rhei Aromaticus.

Uses—Used almost exclusively in preparing the Compound Syrup of Rhubarb.

Average dose—1 fluidrachm (4 cc.).

TINCTURA SCILLÆ. U. S. Tincture of Squill

[Tr. Scill.]

Tincture of Squill, injected into the ventral lymph sac of a frog, has a minimum systolic dose of not less than 0.0055 cc. and not more than 0.0065 cc. equivalent to not less than 0.00,000,046 Gm. and not more than 0.00,000,054 Gm. of ouabain, for each Gm. of body weight of frog.

	Metric	Alternative
Squill, in coarse powder	**100 Gm.**	3 oz. av. 148 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make about	**1000 cc.**	2 pints

Moisten the drug with sufficient menstruum, prepared by mixing 3 volumes of alcohol and 1 volume of water, and macerate in a closed vessel in a moderately warm place for twenty-four hours, stirring occasionally. Then transfer it to a percolator, shake it down evenly without packing, and pour on enough of the menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for twenty-four hours. Then allow the percolation to proceed slowly, gradually adding sufficient of the same menstruum until the percolate measures 950 cc. [30½ fl. oz.].

Assay a portion of this percolate as directed below, and, from the result thus obtained, adjust the volume of the finished Tincture by the addition of menstruum to conform to the above biological standard.

Assay—Proceed as directed under Tinctura Digitalis, page 1504.

Alcohol content, by volume, 64 to 67 per cent.

NOTE—This is probably the best preparation of squill, as neither water nor acetic acid completely extracts the drug. Mucilage is present in such large proportion in the tissue of squill that the drug cannot be packed for percolation without blocking the flow of percolate, therefore the U. S. P. direction to "shake down evenly without packing".

Uses—As a diuretic and heart stimulant. Occasionally used in small doses for expectorant action.

Average dose—15 minims (1 cc.).

TINCTURA STRAMONII. U. S. Tincture of Stramonium

[Tr. Stramon.]

Tincture of Stramonium yields, from each 100 cc., not less than 0.0225 Gm. and not more than 0.0275 Gm. of the alkaloids of stramonium.

	Metric	Alternative
Stramonium, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
To make about	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P, as modified for assayed tinctures (page 365), using diluted alcohol as the menstruum, and adjust the volume of

the finished Tincture by the addition of diluted alcohol to make each 100 cc. contain 0.025 Gm. of the alkaloids of stramonium.

Assay—Proceed by Type Process D, taking 100 cc. of Tincture of Stramonium, use chloroform as the solvent, and determine the alkaloids volumetrically. Each cc. of tenth-normal sulphuric acid corresponds to 0.02893 Gm. of the alkaloids of stramonium (Proximate Assays, pages 1498 and 1499).

Alcohol content, by volume, 44 to 47 per cent.

Uses—Its uses are practically identical with those of belladonna. An anodyne and antispasmodic. Employed for checking excessive secretions.

Average dose—12 minims (0.75 cc.).

TINCTURA STROPHANTHI. U.S. Tincture of Strophanthus

[**Tr. Strophanth.**—STROPHANTHI TINCTURA P. I.]

Tincture of Strophanthus, injected into the ventral lymph sac of a frog, has a minimum systolic dose of not less than 0.00,005,5 cc. and not more than 0.00,006,5 cc., equivalent to not less than 0.00,000,046 Gm. and not more than 0.00,000,054 Gm. of ouabain, for each Gm. of body weight of frog.

	Metric	Alternative
Strophanthus, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
To make about	**1000 cc.**	2 pints

Pack the strophanthus in a cylindrical glass percolator, provided with a stop-cock and arranged with a cover and a receptacle suitable for volatile liquids, and percolate it slowly with purified petroleum benzin until a few drops of the percolate, evaporated from filter paper, leave no greasy stain. Reject the benzin percolate. Remove the powdered drug from the percolator, and expose it to the air until the odor of benzin is no longer noticeable. Prepare from this a tincture by Type Process P, as modified for assayed tinctures (page 365), using alcohol as the menstruum, and allowing the moistened drug to macerate for forty-eight hours before starting the percolation, instead of twenty-four hours as directed in Type Process P. Adjust the volume of the finished Tincture to conform to the above biological standard.

Assay—Proceed as directed under Tinctura Digitalis, page 1504.

Alcohol content, by volume, 88 to 92 per cent.

Uses—It belongs to the "digitalis group" and is used as a stimulant to circulation, especially in chronic heart weakness.

Average dose—8 minims (0.5 cc.).

TINCTURA TOLU. U.S. Tincture of Tolu

[**Tr. Tolu.**—TINCTURA TOLUTANA U.S.P. IX, TOLU TINCTURE]

	Metric	Alternative
Tolu	**200 Gm.**	6 oz. av. 296 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process M (page 366), using alcohol as the solvent.

Alcohol content, by volume, 80 to 85 per cent.

U. S. P. Preparation—Syrupus Tolu.

Uses—A balsamic preparation employed as an addition to expectorant mixtures. Also used in the preparation of the syrup and in applying a coating to oxidizable pills.

Average dose—30 minims (2 cc.).

TINCTURA VALERIANÆ. U.S. Tincture of Valerian

[Tr. Valer.]

	Metric	Alternative
Valerian, in moderately coarse powder	**200 Gm.**	6 oz. av. 296 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (page 365), using a mixture of 3 volumes of alcohol and 1 volume of water as the menstruum.

Alcohol content, by volume, 66 to 70 per cent.

Uses—A sedative used in nervous conditions, as in hysteria.

Average dose—1 fluidrachm (4 cc.).

TINCTURA VALERIANÆ AMMONIATA. U.S. Ammoniated Tincture of Valerian

[Tr. Valer. Ammon.]

	Metric	Alternative
Valerian, in moderately coarse powder	**200 Gm.**	6 oz. av. 296 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (page 365), using aromatic spirit of ammonia as the menstruum.

Alcohol content, by volume, 62 to 65 per cent.

Uses—The same as the simple tincture.

Average dose—30 minims (2 cc.).

TINCTURA VERATRI VIRIDIS. U.S. Tincture of Veratrum Viride

[Tr. Verat. Vir.]

	Metric	Alternative
Veratrum Viride, in moderately coarse powder	**100 Gm.**	6 oz. av. 296 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (page 365), using alcohol as the menstruum.

Alcohol content, by volume, 88 to 92 per cent.

Uses—Employed for the reduction of high blood pressure in arteriosclerosis and threatened apoplexy, also used in uremic convulsion and other conditions due to excessive blood pressure and to reduce over-activity of the heart.

Average dose—15 minims (1 cc.).

Norwood's Tincture of Veratrum, formerly largely used, contained about 40 per cent of veratrum. The U.S.P. tincture is now made exclusively from veratrum viride; veratrum album must be excluded.

TINCTURA ZINGIBERIS. U.S. Tincture of Ginger

[Tr. Zingib.—Tincture of Jamaica Ginger]

	Metric	Alternative
Ginger, in moderately coarse powder	**200 Gm.**	6 oz. av. 296 gr.
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (page 365), using a mixture of 850 cc. [27 fl. oz. 96 min.] of alcohol and 150 cc. [4 fl. oz. 384 min.] of water as the menstruum.

Test for Purity—Evaporate 10 cc. of Tincture of Ginger to dryness in a small flask. Add 5 cc. of half-normal alcoholic potassium hydroxide, and boil the mixture gently for thirty minutes under a reflux condenser. Remove the condenser, and evaporate the alcohol on a water bath. Then add 50 cc. of distilled water to the residue, agitate the mixture, filter, transfer the aqueous filtrate to a separatory funnel, and shake it out with 25 cc. of ether. Evaporate the separated ether solution spontaneously by adding it, a few drops at a time, to the center of a watch glass, and cautiously apply the tip of the tongue to the dry residue. The taste should be slightly camphoraceous but not sharp or bitingly pungent (*capsicum or similar pungent substitute*).

Alcohol content, by volume, 74 to 78 per cent.

Uses—A carminative and stomachic, and an adjuvant in diarrhea and tonic mixtures.

Average dose of the tincture—30 minims (2 cc.).

Tincture of ginger is classified as a beverage under the regulations governing the Volstead Act and cannot be sold except upon a physician's prescription. A double-strength tincture of ginger was formerly permitted to be sold without restriction but that privilege was withdrawn on January 1, 1926 (see Part VII). It was formerly largely used in domestic medicine, but no longer being available the fluidextract will doubtless take its place. *The dose of the fluidextract is 8 minims (0.5 cc.).*

TINCTURA ALOES. N. F. Tincture of Aloe

(U. S. P. IX)

[Tr. Aloes]

	Metric	Alternative
Aloe, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
Glycyrrhiza, in moderately coarse powder	**200 Gm.**	6 oz. av. 296 gr.
Diluted Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process M (see page 366), using diluted alcohol as the solvent.

Approximate alcohol content, by volume, 46 per cent.

Uses—A purgative.

Average dose—30 minims (2 cc.).

TINCTURA ALOES ET MYRRHÆ. N. F. Tincture of Aloe and Myrrh

[Tr. Aloe. et Myrrh.]

	Metric	Alternative
Aloe, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
Myrrh, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
Glycyrrhiza, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process M (see page 366), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 62 per cent.

History—This is an ancient preparation called *Elixir Proprietatis* which was extolled even as far back as the time of Paracelsus in the fifteenth century. It has been officially recognized ever since the 1724 edition of the London Pharmacopœia.

Uses—A purgative and emmenagogue.

Average dose—30 minims (2 cc.).

TINCTURA AMARA. N. F. Bitter Tincture

[Tr. Amar.—Stomachic Tincture, Bitter Stomachic Drops, Stomach Drops]

	Metric	Alternative
Gentian, in moderately coarse powder	**60 Gm.**	2 oz. av.
Centaury, in moderately coarse powder	**60 Gm.**	2 oz. av.
Bitter Orange Peel, in moderately coarse powder	**60 Gm.**	2 oz. av.
Zedoary, in moderately coarse powder	**20 Gm.**	292 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using a mixture of two volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 58 per cent.

Uses—A bitter tonic.

Average dose—30 minims (2 cc.).

TINCTURA ANTIMONII. N. F. Tincture of Antimony

(Replacing Vinum Antimonii N. F. IV)
(Strength of Vinum Stibiatum, P. I.)

[Tr. Antimon.]

	Metric	Alternative
Antimony and Potassium Tartrate	**4 Gm.**	58 gr.
Boiling Distilled Water	**25 cc.**	384 min.
Caramel	**2 cc.**	31 min.
Acetic Ether	**2 cc.**	31 min.
Alcohol	**200 cc.**	6 fl. oz. 192 min.
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the antimony and potassium tartrate in the boiling distilled water; add about 700 cc. [22 fl. oz.] of distilled water, the alcohol, caramel, and acetic ether, then add sufficient distilled water to make the product measure 1000 cc. [2 pints], and filter.

Note—Tincture of Antimony may be dispensed when Vinum Antimonii (Wine of Antimony) is ordered.

Approximate alcohol content, by volume, 18 per cent.

Uses—As a nauseating expectorant and sudorific.

Average dose—15 minims (1 cc.).

TINCTURA ANTIPERIODICA. N. F. Antiperiodic Tincture

[Tr. Antiperiod.—Warburg's Tincture]

	Metric	Alternative
Rhubarb, in moderately coarse powder	**8.00 Gm.**	117 gr.
Angelica Fruit, in moderately coarse powder	**8.00 Gm.**	117 gr.
Inula, in moderately coarse powder	**4.00 Gm.**	58 gr.
Saffron, in moderately coarse powder	**4.00 Gm.**	58 gr.
Fennel, in moderately coarse powder	**4.00 Gm.**	58 gr.
Gentian, in moderately coarse powder	**2.00 Gm.**	29 gr.
Zedoary, in moderately coarse powder	**2.00 Gm.**	29 gr.
Cubeb, in moderately coarse powder	**2.00 Gm.**	29 gr.
Myrrh, in coarse powder	**2.00 Gm.**	29 gr.
Camphor, in coarse powder	**2.00 Gm.**	29 gr.
Agaric, in moderately coarse powder	**2.00 Gm.**	29 gr.
Pepper, in moderately coarse powder	**0.35 Gm.**	5 gr.
Cinnamon, in moderately coarse powder	**0.75 Gm.**	11 gr.
Ginger, in moderately coarse powder	**0.75 Gm.**	11 gr.
Quinine Hydrochloride	**15.00 Gm.**	219 gr.
Aloe	**35.00 Gm.**	1 oz. av. 74 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix alcohol and water in the proportion of three volumes of alcohol and two volumes of water. Saturate the mixed drugs with the menstruum and having macerated them for twenty-four hours percolate them in the usual manner, until the Tincture measures 960 cc. [30 fl. oz. 346 min.]. In this dissolve the quinine hydrochloride and aloe by the aid of a gentle heat, and add sufficient menstruum to make the product measure 1000 cc. [2 pints]. Finally filter the Tincture through paper.

Approximate alcohol content, by volume, 55 per cent.

History—Warburg's Tincture was originated by Dr. Carl Warburg, an Austrian physician, about 1840 and acquired a large use, especially in India, for the treatment of malarial fevers. Its formula, published about 1875, was even more complex than here given. Although he used it as a nostrum or secret remedy, the Austrian Ministry of Health in 1848 required it to be kept in stock in all drug stores. Doctor Warburg later divulged the formula after having accumulated a large fortune, but he suffered reverses and died in England in comparative poverty about forty years ago.

Uses—It is an antiperiodic.

Dose—The dosage of Warburg's Tincture depends on the kind used—whether with aloe or without—and the intended purpose, and varies from 1 fluidrachm (4 cc.) to 4 fluidrachms (15 cc.). The larger quantity is given when Doctor Warburg's original directions are followed for administering the remedy in remittent fevers. These directions were as follows: "One-half ounce to be given alone, without dilution, after the bowels have been evacuated by any convenient purgative, all liquids being withheld. After three hours another half ounce is to be given."

TINCTURA ANTIPERIODICA SINE ALOE. N. F. Antiperiodic Tincture without Aloe

[Tr. Antiperiod. s. Aloe.—Warburg's Tincture without Aloe]

Prepare the Tincture as directed under *Tinctura Antiperiodica*, omitting the Aloe.

Approximate alcohol content, by volume, 55 per cent.

Dose—See *Tinctura Antiperiodica*.

Uses—An antiperiodic.

TINCTURA ARNICÆ. N. F. Tincture of Arnica

(U. S. P. IX)

[Tr. Arnic.]

	Metric	Alternative
Arnica, in coarse powder	**200 Gm.**	6 oz. av. 296 gr.
Diluted Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Moisten the drug with 500 cc. [1 pint] of diluted alcohol, transfer it to a percolator, and, without pressing the powder, allow it to stand well covered for twenty-four hours, then pack it with moderate pressure and allow the percolation to proceed slowly, pouring on additional diluted alcohol as needed. When the percolate measures 250 cc. [8 fl. oz.], stop the flow, macerate the drug for an additional twenty-hour hours, and then continue the percolation until the total percolate measures 500 cc. [1 pint]. Again interrupt the percolation, macerate the drug for another twelve hours and afterwards collect an additional 250 cc. [8 fl. oz.] of percolate. Again macerate the drug for twelve hours and then allow the percolation to proceed slowly, pouring on sufficient diluted alcohol to make 1000 cc. [2 pints] of Tincture.

Approximate alcohol content, by volume, 45 per cent.

Uses—Externally as an embrocation in bruises.

Average dose—15 minims (1 cc.).

TINCTURA AROMATICA. N. F. Aromatic Tincture

[Tr. Arom.]

	Metric	Alternative
Cinnamon, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
Ginger, in moderately coarse powder	**40 Gm.**	1 oz. av. 147 gr.
Galangal, in moderately coarse powder	**20 Gm.**	292 gr.
Clove, in coarse powder	**20 Gm.**	292 gr.
Cardamom Seed, in coarse powder	**20 Gm.**	292 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using a mixture of two volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 60 per cent.

Uses—A carminative and aromatic.

Average dose—30 minims (2 cc.).

TINCTURA BRYONIÆ. N. F. Tincture of Bryonia
[Tr. Bryon.]

	Metric	Alternative
Bryonia, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using alcohol as the menstruum.

Approximate alcohol content, by volume, 90 per cent.

Uses—A hydragogue cathartic employed in dropsy.

Average dose—1 fluidrachm (4 cc.).

TINCTURA CACTI GRANDIFLORI. N. F. Tincture of Cactus Grandiflorus
[Tr. Cact. Grand.]

	Metric	Alternative
Cactus Grandiflorus	**500 Gm.**	16 oz. av. 302 gr.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Cut the cactus grandiflorus and crush it in a mortar, then add 700 cc. [22½ fl. oz.] of alcohol, transfer the mixture to a closed vessel, and macerate for seven days with occasional agitation. Express the drug, measure the expressed liquid, and set it aside in a closed container. Pack the residue firmly in a percolator and slowly percolate it with alcohol until a sufficient quantity of percolate is obtained which when added to the reserved expressed liquid will make the product measure 1000 cc. [2 pints]. Filter the Tincture and store it in well-stoppered bottles, in a cool place.

In this tincture the fresh succulent stems of cactus grandiflorus must be used. These are preserved in alcohol until the tincture is to be made.

Approximate alcohol content, by volume, 75 per cent.

Uses—Claimed to be of value as a cardiac regulator in functional disorders of the heart.

Average dose—15 minims (1 cc.).

TINCTURA CALENDULÆ. N. F. Tincture of Calendula
[Tr. Calend.]

	Metric	Alternative
Calendula, in coarse powder	**200 Gm.**	6 oz. av. 296 gr.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using alcohol as the menstruum.

Approximate alcohol content, by volume, 90 per cent.

Uses—A feeble aromatic. Its extensive reputation for many years as an active remedy has been shown to have been without justification. The alcohol in the tincture is its most active constituent.

TINCTURA CAPSICI ET MYRRHÆ. N. F. Tincture of Capsicum and Myrrh
[Tr. Capsic. et Myrrh.—Hot Drops, Thomsonian Number Six]

	Metric	Alternative
Capsicum, in coarse powder	**30 Gm.**	1 oz. av.
Myrrh, in moderately coarse powder	**120 Gm.**	4 oz. av. 3 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the powders with an equal bulk of clean, fine sand, and prepare a Tincture by Type Process P (see page 365), using a mixture of nine volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 78 per cent.

History—This is one of the few surviving "Thomsonian preparations", a system of medicine founded by Dr. Samuel Thomson of Massachusetts about 1800, consisting chiefly of the use of steam baths and vegetable remedies, the most important of which were lobelia and capsicum. *Composition Powder* (see page 483) was another of the Thomsonian remedies.

Uses—A powerful gastric stimulant and carminative.

Average dose—30 minims (2 cc.).

TINCTURA CIMICIFUGÆ. N. F. Tincture of Cimicifuga

[Tr. Cimicif.]

	Metric	Alternative
Cimicifuga, in moderately coarse powder	**200 Gm.**	6 oz. av. 296 gr.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using alcohol as the menstruum.

Approximate alcohol content, by volume, 87 per cent.

Uses—Used for chorea or St. Vitus' dance, but with caution. An alterative and sedative in chronic rheumatic disorders.

Average dose—1 fluidrachm (4 cc.).

TINCTURA CINNAMOMI. N. F. Tincture of Cinnamon

(U. S. P. IX)

[Tr. Cinnam.]

	Metric	Alternative
Cinnamon, in coarse powder	**200 Gm.**	6 oz. av. 296 gr.
Glycerin,		
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using a mixture of 75 volumes of glycerin, 675 volumes of alcohol, and 250 volumes of water, as the menstruum.

Preparation—Elixir Taraxaci Compositum; Mistura Rhei Alkalina.

Approximate alcohol content, by volume, 63 per cent.

Uses—A flavoring agent used especially in diarrhea mixtures.

Average dose—30 minims (2 cc.).

TINCTURA COCCULI. N. F. Tincture of Cocculus

[Tr. Coccul.—Tinctura Cocculi Indici, N. F. IV]

	Metric	Alternative
Cocculus, in coarse powder	**100 Gm.**	3 oz. av. 148 gr.
Diluted Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 45 per cent.

Uses—This tincture is used almost exclusively for external application to destroy parasites.

TINCTURA COLCHICI CORMI FORTIS. N. F. Stronger Tincture of Colchicum Corm

(Replacing Vinum Colchici Cormi, N. F. IV)

[Tr. Colch. Corm. Fort.]

One hundred cc. of Stronger Tincture of Colchicum Corm yields not less than 0.126 Gm. and not more than 0.154 Gm. of colchicine.

	Metric	Alternative
Colchicum Corm, in moderately coarse powder	**400 Gm.**	13 oz. av. 154 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P, as modified for assayed Tinctures (see page 365), using a mixture of *one volume* of alcohol and *two volumes* of water as the menstruum, and adjust the finished tincture so that each 100 cc. contains 0.140 Gm. of colchicine.

Assay—Evaporate 37.5 cc. of Stronger Tincture of Colchicum Corm to 15 cc. and proceed as directed under Fluidextractum Colchici Cormi, rinsing the dish with a portion of the water there directed.

NOTE—Stronger Tincture of Colchicum Corm may be dispensed when Vinum Colchici Cormi is ordered.

Approximate alcohol content, by volume, 26 per cent.

Uses—In gout.

Average dose—10 minims (0.6 cc.).

TINCTURA CROCI. N. F. Tincture of Saffron

[Tr. Croc.]

	Metric	Alternative
Saffron	**100 Gm.**	3 oz. av. 148 gr.
Diluted Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 44 per cent.

Uses—Employed chiefly for its color and flavor.

TINCTURA CUBEBÆ. N. F. Tincture of Cubeb

[Tr. Cubeb.]

	Metric	Alternative
Cubeb, in coarse powder	**200 Gm.**	6 oz. av. 296 gr.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using alcohol as the menstruum.

Approximate alcohol content, by volume, 86 per cent.

Uses—A diuretic and carminative.

Average dose—1 fluidrachm (4 cc.).

TINCTURA DELPHINII. N. F. Tincture of Larkspur

[Tr. Delphin.]

	Metric	Alternative
Larkspur Seed, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using alcohol as the menstruum.

Approximate alcohol content, by volume, 90 per cent.

Uses—Tincture of Larkspur is rarely used internally, but is commonly employed externally to destroy parasites.

TINCTURA FERRI CHLORIDI ÆTHEREA. N. F. Ethereal Tincture of Ferric Chloride

[**Tr. Ferr. Chlor. Æth.**—Bestuscheff's Tincture, Lamotte's Drops]

An ethereal-alcoholic solution containing ferroso-ferric chloride corresponding to not less than 0.75 Gm. of Fe in each 100 cc.

	Metric	Alternative
Solution of Ferric Chloride	**60 cc.**	1 fl. oz. 442 min.
Ether	**250 cc.**	8 fl. oz.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the solution of ferric chloride with 625 cc. [20 fl. oz.] of alcohol, add the ether, and then sufficient alcohol to make the product measure 1000 cc. [2 pints]. Pour the Tincture into bottles made of flint glass, which should not be entirely filled, cork them tightly and expose them to the rays of the sun, until the liquid has been completely decolorized. Then remove the bottles from the sunlight and open them occasionally, until the liquid has again assumed a yellow color.

Preserve the Tincture in a cool and dark place.

Assay—Evaporate 25 cc. of Ethereal Tincture of Ferric Chloride, accurately measured, to dryness in an evaporating dish on a water bath. Dissolve the residue in 5 cc. of hydrochloric acid and 10 cc. of solution of hydrogen dioxide and evaporate this solution to dryness on a water bath. Dissolve the residue in 25 cc. of warm distilled water, transfer this solution to a 250 cc. glass-stoppered flask, add about 1 Gm. of potassium iodide and allow the mixture to stand for thirty minutes at a temperature of 40° C. Cool the liquid, add 100 cc. of distilled water, and titrate the liberated iodine with tenth-normal sodium thiosulphate. Each cc. of tenth-normal sodium thiosulphate consumed corresponds to 0.005584 Gm. of Fe.

Approximate alcohol content, by volume, 65 per cent.

History—The secret of the formula of this preparation was purchased from Count Bestoujeff (this name has been anglicized to Bestuscheff or Bestucheff, both being found in literature) by Catherine II of Russia in the eighteenth century. It had been known by the name *Tinctura Tonica Nervina Bestucheffi.*

The same preparation had been purchased a short time before by Louis XV of France who pensioned its alleged originator, La Motte, by paying him 4000 livres a year. The preparation at this time was selling at the rate of about $5.00 for a half ounce bottle.

Uses—An iron tonic.

Average dose—30 minims (2 cc.).

TINCTURA FERRI CITROCHLORIDI. N. F. Tincture of Ferric Citrochloride

[**Tr. Ferr. Citrochlor.**—Tasteless Tincture of Ferric Chloride, Tasteless Tincture of Iron]

A hydro-alcoholic solution containing ferric citrochloride corresponding to not less than 4.48 Gm. of Fe in each 100 cc.

	Metric	Alternative
Solution of Ferric Chloride	**350 cc.**	11 fl. oz. 96 min.
Sodium Citrate	**450 Gm.**	15 oz. av. 9 gr.
Alcohol	**150 cc.**	4 fl. oz. 384 min.
Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the solution of ferric chloride with 150 cc. [4 fl. oz.] of water, and dissolve the sodium citrate in this mixture with the aid of a gentle heat. Then add the alcohol, and when the solution has become cold, add sufficient water to make the product measure 1000 cc. [2 pints]. Set the Tincture aside in a cold place for a few days, so that the excess of saline matter may separate, and then filter.

Preserve the Tincture in amber-colored bottles.

Assay—Evaporate 5 cc. of Tincture of Ferric Citrochloride, accurately measured, to dryness in an evaporating dish on a water bath. Dissolve the residue in 5 cc. of hydrochloric acid and 10 cc. of solution of hydrogen dioxide and evaporate this solution to dryness on a water bath. Dissolve the residue in 25 cc. of warm distilled water, transfer the solution to a 250 cc. glass-stoppered flask, add 3 cc. of hydrochloric acid and about 1 Gm. of potassium iodide and allow the mixture to stand for thirty minutes at a temperature of 40° C. Cool the solution, add 100 cc. of distilled water and titrate the liberated iodine with tenth-normal sodium thiosulphate. Each cc. of tenth-normal sodium thiosulphate used corresponds to 0.005584 Gm. of Fe.

N. F. Preparations—Elixir Ferri, Quininæ et Strychninæ; Elixir Gentianæ et Ferri; Liquor Ferri Salicylatis.

Approximate alcohol content, by volume, 14 per cent.

Uses—An iron tonic, employed where tannins are likely to be present, since this form of iron only slightly darkens the preparation.

Average dose—8 minims (0.5 cc.).

The iron solution must not be excessively acid or the characteristic green color will not develop. The U. S. P. test for limit of free acid will check this factor. The direction about aging before use is important if subsequent precipitation is to be avoided.

TINCTURA FERRI POMATA. N. F. Tincture of Ferrated Extract of Apple

[Tr. Ferr. Pomat.—Tinctura Ferri Malatis Crudi, Tincture of Crude Malate of Iron]

	Metric	Alternative
Ferrated Extract of Apple	**100 Gm.**	3 oz. av. 148 gr.
Alcohol	**100 cc.**	3 fl. oz. 96 min.
Cinnamon Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the ferrated extract of apple in 750 cc. [24 fl. oz.] of cinnamon water, add the alcohol, filter, and pass sufficient cinnamon water through the filter to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 9 per cent.

Uses—A hematinic containing iron in the form of malate.

Average dose—1 fluidrachm (4 cc.).

TINCTURA GALLÆ. N. F. Tincture of Nutgall

[Tr. Gall.]

	Metric	Alternative
Nutgall, in moderately coarse powder	**200 Gm.**	6 oz av. 296 gr.
Glycerin,		
Alcohol, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process M (see page 366), using a mixture of nine volumes of alcohol and one volume of glycerin as the menstruum.

Approximate alcohol content, by volume, 85 per cent.

Uses—An astringent.

Average dose—1 fluidrachm (4 cc.).

TINCTURA GELSEMII. N. F. Tincture of Gelsemium

(U. S. P. IX)

[Tr. Gelsem.]

	Metric	Alternative
Gelsemium, in fine powder	**100 Gm.**	3 oz. av. 148 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using a mixture of 65 volumes of alcohol and 35 volumes of water as the menstruum.

Approximate alcohol content, by volume, 60 per cent.

Uses—In neuralgia.

Average dose—4 minims (0.25 cc.).

TINCTURA GUAIACI. N. F. Tincture of Guaiac
[U. S. P. IX]
[Tr. Guaiac.]

	Metric	Alternative
Guaiac, in moderately coarse powder	200 Gm.	6 oz. av. 296 gr.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Prepare a Tincture by Type Process M (see page 366), using alcohol as the solvent.

Approximate alcohol content, by volume, 80 per cent.

Uses—In chronic rheumatism and gout.

Average dose—1 fluidrachm (4 cc.).

TINCTURA GUAIACI AMMONIATA. N. F. Ammoniated Tincture of Guaiac
(U. S. P. IX)
[Tr. Guaiac. Ammon.]

	Metric	Alternative
Guaiac, in moderately coarse powder	200 Gm.	6 oz. av. 296 gr.
Aromatic Spirit of Ammonia, a sufficient quantity,		
To make	1000 cc.	2 pints

Prepare a Tincture by Type Process M (see page 366), using aromatic spirit of ammonia as the menstruum.

N. F. Preparation—Gargarisma Guaiaci Compositum.

Approximate alcohol content, by volume, 60 per cent.

Uses—In chronic rheumatism and amenorrhea.

Average dose—30 minims (2 cc.).

TINCTURA GUAIACI COMPOSITA. N. F. Compound Tincture of Guaiac
[Tr. Guaiac. Co.—Dewees' Tincture of Guaiac]

	Metric	Alternative
Guaiac	125 Gm.	4 oz. av. 75 gr.
Potassium Carbonate	6 Gm.	88 gr.
Pimenta, in fine powder	32 Gm.	1 oz. av. 30 gr.
Pumice, in fine powder	65 Gm.	2 oz. av. 74 gr.
Alcohol	435 cc.	13 fl. oz. 442 min.
Water	435 cc.	13 fl. oz. 442 min.
Diluted Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Triturate the guaiac and potassium carbonate with the pimenta and the pumice, and afterwards with the alcohol, gradually added. Then add the water slowly and triturate the mixture thoroughly. Allow the mixture to macerate during twenty-four hours, then filter and pass sufficient diluted alcohol through the filter to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 45 per cent.

Uses—Employed in rheumatism and as an emmenagogue.

Average dose—1 fluidrachm (4 cc.).

TINCTURA HUMULI. N. F. Tincture of Hop
[Tr. Humul.]

	Metric	Alternative
Hop, in coarse powder	200 Gm.	6 oz. av. 296 gr.
Diluted Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Prepare a Tincture by Type Process P (see page 365), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 45 per cent.

Uses—A bitter tonic and nerve sedative.

Average dose—1 fluidrachm (4 cc.).

TINCTURA HYDRASTIS. N. F. Tincture of Hydrastis
(U. S. P. IX)

[Tr. Hydrast.—Tincture of Golden Seal]

One hundred cc. of Tincture of Hydrastis yields not less than 0.36 Gm. and not more than 0.44 Gm. of the ether-soluble alkaloids of hydrastis.

	Metric	Alternative
Hydrastis, in fine powder	**200 Gm.**	6 oz. av. 296 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P, as modified for assayed tinctures (see page 365), using a mixture of two volumes of alcohol and *one volume* of water as the menstruum and adjusting the volume of the finished Tincture so that each 100 cc. contains 0.4 Gm. of the ether-soluble alkaloids of hydrastis.

Assay—Evaporate 50 cc. of Tincture of Hydrastis to about 10 cc., transfer the concentrated fluid to a separator and estimate the alkaloids according to Type Process D (see page 1496), using the total extraction method, and ether as the solvent. Determine the alkaloids gravimetrically after drying at 100° C.
This assay is explained on page 1500.

Approximate alcohol content, by volume, 60 per cent.

Uses—Locally in various catarrhs; internally in disorders of the stomach.

Average dose—1 fluidrachm (4 cc.).

TINCTURA IGNATIÆ. N. F. Tincture of Ignatia
[Tr. Ignat.]

One hundred cc. of Tincture of Ignatia yields not less than 0.18 Gm. and not more than 0.22 Gm. of the alkaloids of ignatia.

	Metric	Alternative
Ignatia, in fine powder	**100 Gm.**	3 oz. av. 148 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make about	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P, as modified for assayed tinctures (see page 365), using a mixture of eight volumes of alcohol and one volume of water as the menstruum, and adjusting the volume of the finished Tincture so that each 100 cc. contains 0.20 Gm. of the alkaloids of ignatia.

Assay—Evaporate 100 cc. of Tincture of Ignatia on a water bath until it measures about 10 cc., transfer the concentrated fluid to a separator and estimate the alkaloids according to Type Process D (see page 1496), using the total-extraction method, and chloroform as the solvent. Determine the alkaloids volumetrically. Each cc. of tenth-normal acid corresponds to 0.0364 Gm. of the alkaloids of ignatia.
This assay is explained on page 1500.

Approximate alcohol content, by volume, 80 per cent.

Uses—It contains the alkaloids strychnine and brucine and has the same medicinal uses as nux vomica.

Average dose—10 minims (0.6 cc.).

TINCTURA IODIDORUM. N. F. Tincture of Iodides

[Tr. Iodidor.—Tinctura Iodi Decolorata N. F. IV, Decolorized Tincture of Iodine]

	Metric	Alternative
Iodine	**50 Gm.**	1 oz. av. 293 gr.
Potassium Iodide	**25 Gm.**	365 gr.
Stronger Ammonia Water	**100 cc.**	3 fl. oz. 96 min.
Water	**400 cc.**	12 fl. oz. 384 min.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the potassium iodide in the water; add the iodine and 400 cc. [12 fl. oz. 384 min.] of alcohol, and agitate the mixture frequently until the iodine is completely dissolved. Add the stronger ammonia water and set the mixture aside until it becomes colorless. Then add sufficient alcohol to make the product measure 1000 cc. [2 pints], and filter.

Approximate alcohol content, by volume, 45 per cent.

Uses—This tincture was intended to provide the effects of iodine without the objectionable staining. However, as the iodine is converted into ammonium iodide, it possesses little if any therapeutic value when applied externally.

TINCTURA IODI FORTIOR. N. F. Stronger Tincture of Iodine

[Tr. Iod. Fort.—Churchill's Tincture of Iodine]

An alcoholic solution of iodine and potassium iodide containing not less than 16 Gm. and not more than 17 Gm. of I (126.92) and not less than 3 Gm. and not more than 4 Gm. of KI (166.02) in each 100 cc.

	Metric	Alternative
Iodine	**165 Gm.**	5 oz. av. 222 gr.
Potassium Iodide	**35 Gm.**	1 oz. av. 74 gr.
Water	**250 cc.**	8 fl. oz.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Dissolve the potassium iodide in the water; add the iodine and 600 cc. [19 fl. oz. 96 min.] of alcohol and agitate the mixture frequently until the iodine is completely dissolved. Then add sufficient alcohol to make the product measure 1000 cc. [2 pints], and mix well.

Assay for Potassium Iodide—Evaporate 10 cc. of Stronger Tincture of Iodine in a tared porcelain dish on a water bath and gently heat the residue over a flame to volatilize the iodine; it leaves a residue weighing not less than 0.3 Gm. and not more than 0.4 Gm. which corresponds to the identity tests for Potassium Iodide.

This assay is explained on page 1476.

Assay for Iodine—Mix 2 cc. of Stronger Tincture of Iodine, accurately measured, with 25 cc. of distilled water and titrate the solution with tenth-normal sodium thiosulphate. Each cc. of tenth-normal sodium thiosulphate consumed corresponds to 0.01269 Gm. of I.

This assay is explained on page 1469.

Approximate alcohol content, by volume, 62 per cent.

Uses—A discutient and counterirritant. It is more than double the strength of the U. S. P. Tincture of Iodine, but the uses are similar.

TINCTURA IPECACUANHÆ. N. F. Tincture of Ipecac

(Replacing Vinum Ipecacuanhæ, N. F. IV)

[Tinct. Ipecac.—Tinctura Ipecacuanhæ, P. I.]

One hundred cc. of Tincture of Ipecac yields not less than 0.135 Gm. and not more than 0.165 Gm. of the ether soluble alkaloids of ipecac.

	Metric	Alternative
Fluidextract of Ipecac	**100 cc.**	3 fl. oz. 96 min.
Alcohol	**200 cc.**	6 fl. oz. 192 min.
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the alcohol with 600 cc. [19 fl. oz.] of distilled water, add the fluidextract of ipecac and then sufficient distilled water to make the product measure 1000 cc. [2 pints]. Filter.

Note—Tincture of Ipecac may be dispensed when Vinum Ipecacuanhæ (Wine of Ipecac) is ordered.

Assay—Assay 50 cc. of the Tincture by Type Process D (see page 1496), using the direct extraction method, with ether as the solvent, and estimating the alkaloids volumetrically. Each cc. of tenth-normal acid corresponds to 0.024 Gm. of the ether-soluble alkaloids of Ipecac.

This assay is explained on page 1500.

Approximate alcohol content, by volume, 21 per cent.

Uses—Nauseating expectorant and diaphoretic.

Average dose—15 minims (1 cc.).

TINCTURA IPECACUANHÆ ET OPII. N. F. Tincture of Ipecac and Opium

[Tr. Ipecac et Opii—TINCTURE OF DOVER'S POWDER]

	Metric	Alternative
Tincture of Opium	1000 cc.	2 pints
Fluidextract of Ipecac	100 cc.	3 fl. oz. 96 min.
Diluted Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Evaporate the tincture of opium in a tared dish on a water bath, until it measures 580 cc. [18 fl. oz. 269 min.]. When it has become cold, add to it the fluidextract of ipecac and sufficient diluted alcohol to make the product measure 1000 cc. [2 pints], and filter.

N. F. Preparation—Syrupus Ipecacuanhæ et Opii.

Approximate alcohol content, by volume, 17 per cent.

Uses—A diaphoretic and anodyne.

Average dose—8 minims (0.5 cc.).
One average dose represents:
0.50 cc. or 8 minims of Tincture of Opium.

TINCTURA JALAPÆ. N. F. Tincture of Jalap

[Tr. Jalap.]

One hundred cubic centimeters of Tincture of Jalap yields not less than 1.3 Gm., and not more than 1.5 Gm. of the resin of jalap.

	Metric	Alternative
Jalap, in fine powder	200 Gm.	6 oz. av. 296 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make about	1000 cc.	2 pints

Prepare a Tincture by Type Process P (see page 365), using a mixture of two volumes of alcohol and one volume of water, as the menstruum, and adjusting the volume of the finished Tincture to contain 1.4 Gm. of the resin of jalap in each 100 cc.

Assay—Mix 10 cc. of Tincture of Jalap with 10 cc. of alcohol and 10 cc. of chloroform, in a separator, and proceed as directed under Fluidextractum Jalapæ, page 430.

Approximate alcohol content, by volume, 60 per cent.

Uses—A cathartic.

Average dose—1 fluidrachm (4 cc.).

TINCTURA JALAPÆ COMPOSITA. N. F. Compound Tincture of Jalap

[Tr. Jalap. Co.]

	Metric	Alternative
Jalap, in fine powder	125 Gm.	4 oz. av. 75 gr.
Resin of Ipomea, in fine powder	30 Gm.	1 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the powders with half their weight of clean sand and prepare a Tincture by Type Process P (see page 365), using a mixture of two volumes of alcohol and one volume of water as the menstruum.

Assay—Mix 10 cc. of Compound Tincture of Jalap with 10 cc. of alcohol and 10 cc. of chloroform, in a separator, and proceed as directed under Fluidextractum Jalapæ, page 430. The 10 cc. of Compound Tincture of Jalap yields not less than 0.3 Gm. of resin.

Approximate alcohol content, by volume, 60 per cent.

Uses—A purgative.

Average dose—1 fluidrachm (4 cc.).

TINCTURA OPII CROCATA. N. F. Tincture of Opium with Saffron

[Tr. Opii Crocat.—Sydenham's Laudanum, Tinctura Opii Crocata P. I.]

One hundred cc. of Tincture of Opium with Saffron yields not less than 0.95 Gm. and not more than 1.05 Gm. of anhydrous morphine.

	Metric	Alternative
Granulated Opium	100 Gm.	3 oz. av. 148 gr.
Saffron, in coarse powder	25 Gm.	365 gr.
Cinnamon, in fine powder	6 Gm.	88 gr.
Clove, in coarse powder	6 Gm.	88 gr.
Diluted Alcohol, a sufficient quantity,		
To make about	1000 cc.	2 pints

Mix the drugs with about an equal bulk of clean sand and prepare a Tincture by Type Process P, as modified for assayed tinctures (see page 365), using diluted alcohol as the menstruum and adjusting the volume of the finished Tincture so that each 100 cc. will contain 1 Gm. of anhydrous morphine.

Assay—Evaporate 80 cc. of Tincture of Opium with Saffron on a water bath until the alcohol is all removed. Transfer the extract to a 50 cc. graduated flask and wash the evaporating dish with sufficient distilled water to make the entire volume measure exactly 50 cc. when cooled to room temperature. Place in a small mortar 4 Gm. of freshly slaked lime, add about 10 cc. of the opium solution and rub to a smooth paste, then add the remainder of the solution and rinse the flask with exactly 10 cc. of distilled water, adding the rinsings to the mortar and stir frequently during fifteen minutes. Filter through a dry filter, about 10 cm. in diameter, and transfer exactly 30 cc. of the filtrate, representing 40 cc. of the Tincture, to an Erlenmeyer flask of suitable capacity. To this add 2 cc. of alcohol and 15 cc. of ether, and, after shaking the mixture, add 1 Gm. of ammonium chloride, stopper the flask and shake it frequently during half an hour, then set it aside in a cool place for twelve hours, or over night. Remove the stopper and brush any adhering crystals back into the flask. Decant the ethereal layer into a small funnel, the neck of which has been previously closed with a pledget of purified cotton. Rinse the flask and contents with 15 cc. of ether, and, when the ether has passed through, wash the funnel and cotton with a small quantity of ether and then pour the aqueous liquid into the funnel without trying to remove the crystals. Wash the crystals in the flask and the contents of the funnel with distilled water, previously saturated with morphine until the washings are colorless. Then add a few drops of distilled water to replace the morphinated water. Incline the edge of the funnel over the mouth of the flask and by means of a glass rod carefully transfer the cotton with adhering crystals to the flask. Insert the funnel into the neck of the flask and wash the funnel with 20 cc. of tenth-normal sulphuric acid, followed by 10 cc. of distilled water, applied drop by drop around the edge of the funnel. Remove the funnel, replace the cork, warm gently and agitate until the crystals are dissolved. Rinse the cork with distilled water and titrate the excess of acid with fiftieth-normal potassium hydroxide, cochineal T.S. or methyl red T.S. being used as indicator. Each cc. of tenth-normal sulphuric acid corresponds to 0.0285 Gm. of anhydrous morphine.

This assay is explained on page 1500.

Approximate alcohol content, by volume, 44 per cent.

Uses—A sedative. Its uses are identical with those of Tinctura Opii (see page 378).

Average dose—10 minims (0.6 cc.).

TINCTURA OPII ET GAMBIR COMPOSITA. N. F. Compound Tincture of Opium and Gambir

[Tr. Opii et Gambir Co.—Tinctura Pectoralis N. F. IV, Guttæ Pectorales, Pectoral Drops, Bateman's Pectoral Drops]

	Metric	Alternative
Tincture of Opium	42 cc.	1 fl. oz. 165 min.
Compound Tincture of Gambir	64 cc.	2 fl. oz. 23 min.
Spirit of Camphor	40 cc.	1 fl. oz. 134 min.
Oil of Anise	1 cc.	15 min.
Caramel	10 cc.	154 min.
Diluted Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Mix the several ingredients with sufficient diluted alcohol to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 40 per cent.

Uses—This preparation although called "pectoral drops", is more suitable for intestinal than for pectoral complaints.

Average dose—For infants, 10 minims (0.6 cc.).

One average dose represents:

0.025 cc. or ⅔ minim of Tincture of Opium.

TINCTURA PASSIFLORÆ. N. F. Tincture of Passion Flower

[Tr. Passiflor.]

	Metric	Alternative
Passion Flower, in coarse powder	**200 Gm.**	6 oz. av. 296 gr.
Diluted Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 45 per cent.

Uses—Employed in neuralgia, dysmenorrhea, and diarrhea; and used as an analgesic and anodyne.

Average dose—15 minims (1 cc.).

TINCTURA PERSIONIS. N. F. Tincture of Cudbear

[Tr. Persion.]

	Metric	Alternative
Cudbear, in fine powder	**100 Gm.**	3 oz. av. 148 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the cudbear with about twice its volume of clean sand and prepare a Tincture by Type Process P (see page 365), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 70 per cent.

N. F. Preparation—Syrupus Phosphatum Compositus.

Uses—Employed only as a purplish-red coloring agent in syrups and elixirs.

TINCTURA PERSIONIS COMPOSITA. N. F. Compound Tincture of Cudbear

[Tr. Persion. Co.]

	Metric	Alternative
Cudbear, in fine powder	**15 Gm.**	219 gr.
Caramel	**100 Gm.**	3 oz. av. 148 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix one volume of alcohol with two volumes of water and macerate the cudbear with 750 cc. [24 fl. oz.] of this menstruum during twelve hours, agitating occasionally. Then filter, add the caramel, previously dissolved in 125 cc. [4 fl. oz.] of the menstruum, and finally pass enough of the menstruum through the filter to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 26 per cent.

N. F. Preparations—Elixir Ammonii Valeratis; Elixir Cinchonæ Alkaloidorum; Syrupus Bromidorum.

Uses—A reddish-brown coloring agent for syrups and elixirs.

TINCTURA PULSATILLÆ. N. F. Tincture of Pulsatilla

[Tr. Pulsatil.]

	Metric	Alternative
Pulsatilla, in moderately coarse powder	**100 Gm.**	3 oz. av. 148 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using a mixture of three volumes of alcohol with one volume of water as the menstruum.

Approximate alcohol content, by volume, 70 per cent.

Uses—Employed as an alterative and antispasmodic, but of uncertain value.

Average dose—30 minims (2 cc.).

TINCTURA QUASSIÆ. N. F. Tincture of Quassia
(U. S. P. IX)
[Tr. Quas.]

	Metric	Alternative
Quassia, in moderately coarse powder	200 Gm.	6 oz. av. 296 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 cc.	2 pints

Prepare a Tincture by Type Process P (see page 365), using a mixture of one volume of alcohol and two volumes of water as the menstruum.

Approximate alcohol content, by volume, 30 per cent.

Uses—A simple bitter.

Average dose—30 minims (2 cc.).

TINCTURA QUILLAJÆ. N. F. Tincture of Quillaja
[Tr. Quilaj.]

	Metric	Alternative
Quillaja, in coarse powder	200 Gm.	6 oz. av. 296 gr.
Alcohol	350 cc.	11 fl. oz. 96 min.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Boil the quillaja in a covered vessel with 800 cc. [25 fl. oz. 288 min.] of water for fifteen minutes, strain while hot, and wash the residue on the strainer with 200 cc. [6 fl. oz. 192 min.] of boiling water. Then evaporate the strained liquid to 600 cc. [19 fl. oz. 96 min.], allow it to cool, add the alcohol, and set it aside for twelve hours. Decant the supernatant liquid, filter it, then pour the residue on the filter, and, when the liquid ceases to drop, wash the filter with sufficient water to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 30 per cent.

Uses—It is an efficient emulsifying agent but too active an irritant to use in medicinal emulsions such as those of cod liver oil.

TINCTURA RHEI AQUOSA. N. F. Aqueous Tincture of Rhubarb
[Tr. Rhei Aq.]

	Metric	Alternative
Rhubarb	100 Gm.	3 oz. av. 148 gr.
Potassium Carbonate	10 Gm.	146 gr.
Cinnamon Water	125 cc.	4 fl. oz.
Alcohol	110 cc.	3 fl. oz. 250 min.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the potassium carbonate in 750 cc. [24 fl. oz.] of water and macerate the rhubarb in this solution during twenty-four hours, having first cut it into thin slices and carefully freed it from any adhering fine powder. Strain this mixture through muslin, heat the strained liquid to boiling, add the cinnamon water and alcohol, stir it well and, while warm, filter it in a covered funnel. To the cold filtrate add sufficient water to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 10 per cent.

Uses—A cathartic.

Average dose—1 fluidrachm (4 cc.).

TINCTURA RHEI DULCIS. N. F. Sweet Tincture of Rhubarb
[Tr. Rhei Dulc.]

	Metric	Alternative
Rhubarb, in moderately coarse powder	100 Gm.	3 oz. av. 148 gr.
Glycyrrhiza, in moderately coarse powder	40 Gm.	1 oz. av. 147 gr.
Anise, in coarse powder	40 Gm.	1 oz. av. 147 gr.
Cardamom Seed, in coarse powder	10 Gm.	146 gr.
Glycerin	100 cc.	3 fl. oz. 96 min.
Alcohol,		
Water,		
Diluted Alcohol, each, a sufficient quantity,		
To make	1000 cc.	2 pints

Prepare a Tincture by Type Process P (see page 365), using first a menstruum of 1000 cc. [3 fl. oz. 96 min.] of glycerin, 500 cc. [1 pint] of alcohol, and 400 cc. [12 fl. oz. 384 min.] of water and following with sufficient diluted alcohol to obtain 1000 cc. [2 pints] of Tincture.

Approximate alcohol content, by volume, 45 per cent.

Uses—A laxative and carminative.

Average dose—30 minims (2 cc.).

TINCTURA RHEI ET GENTIANÆ. N. F. Tincture of Rhubarb and Gentian

[Tr. Rhei et Gent.]

	Metric	Alternative
Rhubarb, in moderately coarse powder	**70.0 Gm.**	2 oz. av. 147 gr.
Gentian, in moderately coarse powder	**17.5 Gm.**	255 gr.
Diluted Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 45 per cent.

Uses—A laxative and tonic.

Average dose—1 fluidrachm (4 cc.).

TINCTURA SABAL ET SANTALI. N. F. Tincture of Saw Palmetto and Sandal Wood

[Tr. Sabal et Santal.]

	Metric	Alternative
Sabal, in coarse powder	**200 Gm.**	6 oz. av. 296 gr.
Sandalwood, in fine powder	**65 Gm.**	2 oz. av. 74 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), using a mixture of four volumes of alcohol and one volume of water as the menstruum, and allowing a preliminary maceration of forty-eight hours.

Approximate alcohol content, by volume, 72 per cent.

Uses—Employed in urethral irritation as an antiseptic and sedative.

Average dose—1 fluidrachm (4 cc.).

TINCTURA SANGUINARIÆ. N. F. Tincture of Sanguinaria

(U. S. P. IX)

[Tr. Sanguin.—TINCTURE OF BLOODROOT]

	Metric	Alternative
Sanguinaria, in fine powder	**100 Gm.**	3 oz. av. 148 gr.
Hydrochloric Acid	**10 cc.**	154 min.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix 600 cc. [19 fl. oz. 96 min.] of alcohol with 400 cc. [12 fl. oz. 384 min.] of water. Moisten the drug with a mixture of the hydrochloric acid and 30 cc. [461 min.] of this menstruum, transfer it to a percolator, and, without pressing the powder, allow it to stand, well covered, for six hours; then pack it firmly and pour on enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for twenty-four hours. Then allow the percolation to proceed slowly, pouring on sufficient menstruum, made of alcohol and water, in the same proportion as before, to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 56 per cent.

Uses—Alterative and expectorant.

Average dose—15 minims (1 cc.).

TINCTURA SERPENTARIÆ. N. F. Tincture of Serpentaria

[Tr. Serpent.]

	Metric	Alternative
Serpentaria, in moderately coarse powder	200 Gm.	6 oz. av. 296 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 cc.	2 pints

Prepare a Tincture by Type Process P (see page 365), using a mixture of two volumes of alcohol with one volume of water as the menstruum.

Approximate alcohol content, by volume, 60 per cent.

Uses—A bitter tonic.

Average dose—1 fluidrachm (4 cc.).

TINCTURA SUMBUL. N. F. Tincture of Sumbul

[Tr. Sumbul]

	Metric	Alternative
Sumbul, in moderately coarse powder	100 Gm.	3 oz. av. 148 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 cc.	2 pints

Prepare a Tincture by Type Process P (see page 365), using a mixture of two volumes of alcohol with one volume of water as the menstruum.

Approximate alcohol content, by volume, 60 per cent.

Uses—A nervine, employed especially for women in cases of nervous exhaustion.

Average dose—1 fluidrachm (4 cc.).

TINCTURA VANILLÆ. N. F. Tincture of Vanilla

[Tr. Vanil.]

	Metric	Alternative
Vanilla, cut into small pieces	100 Gm.	3 oz. av. 148 gr.
Sucrose, in coarse granules	200 Gm.	6 oz. av. 296 gr.
Alcohol,		
Diluted Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 cc.	2 pints

Macerate the vanilla with 500 cc. [1 pint] of alcohol in a stoppered container, in a moderately warm place for two days, with frequent agitation; then transfer it to a plain filter and reserve the filtered liquid. Spread out the drug on the filter and expose it to the air until all of the alcohol has evaporated. Then grind the vanilla and sucrose to a uniform powder, pack this in a percolator and slowly percolate it with a mixture of the reserved filtrate and an equal volume of water. When the liquid ceases to drop, continue the percolation slowly, gradually adding the remainder of the prepared menstruum and then sufficient diluted alcohol to make the product measure 1000 cc. [2 pints].

Approximate alcohol content, by volume, 40 per cent.

N. F. Preparations—Elixir Ammonii Valeratis; Emulsum Olei Ricini; Syrupus Bromidorum; Syrupus Cacao Præparati; Tabellæ Santonini; Tabellæ Santonini Compositæ.

Uses—A flavoring agent.

TINCTURA VIBURNI OPULI COMPOSITA. N. F. Compound Tincture of Viburnum

[Tr. Viburn. Opul. Co.]

	Metric	Alternative
Viburnum Opulus, in moderately coarse powder	35 Gm.	1 oz. av. 74 gr.
Dioscorea, in moderately coarse powder	35 Gm.	1 oz. av. 74 gr.
Scutellaria, in moderately coarse powder	10 Gm.	146 gr.
Clove, in coarse powder	50 Gm.	1 oz. av. 293 gr.
Cinnamon, in moderately coarse powder	65 Gm.	2 oz. av. 220 gr.
Glycerin	75 cc.	2 fl. oz. 192 min.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 cc.	2 pints

Prepare a Tincture by Type Process P (see page 365), using a mixture of 75 cc. [2 fl. oz. 192 min.] of glycerin, 750 cc. [24 fl. oz.] of alcohol, and 175 cc. [5 fl. oz. 288 min.] of water as the first menstruum, and following with sufficient of a mixture of three volumes of alcohol and one volume of water to obtain 1000 cc. [2 pints] of Tincture.

Approximate alcohol content, by volume, 68 per cent.

Uses—Employed in dysmenorrhea, but of doubtful value.

Average dose—1 fluidrachm (4 cc.).

TINCTURÆ ÆTHEREÆ. N. F. Ethereal Tinctures

Ethereal Tinctures, when not otherwise directed, are to be prepared according to the following general formula.

	Metric	Alternative
The Drug, properly comminuted	**100 Gm.**	3 oz. av. 148 gr.
Alcohol,		
Ether, each, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process P (see page 365), but with proper precautions to avoid loss of menstruum by evaporation, using a mixture of one volume of ether, and two volumes of alcohol as the menstruum.

TINCTURÆ MEDICAMENTORUM RECENTIUM. N. F. Tinctures of Fresh Drugs [Tincturæ Herbarum Recentium]

Tinctures of fresh drugs, when not otherwise directed, are to be prepared according to the following general formula:

	Metric	Alternative
The Fresh Drug, cut, bruised, or crushed	**500 Gm.**	16 oz. av. 302 gr.
Alcohol, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Prepare a Tincture by Type Process M (see page 366), using alcohol as the menstruum, and macerating fourteen days.

Uses—Tinctures of fresh drugs are largely employed in Homeopathic practice and closely resemble the *succi* or *juices* of the British Pharmacopœia.

Table of Some Unofficial Tinctures

Title	*Directions*
Tinctura Alstoniæ (Br. 1914)	Macerate 125 Gm. of alstonia, No. 20 powder, with enough 60 per cent alcohol to make 1000 cc. Dose: thirty minims (2 cc.)
Arnicæ Radicis (U. S. P. 1890)	Percolate 100 Gm. of aconite root, No. 40 powder, with enough 65 per cent alcohol to make 1000 cc. Dose: thirty minims (2 cc.)
Berberidis (Br. 1914)	Percolate 100 Gm. of berberis, No. 60 powder, with enough 60 per cent alcohol to make 1000 cc. Dose: thirty minims (2 cc.)
Buchu (Br. 1914)	Percolate 200 Gm. of buchu leaves, No. 20 powder, with enough 60 per cent alcohol to make 1000 cc. Dose: one fluidrachm (4 cc.)
Cannabis (U. S. P. IX)	Not more than 0.3 cc. tincture per kilogram body weight should be required to produce incoordination when administered to dogs. Percolate 100 Gm. of cannabis, No. 40 powder, with enough alcohol to make 950 cc. Assay and adjust to the above standard (see page for details of assay) Dose: twelve minims (0.75 cc.)
Caramellis (N. F. IV)	Dissolve 10 Gm. of caramel in 50 cc. of water, add 25 cc. of alcohol and enough water to make 100 cc.
Cascarillæ (Br. 1914)	Percolate 200 Gm. of Cascarilla, No. 40 powder, with enough 70 per cent alcohol to make 1000 cc. Dose: thirty minims (2 cc.)
Chiratæ, Br. 1924 (U. S. P. 1890)	Percolate 100 Gm. of chirata, No. 40 powder, with enough 60 per cent alcohol to make 1000 cc. Dose: one fluidrachm (4 cc.)
Chloroformi et Morphinæ Composita (Br. 1914)	Mix 7.5 cc. of chloroform, 2.5 cc. tincture of capsicum, 10 cc. tincture of indian hemp, 0.2 cc. oil of peppermint and 25 cc. of glycerin with 45 cc. of alcohol, dissolve 1 Gm. of morphine hydrochloride in the mixture, add 5 cc. diluted hydrocyanic acid and enough alcohol to make 100 cc. Dose: five minims (0.3 cc.)
Cocci (Br. 1914)	Macerate 100 Gm. cochineal powder for seven days in enough 45 per cent alcohol to make 1000 cc. Dose: twenty minims (1.3 cc.)
Daturæ Seminum (Br. 1914)	Percolate 250 Gm. of datura seeds, No. 20 powder, with enough 70 per cent alcohol to make 1000 cc. Dose: five minims (0.3 cc.)

Table of Some Unofficial Tinctures—*Continued*

Title	*Directions*
Tinctura Ergotæ ammoniata (N. F. IV)	Percolate 250 Gm. of ergot, No. 20 powder, first with a mixture of 100 cc. ammonia water, 600 cc. of alcohol and 200 cc. of water and then with enough 60 per cent alcohol to make 1000 cc. Dose: one fluidrachm (4 cc.)
Hamamelidis (Br. 1914)	Percolate 100 Gm. of hamamelis bark, No. 20 powder, with enough 45 per cent alcohol to make 1000 cc. Dose: thirty minims (2 cc.)
Kaladanæ (Br. 1914)	Percolate 200 Gm. of kaladana, No. 40 powder, with enough 70 per cent alcohol to make 1000 cc. Dose: thirty minims (2 cc.)
Kino et Opii Composita (N. F. IV)	Triturate 8.5 Gm. of cochineal with 8 cc. of aromatic spirit of ammonia and gradually add 625 cc. of diluted alcohol. Then add 200 cc. tincture of kino, 100 cc. of tincture of opium, 65 cc. spirit of camphor, 1.5 cc. oil of clove and enough diluted alcohol to make 1000 cc. Filter Dose: one fluidrachm (4 cc.)
Lactucarii (U. S. P. IX)	Triturate 500 Gm. lactucarium to a coarse powder with sand, exhaust with benzin, dry thoroughly, percolate first with a mixture of 250 cc. of glycerin, 250 cc. of water and 500 cc. of alcohol and then diluted alcohol, until the drug is exhausted. Reserve the first 750 cc. and evaporate the remainder to 250 cc. and mix with the reserve. Filter Dose: thirty minims (2 cc.)
Lobeliæ Ætherea (Br. 1914)	Percolate 200 Gm. of lobelia, No. 40 powder, with enough spirit of ether to make 1000 cc. Dose: five minims (0.3 cc.)
Matico (U. S. P. 1890)	Percolate 100 Gm. of matico, No. 40 powder, with enough diluted alcohol to make 1000 cc. Dose: forty-five grains (3 Gm.)
Moschi (U. S. P. IX)	Macerate 5 Gm. of musk with 45 cc. of water for twenty-four hours, then add 45 cc. of alcohol and macerate for six days, filter and add diluted alcohol to make 1000 cc. Dose: one fluidrachm (4 cc.)
Oliveri Corticis (Br. 1914)	Percolate 100 Gm. of Oliver's bark, No. 40 powder, with enough 60 per cent alcohol to make 1000 cc. Dose: thirty minims (2 cc.)
Opii Ammoniata (Br. 1914)	Dissolve 5 cc. of oil of anise and 20 Gm. benzoic acid in 600 cc. of alcohol, add 150 cc. tincture of opium, 200 cc. solution of ammonia (10 per cent); filter and add enough alcohol to make 1000 cc. Dose: thirty minims (2 cc.)
Paracoto (N. F. IV)	Percolate 125 Gm. paracoto, No. 40 powder, with enough alcohol to make 1000 cc. Dose: thirty minims (2 cc.)
Pectoralis (N. F. IV)	Mix 42 cc. tincture of opium, 64 cc. compound tincture of gambir, 40 cc. spirit of camphor, 1 cc. oil of anise and 16 Gm. caramel with enough diluted alcohol to make 1000 cc. Dose: ten minims (0.6 cc.)
Physostigmatis (U. S. P. IX)	One hundred cc. of tincture yields not less than 0.013 and not more than 0.017 Gm. of alkaloids. Percolate 100 Gm. of physostigma, No. 50 powder, with alcohol, collecting 950 cc. of percolate, assaying and regulating to the above standard Dose: fifteen minims (1 cc.)
Picrorhizæ (Br. 1914)	Macerate 250 Gm. picrorhiza, cut and bruised, with enough 45 per cent alcohol to make 1000 cc. Dose: thirty minims (2 cc.)
Pimpinellæ (N. F. IV)	Percolate 200 Gm. of pimpinella, No. 40 powder, with enough 60 per cent alcohol to make 1000 cc. Dose: one fluidrachm (4 cc.)
Podophylli (Br. 1914)	Macerate 36.5 Gm. of resin of podophyllum with 900 cc. of alcohol for twenty-four hours, filter and add enough alcohol to make 1000 cc. Dose: five minims (0.3 cc.)
Podophylli Indici (Br. 1914)	Macerate 36.5 Gm. of indian podophyllum resin with enough alcohol to make 1000 cc. Dose: five minims (0.3 cc.)
Pruni Virginianæ (Br. 1914)	Macerate 200 Gm. of wild cherry bark with 365 cc. of distilled water for twenty-four hours, add 565 cc. of alcohol and macerate seven days; strain, express and add 100 cc. of glycerin Dose: thirty minims (2 cc.)
Pyrethri (U. S. P. IX)	Percolate 200 Gm. pyrethrum, No. 50 powder, with enough alcohol to make 1000 cc.
Quininæ (Br. 1914)	Dissolve 20 Gm. of quinine hydrochloride in 1000 cc. of tincture of orange Dose: one fluidrachm (4 cc.)
Quininæ Ammoniata (Br. 1914)	Mix 100 cc. of solution of ammonia (10 per cent) with 900 cc. of 60 per cent alcohol, add 20 Gm. of quinine sulphate and shake until a clear solution results, set aside for three days and filter Dose: one fluidrachm (4 cc.)
Senegæ (Br. 1914)	Percolate 200 Gm. of senega, No. 40 powder, with enough 60 per cent alcohol to make 1000 cc. Dose: thirty minims (2 cc.)
Sennæ Composita (Br. 1914)	Percolate 200 Gm. of senna leaves, 25 Gm. caraway fruit and 25 Gm. of coriander fruit, all No. 20 powder, with enough 45 per cent alcohol to make 1000 cc. Dose: two fluidrachms (8 cc.)
Stramonii (Br. 1914)	Percolate 200 Gm. of stramonium leaves, No. 20 powder, with enough 45 per cent alcohol to make 1000 cc. Dose: ten minims (0.6 cc.)
Zedoariæ Amara (N. F. IV)	Percolate 250 Gm. of zedoary, 125 Gm. aloes, 62 Gm. of rhubarb, 62 Gm. of gentian, 62 Gm. agaric and 62 Gm. saffron with enough 60 per cent alcohol to make 750 cc. Add 125 cc. glycerin and set aside. Continue percolation to exhaustion, evaporate the last percolate to 120 cc. Mix with reserved portion and add enough 60 per cent alcohol to make 1000 cc. Dose: one fluidrachm (4 cc.)

Fluidextracta—*Fluidextracts*

Fluidextracts are liquid alcoholic preparations of uniform and definite strength, made by percolating drugs with menstrua, and concentrating a portion of the percolate so that in each case one cc. represents the medicinal virtues of one Gm. of the drug; they are mostly concentrated percolates. Fluidextracts were official for the first time in 1850, and the list was then made up of *seven* concentrated preparations, although but *one* of these could be called a fluidextract within the present meaning of the term. The use of fluidextracts has greatly increased, although they are not as frequently prescribed today as was the custom twenty years ago. They are, however, frequently recommended by manufacturing pharmacists as concentrated drug preparations for making tinctures and syrups, but official processes should not be replaced by any such makeshift. The U. S. P. X contains formulas for *twenty-five* and the N. F. V for *one hundred and four* fluidextracts. They may be justly called "American preparations", their development being largely due to the investigations of American pharmacists. The striking advantages possessed by fluidextracts are: 1. Permanence. 2. Concentration. 3. The uniform relation existing between the fluidextract and the drug.

In the U. S. P., one word, "Fluidextractum", has been adopted in place of two words, "Extractum Fluidum", formerly used. The object of this change was to avoid the confusion heretofore existing due to the alphabetical arrangement, which compelled Fluidextracts to be printed with the Extracts; thus, "Extractum Rhei" had to be followed by "Extractum Rhei Fluidum". By making the Latin name for fluidextracts "Fluidextractum", these preparations are now under the letter F instead of E. The English name is, of course, "Fluidextract" instead of "Fluid Extract".

Permanence is secured by the use of alcoholic menstrua; formerly, sugar and glycerin were relied upon as preservatives, but continued experience has developed the value of alcohol, so that at present it is most largely used as the solvent. Glycerin, however, is used in the menstruum of some fluidextracts, notably those containing tannin, and has a tendency to retard precipitation.

Concentration enables the physician to decrease the bulk of the dose, diminishing the volume of the preparation so that portability is secured and any therapeutic action from the menstruum largely eliminated. It also aids greatly in securing permanence.

The uniform relation existing between the fluidextract and the drug is of great assistance to the physician in fixing the dose, because, as 1 cc. represents 1 Gm. of drug, the dose of the fluidextract must be practically the same as that of the drug. It has also obvious advantages in the arrangement of the formulas and in working from them.

Many able pharmacists have favored making fluidextracts just half their present strength, the principal arguments being that more thorough exhaustion can be secured by the ordinary operator upon the small scale, and that the fluidextracts can be made to represent the drug more accurately and honestly when *one hundred* parts by measure are made from *fifty* parts by weight of the drug than when one hundred parts by measure are made from one hundred parts by weight of the drug. The standard of strength of the official fluidextracts is based upon the theory that from a given weight of drug an amount of fluidextract shall be made equal in measure to the bulk of the same weight of distilled water; in other words, the relation is that of Gm. to cc.

The official fluidextracts are standardized whenever made from a drug capable of being assayed either chemically or biologically.

Preparation—Fluidextracts are made in several ways. The manufacturer generally adopts a different process from that directed by the Pharmacopœia, because upon the large scale some practical modifications are necessary; the finished preparation must, however, be brought to the official standard. The processes at present in use may be classified as follows: 1. Percolation with partial evaporation. 2. Fractional or divided percolation. 3. Hot water exhaustion, evaporation, and preservation.

In the preparation of fluidextracts by the appended type processes A, B, or C, the rate of percolation must be carefully controlled and, for the quantities directed in the formulas of the Pharmacopœia, the flow should not exceed ten drops per minute until the percolate to be reserved is collected, and twenty drops per minute thereafter. One thousand Gm. of powdered drug may frequently be exhausted by percolation with sufficient menstruum to yield 3000 cc. of percolate, but, in all cases the percolation should be continued until the drug is practically exhausted.

1. **Percolation and Partial Evaporation**—This process is well illustrated by the official Type Processes A and B as follows:

"*Type Process A*—This process is recommended for fluidextracts that are made with a menstruum of alcohol, or a mixture of alcohol and water, by the usual process of percolation.

"Moisten 1000 Gm. [16 oz. av. 302 gr.] of the powdered drug directed with a sufficient quantity of the prescribed menstruum to render it evenly and distinctly damp and to so maintain it during maceration for six hours in a tightly-covered container. Then pack it in a cylindrical percolator, and add enough of the menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed slowly, gradually adding more menstruum until the drug is exhausted. Reserve the first 850 cc. [13 fl. oz. 288 min.] of the percolate (unless otherwise specified in the formula), recover the alcohol from the remainder of the percolate, and concentrate the residue to a soft extract at a temperature not exceeding 60° C. Dissolve the extract in the reserved portion, mix thoroughly, and finally add a sufficient quantity of the menstruum to make the fluidextract measure 1000 cc. [1 pint] or the volume determined by calculation from the assay."

"*Type Process B*—This process is recommended for fluidextracts in which glycerin or an acid is used in the extraction and two menstrua are successively employed.

"Moisten 1000 Gm. [16 oz. av. 302 gr.] of the powdered drug directed with a sufficient quantity of the prescribed Menstruum I to render it evenly and distinctly damp and to so maintain it during maceration for six hours in a tightly covered container. Then pack it in a cylindrical percolator, add the remainder of Menstruum I, and when this has just disappeared from the surface, gradually add Menstruum II, constantly maintaining a stratum of liquid above the drug. When the liquid begins to drop from the percolator, close the lower orifice and, having closely covered the percolator, macerate for forty-eight hours, and then allow the percolation to proceed slowly, gradually adding Menstruum II until the drug is exhausted. Reserve the first 850 cc. [13 fl. oz. 288 min.] of the percolate (unless otherwise specified in the formula), recover the alcohol from the remainder of the percolate, and concentrate the residue to a soft extract at a temperature not exceeding 60° C. Dissolve the extract in the reserved portion, mix thoroughly, and finally add a sufficient quantity

of Menstruum II to make the fluidextract measure 1000 cc. [1 pint] or the volume determined by calculation from the assay."

The precipitation experienced heretofore when the evaporated weak percolate was added to the reserved portion is considerably diminished by causing the former to be evaporated to a soft extract. This precipitation, formerly noticed more particularly in alcoholic fluidextracts, was due to the volatility of the alcohol in the weak percolates, which, when evaporated, left the residue to a great extent aqueous; when this residue was added to the strongly alcoholic reserved portion, a precipitation of resinous and frequently of active matter took place, which necessitated the storing of the fluidextract until precipitation ceased, and subsequent filtration. This is almost altogether avoided by evaporating to a soft extract, and the loss of activity through precipitation is thus greatly diminished.

The argument is frequently advanced that the application of heat is detrimental to solutions of organic principles, that it dissociates some, and always proves injurious to the desirable constituents, *and that no heat whatever should be used in making fluidextracts;* these views are undoubtedly correct, when considered in connection with a few special cases, but do not apply with any practical force to the moderate use of heat where recommended by the official processes upon that portion of the percolate which represents the least active and least desirable constituents of the drug, for from seven-tenths to nine-tenths of the whole amount of percolate (frequently representing ninety-five per cent of the activity of the drug) is reserved and is not subjected to heat at all. The official process of "fractional percolation" may, however, be applied to any fluidextract directed to be made by Type Process A and by this method the application of all heat is avoided. This process will now be considered:

2. **Fractional or Divided Percolation**—"*Type Process C*—This process is especially recommended for drugs containing volatile constituents or constituents which are injured by exposure to heat. This process may also be used as an alternative process in the formulas in which Type Process A is directed.

"Divide 1000 Gm. [16 oz. av. 302 gr.] of the powdered drug directed into three portions of 500 Gm., 300 Gm., and 200 Gm. [8 oz. av. 151 gr., 5 oz. av. 3 gr., 3 oz. av. 148 gr.], respectively. Moisten the first portion of the drug (500 Gm.) [8 oz. av. 151 gr.] with a sufficient quantity of the prescribed menstruum to render it evenly and distinctly damp and to so maintain it during maceration for six hours in a tightly-covered container. Then pack it in a cylindrical percolator, and add enough of the menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours, and then allow the percolation to proceed slowly, gradually adding more of the menstruum. Reserve the first 200 cc. [3 fl. oz. 96 min.] of percolate, and continue the process until the additional percolate measures 1500 cc. [24 fl. oz.], the latter being collected in successive portions of 300 cc. [4¾ fl. oz.] each.

"Moisten the second portion of the powdered drug (300 Gm.) [5 oz. av. 3 gr.] with a sufficient quantity of the percolate collected in the preceding operation, immediately after the reserved portion, to render it evenly and distinctly damp and to so maintain it during maceration for six hours in a tightly covered container. Then pack it in a cylindrical percolator, macerate, and percolate as directed for the first portion of the drug, using as menstruum the several portions of percolate from the preceding operation in the order in which they were collected, and, if this is insufficient, follow with more of the original menstruum. Reserve the first 300 cc. [4¾ fl. oz.] of percolate, and continue the

process until the additional percolate measures 800 cc. [12¾ fl. oz.], the latter being collected in successive portions of 200 cc. [3 fl. oz.] each.

"Moisten the third portion of the powdered drug (200 Gm.) [3 oz. av. 148 gr.] with a sufficient quantity of the percolate collected in the preceding operation, immediately after the reserved portion, to render it evenly and distinctly damp and to so maintain it during maceration for six hours in a tightly-covered container. Then pack it in a cylindrical percolator, macerate, and percolate as before, using as menstruum the several portions of percolate from the preceding operation in the order in which they were collected, and, if this is insufficient, follow with more of the original menstruum. Collect 500 cc. [8 fl. oz.] of percolate, and mix this with the two portions previously reserved to make 1000 cc. [1 pint] of finished fluidextract.

"When Type Process C is directed for fluidextracts which are adjusted by assay to a definite alkaloidal standard, collect only 420 cc. [6 fl. oz. 346 min.] of percolate from the third portion of drug instead of the 500 cc. [8 fl. oz.] directed above. Mix this percolate with the two portions previously reserved, assay a portion of the mixture and adjust its volume by the addition of the menstruum directed so that each 100 cc. of finished fluidextract will contain the prescribed amount of alkaloid."

The credit for the development of the fractional percolation method, which so ingeniously avoids the use of heat, is given Dr. E. R. Squibb.* It is recommended officially for the preparation of fluidextract of aconite, in which heat would be injurious, rendering the alkaloid inactive, and also by both the U. S. P. and the N. F. for any fluidextract for which Type Process A is directed.

3. **Hot Water Exhaustion and Evaporation**—This method has been adopted for several official fluidextracts in which the active constituents are soluble in water. The making of fluidextracts by this process is very economical and may be used to advantage by retail pharmacists. It is directed in the U. S. P. for such drugs as cascara sagrada. The process is as follows:

"*Type Process D*—This process is recommended for those fluidextracts in which extraction is effected by infusion and percolation with boiling water, alcohol being added to the concentrated liquid as a preservative.

"To 1000 Gm. [16 oz. av. 302 gr.] of the ground drug add 5000 cc. [5 pints] of boiling water, mix thoroughly, and allow it to macerate in a covered container in a warm place for two hours. Then transfer the moist drug to a tinned or enamelled metallic percolator, and allow percolation to proceed, gradually adding boiling water until the drug is exhausted. Evaporate the percolate on a water bath or steam bath to the volume specified, and when cold add the alcohol directed, and mix thoroughly. Allow the product to stand for seven days in a stoppered container, then decant the clear liquid, filter the remainder, and wash the residue on the filter with sufficient of a mixture of alcohol and water in the proportion used to make the fluidextract measure 1000 cc. [1 pint]."

Preservation of Fluidextracts—Very little trouble is experienced in keeping fluidextracts which have been properly made. The Pharmacopœia directs that they "should be kept in tightly-stoppered, amber-colored bottles, protected from sunlight and extremes of temperature. After keeping for one month, the clear portion should be decanted from any sediment, the remainder filtered, and the liquids thoroughly mixed before storing". Precipitation to a greater or less extent will certainly take place. This is often especially noticeable in fluidextracts made during warm weather, and is due to the greater solvent action of the menstruum at higher temperatures. Precipitation is also caused

*The Theory of Percolation by James F. Couch, A. J. P. Vol. 92, page 862.

by the variation in the strength of different portions of the menstruum in an alcoholic fluidextract; the first part of the percolate which is received contains the displaced water which was present as moisture in the powder, and the mixture of this with the strong alcoholic percolate which follows causes precipitation in time. The character of the precipitate should be ascertained in each case; if active, it should be incorporated by shaking with the fluidextract; if inert, it should be filtered out.

Some manufacturers make a practice of aging and storing fluidextracts in glass-lined or enameled tanks. Experience has shown, however, that tight wooden containers (alcohol barrels are excellent for the purpose) are preferable, as fluidextracts aged in wood will remain clear and free from sedimentation much longer than those aged in glass or enameled vessels.

Acetic Fluidextracts, or Fluidacetracts—These were proposed by C. F. Squibb, and consist of preparations made like fluidextracts of definite strength, Gm. for cc., but made with acetic acid or diluted acetic acid of various strengths. The advantages claimed for them are cheapness, permanence, and miscibility with aqueous liquids but they have the disadvantage of the presence of acetic acid, which is not always desirable, and the loading of the finished preparation with inert constituents for which acetic acid is a good solvent. This class of preparations has not gained much favor.

Fluidextracts from Fresh Drugs—Fluidextracts of this character have been used to some extent, and may be made by crushing the drug, obtaining the liquid by pressure, and adding alcohol or diluted alcohol, according to the nature of the drug, re-pressing, and making the final product represent one gram in each cc. Owing to the varying proportion of water found in fresh drugs, it is evident that each preparation must be made from a special formula, and the quantity of alcohol to be added must depend upon the amount of water present in the drug; for drugs containing princip es which are volatile or easily dissociated, this method produces good preparations, but unusual care must be exercised to secure uniformity.

Alcoholic Percentage of Fluidextracts—The National Food and Drugs Act of 1906 requires that the percentage of alcohol by volume, in all preparations containing alcohol, be stated on the label. The percentage of alcohol in fluidextracts made by type process A, B, or C, is variable and always less than that in the menstruum employed, due, among other causes, to loss of alcohol by evaporation during manufacture, the presence of a variable proportion of water in the air-dried drug, and to the extraction from the drug of its soluble constituents, which also often vary greatly in different lots of the same drug. The percentage of alcohol in the finished product can therefore only be ascertained by an actual determination, but the average alcohol content is given after each official fluidextract (see Alcohol Determination page 908).

FLUIDEXTRACTUM BELLADONNÆ FOLIORUM. U.S. Fluidextract of Belladonna Leaves

[Fldext. Bellad. Fol.]

Fluidextract of Belladonna Leaves yields, from each 100 cc., not less than 0.27 Gm. and not more than 0.33 Gm. of the total alkaloids of belladonna leaves.

	Metric	Alternative
Belladonna Leaves, in moderately coarse powder.....	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a fluidextract by Type Process A (page 403), using a mixture of 3 volumes of alcohol and 1 volume of water as the menstruum, and reserving the first 800 cc. [12 fl. oz. 384 min.] of percolate.

After dissolving the soft extract in the reserve liquid, assay a portion as directed below, and from the result thus obtained ascertain by calculation the amount of alkaloids in the remainder of the liquid, and dilute this with sufficient menstruum to make each 100 cc. of the finished Fluidextract contain 0.3 Gm. of the alkaloids of belladonna leaves.

Assay—Proceed by Type Process D, taking 10 cc. of Fluidextract of Belladonna Leaves, using chloroform as the solvent and determine the alkaloids volumetrically. Each cc. of tenth-normal acid corresponds to 0.02893 Gm. of the alkaloids of belladonna (Proximate Assays, pages 1498 and 1496).

Alcohol content, by volume, 58 to 63 per cent.

Uses—Employed as an anodyne, locally in neuralgia and nerve pains; as an antispasmodic, for checking secretions, as in coryza, night sweats, and excessive milk; also, as a narcotic and mydriatic.

Average dose—1 minim (0.06 cc.).

FLUIDEXTRACTUM BELLADONNÆ RADICIS. Fluidextract of Belladonna Root [Fldext. Bellad. Rad.]

Fluidextract of Belladonna Root yields, from each 100 cc., not less than 0.405 Gm. and not more than 0.495 Gm. of the alkaloids of belladonna root.

	Metric	Alternative
Belladonna Root, in moderately coarse powder.....	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (page 403), using a mixture of 5 volumes of alcohol and 1 volume of water as the menstruum, and reserving the first 800 cc. [12 fl. oz. 384 min.] of the percolate.

After dissolving the soft extract in the reserve liquid, assay a portion as directed below, and from the result thus obtained ascertain by calculation the amount of alkaloids in the remainder of the liquid, and dilute this with enough menstruum to make each 100 cc. of the finished Fluidextract contain 0.45 Gm. of the alkaloids of belladonna root.

Assay—Proceed by Type Process D, taking 10 cc. of Fluidextract of Belladonna Root, using chloroform as the solvent, and determine the alkaloids volumetrically. Each cc. of tenth-normal acid corresponds to 0.02893 Gm. of the alkaloids of belladonna (Proximate Assays, pages 1498 and 1497).

Alcohol content, by volume, 69 to 73 per cent.

N. F. Preparation—Linimentum Belladonnæ.

Uses—Employed as an anodyne, locally in neuralgia and nerve pains; as an antispasmodic, for checking secretions, as in coryza, night sweats, and excessive milk; also, as a narcotic and mydriatic.

Average dose—¾ minim (0.05 cc.).

FLUIDEXTRACTUM BUCHU. U.S. Fluidextract of Buchu [Fldext. Buchu.]

	Metric	Alternative
Buchu, in moderately coarse powder.....	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (page 403), using alcohol as the menstruum.

Alcohol content, by volume, 78 to 84 per cent.

N. F. Preparations—Elixir Buchu; Elixir Buchu et Potassii Acetatis; Elixir Buchu, Juniperi et Potassii Acetatis.

Uses—In inflammations of the bladder. This is probably the best form for the administration of the drug.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM CANNABIS. U.S. Fluidextract of Cannabis
[Fldext. Cannab.]

Fluidextract of Cannabis, administered by the mouth to dogs in doses not exceeding 0.1 cc. for each kilogram of body weight of dog, produces the same degree of incoördination as that produced by an equivalent dose of the standard fluidextract of cannabis, prepared as directed under *Cannabis*.

	Metric	Alternative
Cannabis, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (page 403), using alcohol as the menstruum.

After dissolving the soft extract in the reserve liquid, assay a portion as directed below, and from the result thus obtained adjust the volume of the finished Fluidextract by the addition of alcohol to conform to the above biological standard.

See page 1507 for the assay.

Alcohol content, by volume, 75 to 85 per cent.

N. F. Preparation—Collodium Salicylicum Compositum.

Uses—An analgesic in headache and neuralgia; as a sedative in neuralgia and neurasthenia and sometimes as a hypnotic. Its tendency to form a habit must not be forgotten.

Average dose—1½ minims (0.1 cc.).

FLUIDEXTRACTUM CASCARÆ SAGRADÆ. U.S. Fluidextract of Cascara Sagrada
[Fldext. Casc. Sagr.—Fluidextract of Rhamnus Purshiana]

	Metric	Alternative
Cascara Sagrada, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process D (page 405). Evaporate the aqueous percolate to 750 cc. [12 fl. oz.] and when cold gradually add 250 cc. [4 fl. oz.] of alcohol and, if necessary, sufficient water to make the product measure 1000 cc. [16 fl. oz.].

Alcohol content, by volume, 20 to 24 per cent.

Uses—A mild and effective cathartic, especially valuable because it does not produce habitual or after-constipation. Although this preparation is intensely bitter, it is sometimes desired for its stomachic effect.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM CASCARÆ SAGRADÆ AROMATICUM. U.S. Aromatic Fluidextract of Cascara Sagrada
[Fldext. Casc. Sagr. Arom.—Aromatic Fluidextract of Rhamnus Purshiana]

	Metric	Alternative
Cascara Sagrada, in coarse powder	**1000.0 Gm.**	33 oz. av. 167 gr.
Magnesium Oxide	**60.0 Gm.**	2 oz. av.
Lime	**60.0 Gm.**	2 oz. av.
Pure Extract of Glycyrrhiza	**40.0 Gm.**	1 oz. av. 147 gr.
Glycerin	**200.0 cc.**	6 oz. av. 192 min.
Alcohol	**200.0 cc.**	6 oz. av. 192 min.
Gluside	**1.0 Gm.**	15 gr.
Oil of Anise	**2.5 cc.**	38 min.
Oil of Cinnamon	**0.2 cc.**	3 min.
Oil of Coriander	**0.1 cc.**	1½ min.
Methyl Salicylate	**0.2 cc.**	3 min.
Boiling Water, a sufficient quantity		
To make	**1000 cc.**	2 pints

Slake the lime by the gradual addition of water, mix it thoroughly with the cascara sagrada and the magnesium oxide, moisten uniformly with 2000 cc. [4 pints] of boiling water, set aside in a shallow dish for forty-eight hours, stirring occasionally, and then pack in a percolator. Now pour on boiling water and allow the percolation to proceed until the drug is exhausted. Evaporate the percolate to 500 cc. [1 pint] and while yet warm dissolve in it the pure extract of glycyrrhiza. When cold, add the glycerin, then the alcohol in which the gluside and the oils have been dissolved, and finally sufficient water to make the Fluidextract measure 1000 cc. [2 pints].

The preliminary treatment of the drug with lime and magnesium oxide is for the purpose of neutralizing the acid resins present in cascara sagrada to which the bitterness is due. When these are neutralized, the drug loses its bitterness, but at the same time is reduced about 50 per cent in activity, it being necessary to double the dose.

Alcohol content, by volume, 17 to 19 per cent.

N. F. Preparations—Elixir Cascaræ Sagradæ; Elixir Cascaræ Sagradæ Compositum.

Uses—The uses are the same as for the plain Fluidextract of Cascara Sagrada but larger doses are required.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM CIMICIFUGÆ. U. S. Fluidextract of Cimicifuga

[Fldext. Cimicif.—Fluidextract of Black Cohosh, Fluidextract of Black Snakeroot]

	Metric	Alternative
Cimicifuga, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (page 403), using alcohol as the menstruum.

Alcohol content, by volume, 79 to 85 per cent.

N. F. Preparation—Elixir Sodii Salicylatis Compositum.

Uses—Used for chorea or St. Vitus' dance. It must be used with caution. An alterative and sedative in chronic rheumatism.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM CINCHONÆ. U. S. Fluidextract of Cinchona

[Fldext. Cinchon.]

Fluidextract of Cinchona yields, from each 100 cc., not less than 4 Gm. and not more than 5 Gm. of the total alkaloids of cinchona.

	Metric	Alternative
Cinchona, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process B (page 403), using a mixture of 100 cc. [1 fl. oz. 288 min.] of glycerin, 100 cc. [1 fl. oz. 384 min.] of hydrochloric acid, and 800 cc. [12 fl. oz. 384 min.] of alcohol as Menstruum I, and a mixture of 4 volumes of alcohol and 1 volume of water as Menstruum II.

After dissolving the soft extract in the reserve liquid, assay a portion as directed below, and from the result thus obtained ascertain by calculation the amount of alkaloids in the remainder of the liquid, and dilute this with enough of Menstruum II to make each 100 cc. of the finished Fluidextract contain 4.5 Gm. of the total alkaloids of cinchona.

Assay—Proceed by Type Process C, taking 5 cc. of Fluidextract of Cinchona, using 200 cc. of ether-chloroform mixture for maceration. Decant an aliquot portion of 160 cc., representing 4 cc. of Fluidextract of Cinchona, using chloroform for the final extraction, and determine the alkaloids gravimetrically (Proximate Assays, pages 1498 and 1497).

Alcohol content, by volume, 56 to 62 per cent.

Uses—An antiperiodic and bitter tonic.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM COLCHICI. U. S. Fluidextract of Colchicum

[**Fldext. Colch.**—FLUIDEXTRACTUM COLCHICI SEMINIS U. S. P. IX]

Fluidextract of Colchicum yields, from each 100 cc., not less than 0.36 Gm. and not more than 0.44 Gm. of colchicine.

	Metric	Alternative
Colchicum Seed, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.
Purified Petroleum Benzin, a sufficient quantity.		

Pack the colchicum seed in a cylindrical percolator, and slowly percolate with purified petroleum benzin until a few drops of the percolate leave no greasy stain when evaporated from filter paper. Reject the benzin solution, remove the powder from the percolator, and dry it by exposure to the air. Then proceed to make the Fluidextract by Type Process A (page 403), using a mixture of 2 volumes of alcohol and 1 volume of water as the menstruum.

After dissolving the soft extract in the reserve liquid, assay a portion as directed below, and from the result thus obtained ascertain by calculation the amount of alkaloids in the remainder of the liquid, and dilute this with enough menstruum to make each 100 cc. of the finished Fluidextract contain 0.4 Gm. of colchicine.

Assay—Place 15 cc. of Fluidextract of Colchicum in a 500 cc. flask containing 275 cc. of distilled water, mix well, add 10 cc. of solution of lead subacetate, and agitate the mixture frequently during one hour. Filter off 200 cc. and proceed as directed under *Colchici Semen*, pages 1498 and 1497, fourth line of the Assay, beginning with the word "Add".

Alcohol content, by volume, 53 to 58 per cent.

Uses—In chronic rheumatism and acute gout.

Average dose—3 minims (0.2 cc.).

FLUIDEXTRACTUM ERGOTÆ. U. S. Fluidextract of Ergot

[**Fldext. Ergot.**—SECALIS CORNUTI EXTRACTUM FLUIDUM P. I.]

Fluidextract of Ergot, administered by intramuscular injection to single-comb, white Leghorn cocks, in doses not exceeding 0.5 cc. for each kilogram of body weight of cock, produces a darkening of the comb, corresponding in intensity to that caused by the same dose of the standard fluidextract of ergot prepared as directed under *Ergota*.

	Metric	Alternative
Ergot, recently ground and in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.
Purified Petroleum Benzin, a sufficient quantity.		

Pack the ergot in a cylindrical percolator, and slowly percolate with purified petroleum benzin until a few drops of the percolate leave no greasy stain when evaporated from filter paper. Reject the benzin solution, remove the drug from the percolator, and dry it by exposure to the air. Then proceed to make the Fluidextract by Type Process B (page 403), using a menstruum of 20 cc. [154 min.] of hydrochloric acid and 980 cc. [14 fl. oz. 346 min.] of diluted alcohol as Menstruum I, and diluted alcohol as Menstruum II.

After dissolving the soft extract in the reserve liquid, assay a portion as directed below, and from the result thus obtained adjust the volume of the finished Fluidextract by the addition of enough Menstruum II to make it conform to the required biological standard.

See page 1509 for the assay.
Alcohol content, by volume, 37 to 42 per cent.

Uses—Often employed in the latter stages of labor as a stimulant to the uterus and a preventive of hemorrhage. Also used to control other internal hemorrhages and for the relief of chronic congestions. Because of its effect on the circulation it is also employed in a wide diversity of diseases.

Average dose—30 minims (2 cc.).

NOTE—It deteriorates rapidly during the first few months and then seems to become more stabilized. This explains the requirement that it be aged for six months before being standardized physiologically. It is preferably purchased in small containers, not larger than four ounces, or even smaller if the quantity dispensed does not justify this amount. It has been marketed in hermetically sealed vacuum tubes and the claim is made that in these, little or no deterioration results.

FLUIDEXTRACTUM ERIODICTYI. U. S. Fluidextract of Eriodictyon

[Fldext. Eriodict.—FLUIDEXTRACT OF YERBA SANTA]

	Metric	Alternative
Eriodictyon, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (page 403), using a mixture of 4 volumes of alcohol and 1 volume of water as the menstruum, and reserving the first 800 cc. [12 fl. oz. 384 min.] of percolate.

Alcohol content, by volume, 57 to 62 per cent.

N. F. Preparations—Elixir Eriodictyi Aromaticum; Syrupus Eriodictyi Aromaticus.

Uses—A peculiar, aromatic flavor, used in syrups and elixirs, especially for masking bitter drugs like quinine. Because of its resinous character it requires an alkali to render it soluble in aqueous mixtures. It is sometimes used as an expectorant.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM EUCALYPTI. U. S. Fluidextract of Eucalyptus

[Fldext. Eucalypt.]

	Metric	Alternative
Eucalyptus, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (page 403), using a mixture of 3 volumes of alcohol and 1 volume of water as the menstruum, and reserving the first 800 cc. [12 fl. oz. 384 min.] of percolate.

Alcohol content, by volume, 58 to 63 per cent.

Uses—The oil of this drug is most frequently employed but the fluidextract has been used in malaria when quinine was not available, and as a stimulating expectorant. It has the same general properties as the oil.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM GLYCYRRHIZÆ. U. S. Fluidextract of Glycyrrhiza

[Fldext. Glycyrrh.—Fluidextract of Licorice Root]

	Metric	Alternative
Glycyrrhiza, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process D (page 405). Promptly evaporate the aqueous percolate to 750 cc. [12 fl. oz.], allow this to cool, and gradually add 250 cc. [4 fl. oz.] of alcohol and, if necessary, sufficient water to make the product measure 1000 cc. [16 fl. oz.].

Alcohol content, by volume, 20 to 24 per cent.

U. S. P. Preparations—Elixir Glycyrrhizæ, Mistura Glycyrrhizæ Composita; Syrupus Sarsaparillæ Compositus.

N. F. Preparations—Elixir Glycyrrhizæ Aquosum; Elixir Taraxaci Compositum.

Uses—A pleasant flavor for use in syrups and elixirs to be employed as vehicles and correctives.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM GRANATI. U. S. Fluidextract of Pomegranate

[Fldext. Granat.]

	Metric	Alternative
Pomegranate, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process B (page 403), using a mixture of 100 cc. [1 fl. oz. 288 min.] of glycerin, 500 cc. [8 fl. oz.] of alcohol and 400 cc. [6 fl. oz. 192 min.] of water as Menstruum I, and diluted alcohol as Menstruum II.

Alcohol content, by volume, 34 to 40 per cent.

Uses—A tænifuge. It is usually administered after a twelve hour fast, to be followed within two hours by an active cathartic.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM HYDRASTIS. U. S. Fluidextract of Hydrastis

[Fldext. Hydrast.—Fluidextract of Golden Seal]

Fluidextract of Hydrastis yields, from each 100 cc., not less than 1.8 Gm. and not more than 2.2 Gm. of the ether-soluble alkaloids of hydrastis.

	Metric	Alternative
Hydrastis, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process B (page 403), using a mixture of 100 cc. [1 fl. oz. 288 min.] of glycerin, 600 cc. [9 fl. oz. 288 min.] of alcohol, and 200 cc. [3 fl. oz. 96 min.] of water as Menstruum I, and a mixture of 2 volumes of alcohol and 1 volume of water as Menstruum II. Reserve the first 750 cc. [12 fl. oz.] of percolate.

After dissolving the soft extract in the reserve liquid, assay a portion as directed below, and from the result thus obtained ascertain by calculation the amount of alkaloids in the remainder of the liquid, and dilute this with enough of Menstruum II to make each 100 cc. of the finished Fluidextract contain 2 Gm. of the ether-soluble alkaloids of hydrastis.

Assay—Proceed by Type Process D, taking 5 cc. of Fluidextract of Hydrastis, using ether as the solvent, and determine the alkaloids gravimetrically (Proximate Assays, page 1498).
Alcohol content, by volume, 47 to 52 per cent.

N. F. Preparations—Elixir Hydrastis Compositum; Mistura Rhei Alkalina.

Uses—Employed locally in catarrhal conditions or whenever the tone of mucous membranes is lowered, as in leucorrhea, chronic nasal inflammation, the latter stages of gonorrhea, etc.; internally in stomach troubles.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM HYOSCYAMI. U.S. Fluidextract of Hyoscyamus

[Fldext. Hyosc.—Fluidextract of Henbane]

Fluidextract of Hyoscyamus yields, from each 100 cc., not less than 0.055 Gm. and not more than 0.075 Gm. of the alkaloids of hyoscyamus.

	Metric	Alternative
Hyoscyamus, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (page 403), using a mixture of 3 volumes of alcohol and 1 volume of water as the menstruum.

After dissolving the soft extract in the reserve liquid, assay a portion as directed below, and from the result thus obtained ascertain by calculation the amount of alkaloids in the remainder of the liquid, and dilute this with enough menstruum to make each 100 cc. of the finished Fluidextract contain 0.065 Gm. of the alkaloids of hyoscyamus.

Assay—Proceed by Type Process D, taking 25 cc. of Fluidextract of Hyoscyamus, using chloroform as the solvent, and determine the alkaloids volumetrically. Each cc. of tenth-normal acid corresponds to 0.02893 Gm. of the alkaloids of hyoscyamus (Proximate Assays, page 1498).
Alcohol content, by volume, 58 to 63 per cent.

Uses—Employed to allay nervous irritation, particularly in nervous cough, whooping-cough, and colic. Also to give relief in urinary incontinence due to irritated bladder.

Average dose—3 minims (0.2 cc.).

FLUIDEXTRACTUM IPECACUANHÆ. U.S. Fluidextract of Ipecac

[Fldext. Ipecac.]

Fluidextract of Ipecac yields, from each 100 cc., not less than 1.35 Gm. and not more than 1.65 Gm. of the ether-soluble alkaloids of ipecac.

	Metric	Alternative
Ipecac, in fine powder	**1000 Gm.**	**16 oz. av. 302 gr.**
Diluted Hydrochloric Acid, a sufficient quantity.		

Prepare a Fluidextract by Type Process B (page 403), using a mixture of 150 cc. [2 fl. oz. 192 min.] of diluted hydrochloric acid, 300 cc. [4 fl. oz. 384 min.] of alcohol and 300 cc. [4 fl. oz. 384 min.] of water as Menstruum I, and a mixture of 2 volumes of alcohol and 3 volumes of water as Menstruum II. Reserve the first 800 cc. [12 fl. oz. 384 min.] of percolate.

After dissolving the soft extract in the reserve liquid, assay a portion as directed below, and from the result thus obtained ascertain by calculation the amount of alkaloids in the remainder of the liquid. Test a small portion for miscibility by adding 7 cc. [108 min.] to a mixture of 10 cc. [154 min.] of glycerin and sufficient syrup to make 100 cc. [3 fl. oz. 96 min.]. If this does not produce a clear mixture, gradually add diluted hydrochloric acid, drop by

drop, until a clear mixture is obtained which will remain clear for four days. Add to the remainder of the Fluidextract the amount of diluted hydrochloric acid determined as necessary by this test and sufficient of Menstruum II to make each 100 cc. of the finished Fluidextract contain 1.5 Gm. of the ether-soluble alkaloids of ipecac.

Assay—Proceed by Type Process D, taking 5 cc. of Fluidextract of Ipecac, using ether as the solvent, and determine the alkaloids volumetrically. Each cc. of tenth-normal acid corresponds to 0.024 Gm. of the alkaloids of ipecac (Proximate Assays, page 1498).

Alcohol content, by volume, 28 to 33 per cent.

U. S. P. Preparation—Syrupus Ipecacuanhæ.

N. F. Preparations—Mistura Rhei Composita; Syrupus Asari Compositus; Tinctura Ipecacuanhæ; Tinctura Ipecacuanhæ et Opii.

Uses—Chiefly employed in making the syrup and other preparations. It may be used as an emetic in the treatment of amebic dysentery, or for any other condition for which ipecac is prescribed.

Average dose—Expectorant, 1 minim (0.06 cc.).
Emetic, 15 minims (1 cc.).

FLUIDEXTRACTUM RHEI. U. S. Fluidextract of Rhubarb
[Fldext. Rhei]

	Metric	Alternative
Rhubarb, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (page 403), using a mixture of 4 volumes of alcohol and 1 volume of water as the menstruum.

Alcohol content, by volume, 55 to 63 per cent.

U. S. P. Preparation—Syrupus Rhei.

N. F. Preparations—Elixir Catharticum Compositum; Mistura Rhei Alkalina; Mistura Rhei Composita.

Uses—A cathartic. Employed in making many other preparations.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM RHOIS GLABRÆ. U. S. Fluidextract of Rhus Glabra
[Fldext. Rhois Glab.]

	Metric	Alternative
Rhus Glabra, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process B (page 403), using a mixture of 100 cc. [1 fl. oz. 288 min.] of glycerin, 500 cc. [8 fl. oz.] of alcohol, and 400 cc. [6 fl. oz. 192 min.] of water as Menstruum I, and diluted alcohol as Menstruum II.

Alcohol content, by volume, 37 to 43 per cent.

Uses—An astringent, especially useful as a gargle. Also employed in diarrhea.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM ROSÆ. U. S. Fluidextract of Rose
[Fldext. Ros.]

	Metric	Alternative
Red Rose, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process B (page 403), using a mixture of 100 cc. [1 fl. oz. 288 min.] of glycerin, 500 cc. [8 fl. oz.] of alcohol, and 400 cc.

[6 fl. oz. 192 min.] of water as Menstruum I, and diluted alcohol as Menstruum II.

Alcohol content, by volume, 35 to 40 per cent.

U. S. P. Preparation—Mel Rosæ.
N. F. Preparations—Syrupus Rosæ; Trochisci Eucalypti Gummi.

Uses—A flavor and an astringent employed in sore throat.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM SARSAPARILLÆ. U. S. Fluidextract of Sarsaparilla

[Fldext. Sarsap.]

	Metric	Alternative
Sarsaparilla, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (page 403), using diluted alcohol as the menstruum.

Alcohol content, by volume, 37 to 42 per cent.

U. S. P. Preparation—Syrupus Sarsaparillæ Compositus.

Uses—It has been used as an alterative but possesses little or no medicinal value. It was introduced into the U. S. P. as a pharmaceutic necessity for the making of the compound syrup which is employed chiefly as a vehicle for iodides.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM SCILLÆ. U. S. Fluidextract of Squill

[Fldext. Scill.]

Fluidextract of Squill, properly diluted and injected into the ventral lymph sac of a frog, has a minimum systolic dose of not less than 0.00,055 cc. and not more than 0.00,065 cc. of Fluidextract, or the equivalent in Fluidextract of not less than 0.00,000,046 Gm. and not more than 0.00,000,054 Gm. of ouabain, for each gram of body weight of frog.

	Metric	Alternative
Squill, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.
Diluted Alcohol,		
Alcohol,		
Water, each, a sufficient quantity,		
To make about	**1000 cc.**	16 fl. oz.

Mix 2000 cc. [2 pints] of alcohol with 1000 cc. [1 pint] of water, moisten the squill thoroughly with a sufficient quantity of the mixture, and allow it to macerate for two hours in a tightly-covered container. Then transfer to a percolator, shake it down evenly without packing, and pour on enough of the menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed slowly, gradually adding more menstruum composed of 2 volumes of alcohol and 1 volume of water. When the percolate measures 1000 cc. [1 pint], close the lower orifice, and macerate the drug for twelve hours before continuing the percolation. Then collect a second 1000 cc. [1 pint] of percolate, again interrupt the percolation, macerate for twelve hours, and then continue the percolation until the total percolate measures 5000 cc.

[5 pints]. Recover the alcohol from the percolate at as low a temperature as possible, and then concentrate the residue to a volume measuring 800 cc. [12 fl. oz. 384 min.]. When the residue is cold, add slowly, with continuous agitation, 2000 cc. [2 pints] of alcohol, and set the mixture aside in a tightly-stoppered container for twelve hours. Decant the supernatant liquid from the syrupy layer, filter the decanted liquid, and wash the syrupy residue with two portions of 300 cc. [4 fl. oz. 384 min.] each of a mixture of 4 volumes of alcohol and 1 volume of water, passing the washings through the filter into the previously collected alcoholic liquid. Reduce the combined alcoholic liquids to 800 cc. [12 fl. oz. 384 min.] by distillation, assay a portion as directed below, and from the result thus obtained adjust the volume of the finished Fluidextract by the addition of diluted alcohol to conform to the above biological standard.

See page 1505 for the Assay.
Alcohol content, by volume, 47 to 52 per cent.

U. S. P. Preparation—Syrupus Scillæ Compositus.
N. F. Preparation—Mistura Pectoralis, Stokes'.

Uses—Squill belongs to the "digitalis group", being similar in action. Employed as a diuretic in dropsy, especially when associated with cardiac troubles, but not often used in heart disease because of its irritant action on the kidneys. Given in bronchitis as an expectorant.

Average dose—1½ minims (0.1 cc.).

FLUIDEXTRACTUM SENEGÆ. U. S. Fluidextract of Senega

[Fldext. Seneg.]

	Metric	Alternative
Senega, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.
Ammonia Water,		
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	16 fl. oz.

Moisten the drug with a sufficient quantity of a mixture of 2 volumes of alcohol and 1 volume of water, pack it in a cylindrical percolator and add more of the menstruum to saturate the drug and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed slowly, gradually adding more of the same menstruum until the drug is exhausted. Reserve the first 800 cc. [12 fl. oz. 384 min.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and then gradually add ammonia water until the product is faintly alkaline and has a slight odor of ammonia. Finally add enough of the menstruum to make the Fluidextract measure 1000 cc. [16 fl. oz.].

Ammonia water is added to prevent gelatinization of the pectin in this drug.

Alcohol content, by volume, 45 to 50 per cent.

U. S. P. Preparations—Syrupus Scillæ Compositus; Syrupus Senegæ.
N. F. Preparation—Mistura Pectoralis.

Uses—A stimulating expectorant useful in bronchitis.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM SENNÆ. U. S. Fluidextract of Senna

[Fldext. Senn.]

	Metric	Alternative
Senna, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (page 403), using a mixture of 1 volume of alcohol and 2 volumes of water as the menstruum, and reserving the first 800 cc. [12 fl. oz. 384 min.] of percolate.

Alcohol content, by volume, 23 to 27 per cent.

U. S. P. Preparation—Syrupus Sennæ.

N. F. Preparations—Elixir Cascaræ Sagradæ Compositum; Elixir Catharticum Compositum; Syrupus Ficorum Compositus; Syrupus Sennæ Aromaticus.

Uses—A cathartic, frequently producing griping, when used alone. It is chiefly used to make other preparations.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM UVÆ URSI. U. S. Fluidextract of Uva Ursi

[Fldext. Uvæ Ursi]

	Metric	Alternative
Uva Ursi, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process B (page 403), using a mixture of 100 cc. [1 fl. oz. 288 min.] of glycerin, 300 cc. [4 fl. oz. 384 min.] of alcohol, and 500 cc. [8 fl. oz.] of water as Menstruum I, and a mixture of 1 volume of alcohol and 2 volumes of water as Menstruum II. Reserve the first 800 cc. [12 fl. oz. 384 min.] of percolate.

Alcohol content, by volume, 18 to 25 per cent.

Uses—A mild, astringent diuretic, used in cystitis, chronic gonorrhea, and pyelitis.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM ZINGIBERIS. U. S. Fluidextract of Ginger

[Fldext. Zingib.]

	Metric	Alternative
Ginger, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (page 403), using alcohol as the menstruum.

Alcohol content, by volume, 78 to 83 per cent.

U. S. P. Preparation—Syrupus Zingiberis.

N. F. Preparation—Elixir Hydrastis Compositum.

Uses—A carminative and stomachic, but chiefly used in the making of other preparations of ginger.

Average dose—8 minims (0.5 cc.).

FLUIDEXTRACTUM ACONITI. N. F. Fluidextract of Aconite

(U. S. P. IX)

[Fldext. Aconit.]

When assayed biologically, the minimum lethal dose of Fluidextract of Aconite should not be greater than 0.00004 cc. for each Gm. of body weight, of guinea pig.

	Metric	Alternative
Aconite, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process C, as modified for alkaloidal drugs (see page 405), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Assay—For method of assaying Fluidextract of Aconite see Biological Assays, U. S. P. X. Approximate alcohol content, by volume, 65 per cent.

N. F. Preparation—Linimentum Aconiti et Chloroformi.

Uses—In fevers and heart disease.

Average dose—1 minim (0.06 cc.).

FLUIDEXTRACTUM ADONIDIS. N. F. Fluidextract of Adonis

[Fldext. Adonid.]

	Metric	Alternative
Adonis, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 58 per cent.

Uses—A cardiac tonic resembling digitalis in action. Used in combination with bromides; it is also employed in epilepsy.

Average dose—2 minims (0.125 cc.).

FLUIDEXTRACTUM ALETRIDIS. N. F. Fluidextract of Aletris

[Fldext. Aletrid.]

	Metric	Alternative
Aletris, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 40 per cent.

N. F. Preparations—Elixir Aletridis Compositum; Elixir Viburni Opuli Compositum.

Uses—A bitter tonic; it has been used in dropsy, colic, and chronic rheumatism.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM ANGELICÆ RADICIS. N. F. Fluidextract of Angelica Root

[Fldext. Angel. Rad.]

	Metric	Alternative
Angelica Root, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of five volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 68 per cent.

Uses—A gastric stimulant and carminative.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM APII FRUCTUS. N. F. Fluidextract of Celery Fruit

[Fldext. Apii Fruct.]

	Metric	Alternative
Celery Fruit, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using alcohol as the menstruum. In order to remove any separated oil, after permitting the fluidextract to stand, filter it through an alcohol-wetted filter, rejecting the final few cubic centimeters remaining on the filter with the oil.

Approximate alcohol content, by volume, 85 per cent.

N. F. Preparation—Elixir Guaranæ et Apii.

Uses—A nerve sedative, especially used in menstrual disorders.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM APOCYNI. N. F. Fluidextract of Apocynum
[Fldext. Apocyn.]

	Metric	Alternative
Apocynum, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and two volumes of water as menstruum.

Assay—For a method of assaying Fluidextract of Apocynum see Biological Assays, U. S. P. X.

Approximate alcohol content, by volume, 48 per cent.

Caution—It has been stated that the absorption of Apocynum in the gastro-intestinal tract is uncertain and irregular. To avoid possible toxic or cumulative action of the drug, the physician should determine in each case the tolerance of the patient, and regulate the dosage accordingly.

Uses—Employed in cardiac and renal dropsy. It belongs to the "digitalis group" of cardiac tonics and is a powerful diuretic but must be used with caution.

Average dose—12 minims (0.75 cc.).

FLUIDEXTRACTUM ARALIÆ. N. F. Fluidextract of Aralia
[Fldext. Aral.]

	Metric	Alternative
Aralia, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of two volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 54 per cent.

Uses—An alterative.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM ARNICÆ. N. F. Fluidextract of Arnica
[Fldext. Arnic.]

	Metric	Alternative
Arnica, in coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of two volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 55 per cent.

Uses—A stimulant and alterative, rarely used.

Average dose—1½ minims (0.1 cc.).

FLUIDEXTRACTUM ASCLEPIADIS. N. F. Fluidextract of Asclepias
[Fldext. Asclepiad.]

	Metric	Alternative
Asclepias, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 40 per cent.

Uses—A diaphoretic, expectorant, and cathartic.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM AVENÆ SATIVÆ. N. F. Fluidextract of Oat
[Fldext. Aven. Sativ.]

	Metric	Alternative
Oat, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of two volumes of alcohol and three volumes of water as the menstruum.

Approximate alcohol content, by volume, 34 per cent.

N. F. Preparation—Elixir Hydrastis Compositum.

Uses—An alterative.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM BAPTISIÆ. N. F. Fluidextract of Baptisia

[Fldext. Baptis.]

	Metric	Alternative
Baptisia, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 60 per cent.

N. F. Preparation—Dentifricium.

Uses—It has been used for its laxative and stimulant properties, but its main use in pharmacy is for its yellow color.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM BERBERIDIS. N. F. Fluidextract of Berberis

[Fldext. Berberid.]

	Metric	Alternative
Berberis, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 40 per cent.

Uses—A bitter tonic.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM BOLDI. N. F. Fluidextract of Boldo

[Fldext. Boldi]

	Metric	Alternative
Boldo, in moderately fine powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using alcohol as the menstruum.

Approximate alcohol content, by volume, 80 per cent.

Uses—An alterative and tonic.

Average dose—8 minims (0.5 cc.).

FLUIDEXTRACTUM BUCHU COMPOSITUM. N. F. Compound Fluidextract of Buchu

[Fldext. Buchu Co.]

	Metric	Alternative
Buchu, in moderately coarse powder	**625 Gm.**	10 oz. av. 188 gr.
Cubeb, in moderately coarse powder	**125 Gm.**	2 oz. av. 38 gr.
Juniper Berries, in moderately coarse powder	**125 Gm.**	2 oz. av. 38 gr.
Uva Ursi, in moderately coarse powder	**125 Gm.**	2 oz. av. 38 gr.
To make	**1000 cc.**	1 pint

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of four volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 60 per cent.

N. F. Preparation—Elixir Buchu Compositum.

Uses—For chronic inflammations of the genito-urinary tract.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM CALENDULÆ. N. F. Fluidextract of Calendula

[Fldext. Calend.]

	Metric	Alternative
Calendula, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of two volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 52 per cent.

Uses—Externally for sprains and bruises.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM CALUMBÆ. N. F. Fluidextract of Calumba

[Fldext. Calumb.]

	Metric	Alternative
Calumba, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of two volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 54 per cent.

Uses—A simple bitter, especially valuable in the convalescent period after fevers or severe diarrhea.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM CASTANEÆ. N. F. Fluidextract of Castanea

[Fldext. Castan.]

	Metric	Alternative
Castanea, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.
Glycerin	**100 cc.**	1 fl. oz. 288 min.
Alcohol,		
Water, each, a sufficient quantity		
To make	**1000 cc.**	1 pint

Pour 5000 cc. [5 pints] of boiling water upon the powder, allow it to macerate two hours, then express the liquid, transfer the residue to a percolator, and pour water upon it until the powder is practically exhausted. Evaporate the united liquids, on a water bath, to 2000 cc. [2 pints], allow it to cool, and add 600 cc. [9 fl. oz. 288 min.] of alcohol. When the insoluble matter has subsided, separate the clear liquid, filter the remainder, evaporate the united liquids to 700 cc. [11 fl. oz. 96 min.], allow to cool, add the glycerin, and lastly, enough alcohol to make the Fluidextract measure 1000 cc. [1 pint].

Approximate alcohol content, by volume, 16 per cent.

Uses—An astringent, chiefly used for local application.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM CATARIÆ. N. F. Fluidextract of Catnep

[Fldext. Catar.]

	Metric	Alternative
Catnep, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and four volumes of water as the menstruum.

Approximate alcohol content, by volume, 35 per cent.

N. F. Preparation—Elixir Catariæ et Fœniculi.

Uses—A carminative, antispasmodic, and emmenagogue.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM CAULOPHYLLI. N. F. Fluidextract of Caulophyllum

[Fldext. Caulophyl.]

	Metric	Alternative
Caulophyllum, in fine powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 60 per cent.

N. F. Preparations—Elixir Aletridis Compositum; Elixir Heloniadis Compositum.

Uses—Said to be an emmenagogue, antispasmodic, and sedative.

Average dose—8 minims (0.5 cc.).

FLUIDEXTRACTUM CHIMAPHILÆ. N. F. Fluidextract of Chimaphila

[Fldext. Chimaphil.]

	Metric	Alternative
Chimaphila, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 36 per cent.

Uses—A feeble diuretic, exerting some antiseptic action in the urine.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM CHIONANTHI. N. F. Fluidextract of Chionanthus

[Fldext. Chionanth.]

	Metric	Alternative
Chionanthus, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 55 per cent.

Uses—A diuretic and aperient.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM CHIRATÆ. N. F. Fluidextract of Chirata

[Fldext. Chirat.]

	Metric	Alternative
Chirata, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 42 per cent.

Uses—A bitter tonic. As it is free from tannin it may be prescribed with iron.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM COCILLANÆ. N. F. Fluidextract of Cocillana

[Fldext. Cocillan.]

	Metric	Alternative
Cocillana, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 65 per cent.

Uses—A nauseating expectorant, similar in action to ipecac.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM COFFEÆ. N. F. Fluidextract of Coffee

[Fldext. Coff.—Fluidextractum Coffeæ Tostæ, Fluidextract of Roasted Coffee]

	Metric	Alternative
Coffee, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process B (see page 403), using a mixture of 65 cc. [1 fl. oz. 19 min.] of glycerin, 250 cc. [4 fl. oz.] of alcohol, and 685 cc. [10 fl. oz. 460 min.] of water as Menstruum I and a mixture of one volume of alcohol and three volumes of water as Menstruum II.

Approximate alcohol content, by volume, 20 per cent.

Uses—A flavor.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM COLCHICI CORMI. N.F. Fluidextract of Colchicum Corm

[Fldext. Colch. Corm.]

One hundred cc. of Fluidextract of Colchicum Corm yields not less than 0.31 Gm. and not more than 0.39 Gm. of colchicine.

	Metric	Alternative
Colchicum Corm, in moderately coarse powder.....	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A, as modified for assayed Fluidextracts (see page 403), using a mixture of two volumes of alcohol and one volume of water as the menstruum. Moisten the drug with 350 cc. [5 fl. oz. 288 min.] of this mixture.

After dissolving the soft extract in the reserve, assay 15 cc. of this liquid as directed below and, from the result thus obtained, ascertain by calculation the amount of colchicine in the remainder of the liquid, and add sufficient menstruum to make the finished Fluidextract contain 0.35 Gm. of colchicine in each 100 cc.

Assay—To 15 cc. of Fluidextract of Colchicum Corm, add 275 cc. of distilled water and 10 cc. of solution of lead subacetate, both accurately measured. Agitate the mixture frequently during one hour and filter off 200 cc. Dissolve 2 Gm. of sodium phosphate in the clear filtrate, shake the mixture frequently during half an hour and filter off 100 cc., representing 5 cc. of the Fluidextract. Transfer to a separator and completely extract the alkaloid with chloroform until the liquid gives no test with iodine T.S. Evaporate the chloroformic solution on a water bath, add to the residue 1 cc. of alcohol and again evaporate to dryness. Again add 1 cc. of alcohol, evaporate to dryness and dry to constant weight at 100° C. Cool and weigh. To this weighed residue, add 5 cc. of tenth-normal sulphuric acid and 5 cc. of distilled water, and digest at 70° C., for ten minutes. Filter the solution through a pledget of purified cotton and wash the container and cotton with distilled water, rejecting the filtrate and washings. Rinse the container with a little alcohol and pass the alcohol through the pledget of cotton, collecting the filtrate in a tared flask. Wash the cotton first with alcohol, then with ether, collecting the washings in the flask. Evaporate the liquid, dry the residue at 100° C., cool, and weigh. Deduct this weight from the weight first obtained. The difference is the weight of colchicine obtained from 5 cc. of Fluidextract of Colchicum Corm.

Approximate alcohol content, by volume, 52 per cent.

Uses—Useful in chronic rheumatism and acute gout.

Average dose—3 minims (0.2 cc.).

FLUIDEXTRACTUM CONDURANGO. N.F. Fluidextract of Condurango

[Fldext. Condur.]

	Metric	Alternative
Condurango, in moderately coarse powder.....	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 40 per cent.

Uses—An alterative and stomachic.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM CONVALLARIÆ RADICIS. N.F. Fluidextract of Convallaria Root

[Fldext. Conval. Rad.]

	Metric	Alternative
Convallaria Root, in moderately coarse powder.....	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 58 per cent.

Uses—It belongs to the "digitalis group" and has been used in dropsy. It is emetic and cathartic in action.

Average dose—8 minims (0.5 cc.).

FLUIDEXTRACTUM COPTIS. N. F. Fluidextract of Coptis
[Fldext. Copt.]

	Metric	Alternative
Coptis, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 40 per cent.

Uses—A folk remedy for aphthous stomatitis. It is mildly astringent and bitter.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM CORNI. N. F. Fluidextract of Cornus
[Fldext. Corni]

	Metric	Alternative
Cornus, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process B (see page 403), using a mixture of 150 cc. [2 fl. oz. 192 min.] of glycerin and 850 cc. [13 fl. oz. 288 min.] of diluted alcohol as Menstruum I and diluted alcohol as Menstruum II.

Approximate alcohol content, by volume, 40 per cent.

Uses—A feeble tonic. It has been used as an antiperiodic but is probably worthless.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM CORYDALIS. N. F. Fluidextract of Corydalis
[Fldext. Corydal.]

	Metric	Alternative
Corydalis, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 62 per cent.

N. F. Preparation—Elixir Corydalis Compositum.

Uses—A diuretic and alterative.

Average dose—10 minims (0.65 cc.).

FLUIDEXTRACTUM CUBEBÆ. N. F. Fluidextract of Cubeb
[Fldext. Cubeb.]

	Metric	Alternative
Cubeb, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using alcohol as the menstruum.

Approximate alcohol content, by volume, 72 per cent.

Uses—An antiseptic diuretic and stimulant to the genito-urinary and bronchial mucous membrane.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM CYPRIPEDII. N. F. Fluidextract of Cypripedium
[Fldext. Cypriped.]

	Metric	Alternative
Cypripedium, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 40 per cent.

Uses—An antispasmodic and nerve stimulant similar to valerian in action. Used in hysteria, neuralgia, and hypochondriasis.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM DAMIANÆ. N. F. Fluidextract of Damiana
[Fldext. Damian.]

	Metric	Alternative
Damiana, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 60 per cent.

Uses—A mild purgative and feeble tonic, recommended for the treatment of sexual debility.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM DIGITALIS. N. F. Fluidextract of Digitalis
(U. S. P. IX)
[Fldext. Digit.]

When assayed biologically, the minimum lethal dose should not be greater than 0.0006 cc. of the Fluidextract, or the equivalent in Fluidextract of 0.0000005 Gm. of ouabain, for each Gm. of body weight of frog.

	Metric	Alternative
Digitalis, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of five volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 70 per cent.

Assay—For a method of assaying Fluidextract of Digitalis see page 1504.

Uses—In heart disease. Chiefly used in veterinary practice.

Average dose—1½ minims (0.1 cc.).

FLUIDEXTRACTUM DIOSCOREÆ. N. F. Fluidextract of Dioscorea
[Fldext. Dioscor.]

	Metric	Alternative
Dioscorea, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 40 per cent.

Uses—An expectorant and diaphoretic.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM DROSERÆ. N. F. Fluidextract of Drosera
[Fldext. Droser.]

	Metric	Alternative
Drosera, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of two volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 55 per cent.

Uses—Recommended as an antispasmodic in whooping-cough.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM DULCAMARÆ. N. F. Fluidextract of Dulcamara
[Fldext. Dulcam.]

	Metric	Alternative
Dulcamara, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 42 per cent.

Uses—A diuretic and alterative used in chronic rheumatism and in obstinate skin eruptions.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM ECHINACEÆ. N.F. Fluidextract of Echinacea

[Fldext. Echin.]

	Metric	Alternative
Echinacea, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of four volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 65 per cent.

Uses—An alterative; supposed to be useful in infectious diseases.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM EUONYMI. N.F. Fluidextract of Euonymus

[Fldext. Euonym.]

	Metric	Alternative
Euonymus, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum and reserving the first 800 cc. [12 fl. oz. 384 min.] of the percolate.

Approximate alcohol content, by volume, 42 per cent.

Caution—It has been stated that the absorption of Euonymus in the gastro-intestinal tract is uncertain and irregular. To avoid possible toxic or cumulative action of the drug, the physician should carefully determine in each case the tolerance of the patient, and regulate the dosage accordingly.

Uses—Originally employed as a cathartic. It has been shown to belong to the "digitalis group".

It has been used in dropsy and as a diaphoretic in muscular rheumatism and acute coryza.

Average dose—8 minims (0.5 cc.).

FLUIDEXTRACTUM EUPATORII. N.F. Fluidextract of Eupatorium

[Fldext. Eupator.]

	Metric	Alternative
Eupatorium, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum and reserving the first 800 cc. [12 fl. oz. 384 min.] of the percolate.

Approximate alcohol content, by volume, 40 per cent.

Uses—Employed as a bitter tonic and diaphoretic. In large doses it is emetic and cathartic.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM EUPHORBIÆ. N.F. Fluidextract of Euphorbia

[Fldext. Euphorb.]

	Metric	Alternative
Euphorbia, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 40 per cent.

N. F. Preparation—Elixir Euphorbiæ Compositum.

Uses—Employed in asthma and bronchial catarrh.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM FRANGULÆ. N. F. Fluidextract of Frangula

(U. S. P. IX)

[Fldext. Frang.]

	Metric	Alternative
Frangula, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.
Alcohol	**250 cc.**	4 fl. oz.

Prepare a Fluidextract by Type Process D (see page 405). Evaporate the aqueous percolate to 750 cc. [12 fl. oz.] and, when cold, add the alcohol and, if necessary, sufficient water to make the product measure 1000 cc. [1 pint].

Approximate alcohol content, by volume 23 per cent.

N. F. Preparation—Elixir Catharticum Compositum.

Uses—As a laxative.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM FUCI. N. F. Fluidextract of Fucus

[Fldext. Fuci]

	Metric	Alternative
Fucus, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 65 per cent.

Uses—Used chiefly as an "anti-fat"; it is supposed to act as a stimulant to the thyroid gland.

Average dose—10 minims (0.6 cc.).

FLUIDEXTRACTUM GALEGÆ. N. F. Fluidextract of Galega

[Fldext. Galeg.]

	Metric	Alternative
Galega, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 42 per cent.

Uses—A diuretic and galactagogue.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM GELSEMII. N. F. Fluidextract of Gelsemium

(U. S. P. IX)

[Fldext. Gelsem.]

	Metric	Alternative
Gelsemium, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of four volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 65 per cent.

N. F. Preparation—Elixir Sodii Salicylatis Compositum.

Uses—In neuralgia.

Average dose—½ minim (0.03 cc.).

FLUIDEXTRACTUM GENTIANÆ. N. F. Fluidextract of Gentian

(U. S. P. IX)

[Fldext. Gentian.]

	Metric	Alternative
Gentian, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 36 per cent.

N. F. Preparations—Elixir Gentianæ; Elixir Gentianæ Glycerinatum; Elixir Hydrastis Compositum.

Uses—In bitter tonics.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM GERANII. N. F. Fluidextract of Geranium

[Fldext. Geran.]

	Metric	Alternative
Geranium, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and two volumes of water as the menstruum. Reserve the first 800 cc. [12 fl. oz. 384 min.] of the percolate.

Approximate alcohol content, by volume, 45 per cent.

Uses—An astringent, especially well adapted to the treatment of diarrhea and cholera infantum in infants and delicate persons. Applied externally to indolent ulcers, as an injection in gleet and leucorrhea, and as a gargle in mouth and throat affections.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM GOSSYPII CORTICIS. N. F. Fluidextract of Cotton Root Bark

[Fldext. Gossyp. Cort.]

	Metric	Alternative
Cotton Root Bark, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using alcohol as the menstruum and reserving the first 800 cc. [12 fl. oz. 384 min.] of the percolate.

Approximate alcohol content, by volume, 82 per cent.

Uses—An emmenagogue; it must be sold with caution as it may be employed as an abortifacient.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM GRINDELIÆ. N. F. Fluidextract of Grindelia

(U. S. P. IX)

[Fldext. Grindel.]

	Metric	Alternative
Grindelia, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 58 per cent.

Uses—For bronchial catarrh and asthma.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM GUARANÆ. N. F. Fluidextract of Guarana

(U. S. P. IX)

[Fldext. Guaran.]

One hundred cc. of Fluidextract of Guarana yields not less than 3.6 Gm. and not more than 4.4 Gm. of caffeine.

	Metric	Alternative
Guarana, in fine powder	**1000 Gm**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A, as modified for assayed Fluidextracts (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum, and reserving the first 800 cc. [12 fl. oz. 384 min.] of percolate.

After dissolving the soft extract in the reserve, assay a portion as directed below, and from the result thus obtained, ascertain by calculation the amount of alkaloid in the remainder of the liquid and dilute this with enough menstruum to make each 100 cc. of the finished Fluidextract contain 4 Gm. of caffeine.

Assay—Introduce 5 cc. of Fluidextract of Guarana into a saparator, add 1 cc. of ammonia water, and shake out the alkaloid with chloroform until completely extracted, as shown by testing with iodine T.S. Evaporate the combined chloroform solutions to dryness and dissolve the residue in 20 cc. of distilled water with the aid of heat. Allow this to cool, filter it into a separator and wash the container and filter with several small portions of distilled water, adding the rinsings to the liquid in the separator. Then shake out the alkaloid with chloroform until completely extracted, as shown by testing with iodine T.S., evaporate the combined chloroform solutions and dry the residue to constant weight at 80° C. The weight represents the caffeine in 5 cc. of Fluidextract of Guarana.

Approximate alcohol content, by volume, 60 per cent.

N. F. Preparations—Elixir Guaranæ; Elixir Guaranæ et Apii.

Uses—In headaches.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM HAMAMELIDIS FOLIORUM. N.F. Fluidextract of Hamamelis Leaves

[**Fldext. Hamamel. Fol.**]

	Metric	Alternative
Hamamelis Leaves, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process B (see page 403), using a mixture of 100 cc. [1 fl. oz. 288 min.] of glycerin, 300 cc. [4 fl. oz. 384 min.] of alcohol and 500 cc. [8 fl. oz.] of water as Menstruum I and a mixture of one volume of alcohol and two volumes of water as Menstruum II.

Approximate alcohol content, by volume, 20 per cent.

Uses—A mild astringent, employed locally in the treatment of varicose veins and hemorrhoids.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM HELONIADIS. N.F. Fluidextract of Helonias

[**Fldext. Helon.**]

	Metric	Alternative
Helonias, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 40 per cent.

N. F. Preparations—Elixir Aletridis Compositum; Elixir Heloniadis Compositum.

Uses—A tonic, anthelmintic, and diuretic. By some believed to be useful in menstrual disorders.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM HUMULI. N.F. Fluidextract of Hop

[**Fldext. Humul.**]

	Metric	Alternative
Hop, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of five volumes of alcohol and three volumes of water as the menstruum and reserving the first 800 cc. [12 fl. oz. 384 min.] of the percolate.

Approximate alcohol content, by volume, 50 per cent.

Uses—A nerve sedative, used in hysteria and nervousness.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM HYDRANGEÆ. N. F. Fluidextract of Hydrangea

[Fldext. Hydrang.]

	Metric	Alternative
Hydrangea, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and two volumes of water as the menstruum.

Approximate alcohol content, by volume, 50 per cent.

Uses—A diuretic.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM IRIDIS VERSICOLORIS. N. F. Fluidextract of Blue Flag

[Fldext. Irid. Vers.]

	Metric	Alternative
Blue Flag, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using alcohol as the menstruum.

Approximate alcohol content, by volume, 80 per cent.

N. F. Preparation—Elixir Corydalis Compositum.

Uses—An alterative and cholagogue cathartic.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM JALAPÆ. N. F. Fluidextract of Jalap

[Fldext. Jalap.]

One hundred cc. of Fluidextract of Jalap yields not less than 6.5 Gm. and not more than 7.5 Gm. of the resin of Jalap.

	Metric	Alternative
Jalap, in fine powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Intimately mix the ground drug with 1500 Gm. [25 oz. av.] of clean sand and prepare a Fluidextract by Type Process A (see page 403), as modified for assayed Fluidextracts, using alcohol as the menstruum.

After dissolving the soft extract in the reserve, assay 2 cc. of the liquid by the process given below, and from the result thus obtained ascertain the amount of resin in the remainder of the liquid, and add sufficient menstruum to make the finished Fluidextract contain 7 Gm. of resin in each 100 cc.

Assay—To 18 cc. of alcohol, contained in a separator, add 2 cc. of Fluidextract of Jalap and 10 cc. of chloroform. Mix well, then add 20 cc. of a saturated solution of potassium citrate. Shake the mixture thoroughly for two minutes, then set aside for 12 hours, or over night. Draw off and discard the lower aqueous liquid and filter the chloroformic solution through a small filter wetted with alcohol-chloroform, into a tared flask or beaker. Rinse the separator with a mixture of 10 cc. of alcohol and 5 cc. of chloroform and pass the rinsings through the filter. Evaporate the mixed chloroformic liquids to dryness on a water bath, dry at 100° C., cool, and weigh.

Approximate alcohol content, by volume, 80 per cent.

Uses—A cathartic.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM JUGLANDIS. N. F. Fluidextract of Juglans

[Fldext. Jugland.]

	Metric	Alternative
Juglans, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process B (see page 403), using a mixture of 100 cc. [1 fl. oz. 288 min.] of glycerin, 500 cc. [8 fl. oz.] of alcohol, and 400 cc. [6 fl. oz. 192 min.] of water as Menstruum I, and diluted alcohol as Menstruum II.

Approximate alcohol content, by volume, 38 per cent.

N. F. Preparation—Elixir Cascaræ Sagradæ Compositum.

Uses—A mild cathartic.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM JUNIPERI. N. F. Fluidextract of Juniper Berries

[Fldext. Junip.]

	Metric	Alternative
Juniper Berries, in coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of four volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 50 per cent.

N. F. Preparation—Elixir Buchu, Juniperi et Potassii Acetatis.

Uses—A diuretic.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM KAVÆ. N. F. Fluidextract of Kava

[Fldext. Kav.]

	Metric	Alternative
Kava, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and two volumes of water as the menstruum.

Approximate alcohol content, by volume, 52 per cent.

Uses—A diuretic and alterative; at one time largely employed in the treatment of gonorrhea, its value being due to its rendering the urine antiseptic.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM KOLÆ. N. F. Fluidextract of Kola

[Fldext. Kol.]

One hundred cc. of Fluidextract of Kola yields not less than 0.85 Gm. and not more than 1.15 Gm. of caffeine.

	Metric	Alternative
Kola, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A, as modified for assayed Fluidextracts (see page 403), using a mixture of two volumes of alcohol and one volume of water as the menstruum.

After dissolving the soft extract in the reserve, assay 10 cc. of this liquid as directed below, and from the result thus obtained, ascertain by calculation, the amount of caffeine contained in the remainder of the liquid, and add sufficient menstruum to make the finished Fluidextract contain 1.0 Gm. of caffeine in each 100 cc.

Assay—Proceed as directed under Fluidextractum Guaranæ, using 10 cc. of the Fluidextract of Kola, chloroform as the solvent, and drying the caffeine at 80° C. Determine the caffeine gravimetrically.

Approximate alcohol content, by volume, 55 per cent.

Uses—It contains caffeine and may be used for the same purposes as that drug.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM KRAMERIÆ. N. F. Fluidextract of Krameria

[Fldext. Kramer.]

	Metric	Alternative
Krameria, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process B (see page 403), using a mixture of 100 cc. [1 fl. oz. 288 min.] of glycerin, 500 cc. [8 fl. oz.] of alcohol and 400 cc. [6 fl. oz. 192 min.] of water as Menstruum I, and diluted alcohol as Menstruum II. Reserve the first 800 cc. [12 fl. oz. 384 min.] of the percolate.

Approximate alcohol content, by volume, 35 per cent.

N. F. Preparations—Syrupus Krameriæ.

Uses—An astringent, especially useful in diarrhea.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM LAPPÆ. N. F. Fluidextract of Lappa
[Fldext. Lapp.]

	Metric	Alternative
Lappa, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum and reserving the first 800 cc. [12 oz. av. 384 min.] of the percolate.

Approximate alcohol content, by volume, 40 per cent.

Uses—A diuretic and diaphoretic alterative, used in chronic skin diseases and in gouty tendencies.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM LEPTANDRÆ. N. F. Fluidextract of Leptandra
[Fldext. Leptand.]

	Metric	Alternative
Leptandra, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 60 per cent.

Uses—A cholagogue laxative.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM LOBELIÆ. N. F. Fluidextract of Lobelia
(U. S. P. IX)
[Fldext. Lobel.]

	Metric	Alternative
Lobelia, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process B (see page 403), using a mixture of 50 cc. [384 min.] of acetic acid, 500 cc. [8 fl. oz.] of alcohol, and 450 cc. [7 fl. oz. 96 min.] of water as Menstruum I, and diluted alcohol as Menstruum II.

Approximate alcohol content, by volume, 40 per cent.

N. F. Preparation—Elixir Euphorbiæ Compositum.

Uses—An expectorant.

Average dose—1½ minims (0.1 cc.).

FLUIDEXTRACT LUPULINI. N. F. Fluidextract of Lupulin
[Fldext. Lupulin.]

	Metric	Alternative
Lupulin	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using alcohol as the menstruum.

Approximate alcohol content, by volume, 55 per cent.

Uses—An aromatic bitter and mild sedative.

Average dose—8 minims (0.5 cc.).

FLUIDEXTRACT MANACÆ. N. F. Fluidextract of Manaca
[Fldext. Manac.]

	Metric	Alternative
Manaca, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 64 per cent.

N. F. Preparation—Elixir Manacæ Compositum.

Uses—Recommended for the treatment of chronic and subacute rheumatism.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM MATICO. N. F. Fluidextract of Matico

[Fldext. Matic.]

	Metric	Alternative
Matico, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 60 per cent.

Uses—Employed in diseases of the genito-urinary tract because of its oil, the action being similar to cubeb; also used as a hemostatic for small wounds.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM MEZEREI. N. F. Fluidextract of Mezereum

[Fldext. Mezer.]

	Metric	Alternative
Mezereum, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of two volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 55 per cent.

N. F. Preparation—Linimentum Sinapis Compositum.

Uses—Of little value internally; externally a rubefacient and vesicant.

FLUIDEXTRACTUM MITCHELLÆ. N. F. Fluidextract of Mitchella

[Fldext. Mitchel.]

	Metric	Alternative
Mitchella, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 40 per cent.

N. F. Preparations—Elixir Aletridis Compositum; Elixir Heloniadis Compositum.

Uses—In cystitis.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM NUCIS VOMICÆ. N. F. Fluidextract of Nux Vomica

(U. S. P. IX)

[Fldext. Nuc. Vom.]

One hundred cc. of Fluidextract of Nux Vomica yields not less than 2.37 Gm. and not more than 2.63 Gm. of the alkaloids of nux vomica.

	Metric	Alternative
Nux Vomica, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A, as modified for assayed Fluidextracts (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum, and reserving the first 800 cc. [12 fl. oz. 384 min.] of percolate.

After dissolving the soft extract in the reserve, assay a portion as directed below, and, from the result thus obtained, ascertain by calculation the amount of alkaloids in the remainder of the liquid and dilute this with enough menstruum to make each 100 cc. of the finished Fluidextract contain 2.5 Gm. of the alkaloids of nux vomica.

Assay—Assay 10 cc. of Fluidextract of Nux Vomica by Type Process D (see page 1496), using chloroform as the solvent, and determine the alkaloids volumetrically. Each cc. of tenth-normal acid corresponds to 0.0364 Gm. of the alkaloids of nux vomica.

This assay is explained on page 1500.

Approximate alcohol content, by volume, 60 per cent.

Uses—A bitter tonic.

Average dose—1½ minims (0.1 cc.).

FLUIDEXTRACTUM PAREIRÆ. N. F. Fluidextract of Pareira

[Fldext. Pareir.]

	Metric	Alternative
Pareira, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 40 per cent.

Uses—In inflammation of the genito-urinary system.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM PHYTOLACCÆ. N. F. Fluidextract of Phytolacca

[Fldext. Phytolac.]

	Metric	Alternative
Phytolacca, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum and reserving the first 800 cc. [12 fl. oz. 384 min.] of the percolate.

Approximate alcohol content, by volume, 40 per cent.

Uses—An emetic and purgative; and given in chronic rheumatism, but it must be used with caution.

Average dose—Emetic, 15 minims (1 cc.); alterative, 1½ minims (0.1 cc.).

FLUIDEXTRACT PRUNI VIRGINIANÆ. N. F. Fluidextract of Wild Cherry

[Fldext. Prun. Virg.]

	Metric	Alternative
Wild Cherry, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.
Glycerin	**200 cc.**	3 fl. oz. 96 min.
Alcohol,		
Water, each, a sufficient quantity,		
To make	**1000 cc.**	1 pint

Moisten the drug with a mixture of the glycerin and 400 cc. [6 fl. oz. 192 min.] of water, pack loosely in a cylindrical percolator, and macerate for twenty-four hours. Then add a mixture of 250 cc. [4 fl. oz.] of alcohol and 150 cc. [2 fl. oz. 192 min.] of water, macerate for twenty-four hours longer, and then percolate slowly with a mixture of one volume of alcohol and three volumes of water until the drug is practically exhausted.

Reserve the first 850 cc. [13 fl. oz. 288 min.] of percolate and evaporate the remainder to a soft extract; dissolve this in the reserved portion and add enough of a mixture of one volume of alcohol and three volumes of water to make the Fluidextract measure 1000 cc. [1 pint].

Approximate alcohol content, by volume, 16 per cent.

N. F. Preparation—Elixir Taraxaci Compositum.

Uses—A cough sedative of doubtful utility.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM QUASSIÆ. N. F. Fluidextract of Quassia

[Fldext. Quass.]

	Metric	Alternative
Quassia, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of one volume of alcohol and two volumes of water as the menstruum.

Approximate alcohol content, by volume, 24 per cent.

Uses—A simple bitter, useful in failure of appetite and in constipation due to the debility of intestinal muscular coating.

Average dose—8 minims (0.5 cc.).

FLUIDEXTRACTUM QUERCUS. N. F. Fluidextract of Quercus

[Fldext. Querc.]

	Metric	Alternative
Quercus, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process B (see page 403), using a mixture of 100 cc. [1 fl. oz. 288 min.] of glycerin, 500 cc. [8 fl. oz.] of alcohol and 400 cc. [6 fl. oz. 192 min.] of water as Menstruum I, and diluted alcohol as Menstruum II. Reserve the first 700 cc. [11 fl. oz. 96 min.] of the percolate.

Approximate alcohol content, by volume, 36 per cent.

Uses—An astringent, especially for external preparations.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM RHAMNI CATHARTICÆ. N. F. Fluidextract of Rhamnus Cathartica

[Fldext. Rham. Cathart.]

	Metric	Alternative
Rhamnus Cathartica, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum and reserving the first 750 cc. [12 fl. oz.] of the percolate.

Approximate alcohol content, by volume, 40 per cent.

N. F. Preparation—Syrupus Rhamni Catharticæ.

Uses—A laxative.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM RUBI. N. F. Fluidextract of Rubus

[Fldext. Rubi.]

	Metric	Alternative
Rubus, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum and reserving the first 800 cc. [12 fl. oz. 384 min.] of the percolate.

Approximate alcohol content, by volume, 38 per cent.

N. F. Preparation—Syrupus Rubi.

Uses—Astringent for diarrhea.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM RUMICIS. N. F. Fluidextract of Rumex

[Fldext. Rumic.]

	Metric	Alternative
Rumex, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by moistening the ground drug with 350 cc. [5 fl. oz. 288 min.] of diluted alcohol and then proceeding as directed in Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 40 per cent.

Uses—A feeble astringent.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM SABAL. N. F. Fluidextract of Sabal

(U. S. P. IX)

[Fldext. Sabal]

	Metric	Alternative
Sabal, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of four volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 65 per cent.

Uses—In genito-urinary diseases and occasionally in bronchitis.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM SANGUINARIÆ. N.F. Fluidextract of Sanguinaria

[Fldext. Sanguin.]

	Metric	Alternative
Sanguinaria, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process B (see page 403), using 50 cc. [384 min.] of hydrochloric acid, 200 cc. [3 fl. oz. 96 min.] of water and 750 cc. [12 fl. oz.] of alcohol as Menstruum I, and a mixture of three volumes of alcohol and one volume of water as Menstruum II.

Approximate alcohol content, by volume, 58 per cent.

Uses—In bronchitis.

Average dose—1½ minims (0.1 cc.).

FLUIDEXTRACTUM SANTALI ALBI. N.F. Fluidextract of Sandalwood

[Fldext. Santal. Alb.]

	Metric	Alternative
Sandalwood, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using alcohol as the menstruum.

Approximate alcohol content, by volume, 80 per cent.

N. F. Preparation—Elixir Sabal et Santali Compositum.

Uses—In genito-urinary diseases and occasionally in bronchitis.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM SARSAPARILLÆ COMPOSITUM. N.F. Compound Fluidextract of Sarsaparilla

(U. S. P. IX)

[Fldext. Sarsap. Co.]

	Metric	Alternative
Sarsaparilla, in coarse powder	**750 Gm.**	12 oz. av. 234 gr.
Glycyrrhiza, in coarse powder	**120 Gm.**	2 oz. av.
Sassafras, in moderately coarse powder	**100 Gm.**	1 oz. av. 293 gr.
Mezereum, in moderately coarse powder	**30 Gm.**	219 gr.

Mix the powders and prepare a Fluidextract by Type Process B (see page 403), using a mixture of 100 cc. [1 fl. oz. 288 min.] of glycerin, 500 cc. [8 fl. oz.] of alcohol, and 400 cc. [6 fl. oz. 192 min.] of water as Menstruum I, and diluted alcohol as Menstruum II.

Approximate alcohol content, by volume, 35 per cent.

Uses—An alterative.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM SCOPARII. N.F. Fluidextract of Scoparius

[Fldext. Scopar.]

	Metric	Alternative
Scoparius, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum and reserving the first 750 cc. [12 fl. oz.] of the percolate.

Approximate alcohol content, by volume, 40 per cent.

Uses—As a diuretic in dropsy.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM SCUTELLARIÆ. N. F. Fluidextract of Scutellaria

[Fldext. Scutellar.]

	Metric	Alternative
Scutellaria, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum and reserving the first 800 cc. [12 fl. oz. 384 min.] of the percolate.

Approximate alcohol content, by volume, 40 per cent.

Uses—In neuralgia and nervous diseases.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM SENECIONIS. N. F. Fluidextract of Senecio

[Fldext. Senecion.]

	Metric	Alternative
Senecio, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of two volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 55 per cent.

Uses—An emmenagogue.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM SERPENTARIÆ. N. F. Fluidextract of Serpentaria

[Fldext. Serpentar.]

	Metric	Alternative
Serpentaria, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of four volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 65 per cent.

Uses—A simple bitter.

Average dose—15 minims (1 cc.).

FLUIDEXTRACTUM SOLANI. N. F. Fluidextract of Solanum

[Fldext. Solan.]

	Metric	Alternative
Solanum, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of two volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 50 per cent.

Uses—An antispasmodic and aphrodisiac.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM STILLINGIÆ. N. F. Fluidextract of Stillingia

(U. S. P. IX)

[Fldext. Stilling.]

	Metric	Alternative
Stillingia, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 43 per cent.

N. F. Preparation—Elixir Corydalis Compositum.

Uses—An alterative.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM STILLINGIÆ COMPOSITUM. N. F. Compound Fluidextract of Stillingia

[Fldext. Stilling. Co.]

	Metric	Alternative
Stillingia, in moderately coarse powder	**250 Gm.**	4 oz. av. 75 gr.
Corydalis, in moderately coarse powder	**250 Gm.**	4 oz. av. 75 gr.
Blue Flag, in moderately coarse powder	**125 Gm.**	2 oz. av. 38 gr.
Sambucus, in moderately coarse powder	**125 Gm.**	2 oz. av. 38 gr.
Chimaphila, in moderately coarse powder	**125 Gm.**	2 oz. av. 38 gr.
Coriander, in moderately coarse powder	**63 Gm.**	1 oz. av. 22 gr.
Prickly Ash Berries, in moderately coarse powder	**62 Gm.**	1 oz. av. 15 gr.
To make	**1000 cc.**	1 pint

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 38 per cent.

N. F. Preparation—Syrupus Stillingiæ Compositus.

Uses—Employed as an alterative in syphilis and chronic rheumatism, but is of no real value.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM STRAMONII. N. F. Fluidextract of Stramonium

[Fldext. Stramon.]

One hundred cc. of Fluidextract of Stramonium yields not less than 0.22 Gm. and not more than 0.28 Gm. of the alkaloids of stramonium.

	Metric	Alternative
Stramonium, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A, as modified for assayed Fluidextracts (see page 403), using a mixture of four volumes of alcohol and one volume of water as the menstruum.

After dissolving the soft extract in the reserve, assay 10 cc. of this liquid as directed below, and, from the result thus obtained, ascertain by calculation the amount of alkaloids in the remainder of the liquid, and add to this enough menstruum to make each 100 cc. of the finished Fluidextract contain 0.25 Gm. of the alkaloids of stramonium.

Assay—Assay 10 cc. of Fluidextract of Stramonium by Type Process D (see page 1496), using the total extraction method, chloroform as the solvent, and determine the alkaloids volumetrically. Each cc. of tenth-normal acid corresponds to 0.02892 Gm. of the alkaloids of stramonium.

Approximate alcohol content, by volume, 64 per cent.

Uses—Antihidrotic, to relieve spasm, anti-asthmatic.

Average dose—1 minim (0.05 cc.).

FLUIDEXTRACTUM TARAXACI. N. F. Fluidextract of Taraxacum

(U. S. P. IX)

[Fldext. Tarax.]

	Metric	Alternative
Taraxacum, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process B (see page 403), using a mixture of 100 cc. [1 fl. oz. 288 min.] of glycerin, 500 cc. [8 fl. oz.] of alcohol and 400 cc. [6 fl. oz. 192 min.] of water as Menstruum I, and diluted alcohol as Menstruum II.

Approximate alcohol content, by volume, 36 per cent.

N. F. Preparations—Elixir Gentianæ Glycerinatum; Elixir Taraxaci Compositum.

Uses—A diuretic and alterative.

Average dose—2½ fluidrachms (10 cc.).

FLUIDEXTRACTUM THUJÆ. N. F. Fluidextract of Thuja

[Fldext. Thuj.]

	Metric	Alternative
Thuja, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using alcohol as the menstruum.

Approximate alcohol content, by volume, 80 per cent.

Uses—In chronic bronchitis; also catarrh of the urinary organs.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM THYMI. N. F. Fluidextract of Thyme

[Fldext. Thym.]

	Metric	Alternative
Thyme, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process B (see page 403), using a mixture of 100 cc. [1 fl. oz. 288 min.] of glycerin, 250 cc. [4 fl. oz.] of alcohol, and 650 cc. [10 fl. oz. 192 min.] of water as Menstruum I, and a mixture of one volume of alcohol and three volumes of water as Menstruum II.

Approximate alcohol content, by volume, 18 per cent.

N. F. Preparation—Syrupus Thymi.

Uses—In chronic bronchitis and whooping-cough.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM TONGÆ. N. F. Fluidextract of Tonga

[Fldext. Tong.]

	Metric	Alternative
Tonga, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of one volume of alcohol and three volumes of water as the menstruum.

Approximate alcohol content, by volume, 20 per cent.

Uses—In rheumatism.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM TRIFOLII. N. F. Fluidextract of Trifolium

[Fldext. Trifol.]

	Metric	Alternative
Trifolium, in moderately coarse powder	**1000 Gm.**	**16 oz. av. 302 gr.**

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum and reserving the first 800 cc. [12 fl. oz. 384 min.] of the percolate.

Approximate alcohol content, by volume, 40 per cent.

Uses—An alterative and antispasmodic.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM TRIFOLII COMPOSITUM. N. F. Compound Fluidextract of Trifolium

[Fldext. Trifol. Co.]

	Metric	Alternative
Trifolium, in moderately coarse powder	**215 Gm.**	**3 oz. av. 258 gr.**
Glycyrrhiza, in moderately coarse powder	**215 Gm.**	**3 oz. av. 258 gr.**
Berberis, in moderately coarse powder	**108 Gm.**	**1 oz. av. 351 gr.**
Cascara Amarga, in moderately coarse powder	**108 Gm.**	**1 oz. av. 351 gr.**
Lappa, in moderately coarse powder	**108 Gm.**	**1 oz. av. 351 gr.**
Phytolacca, in moderately coarse powder	**108 Gm.**	**1 oz. av. 351 gr.**
Stillingia, in moderately coarse powder	**108 Gm.**	**1 oz. av. 351 gr.**
Xanthoxylum, in moderately coarse powder	**30 Gm.**	**219 gr.**
To make	**1000 cc.**	**1 pint**

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of one volume of alcohol and three volumes of water as the menstruum.

Approximate alcohol content, by volume, 15 per cent.

N. F. Preparation—Syrupus Trifolii Compositus.

Uses—An alterative.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM TRILLII. N. F. Fluidextract of Trillium

[Fldext. Trill.]

	Metric	Alternative
Trillium, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 60 per cent.

N. F. Preparation—Elixir Viburni Opuli Compositum.

Uses—In uterine diseases.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM TRITICI. N. F. Fluidextract of Triticum

(U. S. P. IX)

[Fldext. Tritic.]

	Metric	Alternative
Triticum, finely cut	**1000 Gm.**	16 oz. av. 302 gr.
Alcohol	**200 cc.**	3 fl. oz. 96 min.

Prepare a Fluidextract by Type Process D (see page 405), evaporate the aqueous percolate to 800 cc. [12 fl. oz. 384 min.] and when cold add the alcohol, and if necessary, sufficient water to make the product measure 1000 cc. [1 pint].

Approximate alcohol content, by volume, 18 per cent.

Uses—In uterine disorders.

Average dose—2½ fluidrachms (10 cc.).

FLUIDEXTRACTUM VALERIANÆ. N. F. Fluidextract of Valerian

[Fldext. Valer.]

	Metric	Alternative
Valerian, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of four volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 65 per cent.

Uses—In hysteria and nervousness.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM VERBASCI FOLIORUM. N. F. Fluidextract of Mullein Leaves

[Fldext. Verbasc. Fol.]

	Metric	Alternative
Mullein Leaves, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 38 per cent.

Uses—A demulcent, domestically employed in acute bronchitis.

Average dose—1 fluidrachm (4 cc.).

FLUIDEXTRACTUM VIBURNI OPULI. N. F. Fluidextract of Viburnum Opulus

[Fldext. Viburn. Opul.]

	Metric	Alternative
Viburnum Opulus, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of two volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 50 per cent.

N. F. Preparations—Elixir Aletridis Compositum; Elixir Heloniadis Compositum; Elixir Viburni Opuli Compositum.

Uses—In uterine disorders.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM VIBURNI PRUNIFOLII. N. F. Fluidextract of Viburnum Prunifolium

(U. S. P. IX)

[Fldext. Viburn. Prun.]

	Metric	Alternative
Viburnum Prunifolium, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of two volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 56 per cent.

N. F. Preparation—Elixir Viburni Prunifolii.

Uses—In uterine disorders.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM XANTHOXYLI. N. F. Fluidextract of Xanthoxylum

(U. S. P. IX)

[Fldext. Xanthox.]

	Metric	Alternative
Xanthoxylum, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using a mixture of three volumes of alcohol and one volume of water as the menstruum.

Approximate alcohol content, by volume, 62 per cent.

N. F. Preparations—Elixir Corydalis Compositum; Elixir Hydrastis Compositum.

Uses—A counterirritant.

Average dose—30 minims (2 cc.).

FLUIDEXTRACTUM ZEÆ. N. F. Fluidextract of Zea

[Fldext. Zea]

	Metric	Alternative
Zea, finely cut	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidextract by Type Process A (see page 403), using diluted alcohol as the menstruum.

Approximate alcohol content, by volume, 30 per cent.

N. F. Preparation—Elixir Sabal et Santali Compositum.

Uses—A diuretic.

Average dose—1 fluidrachm (4 cc.).

Table of Some Unofficial Fluidextracts

In the following preparations, where possible, type processes A, B, C, or D, will be referred to for directions (see pages 403, 404 and 405). Unless otherwise stated, quantities will be based upon 1000 Gm. of drug, yielding 1000 cc. of finished fluidextract.

Title	*Directions*
Fluidextractum Aromaticæ (U. S. P. IX)	Prepare from aromatic powder by type process C, using alcohol as the menstruum (aromatic powder consists of 350 Gm. saigon cinnamon, 350 Gm. ginger, 150 Gm. cardamom seed and 150 Gm. of myristica) Dose: fifteen minims (1 cc.)
Arnicæ Radicis (U. S. P. 1890)	Prepare by type process A, using 70 per cent alcohol as the menstruum Dose: one fluidrachm (4 cc.)
Aspidospermatis (U. S. P. IX)	Prepare by type process B, using a mixture of 110 cc. glycerin, 670 cc. alcohol and 220 cc. water as menstruum I, and 64 per cent alcohol as menstruum II Dose: one fluidrachm (4 cc.)
Aurantii Amari (U. S. P. IX)	Prepare by type process C, using 70 per cent alcohol as the menstruum Dose: fifteen minims (1 cc.)
Belæ (Br. 1914)	Macerate 1000 Gm. of bruised bael fruit for twelve hours in 5000 cc. of chloroform water. Pour off the liquid and repeat the maceration twice, an hour each time, using 5000 cc. of chloroform water for each maceration. Evaporate the mixed liquid to 750 cc. and add 250 cc. of alcohol Dose: one fluidrachm (4 cc.)
Cinchonæ Aquosum (N. F. IV)	One hundred cc. contains from 4.5 to 5.5 Gm. of cinchona alkaloids. Percolate the drug to exhaustion using first a mixture of 30 cc. of hydrochloric acid, 125 cc. of glycerin, and 5000 cc. of water, and afterwards water to exhaustion. Reserve the first 700 cc. of percolate, evaporate the remainder to 400 cc., at not over 80° C., add the reserve portion and evaporate to 700 cc. Assay and add enough alcohol and water to make the finished fluidextract contain 12 per cent by volume of absolute alcohol and the amount of alkaloids required Dose: fifteen minims (1 cc.)
Conii (N. F. IV)	One hundred cc. contains from 0.35 Gm. to 0.45 Gm. of coniine. Prepare by type process C, as modified for assayed fluidextracts, using first a mixture of 20 cc. of acetic acid and 980 cc. of diluted alcohol as the menstruum, and then diluted alcohol Dose: 3 minims (0.2 cc.)
Convallariæ (N. F. IV)	Prepare by type process A, using a mixture of 2 volumes of alcohol and 1 volume of water as the menstruum Dose: 3 minims (0.2 cc.)
Cusso (U. S. P. 1890)	Prepare by type process A, using alcohol as the menstruum
Helianthemi (N. F. IV)	Prepare by type process A, using diluted alcohol as the menstruum Dose: one fluidrachm (4 cc.)
Menispermi (U. S. P. 1890)	Prepare by type process A, using 64 per cent alcohol as the menstruum Dose: thirty minims (2 cc.)
Opii Liquidum (Br. 1914)	Triturate 37.5 Gm. of dry extract of opium with 700 cc. of water, stir frequently during twenty-four hours, add 200 cc. alcohol, set aside for twenty-four hours, filter, and add enough distilled water to make 1000 cc.
Paracoto (N. F. IV)	Prepare by type process A, using 85 per cent alcohol as the menstruum Dose: five minims (0.3 cc.)
Petroselini Radicis (N. F. IV)	Prepare by type process A, using 64 per cent alcohol as the menstruum Dose: thirty minims (2 cc.)
Picrorhizæ (Br. 1914)	Prepare by type process A, using 60 per cent alcohol as the menstruum
Pilocarpi (U. S. P. IX)	One hundred cc. contains from 0.55 Gm. to 0.65 Gm. of alkaloids. Prepare by type process A, using 64 per cent alcohol as the menstruum and reserving the first 800 cc. Assay and adjust the final volume to the required standard Dose: thirty minims (2 cc.)
Podophylli (U. S. P. IX)	Prepare by type process A, using alcohol as the menstruum Dose: eight minims (0.5 cc.)
Spigeliæ (U. S. P. IX)	Prepare by type process A, using diluted alcohol as the menstruum Dose: one fluidrachm (4 cc.)
Staphisagriæ (U. S. P. IX)	Prepare by type process A, using alcohol as the menstruum
Sumbul (U. S. P. IX)	Prepare by type process A, using 75 per cent alcohol as the menstruum Dose: thirty minims (2 cc.)
Veratri Viridis (U. S. P. IX)	Prepare by type process A, using alcohol as the menstruum Dose: one and one half minims (0.1 cc.)
Verbenæ (N. F. IV)	Prepare by type process A, using diluted alcohol as the menstruum Dose: fifteen minims (1 cc.)

CHAPTER XXXIII

GLYCERIN PREPARATIONS MADE BY PERCOLATION OR MACERATION

Fluidglycerata—*Fluidglycerates*

Fluidglycerates are intended to be of the same drug strength as Fluidextracts. They contain approximately 50 per cent, by volume, of glycerin and no alcohol. The drug should be in a coarse or moderately coarse powder unless otherwise directed. Fluidglycerates made from drugs that do not require either an acid or an alkaline menstruum may be prepared by the following general process.

General Process

	Metric	Alternative
The Drug, in coarse powder	1000 Gm.	16 oz. av. 302 gr.
Glycerin	500 cc.	8 fl. oz.
Water	1500 cc.	24 fl. oz.
Chloroform Water, a sufficient quantity,		
To make	1000 cc.	1 pint

Mix the glycerin and water and moisten the drug thoroughly with a portion of the mixture, then pack it very lightly in a cylindrical percolator, and add enough of the menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed slowly until the drug is practically exhausted, using first the remainder of the menstruum and then the chloroform water.

Reserve the first 500 cc. [8 fl. oz.] of the percolate and evaporate the remainder on a water bath, the weaker portion first, then the stronger, until reduced to 600 cc. [9 fl. oz. 288 min.], then add the reserved portion and continue evaporation until the product measures 1000 cc. [1 pint]. Allow the preparation to stand for a few days, then decant the clear portion and strain the remainder. Mix well.

FLUIDGLYCERATUM CASCARÆ SAGRADÆ. N. F. Fluidglycerate of Cascara Sagrada

[Fldglycer. Casc. Sagr.]

	Metric	Alternative
Cascara Sagrada, in coarse powder	1000 Gm.	16 oz. av. 302 gr.

Prepare a Fluidglycerate by the General Process (see page 443), using 500 cc. [8 fl. oz.] of menstruum to moisten the drug.

Uses—A laxative.

Average dose—15 minims (1 cc.).

FLUIDGLYCERATUM CASCARÆ SAGRADÆ AROMATICUM. N. F. Aromatic Fluidglycerate of Cascara Sagrada

[Fldglycer. Casc. Sagr. Arom.]

	Metric	Alternative
Cascara Sagrada, in coarse powder	750 Gm.	12 oz. av. 226 gr.
Fluidglycerate of Glycyrrhiza	250 cc.	4 fl. oz.
Lime	20 Gm.	146 gr.
Heavy Magnesium Oxide	20 Gm.	146 gr.
Glycerin	375 cc.	6 fl. oz.
Oil of Fennel	1 cc.	8 min.
Oil of Clove	1 cc.	8 min.
Oil of Cinnamon	1 cc.	8 min.
Water,		
Chloroform Water, each, a sufficient quantity,		
To make	1000 cc.	1 pint

Slake the lime, mix it with the magnesium oxide and 1500 cc. [24 fl. oz.] of water and stir in the cascara sagrada, moistening the drug evenly and thoroughly. Expose the moist powder to the air until dry. Mix the glycerin with 1125 cc. [18 fl. oz.] of water and moisten the cascara sagrada with 600 cc. [9 fl. oz. 288 min.] of this menstruum, pack it lightly in a cylindrical percolator and add enough of the menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice and, having closely covered the percolator, macerate the mixture for forty-eight hours. Then allow the percolation to proceed slowly until the drug is practically exhausted, using first the remainder of the menstruum and afterwards chloroform water.

Reserve the first 375 cc. [6 fl. oz.] of the percolate and evaporate the remainder on a water bath, the weaker portion first, then the stronger portion until it is reduced to 450 cc. [7 fl. oz. 96 min.], then add the reserved portion and continue the evaporation until the liquid measures 747 cc. [11 fl. oz. 457 min.]. When cold, add the fluidglycerate of glycyrrhiza and the volatile oils and mix thoroughly. Allow the preparation to stand for a few days, then decant the clear portion and strain the remainder.

N. F. Preparation—Syrupus Ficorum Compositus.

Uses—A laxative.

Average dose—15 minims (1 cc.).

FLUIDGLYCERATUM GLYCYRRHIZÆ. N. F. Fluidglycerate of Glycyrrhiza

[Fldglycer. Glycyrrhiz.]

	Metric	Alternative
Glycyrrhiza, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.
Glycerin	**500 cc.**	8 fl. oz.
Boiling Water, a sufficient quantity, To make	**1000 cc.**	1 pint

Macerate the glycyrrhiza in hot water for six hours, then exhaust it by percolation with boiling water. Boil the percolate down in a steam pan to a volume of about 2000 cc. [2 pints], and filter it. Then evaporate the filtered liquid to a volume of about 500 cc. [8 fl. oz.], add the glycerin, allow the liquid to cool, then add sufficient water to make the product measure 1000 cc. [1 pint].

N. F. Preparations—Elixir Bromidorum Quinque, Elixir Guaranæ et Apii; Fluidglyceratum Cascaræ Sagradæ Aromaticum; Syrupus Glycyrrhizæ.

Uses—A vehicle and flavor.

Average dose—30 minims (2 cc.).

FLUIDGLYCERATUM KRAMERIÆ. N. F. Fluidglycerate of Krameria

[Fldglycer. Kramer.]

	Metric	Alternative
Krameria, in coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidglycerate by the General Process (see page 443), using 600 cc. [9 fl. oz. 288 min.] of menstruum to moisten the drug.

Uses—An astringent for diarrhea.

Average dose—15 minims (1 cc.).

FLUIDGLYCERATUM RHEI. N. F. Fluidglycerate of Rhubarb

[Fldglycer. Rhei]

	Metric	Alternative
Rhubarb, in moderately coarse powder	**1000 Gm.**	16 oz. av. 302 gr.

Prepare a Fluidglycerate by the General Process (see page 443), using 500 cc. [8 fl. oz.] of menstruum to moisten the drug.

Uses—A laxative.

Average dose—15 minims (1 cc.).

Unofficial Glycerin Preparation

Title	*Directions*
Glyceritum Hydrastis (N. F. IV)	Exhaust 100 Gm. of hydrastis by percolation with alcohol, distil the alcohol from the percolate, pour the thick liquid into 45 cc. of ice water and cool for twenty-four hours. Filter, assay, add water to make each 10 cc. contain 0.25 Gm. of alkaloids and finally add an equal volume of glycerin Dose: thirty minims (2 cc.)

CHAPTER XXXIV

OLEORESINOUS LIQUIDS MADE BY PERCOLATION

Oleoresinæ—*Oleoresins*

The oleoresins are liquid preparations, consisting principally of natural oils and resins extracted from vegetable substances by percolation with acetone or ether. The latter is now directed in the Pharmacopœia for this purpose, but acetone has been used and apparently produces identical products. Alcohol is used in preparing the oleoresin of cubeb, this being the one drug in which it is satisfactory. The choice between ether and acetone is largely a question of cost although the acetone is less dangerous and therefore preferred by many manufacturers. Either will produce a U. S. P. product, under the general authorization of the U. S. P. The oleoresins were formerly classed with fluidextracts, but they differ essentially from them: 1. They do not bear a uniform relation to the drug as do the fluidextracts, of Gm. to cc., and the yield of oleoresin obtained from the drug varies according to the proportion of oil and resin naturally present. 2. The menstruum (ether) extracts principles which are often insoluble in alcohol, diluted alcohol or water. 3. They are without exception the most concentrated liquid preparations of drugs that are produced.

Fig. 423

Percolator for volatile liquids

Oleoresins are prepared by percolating the powdered drug contained in a cylindrical percolator provided with a cover and a receptacle suitable for volatile liquids, with the menstruum directed, until exhausted, recovering the greater part of the liquid by distillation, and exposing the residue in a shallow dish to spontaneous evaporation until the remaining solvent has evaporated. Fig. 423 shows a convenient percolator for making oleoresins. The powder should not be packed too tightly in the narrow percolator; the exit tube affords a means of easily regulating the flow. A *continuous extraction apparatus* can be made of this percolator by enclosing the upper part in a suitable case and passing cold water between, arranging the apparatus like a Liebig's condenser (see page 140). A glass tube is connected with the top of the percolator and the mouth of the bottle by rubber tube connections, and if the receiving bottle is placed in a water bath and the water gently heated, the ether will evaporate from the percolate, and the vapors rising in the tube will condense in the upper part of the percolator.

A form of continuous extraction apparatus frequently used on the small scale for the extraction of drugs with volatile solvents is known as a Soxhlet apparatus (see page 133).

Oleoresins which have not been evaporated sufficiently are frequently found in commerce; they have a decided odor of the menstruum, sometimes of benzin, showing in the latter case that a menstruum which is an inferior solvent has been substituted for the one authorized by the Pharmacopœia. Commercial gasoline often contains appreciable quantities of kerosene, which does not volatilize, but permanently contaminates the oleoresins. It should never be used as a menstruum for oleoresins.

OLEORESINA ASPIDII. U.S. Oleoresin of Aspidium

[Oleores. Aspid.—Oleoresin of Male Fern]

Oleoresin of Aspidium yields not less than 24 per cent of crude filicin.

	Metric	Alternative
Aspidium, recently reduced to coarse powder	500 Gm.	16 oz. av.
Ether, a sufficient quantity.		

Place the aspidium in a cylindrical glass percolator provided with a stopcock, and arranged with a cover and a receptacle suitable for volatile liquids. Pack the powder firmly, and percolate slowly with ether added in successive portions until the drug is exhausted. Recover the greater part of the ether from the percolate by distillation on a water bath, and, having transferred the residue to a dish, allow the remaining ether to evaporate spontaneously in a warm place, remote from a naked flame.

Description and Physical Properties—A dark green, thick liquid, usually depositing a granular, crystalline substance, which must be thoroughly mixed with the liquid portion before use.

Not less than 85 per cent of the Oleoresin is soluble in purified petroleum benzin.

Specific gravity: not less than 1.00 at 25° C.

Assay—Warm the Oleoresin on a water bath and stir until it is thoroughly mixed. Transfer about 5 Gm. accurately weighed, to a 200 cc. flask, dissolve in 40 Gm. of ether, add 100 Gm. of an aqueous solution of barium hydroxide (3 in 100), and shake vigorously for five minutes. Allow the liquids to separate, and filter off 86 Gm. of the aqueous fluid. Transfer this to a separator, add sufficient hydrochloric acid to produce a distinctly acid reaction, and extract with three successive portions of 30 cc., 20 cc. and 15 cc., of ether. Draw off and combine the ethereal solutions, filter, wash the filter with ether, evaporate, and dry the residue to constant weight at 100° C. This residue weighs not less than 0.96 Gm., corresponding to not less than 24 per cent of crude filicin.

Preserve in well-stoppered bottles.

Uses—A tenifuge. It must be used with caution, as it becomes a violent poison if allowed to remain in the alimentary canal until absorbed. It is usually administered after twelve to twenty-four hours of fasting and must be followed within a few hours by an active purge. Castor oil, however, should not be used, as it promotes absorption.

Average dose—Caution! Single dose, once a day, 1 drachm (4 Gm.).

OLEORESINA CAPSICI. U.S. Oleoresin of Capsicum

[Oleores. Capsic.]

	Metric	Alternative
Capsicum, in coarse powder	500 Gm.	32 oz. av.
Ether, a sufficient quantity.		

Place the capsicum in a cylindrical glass percolator provided with a stopcock, and arranged with a cover and a receptacle suitable for volatile liquids. Pack the powder firmly, and percolate slowly with ether, added in successive portions until the percolate measures 800 cc. [about 3 pints]. Recover the greater part of the ether from the percolate by distillation on a water bath, and, having transferred the residue to a dish, allow the remaining ether to evaporate spontaneously in a warm place, remote from a naked flame. Then pour off the liquid portion, transfer the remainder to a glass funnel provided with a pledget of cotton, and, when the separated fatty matter (which is to be rejected) has been completely drained, mix the liquid portions.

Oleoresin of Capsicum should meet the requirements of the following test: Dissolve 0.2 Gm. of the Oleoresin in 50 cc. of alcohol in a stoppered flask, dilute 0.1 cc. of the clear separated solution with 140 cc. of distilled water containing 10 per cent of sucrose: five cc. of this dilution, swallowed at one time, will produce a distinct sensation of pungency in the mouth and throat of at least two out of three individuals.

Preserve in well-stoppered bottles.

This organoleptic test is intended to distinguish between the true Cayenne pepper and other mild varieties more suited for seasoning purposes. No other variety of pepper will produce the rubefacient effect expected of this oleoresin when used externally in ointments.

Uses—Applied to the skin it is a powerful rubefacient. It is usually applied in ointments. Internally it is a stomachic, producing a warmth over the entire body. It is used on plaster for neuralgia and as a toothache pad.

Average dose—¼ grain (0.015 Gm.).

OLEORESINA CUBEBÆ. N. F. Oleoresin of Cubeb

(U. S. P. IX)

[Oleores. Cubeb.]

	Metric	Alternative
Cubeb, in moderately coarse powder	**500 Gm.**	16 oz. av.
Alcohol, a sufficient quantity.		

Place the cubeb in a cylindrical glass percolator, pack the powder firmly, and percolate slowly with alcohol, added in successive portions, until the drug is exhausted. Recover the greater part of the alcohol from the percolate by distillation on a water bath, and, having transferred the residue to a dish, allow the remaining alcohol to evaporate in a warm place, stirring frequently. Keep the Oleoresin in a well-stoppered bottle.

NOTE—Oleoresin of Cubeb, after standing for some time, deposits a waxy and crystalline precipitate, which should be rejected, the liquid portion only being used.

Uses—A urinary antiseptic and stimulant; also in the form of lozenges for throat troubles.

Average dose—8 grains (0.5 Gm.).

Table of Some Unofficial Oleoresins

Title	*Directions*
Oleoresina Lupulini (N. F. IV)	Percolate 500 Gm. of lupulin with ether to exhaustion; recover most of the ether by distillation on a water bath and allow the balance to evaporate spontaneously Dose: three grains (0.2 Gm.)
Petroselini (U. S. P. IX)	Prepare as directed under oleoresina lupulini. Set aside for several days and decant the clear liquid from any solid residue Dose: eight minims (0.5 cc.)
Piperis (U. S. P. IX)	Prepare as directed under oleoresina lupulini. Strain through cotton to remove the piperine which is deposited Dose: one half grain (0.03 Gm.)
Zingiberis (U. S. P. IX)	Prepare as directed under oleoresina lupulini Dose: one half grain (0.03 Gm.)

CHAPTER XXXV

OILY PREPARATIONS MADE BY MACERATION

Olea Infusa—*Infused Oils*

THESE consist of a solution in oil of the soluble constituents of plants, chiefly of those containing alkaloids or volatile oils, such as hyoscyamus, belladonna, calendula, etc. The compound Oil of Hyoscyamus closely resembles the *Baumé Tranquille* of the French Pharmacopœia and is extensively used for earache.

OLEA INFUSA. N. F. Infused Oils

[Ol. Inf.]

	Metric	Alternative
The Air Dried Drug, in moderately coarse powder	100 Gm.	3 oz. av. 148 gr.
Alcohol	100 cc.	3 fl. oz. 96 min.
Ammonia Water	2 cc.	31 min.
Sesame Oil	1000 cc.	2 pints
To make about	1000 cc.	2 pints

Moisten the drug with the alcohol and ammonia water, previously mixed, macerate for six hours in a covered vessel, and add the sesame oil. Warm this mixture on a water bath, at a temperature between 60° and 70° C. in an open vessel, stirring frequently, until the alcohol and ammonia water are dissipated. Then transfer the mixture to a strainer, express the residue and filter the strained oil.

Preserve infused oils in small, amber-colored bottles in a cool place.

OLEUM HYOSCYAMI COMPOSITUM. N. F. Compound Oil of Hyoscyamus

[Ol. Hyoscy. Co.—BALSAMUM TRANQUILLANS]

	Metric	Alternative
Oil of Lavender	2 cc.	31 min.
Oil of Peppermint	2 cc.	31 min.
Oil of Rosemary	2 cc.	31 min.
Oil of Thyme	2 cc.	31 min.
Infused Oil of Hyoscyamus (prepared by the general formula above), a sufficient quantity,		
To make	1000 cc.	2 pints

Mix them.

History—This preparation was first made by the Capucin Monk Aignan in the seventeenth century, whose monastery name was *Padre Tranquille.* At one time the formula called for one live frog to be boiled with each pound of oil before infusing the herbs therein.

Uses—A local anodyne, especially for earache.

CHAPTER XXXVI

ACETOUS LIQUIDS MADE BY PERCOLATION OR MACERATION

Aceta—*Vinegars*

This class of preparations is an old one, having been in use since the days of Hippocrates. Medicated vinegars are solutions of the active principles of drugs in diluted acetic acid, the latter being chosen as a menstruum because acetic acid is not only a good solvent but also possesses antiseptic properties.

Diluted acetic acid replaces the natural vinegar formerly used, cider vinegar having been discarded because of its variable quality and strength. Acetic acid may be obtained in all parts of the country very cheaply and of unexceptionable quality. The properties of acetic acid are noted in Part V of this book.

Only *one* vinegar is official at present in the U. S. P. X and *one* in the N. F. V. The medicated vinegars should not be made in larger quantities than can be used within a reasonable time, for, although possessed of most of the characteristics of permanent preparations, they are liable to deposit upon standing.

The official vinegars are uniform in strength (10 per cent) and are made by maceration.

ACETUM SCILLÆ. U. S. Vinegar of Squill

[Acet. Scill.]

	Metric	Alternative
Squill, in coarse powder	100 Gm.	3 oz. av. 148 gr.
Diluted Acetic Acid, a sufficient quantity,		
To make	1000 cc.	2 pints

Macerate the squill with 900 cc. [29 fl. oz.] of diluted acetic acid during seven days with frequent agitation. Then strain the mixture, and wash the mass on the strainer with enough diluted acetic acid to make the strained liquid measure nearly 1000 cc. [2 pints]. Heat this liquid to boiling, filter while hot, and when cold add sufficient diluted acetic acid to make the product measure 1000 cc. [2 pints.].

U. S. P. Preparation—Syrupus Scillæ.
N. F. Preparation—Oxymel Scillæ.

Uses—Used chiefly in the preparation of the syrup. It is diuretic.

Average dose—15 minims (1 cc.).

ACETUM AROMATICUM. N. F. Aromatic Vinegar

[Acet. Arom.]

	Metric	Alternative
Oil of Lavender	0.5 cc.	8 min.
Oil of Rosemary	0.5 cc.	8 min.
Oil of Juniper	0.5 cc.	8 min.
Oil of Peppermint	0.5 cc.	8 min.
Oil of Cinnamon	0.5 cc.	8 min.
Oil of Lemon	1.0 cc.	15 min.
Oil of Clove	1.0 cc.	15 min.
Alcohol	250.0 cc.	8 fl. oz.
Acetic Acid	260.0 cc.	8 fl. oz. 154 min.
Water, a sufficient quantity,		
To make	1000 cc.	2 pints

Dissolve the oils in the alcohol, add the acetic acid, and sufficient water to make the product measure 1000 cc. [2 pints]. Set the mixture aside for eight days, occasionally agitating it, and filter.

See page 1505 for the assay.

Approximate alcohol content, by volume, 23 per cent.

History—This preparation was known a little over a hundred years ago as *Vinegar of the Four Thieves* (*Vinaigre des quatre voleurs*) because it was alleged to have been used as a prophylactic against the plague in Marseilles by four thieves who robbed the dead and the dying.

Uses—Employed in the same way as smelling salts, as a restorative in faintness.

Table of Some Unofficial Vinegars

Title	*Directions*
Acetum Cantharidini (Br. 1914)	Dissolve 0.5 Gm. of cantharidin in 100 cc. of glacial acetic acid on a water bath and add enough acetic acid to make 1000 cc.
Opii (N. F. IV)	Macerate 100 Gm. of granulated opium, 30 Gm. powdered myristica and 200 Gm. sucrose in 500 cc. diluted acetic acid for seven days, transfer to a percolator and add enough diluted acetic acid to make 1000 cc. of percolate Dose: eight minims (0.5 cc.)
Urgineæ (Indian Squill) (Br. 1914)	Macerate 100 Gm. bruised urginea with 100 cc. acetic acid and 320 cc. distilled water for seven days and filter Dose: five minims (0.3 cc.)

CHAPTER XXXVII

SOLID PREPARATIONS MADE BY PERCOLATION, ETC.

Extracta—*Extracts*

Extracts are either pasty or semi-solid masses, or dry, solid or powdered products, prepared by exhausting drugs with appropriate solvents, carefully evaporating the solutions so obtained to the prescribed consistence and adjusting the products to the fixed standards. An extract is intended to preserve the useful constituents of the drug in a concentrated, relatively uniform, permanent condition, and in a form suitable for medication.

The solvent or menstruum to be employed in the preparation of an extract is dependent upon the physical characteristics of the drug and the nature of its constituents. The solvents commonly adopted are water or alcohol, or mixtures of these, in the proportions directed in the formulas. For the extraction of a few drugs, the addition of an acid or an alkali to the solvent is required. When alcohol is used as a solvent, it may be recovered by distillation. When a drug contains an oily constituent that is extracted by the menstruum, it becomes necessary to adopt in the process of manufacture some method for the separation of this oil so that a permanent product of the proper consistence, dryness, or powdered form may be obtained.

The proximate principles most commonly present in extracts are *gum*, *sugar*, *starch*, *tannin*, *extractive*, *chlorophyll*, *coloring-matter*, *inorganic salts*, and the *active principles of plants*, to which, when a spiritous solvent is employed, may usually be added, *resinous substances*, *fatty matter*, and frequently more or less *volatile oil*, gum and starch being excluded when the menstruum is strong alcohol. Inert fixed oil or fat is often removed from powdered drugs by previous percolation with ether or with petroleum benzin; these liquids do not, as a rule, extract the active principles, and thus a dry powdered extract can be made.

In the preparation of extracts, the concentration of the liquid extractions is to be completed without delay, and undue exposure to heat must be avoided. The limit of temperature for the evaporation, as stated in the formulas, should not be exceeded. In the manufacture of extracts on a large scale, apparatus for distilling and evaporating under reduced pressure should be used. It is also important that the residue be frequently stirred in order to hasten the evaporation and to obtain a uniformly smooth product.

In addition to extracts made by extracting drugs, sometimes the juices of fresh plants extracted by contusion and expression are evaporated, and such extracts are frequently called *succi spissati*, or *inspissated juices*.

Extractive—It has long been known that in most vegetable bodies there is a substance, soluble both in water and in alcohol, which, in the preparation of extracts, undergoes chemical change during the process of evaporation, imparting to the liquid, even if originally limpid, first, a greenish, then a yellowish-brown, and ultimately a deep brown color, and becoming itself insoluble. This substance has received the appropriate name of *extractive*, derived from its frequent presence in extracts. Its existence as a distinct principle is denied, or at least doubted, by some chemists, who consider the phenomena supposed to result from its presence as depending upon the mutual reaction of other principles. The most important property of extractive is its

disposition to become insoluble under the influence of atmospheric air at a high temperature. If a vegetable infusion or decoction is evaporated in the open air to the consistence of an extract, then diluted, filtered, and again evaporated, and the process repeated so long as any insoluble matter is formed, the whole of the extractive will be separated from the liquid, while the other ingredients may remain. If chlorine is passed through an infusion or decoction, a similar precipitate is formed with much greater rapidity. The change is usually ascribed to the absorption of oxygen by the extractive, which has, therefore, been called, in its altered condition, oxidized extractive; but De Saussure ascertained that, though oxygen is absorbed during the process, an equal measure of carbonic acid gas is given out, and the oxygen and hydrogen of the extractive unite to form water in such a manner as to leave the principle richer in carbon than it was originally. The name of oxidized extractive is, therefore, obviously incorrect; and Berzelius long ago proposed to substitute for it that of *apothem*, synonymous with deposit. According to Berzelius, apothem is not completely insoluble in water, but imparts a slight color to that liquid when cold, and is rather more soluble in boiling water, which becomes turbid upon cooling. It is still more soluble in alcohol, and is freely dissolved by solutions of the alkalies and alkaline carbonates, from which it is precipitated by acids. It has a great tendency, when precipitated from solutions, to unite with other principles and to carry them along with it, thus acquiring properties somewhat different, according to the source from which it is obtained. In this way, also, even when the extractive of a plant is itself medicinally inert, its conversion into apothem may be injurious by causing a precipitation of a portion of the active principle; in practical pharmaceutical operations this change should always, if possible, be avoided.

Variable Quality of Extracts—*It is evident that there must be great variation in the quality of extracts of pilular consistence as found in commerce*, for, whether made by any of the processes commonly employed, or by a special patented process, the lack of a fixed standard to determine the amount of moisture which is to remain in pilular extracts renders them very variable in strength. The Pharmacopœia is necessarily compelled to avoid specifying an exact limit in this respect, and the approximate standard of *"pilular consistence"* has been adopted. The powdered extracts are more stable and being adjusted through the addition of a diluent to an exact weight, they have a great advantage over pilular extracts. It should be said in addition that the variation in the strength of extracts of pilular consistence does not cease even after their manufacture. The exposure to the air to which they are subjected in dispensing, particularly if kept in the customary open queen's-ware or glass jars, causes loss of moisture and they become hard, and consequently stronger, in proportion to the quantity of moisture that is thus lost; this loss may in some cases amount to as much as 25 per cent. In moist climates, however, some extracts absorb moisture and become thinner. One of the advantages of powdered extracts is that they may be kept in tightly corked vials, and thus protected from moisture. The greatest variation in the commercial extracts, however, arises from the difference in the alcoholic strength of the menstruum employed. This may be best illustrated by taking the case of extract of jalap. Alcohol dissolves the active principles of jalap, while water is the best solvent for those that are inert. If a manufacturer in making extract of jalap uses equal parts of alcohol and water, he will obtain twice as much extract as the manufacturer who simply uses alcohol; but the alcohol extract or resin has twice the strength of the hydro-alcoholic extract, and is worth double the price, because it has been shown that the aqueous extract of jalap is absolutely inert even in doses of

240 grains. The difference between the relative merits of alcoholic and aqueous extracts does not so clearly appear in many of the extracts as in the instance just noted, but it is shown in such important extracts as those from belladonna, hyoscyamus, digitalis, etc., for the strength of these depends largely upon the menstrua used in exhausting them, water removing the inert principles, starch, gum, albumen, sugar, salt, etc. The relative value of commercial extracts must depend upon the amount of *active* principles present. When an extract is official, the menstruum directed should be employed and no other. The U. S. P. X permits the replacement of ethyl alcohol by specially denatured alcohol through the following provision:

"In the manufacture of pharmacopœial extracts and resins in which alcohol is used as a solvent only and does not remain in the finished product, it is permissible that alcohol made non-potable by the addition of from 5 to 10 per cent by volume of commercially pure methanol or of acetone be used in the place of ethyl alcohol in accordance with Federal Statutes and Regulations of the Internal Revenue Department, but the extracts and resins so made must be identical with those prepared by the processes in the monographs and must conform to the standards fixed by the tests of the U. S. Pharmacopœia, Tenth. This provision is not to be construed as permitting the use of specially denatured alcohol in the manufacture of any medicinal product other than extracts and resins."

It is now common practice for manufacturers to indicate on the labels of extracts not amenable to assay, the yield of the extract in relation to the drug from which it was prepared. Commercial extracts from most drugs will run from 1 to 4, to 1 to 6, *i. e.*, 1 pound of extract represents 4, or 5, or 6 parts of drug, but some drugs yield so great a proportion of extractive matter that their extracts run only 1 to 2 or 1 to 3. As examples might be mentioned solid extract of gentian, 1 to 2, and powdered extract cascara sagrada, 1 to 3.

Preparation of Extracts—The manipulations necessary to produce extracts have been considered under the various heads of Maceration, Expression, Percolation, Decoction, Infusion, Evaporation, Use of Steam Heat, Vacuum Apparatus, etc. The special precautions necessary for each extract will be noted in the official working formulas which follow. The details of the formulas vary so much that a general formula is of little value, except to serve as a type for the alcoholic extracts, which resemble one another.

Preservation of Extracts—Special care in the preservation of pilular extracts is rarely taken. This arises from the incorrect impression that they are permanent preparations and do not need it. The manufacturers seal the jars or bottles which contain them, because experience has compelled them to be very careful to avoid loss in transportation. The loosely fitting covers often used for the jars permit exposure which causes the variation noted, and it is impracticable for the pharmacist on every occasion to seal the jar immediately after he has used a portion of the extract. Several expedients have been suggested to overcome these difficulties. It is good practice to enclose the jar in a tightly fitting tin can, or to put the extract in a jar with a cover which clamps down tightly and is fitted with a thin cork disc in the top to aid in making a tight joint; many manufacturers are now marketing pilular extracts in jars fitted with covers of this character and several are using collapsible tin tubes to prevent evaporation or absorption of moisture.

Powdered extracts should be preserved in tightly-stoppered, small, wide-mouthed, amber-colored bottles, and stored in a cool, dry place.

Pilular Extracts—The pasty or semi-solid extracts are designated "pilular extracts" because they are extensively used in pill masses. They are also used

in ointments, and to facilitate their use in these preparations, the degree of concentration is directed to be that of a "pilular consistence". In these, an excess of moisture is to be avoided and the proper pliability and consistence may be maintained by the addition of a small amount of glucose or glycerin.

Powdered Extracts—Powdered extracts differ from pilular extracts in that they are dry and prepared either as fine or granular powders. They are more generally used than pilular extracts because they can be more accurately weighed, more easily dispensed, and more conveniently preserved. The difficulty in making them arises from the injurious influence of heat upon concentrated percolates of organic substances, but by the use of vacuum apparatus, suitable absorptive diluents, and care, they can be made successfully (pages 126 and 127). The limit of temperature as stated in the formulas should not be exceeded, and final drying of the soft extract can be greatly facilitated by spreading it upon plates of glass or tinned metal and exposing it to currents of warm, dry air, if vacuum apparatus is not available.

In the preparation of powdered extracts, it is necessary to use solvents that will extract the active principles of the drugs, and only a minimum amount of the inert substances. If the drug contains an oily constituent that would be extracted by the menstruum directed, it becomes necessary to adopt in the process of manufacture a method for the separation of this oil so that the product will retain a satisfactory, powdered form.

Assaying Extracts—When pilular extracts are assayed, the weight of the final product is adjusted by the addition of a sufficient amount of glucose except in the case of extract of cannabis when a resinous diluent must be used, as storax or a substandard extract of cannabis.

Dried starch is to be used as the diluent for powdered extracts, but it is permissible for the manufacturer to also use as inert diluents, a substandard extract of the same drug, or sucrose, lactose, powdered glycyrrhiza, magnesium carbonate, or the finely powdered, dried drug or marc from which the respective extract was made. Before admixture the diluent may be colored by the addition of chlorophyll, caramel or other harmless coloring to simulate the color of the extract. For the convenience of the prescriber, the standards of strength for the extracts have been adjusted wherever possible, so that each bears a definite relation to that of the respective drug of average strength. A statement of the standard adopted accompanies each formula.

Abstracts—A class of preparations known as abstracts was official in the U. S. P. 1880. These were powdered extracts bearing uniformly a definite relation to the drug, *i. e.*,—one part of abstract representing two parts of drug. The abstracts did not gain popularity and were not continued in the 1890 Pharmacopœia.

Inspissated Juices—The variation in the amount of extractive matter afforded by expressing fresh plants is so great that the quality of this class of extracts is necessarily very uncertain. Although alcoholic extracts are also subject to variations, experience has shown that they are much more reliable, when properly made, than extracts prepared from expressed juices. For this reason inspissated juices are not recognized in the U. S. Pharmacopœia. The inspissated juices most largely consumed in America are made in Great Britain, and the general formula of the British Pharmacopœia of 1898 is appended:

"Bruise the fresh plant in a mortar, press out the juice, and heat it gradually to 130° F. and separate the green colouring matter by means of a calico filter. Heat the strained liquid to 200° F. (to coagulate the albumen) and filter again. Evaporate the filtrate by a water-bath to the consistence of a thin

syrup; add to it the green colouring matter previously separated and passed through a hair-sieve, stir the whole together, and evaporate at a temperature not exceeding 140° F. to the consistence of a soft extract."

Two extracts from fresh plants or parts of plants are official in the 1914 British Pharmacopœia: extract of colchicum, and extract of taraxacum. In the British Pharmacopœia 1898 *two* additional extracts of this character were official: green extract of belladonna and green extract of hyoscyamus.

Professor Herrara proposed a plan for making extracts by freezing the juices. He finds that by compressing the frozen juice the expressed liquid, or mother-liquor, is greatly strengthened, the water being largely removed as ice, which remains in the press-cloth, and the concentrated juice is then dried by exposure on plates to the sun.

The following extracts are official:

EXTRACTUM BELLADONNÆ. U. S. Extract of Belladonna

[**Ext. Bellad.**—Extractum Belladonnæ Foliorum U. S. P. IX, Belladonnæ Extractum P. I.]

Extract of Belladonna yields not less than 1.18 per cent and not more than 1.32 per cent of the alkaloids of belladonna leaves. One Gm. of the Extract represents about 4 Gm. of belladonna leaves.

PILULAR EXTRACT OF BELLADONNA

	Metric	Alternative
Belladonna Leaves, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Glucose,		
Alcohol,		
Water, each, a sufficient quantity.		

Moisten the drug with sufficient of a mixture of 3 volumes of alcohol and 1 volume of water, and pack it firmly in a cylindrical percolator, then add enough menstruum, using the same proportion of alcohol and water as before, to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum of the same strength, until the percolate measures 3000 cc. [6 pints] or until the drug is exhausted. Recover the alcohol from the percolate by distillation, and evaporate the residue with frequent stirring at a temperature not exceeding 70° C. to a pilular consistence. Mix the mass thoroughly and weigh it.

Assay a portion of this extract as directed below, and, from the alkaloidal content thus determined, ascertain by calculation the amount of alkaloids in the remainder of the mass, and to this add sufficient glucose to make the finished Extract contain 1.25 per cent of the alkaloids of belladonna leaves. Mix thoroughly.

Assay—Proceed by Type Process D, taking 2 Gm. of Extract of Belladonna, using chloroform as the solvent, and determine the alkaloids volumetrically. Each cc. of tenth-normal acid corresponds to 0.02893 Gm. of the alkaloids of belladonna (Proximate Assays, page 1497).

POWDERED EXTRACT OF BELLADONNA

	Metric	Alternative
Belladonna Leaves, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Starch, dried at 100° C.		
Alcohol, each, a sufficient quantity.		

Moisten the drug with sufficient alcohol, and pack it in a cylindrical percolator, then add enough alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed very slowly, adding alcohol as required. Reserve the first 1000 cc. [2 pints] of percolate, and continue the percolation until the second percolate measures 1000 cc. [2 pints] or until the drug is exhausted. Transfer the second percolate to a suitable apparatus, and distil the alcohol at as low a temperature as practicable, until a residue measuring about 100 cc. [4 fl. oz.] remains, then add the reserved percolate, and continue distillation until the residue in the still is of syrupy consistence.

Transfer this syrupy residue to a shallow evaporating dish, rinse the flask or still with small portions of warm alcohol, adding the rinsings to the residue in the dish. Evaporate this to a soft extract, with frequent stirring, at a temperature not exceeding 70° C. Then add 50 Gm. [1 oz. av. 262 gr.] of the dried starch, and continue the heating at the same temperature, with frequent stirring until the mass is nearly dry. Now thoroughly incorporate an additional 20 Gm. [280 gr.] of dried starch, and set the product aside in a current of warm air until thoroughly dry. Reduce the product to a fine powder and weigh it.

Assay a portion of this product as directed below, and from the alkaloidal content thus determined ascertain by calculation the amount of alkaloids in the remainder of the powder, and add to this sufficient of the dried starch to make the finished Extract contain 1.25 per cent of the alkaloids of belladonna leaves. Mix the powders thoroughly, pass the Extract through a fine sieve, transfer it to small, wide-mouthed bottles, and stopper them tightly.

Assay—Proceed as directed under the *Pilular Extract of Belladonna*.

U. S. P. Preparation—Unguentum Belladonnæ.

N. F. Preparations—Pilulæ Aloes et Podophylli Compositæ; Pilulæ Aloini Compositæ; Pilulæ Aloini, Strychninæ et Belladonnæ; Pilulæ Aloini, Strychninæ et Belladonnæ Compositæ; Pilulæ Laxativæ Compositæ.

The U. S. P. has introduced both Pilular and Powdered Extracts of Belladonna Leaves under the one Latin title. This provides the powdered form for pills and capsules should the pharmacist prefer to use it and also the Pilular Extract, which contains no insoluble diluent, and consequently, much better adapted for the making of ointments or suppositories.

Uses—Used to check excessive secretions and to relax intestinal spasms; often combined with cathartics to prevent griping.

Average dose—¼ grain (0.015 Gm.).

EXTRACTUM CANNABIS. U. S. Extract of Cannabis

[Ext. Cannab.]

Extract of Cannabis, administered by the mouth to dogs, in doses not exceeding 0.004 Gm. for each kilogram of body weight of dog, produces a degree of incoördination equivalent to that caused by 0.03 cc. for each kilogram of body weight of dog, of the standard fluidextract of cannabis prepared as directed under *Cannabis*.

	Metric	Alternative
Cannabis, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Alcohol, a sufficient quantity.		

Moisten the drug with sufficient alcohol, pack it firmly in a cylindrical percolator, and add enough alcohol to saturate the powder and leave a stratum

above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding alcohol until the drug is exhausted. Recover the alcohol from the percolate by distillation, and evaporate the residue with frequent stirring, at a temperature not exceeding 70° C., to a pilular consistence. Mix the mass thoroughly and weigh it.

Assay a portion of this extract as directed under *Cannabis*, and from the result thus obtained adjust the weight of the finished Extract by the addition of either storax or a substandard Extract of Cannabis to conform to the required biological standard.

See page 1507 for the Assay.

N. F. Preparation—Mistura Chloralis et Potassii Bromidi Composita.

Uses—An anodyne and nerve sedative. The extract is an efficient form of cannabis.

Average dose—¼ grain (0.015 Gm.).

EXTRACTUM CASCARÆ SAGRADÆ. U.S. Extract of Cascara Sagrada

[**Ext. Casc. Sagr.**—Powdered Extract of Cascara Sagrada, Extract of Rhamnus Purshiana]

One Gm. of the Extract represents 3 Gm. of cascara sagrada.

	Metric	Alternative
Cascara Sagrada, in coarse powder	**900 Gm.**	30 oz. av.
Starch, dried at 100° C.		
Boiling Water, each, a sufficient quantity,		
To make	**300 Gm.**	10 oz. av.

Mix the cascara sagrada with 4000 cc. [8 pints] of boiling water, and macerate the mixture during three hours. Then transfer it to a metallic percolator, allow it to drain, and pour on boiling water until the percolate measures 5000 cc. [10 pints] or the drug is exhausted. Evaporate the percolate to dryness on a water or steam bath, reduce the extract to a fine powder, weigh it, and add sufficient of the dried starch to make the product weigh 300 Gm. [10 oz. av.]. Mix the powders thoroughly, pass the Extract through a fine sieve, transfer it to small, wide-mouthed bottles, and stopper them tightly.

N. F. Preparations—Pilulæ Aloini, Strychninæ et Belladonnæ Compositæ.

Uses—A laxative, especially valuable in habitual constipation.

Average dose—5 grains (0.3 Gm.).

EXTRACTUM COLCHICI. U.S. Extract of Colchicum

[**Ext. Colch.**—Extractum Colchici Cormi U.S.P. IX, Powdered Extract of Colchicum]

Extract of Colchicum yields not less than 1.25 per cent and not more than 1.55 per cent of colchicine. One Gm. of the Extract represents about 4 Gm. of colchicum corm.

	Metric	Alternative
Colchicum Corm, in fine powder	**1000 Gm.**	32 oz. av.
Alcohol,		
Purified Petroleum Benzin,		
Starch, dried at 100° C., each, a sufficient quantity.		

Moisten the colchicum corm with sufficient alcohol, pack it in a cylindrical percolator, and add enough alcohol to saturate the drug and leave a stratum

above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed slowly, adding alcohol as required, until the percolate measures 2000 cc. [4 pints] or until the drug is exhausted. Recover the alcohol from the percolate by distillation at as low a temperature as practicable, until a residue measuring about 150 cc. [5 fl. oz.] remains in the still. Transfer this residue to a flask or separator, using small portions of warm alcohol to rinse the still, and add the rinsings to the residue in the flask. When it has cooled, add 250 cc. [8 fl. oz.] of purified petroleum benzin, and shake the mixture thoroughly for several minutes. Allow the liquids to separate, and decant the benzin layer as closely as possible, again add to the residue 150 cc. [5 fl. oz.] of purified petroleum benzin, agitate, decant the benzin layer as before, repeat the washing with 100 cc. [4 fl. oz.] of purified petroleum benzin, and reject the benzin washings.

Transfer the fat-free residue to a shallow evaporating dish, rinse the flask with small portions of warm alcohol, add the rinsings to the residue in the dish, and evaporate on a water bath to a thick extract. To this add 50 Gm. [1 oz. av. 262 gr.] of the dried starch, mix well, spread the mixture on glass plates, and continue the drying in a current of warm air at a temperature not exceeding 70° C. until thoroughly dry. Reduce the product to a fine powder, and weigh it.

Assay a portion of this product as directed below, and from the alkaloidal content thus determined ascertain by calculation the amount of alkaloid in the remainder of the powder, and add to this sufficient of the dried starch to make the finished Extract contain 1.4 per cent of colchicine. Mix the powders thoroughly, pass the Extract through a fine sieve, transfer it to small, wide-mouthed bottles, and stopper them tightly.

Assay—Place 6 Gm. of Extract of Colchicum in a 500 cc. flask containing 290 cc. of distilled water, mix well, add 10 cc. of solution of lead subacetate, and agitate the mixture frequently during one hour. Filter off 200 cc. and proceed as directed under *Colchici Semen*, page 1497, fourth line of the assay, beginning with the word "Add".

Uses—Used in gout.

Average dose—1 grain (0.06 Gm.).

EXTRACTUM COLOCYNTHIDIS. U. S. Extract of Colocynth

[**Ext. Colocyn.**—Powdered Extract of Colocynth]

One Gm. of the Extract represents 4 Gm. of colocynth.

	Metric	Alternative
Colocynth, in coarse powder	**1000 Gm.**	32 oz. av.
Diluted Alcohol,		
Starch, dried at 100° C., each, a sufficient quantity,		
To make	**250 Gm.**	8 oz. av.

Moisten the drug with 2000 cc. [4 pints] of diluted alcohol, and macerate it in a closed vessel for twenty-four hours, then transfer the moist drug to a cylindrical percolator, shake it down evenly without packing, and gradually pour diluted alcohol upon it, allowing the percolation to proceed slowly until the percolate measures 5000 cc. [10 pints] or until the drug is practically exhausted. Recover the alcohol from the percolate by distillation, and evaporate the residue to dryness on a water or steam bath. Reduce the product to a fine powder, weigh it, and add sufficient of the dried starch to make

the product weigh 250 Gm. [8 oz. av.]. Mix the powders thoroughly, pass the Extract through a fine sieve, transfer it to small, wide-mouthed bottles, and stopper them tightly.

U. S. P. Preparation—Extractum Colocynthidis Compositum.

Uses—A purgative, usually or nearly always combined with other drugs.

Average dose—½ grain (0.03 Gm.).

EXTRACTUM COLOCYNTHIDIS COMPOSITUM. U. S. Compound Extract of Colocynth

[Ext. Colocyn. Co.—Powdered Compound Extract of Colocynth]

	Metric	Alternative
Extract of Colocynth	160 Gm.	5 oz. av. 53 gr.
Aloe	500 Gm.	16 oz. av.
Cardamom Seed, in fine powder	50 Gm.	1 oz. av. 263 gr.
Resin of Ipomœa, in fine powder	140 Gm.	4 oz. av. 210 gr.
Soap, dried and in powder	150 Gm.	4 oz. av. 350 gr.
To make	1000 Gm.	32 oz. av.

Triturate the ingredients until the product is reduced to a fine powder. Pass the Extract through a fine sieve, transfer it to small, wide-mouthed bottles, and stopper them tightly.

U. S. P. Preparation—Pilulæ Hydrargyri Chloridi Mitis Compositæ.

N. F. Preparations—Pilulæ Antidyspepticæ; Pilulæ Catharticæ Vegetabiles; Pilulæ Colocynthidis et Podophylli; Pilulæ Laxativæ Post Partum.

Uses—An active hydragogue purgative.

Average dose—4 grains (0.25 Gm.).

EXTRACTUM FELLIS BOVIS. U. S. Extract of Oxgall

[Ext. Fel. Bov.—Powdered Extract of Oxgall]

One Gm. of the Extract represents 8 Gm. of oxgall.

	Metric	Alternative
Oxgall	800 Gm.	32 oz. av.
Alcohol	1500 cc.	3¾ pints
Starch, dried at 100° C., a sufficient quantity,		
To make	100 Gm.	4 oz. av.

Add 1000 cc. [2½ pints] of alcohol slowly and with agitation to the oxgall contained in a bottle of sufficient size. Allow the mixture to stand for two days, and then decant the liquid portion. Wash the residue in the bottle with an additional 500 cc. [20 fl. oz.] of alcohol, decant the liquid portion, mix it with the liquid first separated, and filter. Recover the alcohol from the filtrate by distillation, transfer the residue to a shallow dish, and evaporate it to a thick extract at a temperature between 75° and 80° C. Spread this extract on glass plates, and continue the drying by exposure to warm air at a temperature not exceeding 70° C. until thoroughly dry. Reduce the product to a fine powder, weigh it, and add sufficient of the dried starch to make the product weigh 100 Gm. [4 oz. av.]. Mix the powders thoroughly, pass the Extract through a fine sieve, transfer it to small, wide-mouthed bottles, and stopper them tightly. The use of copper apparatus in the preparation of this Extract should be avoided.

This extract contains potassium and *sodium glycocholates* and *taurocholates* which exist naturally in oxgall and to which its therapeutic value is chiefly due. No official assay is provided but an assay method used by Hynson, Wescott and Dunning will be found under oxgall, page 1184.

Uses—Employed in certain types of intestinal indigestion.

Average dose—6 grains (0.4 Gm.).

EXTRACTUM GLYCYRRHIZÆ. U.S. Extract of Glycyrrhiza

[Ext. Glycyrrh.—Extract of Licorice Root]

The commercial Extract of Glycyrrhiza.

Description and Physical Properties—In flattened, cylindrical rolls or in masses, of a glossy black color externally; fracture brittle, sharp, smooth, conchoidal; taste characteristic and sweet. When pulverized it yields a brown powder.

Tests for Purity—Not less than 60 per cent of Extract of Glycyrrhiza is soluble in cold water. The yield of ash does not exceed 8 per cent.

This extract may be assayed for its glycyrrhizin content, by the unofficial method given under glycyrrhiza, page 900.

U. S. P. Preparation—Trochisci Ammonii Chloridi.
N. F. Preparation—Pilulæ Ferri Iodidi.

Uses—A flavoring agent.

EXTRACTUM GLYCYRRHIZÆ PURUM. U.S. Pure Extract of Glycyrrhiza

[Ext. Glycyrrh. Pur.—Pure Extract of Licorice Root]

	Metric	Alternative
Glycyrrhiza, in coarse powder	**1000 Gm.**	32 oz. av.
Boiling Water, a sufficient quantity.		

Moisten the drug with sufficient boiling water, transfer the moist drug to a metallic percolator, and percolate with boiling water until the glycyrrhiza is exhausted. Promptly evaporate the percolate to a pilular consistence on a water bath.

U. S. P. Preparation—Fluidextractum Cascaræ Sagradæ Aromaticum.

Uses—A flavoring agent.

EXTRACTUM HYOSCYAMI. U.S. Extract of Hyoscyamus

[Ext. Hyosc.—Extract of Henbane, Hyoscyami Extractum P. I.]

Extract of Hyoscyamus yields not less than 0.22 per cent and not more than 0.28 per cent of the alkaloids of hyoscyamus. One Gm. of the Extract represents about 4 Gm. of hyoscyamus.

Pilular Extract of Hyoscyamus

	Metric	Alternative
Hyoscyamus, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Glucose,		
Alcohol,		
Water, each, a sufficient quantity.		

Moisten the drug with sufficient of a mixture of 3 volumes of alcohol and 1 volume of water, pack it firmly in a cylindrical percolator, and add enough menstruum, using the same proportion of alcohol and water as before, to

saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed slowly, gradually adding more of the same menstruum until the drug is exhausted. Recover the alcohol by distillation, and evaporate the residue with frequent stirring, at a temperature not exceeding 70° C. until it is reduced to a pilular consistence. Mix the mass thoroughly, and weigh it.

Assay a portion of this extract as directed below, and from the alkaloidal content thus determined ascertain by calculation the amount of alkaloids in the remainder of the mass, and to this add sufficient glucose to make the finished Extract contain 0.25 per cent of the alkaloids of hyoscyamus. Mix thoroughly.

Assay—Proceed by Type Process D, taking 5 Gm. of Extract of Hyoscyamus, using chloroform as the solvent, and determine the alkaloids volumetrically. Each cc. of tenth-normal acid corresponds to 0.02893 Gm. of the alkaloids of hyoscyamus (Proximate Assays, page 1497).

Powdered Extract of Hyoscyamus

	Metric	Alternative
Hyoscyamus, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Starch, dried at 100° C.,		
Alcohol, each, a sufficient quantity.		

Moisten the drug with sufficient alcohol, and pack it in a cylindrical percolator; then add enough alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed very slowly, adding alcohol as required. Reserve the first 1000 cc. [2 pints] of percolate, and continue the percolation until the drug is exhausted. Transfer the weaker percolate to a suitable apparatus, and distil the alcohol at as low a temperature as practicable until a residue measuring about 100 cc. [4 fl. oz.] remains, then add the reserved percolate and continue distillation until the residue in the still is of syrupy consistence.

Transfer this syrupy residue to a shallow evaporating dish, and rinse the flask or still with small portions of warm alcohol, adding the rinsings to the residue in the dish. Evaporate this to a soft extract, with frequent stirring, at a temperature not exceeding 70° C. Then add 50 Gm. [1 oz. av. 262 gr.] of the dried starch, and continue the heating at the same temperature, with frequent stirring, until the mass is nearly dry. Now thoroughly incorporate an additional 20 Gm. [280 gr.] of the dried starch, and set the product aside in a current of warm air, until thoroughly dry. Reduce the product to a fine powder and weigh it.

Assay a portion of this product as directed below, and from the alkaloidal content thus determined ascertain by calculation the amount of alkaloids in the remainder of the powder, and add to this sufficient of the dried starch to make the finished Extract contain 0.25 per cent of the alkaloids of hyoscyamus. Mix the powders thoroughly, pass the Extract through a fine sieve, transfer it to small, wide-mouthed bottles, and stopper them tightly.

Assay—Proceed as directed under *Pilular Extract of Hyoscyamus.*

N. F. Preparations—Mistura Chloralis et Potassii Bromidi Composita; Pilulæ Catharticæ Vegetabiles.

Uses—Employed in intestinal spasms.

Average dose—5/6 grain (0.05 Gm.).

EXTRACTUM MALTI. U. S. Extract of Malt
[Ext. Malt.]

Extract of Malt is obtained by infusing malt with water at 60° C., concentrating the expressed liquid at a temperature not exceeding 60° C. and adding 10 per cent, by weight, of glycerin. It contains dextrin, maltose, a small amount of glucose, and an amylolytic enzyme.

Extract of Malt is capable of converting not less than five times its weight of starch into water-soluble sugars.

When freshly made, malt extract possesses much greater diastatic activity but deteriorates so rapidly that the U. S. P. has fixed a comparatively low requirement.

Description and Physical Properties—A sweet, viscous, light brown liquid extract having an agreeable, characteristic odor.

It is soluble in cold water, more readily soluble in warm water.

Specific gravity: not less than 1.350 and not more than 1.430 at 25° C.

Assay—Mix a quantity of potato starch, purified as directed under *Pancreatinum*, equivalent to 5 Gm. of dried starch, in a beaker with 10 cc. of cold, distilled water. Add 140 cc. of boiling distilled water, and heat on a water bath with constant stirring for two minutes, or until a translucent, uniform paste is obtained. Cool to 40° C. in a suitable bath previously adjusted to this temperature. Add 20 cc. of a fresh solution of Extract of Malt at 40° C., prepared by dissolving 5 Gm. of Extract of Malt in sufficient distilled water to make 100 cc. of solution at 40° C. Mix well, and maintain the same temperature for exactly thirty minutes, stirring frequently. A thin, nearly clear liquid is produced. Add at once 0.1 cc. of this liquid to a previously made mixture of 0.2 cc. of tenth-normal iodine and 60 cc. of distilled water. No blue or reddish color is produced.

N. F. Preparation—Emulsum Olei Morrhuæ cum Malto.

Uses—A nutrient and digestant; also as an emulsifying agent for cod liver oil.

Average dose—4 drachms (15 Gm.).

EXTRACTUM NUCIS VOMICÆ. U. S. Extract of Nux Vomica
[Ext. Nuc. Vom.—Powdered Extract of Nux Vomica, Nucis Vomicæ Extractum P. I.]

Extract of Nux Vomica yields not less than 15.2 per cent and not more than 16.8 per cent of the alkaloids of nux vomica.

	Metric	Alternative
Nux Vomica, in moderately coarse powder.....	**1000 Gm.**	32 oz. av.
Alcohol,		
Water,		
Acetic Acid,		
Purified Petroleum Benzin,		
Starch, dried at 100° C., each, a sufficient quantity.		

Moisten the drug with a sufficient quantity of a mixture of 75 volumes of alcohol, 1 volume of acetic acid and 24 volumes of water, pack it firmly in a cylindrical percolator, and add enough of this menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed slowly, adding more of the same menstruum as required until the drug is practically exhausted. Recover the alcohol from the percolate by distillation at as low a temperature as practicable and concentrate the liquid until the residue measures about 200 cc. [6½ fl. oz.]. Transfer this residue to a flask or separator, add 150 cc. [5 fl. oz.] of water and 200 cc. [6½ fl. oz.] of purified petroleum benzin, and shake the mixture thoroughly for several minutes. Allow the liquids to separate and decant the benzin layer as closely as possible, again add to the residue 100 cc. [3¼ fl. oz.] of purified petroleum benzin, agitate, and decant the benzin as before, and then reject the benzin solutions. Evaporate the fat-free residue to dryness on a water bath with frequent stirring.

Assay a portion of this product as directed below, and from the alkaloidal content thus determined, ascertain by calculation the amount of alkaloids in the remainder of the product, and add sufficient of the dried starch to make the finished Extract contain 16 per cent of the alkaloids of nux vomica. Reduce the mixture to a fine powder, mix thoroughly, pass the Extract through a fine sieve, transfer it to small, wide-mouthed bottles, and stopper them tightly.

Assay—Proceed by Type Process D, taking 1 Gm. of Extract of Nux Vomica, using chloroform as the solvent, and determine the alkaloids volumetrically. Each cc. of tenth-normal acid corresponds to 0.0364 Gm. of the alkaloids of nux vomica (Proximate Assays, page 1497).

N. F. Preparations—Pilulæ Aloes et Podophylli Compositæ; Pilulæ Ferri, Quininæ, Aloes et Nucis Vomicæ.

Uses—A gastric stimulant.

Average dose—¼ grain (0.015 Gm.).

EXTRACTUM RHEI. U.S. Extract of Rhubarb

[Ext. Rhei—Powdered Extract of Rhubarb]

One Gm. of the Extract represents 2 Gm. of rhubarb.

	Metric	Alternative
Rhubarb, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Starch, dried at 100° C.,		
Alcohol,		
Water, each, a sufficient quantity,		
To make	**500 Gm.**	16 oz. av.

Moisten the drug with sufficient of a mixture of 4 volumes of alcohol and 1 volume of water, pack it in a cylindrical percolator, and add enough of this menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed slowly, gradually adding menstruum of the same proportion of alcohol and water as before until the drug is exhausted. Recover the alcohol from the percolate by distillation at as low a temperature as practicable and continue distillation until a residue of syrupy consistence remains in the still. Transfer this to a shallow dish, rinse the still with small portions of warm menstruum, add the rinsings to the residue in the dish, and evaporate the mixture to dryness, with frequent stirring, at a temperature not exceeding 70° C. Weigh the dry product, and add sufficient of the dried starch to make the weight 500 Gm. [16 oz. av.]. Reduce the mixture to a fine powder, mix thoroughly, pass the Extract through a fine sieve, transfer it to small, wide-mouthed bottles, and stopper them tightly.

Uses—Employed as a laxative.

Average dose—8 grains (0.5 Gm.).

EXTRACTUM STRAMONII. U.S. Extract of Stramonium

[Ext. Stramon.]

Extract of Stramonium yields not less than 0.9 per cent and not more than 1.1 per cent of the alkaloids of stramonium. One Gm. of the Extract represents about 4 Gm. of stramonium.

Pilular Extract of Stramonium

	Metric	Alternative
Stramonium, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Glucose,		
Alcohol,		
Water, each, a sufficient quantity.		

Moisten the drug with sufficient of a mixture of 3 volumes of alcohol and 1 volume of water, and pack it in a cylindrical percolator; then add enough of this menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice and, having closely covered the percolator, macerate for forty-eight hours.

Then allow the percolation to proceed, gradually adding menstruum of the same strength until the drug is exhausted. Recover the alcohol from the percolate by distillation, and evaporate the residue with frequent stirring at a temperature not exceeding 70° C. to a pilular consistence. Mix the mass thoroughly and weigh it.

Assay a portion of this Extract as directed below, and from the alkaloidal content thus determined, ascertain by calculation the amount of alkaloids in the remainder of the mass, and to this add sufficient glucose to make the finished Extract contain 1 per cent of the alkaloids of stramonium. Mix thoroughly.

Assay—Proceed by Type Process D, taking 2 Gm. of Extract of Stramonium, using chloroform as the solvent, and determine the alkaloids volumetrically. Each cc. of tenth-normal acid corresponds to 0.02893 Gm. of the alkaloids of stramonium (Proximate Assays, page 1498).

Powdered Extract of Stramonium

	Metric	Alternative
Stramonium, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Starch, dried at 100° C.,		
Alcohol, each, a sufficient quantity.		

Moisten the drug with sufficient alcohol, and pack it in a cylindrical percolator; then add enough alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed very slowly, adding alcohol as required. Reserve the first 1000 cc. [2 pints] of percolate and continue the percolation until the second percolate measures 1000 cc. [2 pints] or until the drug is exhausted. Transfer the second percolate to a suitable apparatus and distil the alcohol at as low a temperature as practicable until a residue measuring about 100 cc. [4 fl. oz.] remains, then add the reserved percolate, and continue distillation until the residue in the still is of syrupy consistence.

Transfer this syrupy residue to a shallow evaporating dish, rinse the flask or still with small portions of warm alcohol, and add the rinsings to the contents of the dish. Evaporate this to a soft extract, with frequent stirring, at a temperature not exceeding 70° C. Then add 50 Gm. [1 oz. av. 262 gr.] of the dried starch, and continue the heating at the same temperature, with frequent stirring, until the mass is nearly dry. Now thoroughly incorporate an additional 20 Gm. [280 gr.] of dried starch, and set the product aside in a current of warm air until thoroughly dry. Reduce the product to a fine powder and weigh it.

Assay a portion of this product as directed below, and from the alkaloidal content thus determined ascertain by calculation the amount of alkaloids in the remainder of the powder, and add to this sufficient of the dried starch to make the finished Extract contain 1 per cent of the alkaloids of stramonium. Mix the powders thoroughly, pass the Extract through a fine sieve, transfer it to small, wide-mouthed bottles, and stopper them tightly.

Assay—Proceed as directed under *Pilular Extract of Stramonium.*

N. F. Preparation—Unguentum Stramonii.

Uses—Employed to relax spasms, especially of the bowels.

Average dose—⅓ grain (0.02 Gm.).

EXTRACTUM CONII. N. F. Extract of Conium

[Ext. Conii]

Extract of Conium yields not less than 1.8 per cent and not more than 2.2 per cent of coniine.

	Metric	Alternative
Conium, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Diluted Hydrochloric Acid	**3 cc.**	44 min.
Glucose,		
Diluted Alcohol, each, a sufficient quantity.		

Moisten the powder with 300 cc. [9½ fl. oz.] of diluted alcohol and pack it firmly in a cylindrical percolator; then add enough diluted alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding diluted alcohol, until the conium is exhausted. Reserve the first 900 cc. [28¾ fl. oz.] of the percolate, add the diluted hydrochloric acid to the remainder, and evaporate it to 100 cc. [3¼ fl. oz.] at a temperature not exceeding 50° C.; mix this with the reserved portion in a porcelain dish, and evaporate at or below 50° C. to a pilular consistence.

Assay 2 Gm. of this extract as directed below, and from the result thus obtained ascertain by calculation the amount of coniine in the remainder of the product, and add enough glucose to make the finished Extract contain 2 per cent of coniine.

Assay—Weigh accurately 2 Gm. of Extract of Conium and mix it intimately in a flask of about 50 cc. capacity with 2 cc. of diluted hydrochloric acid and 8 cc. of distilled water. Shake this mixture thoroughly with 20 cc. of purified petroleum benzin, allow the liquids to separate, and decant the benzin as closely as possible. Add a second portion of the benzin, shake well, and decant as before. Repeat the extraction with purified petroleum benzin, until the washings are nearly colorless and are free from fat, and reject the benzin washings. Then add to the aqueous liquid an excess of potassium carbonate, to render it alkaline, and extract the alkaline solution by shaking it with successive portions of purified petroleum benzin until the alkaloid is all removed as shown by shaking 5 cc. of the last washing with 1 cc. of diluted hydrochloric acid and adding a drop of iodine T.S. to the acid solution, when no precipitate should form in the acid liquor. Filter the benzin into a wide-mouthed flask or beaker and wash the funnel and filter with a little of the benzin. Then add 10 cc. of tenth-normal sulphuric acid and evaporate off the benzin at a gentle heat, with frequent stirring. Titrate the acid solution with fiftieth-normal potassium hydroxide, using cochineal T.S. or methyl red T.S. as indicator, and calculate the amount of coniine present, using the factor 0.0127 for the tenth-normal sulphuric acid consumed by the alkaloid and multiplying the result by 50 to obtain the percentage of coniine in the extract.

Uses—A nerve sedative.

Average dose—½ grain (0.03 Gm.).

EXTRACTUM ERGOTÆ AQUOSUM. N. F. Aqueous Extract of Ergot

[Ext. Ergot. Aq.—Ergotine P. I.]

	Metric	Alternative
Ergot, in moderately coarse powder	**200 Gm.**	8 oz. av.
Alcohol	**100 cc.**	4 fl. oz.
Choroform Water, a sufficient quantity.		

Moisten the ergot with 400 cc. [1 pint] of chloroform water and allow it to stand in a closely covered vessel for twenty-hour hours, then transfer it to a cylindrical percolator, pack the drug lightly, and percolate with chloroform water, regulating the flow to not over 20 drops per minute, until the percolate measures 1000 cc. [40 fl. oz.]. Evaporate the percolate in a tared dish on a water bath, at a moderate temperature, until reduced to 100 Gm. [4 oz. av.] and, when cold, incorporate the alcohol and allow the mixture to stand in a tightly-covered or closed vessel during three days. Then filter the liquid, and evaporate the filtrate on a water bath, at a temperature not exceeding 50° C., to a pilular consistence.

Uses—A uterine stimulant.

Average dose—3 grains (0.2 Gm.).

EXTRACTUM EUONYMI. N. F. Extract of Euonymus

[Ext. Euonymi.—Powdered Extract of Euonymus]

One Gm. of the Extract represents 4 Gm. of euonymus.

	Metric	Alternative
Euonymus, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Diluted Alcohol,		
Starch, dried at 100° C., each, a sufficient quantity,		
To make	**250 Gm.**	8 oz. av.

Moisten the drug with sufficient diluted alcohol and pack it firmly in a cylindrical percolator; then add enough diluted alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed slowly, adding the menstruum as required until the drug is practically exhausted. Recover the alcohol from the percolate by distillation and evaporate the residue to dryness, with frequent stirring, at a temperature not exceeding 70° C. Reduce the extract to a fine powder, weigh it and add sufficient of the dried starch to make the product weigh 250 Gm. [8 oz. av.]. Mix it thoroughly, pass the Extract through a fine sieve, transfer it to small, wide-mouthed bottles and stopper them tightly.

Caution—It has been stated that the absorption of Euonymus in the gastro-intestinal tract is uncertain and irregular. To avoid possible toxic or cumulative action of the drug the physician should determine in each case the tolerance of the patient, and regulate the dosage accordingly.

Uses—A cathartic, but a dangerous drug.

Average dose—2 grains (0.125 Gm.).

EXTRACTUM FERRI POMATUM. N. F. Ferrated Extract of Apples

[Ext. Ferr. Pomat.—Ferri Malas Crudus, Crude Malate of Iron]

	Metric	Alternative
Reduced Iron	**40 Gm.**	2 oz. av.
Fresh Apple Juice	**1000 cc.**	3 pints
Water, a sufficient quantity.		

Mix the fresh apple juice with the iron in an enameled or porcelain vessel, and apply the heat of a water bath, until no more gas is given off, adding a little water from time to time to make up any loss by evaporation. Dilute the liquid with water to make 1000 cc. [3 pints] and set it aside for a few days. Then filter, and evaporate the filtrate on a water bath in an enameled or porcelain vessel to the consistence of a pilular extract.

N. F. Preparation—Tinctura Ferri Pomata.

Uses—As a hematinic.

Average dose—10 grains (0.65 Gm.).

EXTRACTUM GENTIANÆ. N. F. Extract of Gentian

(U. S. P. IX)

[Ext. Gentian.]

	Metric	Alternative
Gentian, in coarse powder	**1000 Gm.**	32 oz. av.
Water, a sufficient quantity.		

Moisten the powder with sufficient water, and allow it to macerate for twenty-four hours; then pack it in a conical percolator and extract it with water until the drug is exhausted. Reduce the liquid to 2000 cc. [4 pints] by boiling, strain it, and then evaporate it to a pilular consistence on a water bath.

N. F. Preparations—Pilulæ Antiperiodicæ; Pilulæ Antiperiodicæ Sine Aloe; Pilulæ Ferri, Quininæ, Aloes et Nucis Vomicæ.

Uses—A gastric stimulant.

Average dose—4 grains (0.25 Gm.).

EXTRACTUM HÆMATOXYLI. N. F. Extract of Hematoxylon

[Ext. Hæmatox.]

	Metric	Alternative
Hematoxylon, rasped	**1000 Gm.**	32 oz. av.
Water,	**10000 cc.**	20 pints

Macerate the hematoxylon with the water for forty-eight hours. Then boil the mixture (avoiding the use of iron vessels) until one-half of the water has evaporated; strain the decoction while hot and evaporate the strained liquid to dryness.

Uses—An astringent for diarrhea.

Average dose—15 grains (1 Gm.).

EXTRACTUM HYDRASTIS. N. F. Extract of Hydrastis

(U. S. P. IX)

[Ext. Hydrast.—Extract of Golden Seal, Powdered Extract of Hydrastis]

Extract of Hydrastis yields not less than 9 per cent nor more than 11 per cent of the ether-soluble alkaloids of hydrastis. One Gm. of the Extract represents about 4 Gm. of hydrastis.

	Metric	Alternative
Hydrastis, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Tartaric Acid	**5 Gm.**	70 gr.
Alcohol,		
Magnesium Oxide,		
Starch, dried at 100° C., each, a sufficient quantity.		

Dissolve the tartaric acid in 1000 cc. [2 pints] of alcohol, moisten the drug with sufficient of this solution and pack in a cylindrical percolator; then add enough of the acidified alcohol, followed by alcohol if necessary, to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed slowly, adding alcohol as required, until the drug is exhausted. Recover the alcohol from the percolate by distillation, and evaporate the residue to a soft extract, with frequent stirring at a temperature not exceeding 70° C. Add 50 Gm. [1 oz. av. 263 gr.] of a mixture of one part of magnesium oxide and three parts of the dried starch, mix thoroughly and spread the mass in a thin layer on glass or tinned-metal plates or in a porcelain dish, and continue the drying in an air bath at a temperature not exceeding 70° C., until thoroughly dry. Then reduce the extract to a fine powder and weigh it.

Assay a portion of this product as directed below, and, from the alkaloidal content thus determined, ascertain by calculation the amount of alkaloids in the remainder of the powder and add to this enough of the mixture of magnesium oxide and dried starch, made in the same proportion as before, to make the finished Extract contain 10 per cent of the ether-soluble alkaloids of hydrastis. Mix the powders thoroughly, pass the Extract through a fine sieve, transfer it to small wide-mouthed bottles and stopper them tightly.

Assay—Assay 3 Gm. of Extract of Hydrastis by Type Process C (see page 1495), using 150 cc. of ether and the aliquot method, and determining the alkaloids in 100 cc. of the ether solution, representing 2 Gm. of extract. Use ether for the final extraction of the alkaloids and determine them gravimetrically, after drying at 100° C.

This assay is explained on page 1500.

Uses—A stomachic.

Average dose—8 grains (0.5 Gm.).

EXTRACTUM IGNATIÆ. N. F. Extract of Ignatia

[Ext. Ignat.—Powdered Extract of Ignatia]

Extract of Ignatia yields not less than 5.4 per cent and not more than 6.6 per cent of the alkaloids of ignatia.

	Metric	Alternative
Ignatia, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Alcohol,		
Water,		
Starch, dried at 100° C., each, a sufficient quantity.		

Mix 3000 cc. [6 pints] of alcohol, with 1000 cc. [2 pints] of water, and, having moistened the powder with 500 cc. [1 pint] of the mixture, pack it firmly in a conical percolator, and add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed slowly, gradually adding the remainder of the menstruum and continuing the percolation with a mixture of alcohol and water in the same proportions as before, until the drug is practically exhausted. Recover the alcohol from the percolate, evaporate the residue to dryness at a temperature not exceeding 100° C., and weigh the product.

Assay 3 Gm. of this extract as directed below, and, from the result thus obtained, ascertain by calculation the amount of alkaloids in the remainder of the product and add enough starch, previously dried at 100° C., to make the finished Extract contain 6 per cent of the alkaloids of ignatia.

Assay—Assay Extract of Ignatia by Type Process C (see page 1495), using 3 Gm. of the Extract, 150 cc. of ether-chloroform mixture and decanting an aliquot of 100 cc. representing 2 Gm. of extract. Use chloroform for the final extraction of the alkaloids and determine them volumetrically. Each cc. of tenth-normal acid corresponds to 0.0364 Gm. of the total alkaloids of ignatia.

This assay is explained on page 1500.

Uses—A stomachic.

Average dose—½ grain (0.03 Gm.).

EXTRACTUM KRAMERIÆ. N. F. Extract of Krameria

[**Ext. Kramer.**—Powdered Extract of Krameria]

One Gm. of the Extract represents 5 Gm. of krameria.

	Metric	Alternative
Krameria, in moderately coarse powder	**1000 Gm.**	30 oz. av.
Starch, dried at 100° C.,		
Water, each, a sufficient quantity,		
To make	**200 Gm.**	6 oz. av.

Moisten the drug thoroughly with water and pack it in a conical glass percolator, and gradually pour water upon it, until the percolate passes but slightly imbued with the taste of the drug. Heat the percolate to the boiling point, strain, and evaporate the strained liquid to dryness, by means of a water bath, at a temperature not exceeding 70° C. Reduce the extract to a fine powder, and add sufficient starch, previously dried at 100° C., to make the product weigh 200 Gm. [6 oz. av.]. Mix the powders thoroughly, pass the Extract through a fine sieve and transfer it to small wide-mouthed bottles and stopper them tightly.

Uses—An astringent.

Average dose—8 grains (0.5 Gm.).

EXTRACTUM LEPTANDRÆ. N. F. Extract of Leptandra

[**Ext. Leptand.**—Powdered Extract of Leptandra]

One Gm. of the Extract represents 4 Gm. of leptandra.

	Metric	Alternative
Leptandra, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Starch, dried at 100° C.,		
Alcohol,		
Water, each, a sufficient quantity,		
To make	**250 Gm.**	8 oz. av.

Moisten the powdered drug with sufficient of a mixture of three volumes of alcohol and one volume of water, and macerate it in a closed vessel for twenty-four hours. Then pack in a cylindrical percolator and gradually percolate with a menstruum of alcohol and water, made in the same proportion as before, until the drug is practically exhausted. Recover the alcohol and evaporate the residue to dryness on a water bath at a temperature not exceeding 70° C. Reduce the extract to a fine powder and add sufficient starch, previously dried at 100° C., to make the product weigh 250 Gm. [8 oz. av.]. Mix the powders thoroughly, pass the Extract through a fine sieve and transfer it to small, wide-mouthed bottles and stopper them tightly.

N. F. Preparation—Pilulæ Catharticæ Vegetabiles.

Uses—As a cathartic.

Average dose—4 grains (0.25 Gm.).

EXTRACTUM OPII. N.F. Extract of Opium

(U. S. P. IX)

[**Ext. Opii.**—Powdered Extract of Opium, Extractum Opii Aquosum, P. I.]

Extract of Opium yields not less than 19.5 per cent and not more than 20.5 per cent of anhydrous morphine. One Gm. of the Extract represents about 2 Gm. of opium.

	Metric	Alternative
Opium, cut into small pieces	**100 Gm.**	4 oz. av.
Starch, dried at 100° C.,		
Water, each, a sufficient quantity.		

Macerate the opium with 300 cc. [11½ fl. oz.] of hot water until softened, then rub to a smooth paste. Add to this 100 Gm. [4 oz. av.] of clean, white sand and mix thoroughly. Transfer the mixture to a percolator and allow the percolation to proceed, gradually adding water until the opium is exhausted. Evaporate the percolate to dryness in a shallow evaporating dish, on a water bath, reduce the product to a fine powder and weigh it.

Assay a portion of this product as directed below, and, from the alkaloidal content thus determined, ascertain by calculation the amount of anhydrous morphine in the remainder of the powder, and add to this enough of the dried starch to make the finished Extract contain 20 per cent of anhydrous morphine. Mix the powders thoroughly, pass the Extract through a fine sieve, transfer it to small, wide-mouthed bottles and stopper them tightly.

Assay—Dissolve 4 Gm. of Extract of Opium in 5 cc. of distilled water, add gradually, with constant stirring, 25 cc. of distilled water, filter, and wash the filter and residue with sufficient distilled water to make the solution measure exactly 50 cc. Then proceed as directed under Tinctura Opii Crocata, page 395, fourth line of the Assay. The morphine obtained represents 2 Gm. of Extract of Opium.

Uses—A sedative and narcotic.

Average dose—½ grain (0.03 Gm.).

EXTRACTUM SUMBUL. N.F. Extract of Sumbul

(U. S. P. IX)

[**Ext. Sumbul**]

	Metric	Alternative
Sumbul, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Alcohol,		
Water, each, a sufficient quantity.		

Moisten the powder with sufficient of a mixture of four volumes of alcohol and one volume of water and pack it in a cylindrical percolator; then add enough of this menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed slowly, gradually adding menstruum of the same strength until the drug is exhausted. Recover the alcohol from the percolate by distillation and evaporate the residue, with frequent stirring at a temperature not exceeding 70° C., to a pilular consistence.

Uses—In dysmenorrhea and a nerve sedative.

Average dose—4 grains (0.25 Gm.).

EXTRACTUM TARAXACI. N.F. Extract of Taraxacum

(U. S. P. IX)

[**Ext. Tarax.**]

	Metric	Alternative
Taraxacum, in moderately coarse powder	**1000 Gm.**	32 oz. av.
Alcohol,		
Water, each, a sufficient quantity.		

Mix 125 cc. [4 fl. oz.] of alcohol with 875 cc. [28 fl. oz.] of water, and, having moistened the powder with a portion of the mixture, pack it in a cylindrical percolator, then add enough of the menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice and having closely covered the percolator, macerate for twenty-four hours. Then allow the percolation to proceed, gradually adding menstruum of the same strength until the drug is exhausted. Recover the alcohol from the percolate by distillation and evaporate the residue on a water bath, with frequent stirring, to a pilular consistence.

Uses—A diuretic and alterative.

Average dose—15 grains (1 Gm.).

Table of Some Unofficial Extracts

Title	*Directions*
Extractum Aconiti (U. S. P. IX)	Assayed—It contains from 1.8 to 2.2 per cent of the ether-soluble alkaloids of aconite Dissolve 5 Gm. of tartaric acid in 500 cc. of alcohol, moisten 1000 Gm. of the drug with the mixture and percolate after forty-eight hours' maceration, using alcohol as the menstruum. Reserve the first 1000 cc. of percolate, recover the alcohol by distillation from the remaining percolate and when the residue measures 100 cc. add the reserved portion and again distil the alcohol until the residue is of syrupy consistence. Shake residue with two successive portions of petroleum benzin of 250 cc. each, incorporate 50 Gm. of dried starch with the washed residue, and evaporate on a water bath, at not over 70° C. Powder the product, weigh, assay and adjust the finished extract to the above standard by adding sufficient dried starch Dose: one sixth grain (0.01 Gm.)
Aloes (N. F. IV)	Thoroughly mix 1000 Gm. of aloes with 10,000 cc. of boiling water, stand for twelve hours, decant the clear liquid, strain the remainder and evaporate the mixed liquids to dryness on a water bath. Powder and add enough starch to make 500 Gm. Dose: two grains (0.125 Gm.)
Arnica (U. S. P. 1890)	Percolate 1000 Gm. of arnica root with diluted alcohol; reserve the first 900 cc. of percolate, evaporate the remainder to 100 cc. Mix it with the reserve and evaporate to pilular consistence at not over 50° C. Dose: fifteen grains (1 Gm.)
Cimicifugæ (U. S. P. IX)	Percolate 1000 Gm. of cimicifuga to exhaustion with alcohol, recover the alcohol by distillation, evaporate the residue to dryness at not over 70° C., powder and add enough starch to make 250 Gm. Dose: four grains (0.25 Gm.)
Cinchonæ (N. F. IV)	Assays not less than 22 per cent and not more than 26 per cent of combined alkaloids. Percolate 1000 Gm. of cinchona using 4000 cc. of 71 per cent alcohol as the first menstruum and diluted alcohol as the second menstruum. Collect 4000 cc. of percolate, reserve the first 900 cc., and evaporate first the remaining percolate to 100 cc., add to the reserve and evaporate at not over 80° C. until the product is of a pilular consistence. Assay and add glucose to make the product contain 24 per cent of combined alkaloids of cinchona Dose: four grains (0.25 Gm.)
Colchici (Br. 1914)	Crush fresh colchicum corms, deprived of their coats; press, set the liquid aside, decant clear portion, heat to 100° C., strain, and evaporate at not over 70° C. to a soft extract
Ergotæ (U. S. P. IX)	Extract 1000 Gm. of ergot with petroleum benzin, dry the drug and percolate to exhaustion, using first a mixture of 10 cc. of hydrochloric acid, 340 cc. of alcohol and 60 cc. of water, and then 80 per cent alcohol. Recover the alcohol by distillation and evaporate the residue at not over 70° C. to a pilular consistence Dose: four grains (0.25 Gm.)
Gelsemii (U. S. P. IX)	Percolate 1000 Gm. of gelsemium to exhaustion with alcohol, recover the alcohol by distillation until the residue in the still measures 500 cc., evaporate this in a dish, at not over 70° C., to a soft extract. Then incorporate 50 Gm. of a mixture of 1 part of magnesium oxide and 3 parts of dried starch and dry the mixture on plates, in an air bath, at not over 70° C. Powder the product and add enough of the same diluting material to make 250 Gm. Dose: one sixth grain (0.01 Gm.)
Jalapæ (N. F. IV)	Percolate 1000 Gm. of jalap to exhaustion with alcohol, reserve the first 900 cc. of percolate, evaporate first the remaining percolate to 100 cc. Add to the reserved portion and evaporate at not over 50° C. to a pilular consistence Dose: fifteen grains (1 Gm.)
Physostigmatis (U. S. P. IX)	It contains from 1.7 to 2.3 per cent of physostigma alkaloids. Percolate 1000 Gm. of physostigma to exhaustion, using first a mixture of 5 Gm. of tartaric acid dissolved in 1000 cc. of 70 per cent alcohol, and afterward 70 per cent alcohol. Recover the alcohol by distillation and evaporate the residue to about 200 cc. at not over 70° C. Transfer the concentrated liquid to a flask, add 100 cc. of water and wash the mixture with two successive portions of petroleum benzin, 250 and 200 cc. respectively. Discard the benzin and evaporate the washed liquid to pilular consistence at not over 70° C. Add 20 Gm. of dried starch and thoroughly dry by exposure to currents of warm air. Powder the product, assay, and add enough dried starch to make the finished extract contain 2 per cent of physostigma alkaloids Dose: one eighth grain (0.008 Gm.)
Podophylli (N. F. IV)	Prepare as directed under extractum jalapæ, using 75 per cent alcohol as the menstruum Dose: one fourth grain (0.015 Gm.)
Quassiæ (N. F. IV)	Percolate 1000 Gm. of quassia with water until exhausted, evaporate the percolate to three-fourths of its bulk by boiling, then strain, and evaporate the liquid to dryness on a water bath. Powder the product and add enough dried starch to make 100 Gm. Dose: one grain (0.06 Gm.)
Strophanthi (Br. 1914)	Exhaust 25 Gm. of strophanthus seeds with ether, dry the mass, and percolate with alcohol to make 250 cc. Evaporate the liquid until it thickens, and add enough lactose to make 50 Gm. Dose: one-eighth grain (0.080 Gm.)
Viburni Prunifolii (U. S. P. IX)	Percolate 1000 Gm. of viburnum prunifolium to exhaustion with diluted alcohol, recover the alcohol by distillation and evaporate the residue to a soft extract at not over 70° C. Add 5 Gm. of magnesium oxide, dry on glass plates in a current of warm air. Powder, and add enough dried starch to make 200 Gm. Dose: eight grains (0.5 Gm.)

Resinæ—*Resins*

The official resins are solid preparations consisting chiefly of the resinous principles from vegetable bodies. The officially prepared resins differ from alcoholic extracts in the fact that the latter contain all the principles in the drug which alcohol is capable of dissolving, while the resins contain only those principles which are soluble in alcohol and are insoluble in water. It is obvious that the resins prepared from those drugs that owe their activity exclusively to resinous principles, that are insoluble in water, are stronger preparations than the alcoholic extracts from such drugs.

RESINA. U. S. Rosin
[Resin.—Colophony]

The residue left after distilling the volatile oil from the oleoresin obtained from *Pinus palustris* Miller and from other species of *Pinus* (Fam. *Pinaceæ*).

Description and Physical Properties—Sharply angular, translucent, amber-colored fragments, frequently covered with a yellow dust, brittle at ordinary temperatures, the fracture shiny and shallow-conchoidal. The odor and taste are slightly terebinthinate.

Rosin is freely soluble in alcohol, ether, benzene, glacial acetic acid, and in fixed and volatile oils. It is also soluble in dilute solutions of the fixed alkali hydroxides.

Tests for Identity and Purity—Its alcoholic solution is acid to litmus paper.

Specific gravity: 1.07 to 1.09 at 25° C.

Rosin is easily fusible and burns with a dense yellowish smoke.

Ash: not more than 0.05 per cent.

Acid number: not less than 150, page 1512.

U. S. P. Preparations—Ceratum Cantharidis; Ceratum Resinæ.

N. F. Preparations—Ceratum Resinæ Compositæ; Solutio Resinæ Chloroformica.

RESINA IPOMŒÆ. U. S. Resin of Ipomea
[Res. Ipom.]

	Metric	Alternative
Ipomea, in coarse powder	**1000 Gm.**	**32 oz. av.**
Alcohol,		
Water, each, a sufficient quantity.		

Moisten the Ipomea with sufficient alcohol, pack it in a cylindrical percolator, and add enough alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding alcohol until the percolate ceases to produce more than a slight turbidity when dropped into water. Distil off the alcohol until the percolate is reduced to the consistence of thin syrup, and pour this slowly, with constant stirring, into 1000 cc. [2 pints] of hot water. When the precipitate has subsided, decant the supernatant liquid, wash the precipitated resin twice by decantation with fresh portions of 1000 cc. [2 pints] each of hot water, drain off the water thoroughly, and dry the Resin on a water bath.

Description and Physical Properties—Translucent masses or fragments, of a brown color, breaking with a glossy, resinous fracture; odor characteristic.

Resin of Ipomea is soluble in alcohol and in chloroform; from 80 to 90 per cent is soluble in ether, and less than 5 per cent is soluble in petroleum benzin.

Tests for Purity—Ash: not more than 0.5 per cent.

Resin of Ipomea is slowly soluble in five times its weight of ammonia T.S. and in potassium hydroxide T.S., yielding a somewhat cloudy solution which does not become gelatinous on standing. When these solutions are acidified with hydrochloric acid, only a slight turbidity appears (*rosin, guaiac or other resins*).

Resin of Ipomea, dried at 100° C., loses not more than 1 per cent (*water*).

Triturate Resin of Ipomea with distilled water: the latter does not become colored, none of the resin dissolves (*soluble impurities*), and the water does not have a bitter taste (*aloin*).

Shake 0.02 Gm. of Resin of Ipomea with 5 cc. of ether, filter, and evaporate the filtrate on filter paper: no greenish-blue color is produced by the addition of a drop of ferric chloride T.S. to the filter paper (*guaiac*).

Dissolve 0.02 Gm. of Resin of Ipomea in 2 cc. of glacial acetic acid and add a few drops of sulphuric acid: the mixture does not acquire a pink color (*rosin*).

Acid number: not less than 25 and not more than 30.

Ester number: not less than 170 and not more than 185.

Saponification value: not less than 195 and not more than 215.

U. S. P. Preparation—Extractum Colocynthidis Compositum.

N. F. Preparation—Tinctura Jalapæ Composita.

Uses—A cathartic, usually combined with other drugs. It has been admitted to the U. S. P. to replace the true *resin of scammony* which is no longer commercially available. It is not chemically identical with resin of scammony but seems to possess practically the same therapeutic uses. It is sometimes called *Resin of Mexican Scammony.*

Average dose—3 grains (0.2 Gm.).

RESINÆ JALAPÆ. U. S. Resin of Jalap

[Res. Jalap.]

	Metric	Alternative
Jalap, in fine powder	**1000 Gm.**	32 oz. av.
Alcohol,		
Water, each, a sufficient quantity.		

Moisten the powder with 500 cc. [1 pint] of alcohol, pack it in a cylindrical percolator, and add enough alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed slowly, gradually adding alcohol, until the percolate ceases to produce more than a slight turbidity when dropped into water. Distil off the alcohol until the percolate is reduced in weight to 250 Gm. [8 oz. av.] and add the latter slowly, with constant stirring, to 3000 cc. [6 pints] of water. When the precipitate has subsided, decant the supernatant liquid, and wash the precipitate twice by decantation with fresh portions of 1000 cc. [2 pints] each of hot water. After having drained off all of the liquid, transfer the Resin to a porcelain dish and heat it to dryness on a water bath.

Description and Physical Properties—Yellow to brown masses or fragments, breaking with a resinous, glassy fracture and translucent at the edges, or a yellowish-gray to yellowish-brown powder. It has a slight, peculiar odor, a somewhat acrid taste, and is permanent in the air.

Resin of Jalap is soluble in alcohol in all proportions; insoluble in carbon disulphide, benzene, and in fixed or volatile oils.

Test for Purity—Add 1 Gm. of the powdered Resin to 20 cc. of chloroform in a stoppered flask, shake the mixture occasionally during one hour, then filter, wash the flask and residue on the filter with three successive 5 cc. portions of chloroform, evaporate the combined filtrates in a tared dish, and dry the residue to constant weight at 100° C.: it weighs not more than 0.3 Gm.

Add 1 Gm. of the powdered Resin to 20 cc. of ether in a stoppered flask, shake the mixture occasionally during one hour, then filter, wash the flask and residue on the filter with three successive 5 cc. portions of ether, evaporate the combined filtrates in a tared dish, and dry the residue to constant weight at 100° C.: it weighs not more than 0.12 Gm. (*rosin or other resins*).

It is slowly but completely soluble in 5 times its weight of ammonia water, and the solution does not become gelatinous on standing. When this solution is acidified with hydrochloric acid, only a slight turbidity appears (*rosin, guaiac, or other resins*).

When Resin of Jalap is dried at 100° C., the loss in weight should not exceed 1 per cent (*water*).

When Resin of Jalap is triturated with distilled water, the latter does not become colored, none of the Resin dissolves (*soluble impurities*), and the water does not have a bitter taste (*aloin*).

Shake 0.02 Gm. of Resin of Jalap with 5 cc. of ether, filter, and evaporate the ethereal filtrate on filter paper: no greenish-blue color is produced by the application of a drop of ferric chloride T.S. to the filter paper (*guaiac*).

One Gm. of Resin of Jalap when dissolved in 50 cc. of alcohol containing 1 cc. of phenolphthalein T.S. requires not more than 0.5 cc. of half-normal alcoholic potassium hydroxide to produce a red color (*acid resins*).

Dissolve 0.02 Gm. of Resin of Jalap in 2 cc. of glacial acetic acid and add a few drops of sulphuric acid: the mixture does not acquire a pink color (*rosin*).

U. S. P. Preparation—Pilulæ Hydrargyri Chloridi Mitis Compositæ.

N. F. Preparation—Pilulæ Catharticæ Vegetabiles.

Uses—A purgative.

Average dose—2 grains (0.125 Gm.).

RESINA PODOPHYLLI. U.S. Resin of Podophyllum

[Res. Podoph.—PODOPHYLLIN]

	Metric	Alternative
Podophyllum, in fine powder	**1000 Gm.**	32 oz. av.
Hydrochloric Acid	**10 cc.**	2½ fl. dr.
Alcohol,		
Water, each, a sufficient quantity.		

Moisten the drug with 500 cc. [1 pint] of alcohol, pack it in a cylindrical percolator, and add enough alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding alcohol, until the percolate ceases to produce more than a slight turbidity when dropped into water. Distil off the alcohol until the percolate is reduced to the consistence of a thin syrup, and pour this slowly, with constant stirring, into 1000 cc. [2 pints] of water, mixed with the hydrochloric acid and cooled to a temperature below 10° C. When the precipitate has subsided, decant the supernatant liquid, and wash the precipitate twice by decantation with fresh portions of 1000 cc. [2 pints] of cold water. Spread it in a thin layer upon a strainer and dry the product by exposure to the air, in a cool place, protected from light. Should it coalesce during the drying or aggregate into lumps having a glossy surface, break it into pieces, and powder it in a mortar.

Description and Physical Properties—An amorphous powder, varying in color from light brown to greenish-yellow, turning darker when subjected to a temperature exceeding 25° C. or when exposed to light. It has a slight, peculiar and a faintly bitter taste. *It is very irritating to the eye, and to mucous membranes in general.*

Tests for Identity—Resin of Podophyllum is soluble in potassium or sodium hydroxide T.S., forming a deep yellow liquid, which gradually becomes darker on standing, and from which the resin is reprecipitated by acids.

A hot aqueous solution of Resin of Podophyllum deposits most of its contents on cooling, and if the cooled liquid is filtered, the filtrate has a bitter taste, and turns brown upon the addition of a few drops of ferric chloride T.S.

Tests for Purity—Ash: not more than 1.5 per cent.

Resin of Podophyllum is soluble in alcohol with only a slight opalescence and the solution is faintly acid to litmus paper.

Add 0.4 Gm. of Resin of Podophyllum to 3 cc. of 60 per cent alcohol, follow with 0.5 cc. of potassium hydroxide T.S., and shake gently: the mixture does not gelatinize (*difference from resin obtained from Podophyllum Emodi*).

Add 1 Gm. of the powdered Resin to 20 cc. of ether in a stoppered flask and shake the mixture occasionally during one hour. Filter, and wash the residue in the flask and on the filter with three successive 5 cc. portions of ether. Evaporate the combined ether solutions in a tared dish and dry the residue to constant weight at 100° C.: it weighs not less than 0.75 Gm.

Add 1 Gm. of the powdered Resin to 20 cc. of chloroform in a stoppered flask and shake the mixture occasionally during one hour. Filter, and wash the residue in the flask and on the filter with three successive 5 cc. portions of chloroform. Evaporate the combined filtrates in a tared dish and dry the residue to constant weight at 100° C.: it weighs not less than 0.65 Gm.

Preserve in well-closed containers protected from light.

N. F. Preparations—Pilulæ Aloes et Podophylli Compositæ; Pilulæ Aloes, Hydrargyri et Podophylli; Pilulæ Aloini Compositæ; Pilulæ Catharticæ Vegetabiles.

Uses—An active purgative; the basis of several proprietary "liver-pills".

Average dose—⅙ grain (0.01 Gm.).

Unofficial Resin

Title	*Directions*
Resinae Scammonii (U. S. P. IX)	Percolate 1000 Gm. of scammony root, in No. 30 powder, with alcohol until the tincture ceases to produce more than a slight turbidity when dropped into water. Distil off the alcohol until the residue is reduced to the consistence of thin syrup, and pour this slowly and with consistent stirring into 1000 cc. of hot water, wash the precipitate with two portions of 1000 cc. each of hot water, and dry the resin on a water bath

CHAPTER XXXVIII

SOLID OFFICIAL PREPARATIONS MADE WITHOUT PERCOLATION OR MACERATION

It is not the intention in this chapter to consider in detail the classes of solid official preparations included in the above title, because their manufacture either belongs to the domain of magistral pharmacy or is intimately connected with it. They are more appropriately treated in the final chapters of the book, because their preparation generally demands a higher degree of skill, and a more intimate knowledge of the physical properties of medicinal substances, than are necessary in making those which have been heretofore considered. For these reasons it has been the custom, in lecturing upon the subjects treated of in this work, to reserve the consideration of the solid official preparations made without percolation, and those which are embraced under the general term "extemporaneous", until after the student has studied the physical and chemical properties of the various substances which compose the materia medica. It is well for the student to have sufficient knowledge of these preparations to be able to define each class, so that when they are incidentally mentioned in Parts IV and V he may be able to describe the use and appearance of a powder, troche, plaster, pill, etc. If it is considered desirable to deviate from this plan, the chapters on these subjects are so constructed that the student may easily turn to them and study them out of the order given here. They will be found in Part XI.

It will be well, however, in this place, in order to keep the classification in view, to enumerate them briefly. They are Artificial Salts, Effervescent Salts, Powders, Oil Sugars, Species, Dentifrices, Masses, Confections, Pills, Troches, Tablets, Ointments, Inunctions, Glycerogelatins, Dermatologic Pastes, Cerates, Cataplasms, Plasters, Mulls, Papers, Suppositories, and Pencils. In this group artificial and effervescent salts, powders, oil sugars, species and dentifrices are considered together. Masses and confections being used in the preparation of pills, troches, and tablets, are considered with them. Ointments, inunctions, glycerogelatins, dermatologic pastes, cerates, cataplasms, plasters, mulls, and papers form a natural group, being preparations that are used externally, while suppositories and pencils form another classification.

Salia Factitia—*Artificial Salts*

It has long been the custom to prepare a mixture of the more important chemical salts naturally present in several of the well-known mineral springs of Europe. These are properly labeled artificial, and if used to prepare effervescent salts or mineral waters they should be sold only as an imitation of the genuine.

SAL CAROLINUM FACTITIUM. N.F. Artificial Carlsbad Salt [Sal Carol. Fact.]

1. *In dry, amorphous form:*

	Metric	Alternative
Potassium Sulphate	**2 Gm.**	35 gr.
Sodium Chloride	**18 Gm.**	315 gr.
Sodium Bicarbonate	**36 Gm.**	1 oz. av. 193 gr.
Sodium Sulphate	**100 Gm.**	4 oz. av.
To make about	**100 Gm.**	4 oz. av.

Mix the sulphates and chloride and dry to constant weight at about 40° C., cool, add the sodium bicarbonate and mix thoroughly.

2. *In crystalline form:*

	Metric	Alternative
Potassium Sulphate, in crystals	2 Gm.	35 gr.
Sodium Chloride in crystals	18 Gm.	315 gr.
Monohydrated Sodium Carbonate	28 Gm.	1 oz. av. 53 gr.
Sodium Sulphate, in crystals	100 Gm.	4 oz. av.
Distilled Water	100 cc.	3 fl. oz. 362 min.
To make about	180 Gm.	7 oz. av. 88 gr.

Dissolve the potassium sulphate and sodium chloride in the distilled water, and add this solution to the other two salts, previously melted in a tared dish, at a gentle heat, in their own water of crystallization. Evaporate the mixture to 180 Gm. [7 oz. av. 88 gr.], set it aside in a cool place, and stir it frequently, to prevent the formation of large crystals, taking care, however, that none of the salt separates in a pulverulent form. Distribute any remaining mother liquor uniformly over the crystals, and dry the whole mixture sufficiently by exposure to air, so that it will retain its crystalline character.

NOTE—A solution of 1 Gm. of the dry or 1.75 Gm. of the crystalline salt in 200 cc. of water is similar to an equal volume of Carlsbad water (Sprudel) in its main constituents.

Preparation—Sal Carolinum Factitium Effervescens.

SAL KISSINGENSE FACTITIUM. N. F. Artificial Kissingen Salt

[Sal Kissingen. Fact.]

	Metric	Alternative
Potassium Chloride, in crystals	32 Gm.	56 gr.
Sodium Chloride, in crystals	660 Gm.	2 oz. av. 280 gr.
Magnesium Sulphate	220 Gm.	385 gr.
Sodium Bicarbonate, dried	198 Gm.	346 gr.
To make about	1000 Gm.	4 oz. av.

Dry the magnesium sulphate to constant weight at 110° C., cool, add the other ingredients and mix thoroughly.

NOTE—A solution of 1.5 Gm. of this preparation in 200 cc. of water is similar to an equal volume of Kissingen water (Rakoczi Spring) in its main constituents.

Preparation—Sal Kissingense Factitium Effervescens.

SAL VICHYANUM FACTITIUM. N. F. Artificial Vichy Salt

[Sal Vichy. Fact.]

	Metric	Alternative
Sodium Bicarbonate, dried	846.0 Gm.	3 oz. av. 168 gr.
Potassium Carbonate, dried	38.5 Gm.	1 oz. av. 236 gr.
Magnesium Sulphate	80.0 Gm.	140 gr.
Sodium Chloride	77.0 Gm.	135 gr.
To make about	1000 Gm.	4 oz. av.

Dry the magnesium sulphate to constant weight at 110° C., cool, add the other ingredients, and mix thoroughly.

NOTE—A solution of 1 Gm. of this preparation in 200 cc. of water is similar to an equal volume of Vichy water (Grande Grille Spring) in its main constituents.

Preparation—Sal Vichyanum Factitium Effervescens.

Salia Effervescentia—*Granular Effervescent Salts*

Granular effervescent salts were formerly made by mixing the dry powders with dry tartaric acid and sodium bicarbonate and moistening the mixture with strong alcohol. The pasty mass was passed through a sieve, and the granules dried quickly in a hot room, sifted, and filled into bottles, which were hermetically sealed to prevent the access of moist air.

The use of alcohol in making granulated effervescent salts is expensive, and an improvement was made by using citric acid to replace a part of the tartaric acid. The molecule of water of crystallization in citric acid is liberated when heated in contact with the sodium bicarbonate, and this furnishes just

sufficient water to make a pasty mass, without causing much loss of carbonic acid; by quickly drying the granules further chemical action is prevented.

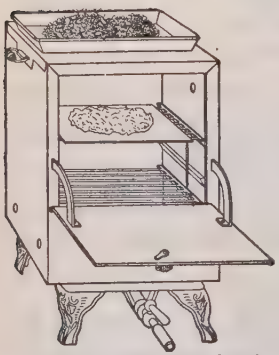
This method was greatly improved by mixing the powders in a flat enameled dish and heating in an oven to about 100° C., or by heating the mixture in a deep jacketed kettle or in a pill coating pan, heated, as it revolves, by a gas flame. When the mixture becomes moist, it is manipulated with a wooden spatula to make it uniform in consistence, and rubbed through a coarse tinned-iron sieve and the granules dried slowly, at a low heat, in an oven. Fig. 423*a* shows a convenient method for preparing effervescent salts on a small scale.

Acid sodium phosphate (Sodium Biphosphate, U. S. P. X) is now replacing citric and tartaric acids in many commercial effervescent salts, it being less costly.

The National Formulary gives the following general directions for the preparation of granular effervescent salts:

"The citric acid directed in the formulas should be uneffloresced crystals and be finely powdered just before using. All other ingredients should be well dried at a temperature not exceeding 50° C. until they cease to lose weight, and then finely powdered and passed through a No. 60 sieve. As atmospheric dampness, if present, will be absorbed by the finished salt and destroy the effervescent character of the product, it is important that these preparations be made in an atmosphere free from moisture.

FIG. 423*a*



Oven for making granulated effervescent salts

"*Directions for Granulating in an Oven*—Having prepared the citric acid and the other ingredients of the formula as directed above, intimately mix the powders, without trituration, adding the citric acid last, and spread the resulting product evenly, about 10 mm. thick, on a sheet of paper on a canvas tray, glass plate, or in a shallow porcelain or enameled dish, and place it in an oven, heated to a temperature between 95° and 105° C. Allow the powder to remain in the oven (see Fig. 423*a*), without stirring, until it becomes moist and acquires the proper consistence, about that of dough, then force the mass immediately through a No. 6 tinned-iron sieve and dry the product at a temperature not exceeding 50° C. When dry, again pass the granular powder through a No. 6 tinned-iron sieve, and immediately transfer it to dry bottles or containers, and tightly seal them.

"*Directions for Granulating on a Water Bath*—If a small quantity of the salt is to be prepared, the powders, mixed as directed above, may be transferred to a covered dish on a water bath or to a double boiler, heated by water actively boiling, the inner dish being in contact with the water, and the resulting pasty mass stirred until dry. The dry granules should be immediately passed through a No. 6 tinned-iron sieve and transferred to a dry container, which should then be tightly sealed."

In the manufacturing laboratory the mixture is usually heated in a shallow, enameled, jacketed steam kettle until moist, then forced through a No. 6 tinned-iron sieve by mechanical means and the moist granules dried in a vacuum dryer.

The title *Granulæ Effervescentes* (*Effervescent Granules*) is given by the B. P. Codex to this class of products, many formulas being offered.

POTASSII CITRAS EFFERVESCENS. U. S. P. **Effervescent Potassium Citrate** (see page 607).

SODII PHOSPHAS EFFERVESCENS. U. S. P. **Effervescent Sodium Phosphate** (see page 630).

PULVIS EFFERVESCENS COMPOSITUS. U. S. P. **Compound Effervescent Powder** (see page 478).

SAL CAROLINUM FACTITIUM EFFERVESCENS, N. F. Effervescent Artificial Carlsbad Salt

[Sal Carol. Fact. Eff.]

	Metric	Alternative
Artificial Carlsbad Salt, in the dry form	**266 Gm.**	1 oz. av. 28 gr.
Sodium Bicarbonate, dried and powdered	**400 Gm.**	1 oz. av. 262 gr.
Tartaric Acid, dried and powdered	**157 Gm.**	275 gr.
Citric Acid, unefflorescd crystals	**250 Gm.**	1 oz. av.
To make about	**1000 Gm.**	4 oz. av.

Prepare an effervescent salt as directed in the General Process (see page 476).

Average dose—60 grains (4 Gm.).

NOTE—A solution of 4 Gm. of this preparation in 200 cc. of water is similar to an equal volume of Carlsbad water (Sprudel) in its main constituents.

SAL KISSINGENSE FACTITIUM EFFERVESCENS. N. F. Effervescent Artificial Kissingen Salt

[Sal Kissingen. Fact. Eff.]

	Metric	Alternative
Artificial Kissingen Salt, dried and powdered	**400 Gm.**	1 oz. av. 262 gr.
Sodium Bicarbonate, dried and powdered	**406 Gm.**	1 oz. av. 273 gr.
Tartaric Acid, dried and powdered	**94 Gm.**	164.5 gr.
Citric Acid, in unefflorescd crystals	**250 Gm.**	1 oz. av.
To make about	**1000 Gm.**	4 oz. av.

Prepare an effervescent salt as directed in the General Process (see page 476).

Average dose—60 grains (4 Gm.).

NOTE—A solution of 3.75 Gm. of this preparation in 200 cc. of water is similar to an equal volume of Kissingen water (Rakoczi Spring) in its main constituents.

SAL LITHII CITRATIS EFFERVESCENS. N. F. **Effervescent Salt of Lithium Citrate** (see page 647)

SAL MAGNESII SULPHATIS EFFERVESCENS. N. F. **Effervescent Magnesium Sulphate** (see page 670)

SAL POTASSII BROMIDI EFFERVESCENS COMPOSITUM. N. F. **Compound Effervescent Salt of Potassium Bromide** (see page 603)

SAL VICHYANUM FACTITIUM EFFERVESCENS. N. F. Effervescent Artificial Vichy Salt

[Sal Vichy. Fact. Eff.]

	Metric	Alternative
Artificial Vichy Salt, dried and powdered	**250.0 Gm.**	1 oz. av.
Sodium Bicarbonate, dried and powdered	**485.5 Gm.**	1 oz. av. 412 gr.
Tartaric Acid, dried and powdered	**164.5 Gm.**	288 gr.
Citric Acid, unefflorescd crystals	**250.0 Gm.**	1 oz. av.
To make about	**1000 Gm.**	4 oz. av.

Prepare an effervescent salt as directed in the General Process (see page 476).

Average dose—60 grains (4 Gm.).

NOTE—A solution of 4 Gm. of this preparation in 200 cc. of water is similar to an equal volume of Vichy water (Grande Grille Spring) in its main constituents.

Some Unofficial Granular Effervescent Salts

Title	*Directions*
Sal Potassii Bromidi Effervescens (N. F. IV)	Prepare an effervescent salt by the general process, using 16.6 Gm. of potassium bromide, 53 Gm. of sodium bicarbonate, 20.4 Gm. of tartaric acid and 25 Gm. of citric acid
Sal Vichyanum Factitium Effervescens cum Lithio* (N. F. IV)	Prepare an effervescent salt by the general process, using 25 Gm. of artificial vichy salt, 8.33 Gm. of lithium citrate, 44.1 Gm. of sodium bicarbonate, 12.5 Gm. of tartaric acid and 25 Gm. of citric acid

Pulveres—*Powders*

The preparations considered here under this title are the official compound powders. They consist of intimate mixtures of substances which, in the majority of instances, have previously been reduced to a fine powder. Because some substances, especially those containing aromatic volatile oils, would be injured by preliminary powdering, these are usually mixed without grinding and the mixture reduced to a fine powder. They therefore call for a consideration of many of the principles and much of the apparatus described under comminution and trituration (see pages 151, etc.).

The extemporaneous preparation of powders in prescription filling, is discussed in Part XI.

The official compound powders are as follows:

PULVIS CRETÆ COMPOSITUS. U.S. Compound Chalk Powder

[Pulv. Cret. Co.]

	Metric	Alternative
Prepared Chalk	**30 Gm.**	1½ oz. av.
Acacia, in very fine powder	**20 Gm.**	1 oz. av.
Sucrose, in fine powder	**50 Gm.**	2½ oz. av.
To make	**100 Gm.**	5 oz. av.

Mix the powders intimately by trituration and pass the product through a No. 60 sieve.

U. S. P. Preparation—Mistura Cretæ.

Uses—A convenient form for the administration of chalk as an antacid.

Average dose—30 grains (2 Gm.).

PULVIS EFFERVESCENS COMPOSITUS. U.S. Compound Effervescing Powder

[Pulv. Eff. Co.—SEIDLITZ POWDER**]**

The mixture in a blue paper weighs not less than 9.5 Gm. and not more than 10.5 Gm., and contains not less than 23 per cent and not more than 27 per cent of sodium bicarbonate [$NaHCO_3$], and not less than 73 per cent and not more than 78 per cent of potassium and sodium tartrate [$KNaC_4H_4O_6.4H_2O$]. The white paper contains not less than 2 Gm. and not more than 2.4 Gm. of tartaric acid [$H_2C_4H_4O_6$].

	Metric	Alternative
Sodium Bicarbonate, dried and in fine powder	**30 Gm.**	1 oz. av. 26 gr.
Potassium and Sodium Tartrate, dried and in fine powder	**90 Gm.**	3 oz. av. 28 gr.
Tartaric Acid, dried and in fine powder	**26 Gm.**	401 gr.

Mix the sodium bicarbonate intimately with the potassium and sodium tartrate, divide the mixture into 12 equal parts, and wrap each part in a blue paper. Then divide the tartaric acid into 12 equal parts, and wrap each part in a white paper.

Tests for Identity—To 5 cc. of an aqueous solution of the mixture in a blue paper (1 in 20) add 5 cc. of acetic acid, and when effervescence has ceased, shake the solution vigorously: a white, crystalline precipitate, soluble in ammonia T.S., separates.

Assay for Sodium Bicarbonate—Mix thoroughly the contents of a blue paper, then dissolve 2 Gm. of it in 80 cc. of distilled water, add 20 cc. of half-normal sulphuric acid, boil the solution

until the volume is reduced to about 50 cc., and titrate the excess of acid with half-normal sodium hydroxide, phenolphthalein T.S. being used as indicator. Each cc. of half-normal sulphuric acid corresponds to 0.04201 Gm. of sodium bicarbonate.

Assay for Potassium and Sodium Tartrate—Proceed as directed under the assay for alkali salts of organic acids, page 1514, using 2 Gm. of the mixture taken from the blue paper used in the preceding assay. The difference between the number of cc. of half-normal sulphuric acid consumed in this assay and in the assay for sodium bicarbonate multiplied by 0.07056, represents the potassium and sodium tartrate.

The sum of the percentage of sodium bicarbonate and of the potassium and sodium tartrate is not less than 99 per cent.

Assay for Tartaric Acid—The contents of the white paper should meet the requirements of the tests and assay under *Acidum Tartaricum*.

This assay is explained on page 1453.

Preserve the powders in well-closed containers, in a dry place.

History—The name Seidlitz Powder was given to this preparation by the originator and patentee, Thomas Savory, in 1815. Although custom has established its use and its legality, the name is incorrect, as the patentee misrepresented when he claimed that the powders owed their value to the mineral properties of the Seidlitz Spring in Germany. The Seidlitz Spring owes its therapeutic properties to magnesium sulphate. The formula of this patent medicine, for such it was at that time, was exposed in a book of receipts published by the Philadelphia College of Pharmacy in 1824.

Uses—These powders are aperient and refrigerant. Dose, the contents of a white and of a blue paper, dissolved separately in water, and the solutions mixed.

PULVIS GLYCYRRHIZÆ COMPOSITUS. U.S. Compound Powder of Glycyrrhiza

[**Pulv. Glycyrrh. Co.**—Compound Licorice Powder]

	Metric	Alternative
Senna, in very fine powder	180 Gm.	315 gr.
Glycyrrhiza, in very fine powder	236 Gm.	413 gr.
Washed Sulphur	80 Gm.	140 gr.
Oil of Fennel	4 Gm.	5 min.
Sucrose, in fine powder	500 Gm.	2 oz. av.
To make	1000 Gm.	4 oz. av.

Mix the oil of fennel thoroughly with about one-half of the sucrose, then add the remainder of the sucrose and the other ingredients, and mix thoroughly. Finally, pass the powder through a No. 80 sieve, pulverize the residue if any should be left on the sieve, add it to the sifted powder, and mix thoroughly. Keep it in well-closed containers.

Description—Greenish-yellow to greenish-brown, with a fennel-like odor. The elements of identification are the tissues of glycyrrhiza and senna.

For further tests see the U. S. P. X.

History—This preparation first appeared in the Prussian Pharmacopœia of 1799, having been devised by a famous physician of Berlin, but which was based upon a similar preparation called *compound senna powder* which was recognized in the first London Pharmacopœia in 1618.

Uses—This powder is an agreeable laxative.

Average dose—60 grains (4 Gm.).

PULVIS IPECACUANHÆ ET OPII. U.S. Powder of Ipecac and Opium

[**Pulv. Ipecac. et Opii.**—Compound Powder of Ipecac, Dover's Powder, Opii et Ipecacuanhæ Pulvis Compositus P. I.]

	Metric	Alternative
Ipecac, in very fine powder	10 Gm.	175 gr.
Powdered Opium	10 Gm.	175 gr.
Lactose, in coarse powder	80 Gm.	3 oz. av. 87½ gr.
To make	100 Gm.	4 oz. av.

Triturate the ingredients together thoroughly until the mixture is reduced to a very fine, uniform powder.

Description—A grayish-white or very light brown powder.
For further description see the U. S. P. X.

History—This preparation was first introduced by Thomas Dover, an English physician of the early part of the 18th century. He originally called it *Pulvis Diaphoreticus* or *diaphoretic powder*, and gave it in doses from 60 to 100 grains. Dover is noted particularly for having rescued Alexander Selkirk in 1709, while engaged in privateering and Defoe immortalized the story in the classic Robinson Crusoe.

Uses—This powder is anodyne and diaphoretic.

Average dose—5 grains (0.3 Gm.).

PULVIS JALAPÆ COMPOSITUS. U. S. Compound Powder of Jalap

[**Pulv. Jalap. Co.**—PULVIS PURGANS]

	Metric	Alternative
Jalap, in very fine powder	**35 Gm.**	1 oz. av. 175 gr.
Potassium Bitartrate, in fine powder	**65 Gm.**	2 oz. av. 262 gr.
To make	**100 Gm.**	4 oz. av.

Mix the powders intimately by trituration and pass the product through a No. 60 sieve.

Description—A very light brown powder.
For further description see the U. S. P. X.

Uses—Compound Powder of Jalap is a hydragogue cathartic.

Average dose—30 grains (2 Gm.).

PULVIS RHEI COMPOSITUS. U. S. Compound Powder of Rhubarb

[**Pulv. Rhei. Co.**—GREGORY'S POWDER]

	Metric	Alternative
Rhubarb, in very fine powder	**25 Gm.**	1 oz. av.
Magnesium Oxide	**65 Gm.**	2 oz. av. 262 gr.
Ginger, in very fine powder	**10 Gm.**	175 gr.
To make	**100 Gm.**	4 oz. av.

Triturate the rhubarb and ginger together, gradually add the magnesium oxide, continuing the trituration until the ingredients are thoroughly mixed, and finally pass the product through a No. 60 sieve.

Description and Physical Properties—A pinkish-white, mobile powder, becoming darker on exposure to moisture.
For further description see the U. S. P. X.
Preserve in well-closed containers.

History—Gregory's Powder in its original form was a prescription frequently written by Dr. James Gregory of Edinburgh who practiced a little over a hundred years ago in that Scottish City.

Uses—A laxative and antacid.

Average dose—30 grains (2 Gm.).

PULVIS ACETANILIDI COMPOSITUS. N. F. Compound Acetanilid Powder

[Pulv. Acetanil. Co.]

	Metric	Alternative
Acetanilid	70 Gm.	2 oz. av. 350 gr.
Caffeine	10 Gm.	175 gr.
Sodium Bicarbonate	20 Gm.	350 gr.
To make	100 Gm.	4 oz. av.

Reduce the ingredients to a fine powder and mix them thoroughly.

Uses—An analgesic, often employed in the treatment of headaches

Average dose—5 grains (0.32 Gm.).

PULVIS ALOES ET CANELLÆ. N. F. Powder of Aloes and Canella

[Pulv. Aloe. et Canell.—Hiera Picra]

	Metric	Alternative
Aloe, in fine powder	80 Gm.	3 oz. av. 87½ gr.
Canella, in fine powder	20 Gm.	350 gr.
To make	100 Gm.	4 oz. av.

Mix the powders intimately.

History—Hiera Picra is one of the most ancient of pharmaceutical preparations. It dates from about 500 B. C. when a class of preparations known as Hieras came into existence. *Hiera picra* literally means sacred bitters, and the members of this class were complex preparations, frequently sold as nostrums or used as secret preparations by the early physicians, and always containing aloes or a similar purgative drug as the principal active constituent.

Uses—This is used as a laxative but is rarely employed today. It has gained some reputation as an abortifacient and therefore must be sold with caution. (See under Laws, Part VII.)

Average dose—5 grains (0.32 Gm.).

PULVIS ANTIMONIALIS. N. F. Antimonial Powder

[Pulv. Antimon.—James' Powder]

	Metric	Alternative
Antimony Oxide	33 Gm.	1 oz. av. 140 gr.
Precipitated Calcium Phosphate	67 Gm.	2 oz. av. 297½ gr.
To make	100 Gm.	4 oz. av.

Mix the powders intimately.

History—Under the name Dr. James's Fever Powder this preparation was patented in 1747. The patent specifications were very complicated and their integrity was questioned as others could not make the preparation satisfactorily even when directions were strictly followed.

Uses—James' powder has been used as a diaphoretic, but in large doses becomes emetic and purgative.

Average dose—3 grains (0.2 Gm.).

PULVIS ANTISEPTICUS. N. F. Antiseptic Powder

[Pulv. Antisept.—Soluble Antiseptic Powder, Pulvis Antisepticus Solubilis]

	Metric	Alternative
Salicylic Acid	5 Gm.	70 gr
Phenol	1 Gm.	14 gr.
Eucalyptol	1 Gm.	14 gr.
Menthol	1 Gm.	14 gr.
Thymol	1 Gm.	14 gr.
Zinc Sulphate	125 Gm.	4 oz. av.
Boric Acid, in impalpable powder	866 Gm.	27 oz. av. 311 gr.
To make	1000 Gm.	32 oz. av.

Triturate the salicylic acid and zinc sulphate to a very fine powder, add the phenol, eucalyptol, menthol and thymol, previously liquefied by trituration, add the boric acid and continue the trituration until a uniformly fine powder is obtained. Finally pass the powder through a very fine sieve.

Uses—An antiseptic.

PULVIS AROMATICUS. N.F. Aromatic Powder

(U.S.P. IX)

[Pulv. Arom.]

	Metric	Alternative
Cinnamon, in fine powder	35 Gm.	1 oz. av. 157½ gr.
Ginger, in fine powder	35 Gm.	1 oz. av. 157½ gr.
Cardamom Seed, in fine powder	15 Gm.	280 gr.
Myristica, freshly grated	15 Gm.	280 gr.
To make	100 Gm.	4 oz. av.

Triturate the cardamom seed and the myristica with a portion of the cinnamon until they are reduced to a fine powder; then add the remainder of the cinnamon and the ginger and rub them together until they are thoroughly mixed.

A light reddish-brown powder with a strong, distinctive aromatic odor.

For further description see the N. F. V.

Uses—Aromatic powder is used as a pleasant flavor and adjuvant in powders prepared extemporaneously; also as an aromatic and flavor in pills.

Average dose—15 grains (1 Gm.).

PULVIS AROMATICUS RUBEFACIENS. N.F. Rubefacient Spice Powder

[Pulv. Arom. Rubefac.—Replacing Emplastrum Aromaticum]

	Metric	Alternative
Clove, in moderately coarse powder	30 Gm.	1 oz. av. 87½ gr.
Cinnamon, in fine powder	30 Gm.	1 oz. av. 87½ gr.
Ginger, in moderately coarse powder	20 Gm.	350 gr.
Capsicum, in moderately coarse powder	20 Gm.	350 gr.
To make	100 Gm.	4 oz. av.

Mix the powders thoroughly and keep the product in a tightly-closed container.

Uses—This powder has been introduced for the purpose of making *Spice Poultice.* The required quantity should be placed in a flat muslin bag and moistened with either diluted alcohol, whisky, or vinegar, previously heated.

PULVIS CRETÆ AROMATICUS. N.F. Aromatic Powder of Chalk

[Pulv. Cret. Arom.]

	Metric	Alternative
Cinnamon	8 Gm.	140 gr.
Myristica	6 Gm.	105 gr.
Clove	3 Gm.	52 gr.
Cardamom Seed	2 Gm.	35 gr.
Prepared Chalk	25 Gm.	1 oz. av.
Sucrose	56 Gm.	2 oz. av. 105 gr.
To make	100 Gm.	4 oz. av.

Mix the ingredients and reduce them to a fine powder. Pass this through a fine sieve, and afterwards rub it lightly in a mortar. Preserve it in a stoppered bottle.

History—This simple preparation is all that is left of a complex confection devised by Sir Walter Raleigh during his imprisonment prior to his execution. It was introduced into the London Pharmacopœia in 1721 under the name *Confectio Raleighana,* which was later changed to *Confectio Cardiaca* and still later to *Confectio Aromatica.* Each time the formula was simplified until during the 19th century it changed from a confection to a powder and was included under the present official name in the British Pharmacopœia.

Uses—This powder combines the carminative effects of the aromatics with the antacid chalk and is employed in diarrhea involving superacidity.

Average dose—30 grains (2 Gm.).

PULVIS CRETÆ ET OPII AROMATICUS. N. F. Aromatic Powder of Chalk and Opium

[Pulv. Cret. et Opii Arom.—Pulvis Cretæ Aromaticus cum Opio]

	Metric	Alternative
Aromatic Powder of Chalk	97.5 Gm.	3 oz. av. 394 gr.
Powdered Opium	2.5 Gm.	44 gr.
To make	100 Gm.	4 oz. av.

Mix the powders intimately.

Uses—In this preparation the narcotic effect of opium is added to the aromatic chalk powder. It is used when diarrhea is accompanied with much pain.

Average dose—15 grains (1 Gm.).

One average dose contains about:

0.025 Gm. or ⅜ grain of Powdered Opium.

PULVIS HYDRARGYRI CHLORIDI MITIS ET JALAPÆ. N. F. Powder of Mild Mercurous Chloride and Jalap

[Pulv. Hydrarg. Chlor. Mit. et Jalap.—Calomel and Jalap]

	Metric	Alternative
Mild Mercurous Chloride	34 Gm.	1 oz. av. 157½ gr.
Jalap, in fine powder	66 Gm.	2 oz. av. 280 gr.
To make	100 Gm.	4 oz. av.

Mix them intimately.

Uses—It is a cathartic and cholagogue, but is not extensively used today.

Average dose—10 grains (0.65 Gm.).

PULVIS MYRICÆ COMPOSITUS. N. F. Compound Powder of Bayberry

[Pulv. Myric. Co.—Composition Powder]

	Metric	Alternative
Bayberry Bark	60 Gm.	2 oz. av. 175 gr.
Ginger	30 Gm.	1 oz. av. 87½ gr.
Capsicum	5 Gm.	87½ gr.
Clove	5 Gm.	87½ gr.
To make	100 Gm.	4 oz. av.

Reduce the substances to a moderately fine powder and mix them intimately.

Uses—It is used as a carminative and stimulant, chiefly as a home remedy.

Average dose—15 grains (1 Gm.).

PULVIS PANCREATINI COMPOSITUS. N. F. Compound Pancreatin Powder

[Pulv. Pancreat. Co.—Pulvis Pancreaticus Compositus, Peptonizing Powder]

	Metric	Alternative
Pancreatin	20 Gm.	350 gr.
Sodium Bicarbonate	80 Gm.	3 oz. av. 87½ gr.
To make	100 Gm.	4 oz. av.

Mix them by trituration.

Note—One and five-tenths Gm. [22 gr.] of this powder will peptonize 500 cc. [1 pint] of fresh milk when treated as follows: Dissolve 1.5 Gm. [22 gr.] of Compound Pancreatin Powder in 125 cc. [4 fl. oz.] of water, previously heated to 38° C., and add 500 cc. [1 pint] of fresh milk, also heated to 38° C. Maintain the mixture at this temperature during thirty minutes, then transfer it to a cool place, preferably a refrigerator.

Do not use peptonized milk which has been kept longer than twenty-four hours, or which has developed an unpleasant bitter taste.

Uses—For preparing predigested foods.

PULVIS RHEI ET MAGNESIÆ ANISATUS. N. F. Anisated Powder of Rhubarb and Magnesia

[Pulv. Rhei. et Magnes. Anis.—Compound Anise Powder]

	Metric	Alternative
Rhubarb, in fine powder	**35 Gm.**	1 oz. av. 103 gr.
Heavy Magnesium Oxide	**65 Gm.**	2 oz. av. 128 gr.
Anethol	**8 cc.**	130 min.
Alcohol	**10 cc.**	162 min.

Mix the powders, add the anethol, previously dissolved in the alcohol, and triturate until a uniform mixture results. Preserve it in well-stoppered bottles.

Uses—An antacid and carminative in diarrhea.

Average dose—Infants, 5 grains (0.32 Gm.).

PULVIS TALCI COMPOSITUS. N. F. Compound Powder of Talc

[Pulv. Talc. Co.—Pulvis Talci Salicylicus, Boro-Salicylated Powder of Talc]

	Metric	Alternative
Salicylic Acid, in fine powder	**30 Gm.**	420 gr.
Boric Acid, in fine powder	**100 Gm.**	3 oz. av. 87 gr.
Talc, in fine powder	**870 Gm.**	27 oz. av. 367 gr.
To make	**1000 Gm.**	32 oz. av.

Mix the salicylic acid and boric acid intimately and then add the talc in portions, thoroughly mixing after each addition.

Uses—This is a typical formula for a medicated talc to be used as a dusting powder. (See also talcum powders, Part VI.)

Some Unofficial Powders

Title	*Directions*
Pulvis Amygdalæ Compositus (Br. 1914)	Blanch 60 Gm. of sweet almonds, dry them thoroughly with the aid of a gentle heat, triturate in a mortar to a smooth paste, add 10 Gm. of powdered acacia and 30 Gm. of powdered sugar, and thoroughly mix
Buteæ Seminum	Macerate butea seed in distilled water. Carefully remove the integument, dry and powder the kernels
Catechu Compositus (Br. 1914)	Mix 40 Gm. of powdered catechu, 20 Gm. of powdered kino; 20 Gm. of powdered krameria root, 10 Gm. of powdered cinnamon bark, and 10 Gm. of powdered nutmeg
Cinnamomi Compositus (Br. 1914)	Mix 25 Gm. each of powdered cinnamon bark, cardamom seed, and ginger
Pepsini Compositus (Digestive Powder) (N. F. III)	Gradually add 15 min. of lactic acid and 30 min. of hydrochloric acid to 960 gr. of lactose and triturate thoroughly. Add 225 gr. of saccharated pepsin, 225 gr. of pancreatin, and 15 gr. of diastase and triturate thoroughly
Gambir Compositus (N. F. IV)	Mix 40 Gm. of powdered gambir, 20 Gm. of kino, 20 Gm. of krameria 10 Gm. of cinnamon, and 10 Gm. of myristica
Kaladanæ Compositus (Br. 1914)	Mix 30 Gm. of kaladana, 60 Gm. of acid potassium tartrate, and 10 Gm. of ginger
Kino et Opii Compositus (N. F. IV)	Mix 75 Gm. of powdered kino, 5 Gm. of powdered opium, and 20 Gm. of Saigon cinnamon
Morphinæ Compositus (Tully's Powder) (U. S. P. VIII)	Mix 1.5 Gm. of morphine sulphate intimately with 33.5 Gm. of precipitated calcium carbonate, and add 32 Gm. of camphor, previously powdered. Triturate thoroughly, add 33 Gm. of powdered glycyrrhiza, and mix
Opii Compositus (Br. 1914)	Mix 30 Gm. of opium, 40 Gm. of black pepper, 100 Gm. of ginger, 120 Gm. of caraway fruit, and 10 Gm. of tragacanth, all in powder
Scammoniæ Compositus (Br. 1914)	Mix 50 Gm. of resin of scammony, 35 Gm. of jalap, 15 Gm. of ginger, all in powder
Tragacanthæ Compositus (Br. 1914)	Mix 15 Gm. of tragacanth, 20 Gm. of acacia, 20 Gm. of starch, and 45 Gm. of sugar, all in powder

Oleosaccharæ—*Oil Sugars*

This class of preparations for which the N. F. gives a general formula, is offered as a convenient mode for the administration of medicines to children. They are sometimes called *Elæosacchara*. *Saccharures* are preparations made by saturating sucrose with a tincture, drying, and then reducing the mixture to a fine powder.

OLEOSACCHARA. N.F. Oil Sugars

[Elæosacchara]

	Metric	Alternative
The Prescribed Volatile Oil	**2 cc.**	32 min.
Sucrose, in fine powder	**100 Gm.**	3 oz. av. 231 gr.

Triturate the sucrose with the volatile oil until a homogeneous mixture is obtained.

Triturationes—*Triturations*

Only the general formula for triturations is now recognized by the Pharmacopœia. Triturates, however, are frequently prepared by the pharmacist for use at the prescription counter. Such poisonous substances as strychnine sulphate, arsenic, mercury bichloride, atropine, etc., in 10 per cent dilution are much more accurately dispensed by using this plan, ten times the quantity prescribed being weighed. Manufacturing pharmacists are now preparing such triturates in tablet form for use at the prescription counter.

TRITURATIONES. U.S. Triturations

Unless otherwise directed, Triturations are to be prepared according to the following formula:

	Metric	Alternative
The Substance	**10 Gm.**	6 gr.
Lactose, in moderately fine powder	**90 Gm.**	54 gr.
To make	**100 Gm.**	60 gr.

Weigh the medicinal substance and the lactose separately; then place the substance previously reduced, if necessary, to a moderately fine powder, in a mortar. Add about an equal measure of lactose, mix well by means of a spatula, and triturate the powders thoroughly together. Then add fresh portions of the lactose, from time to time, until the whole is added, and continue the trituration after each addition until the substance is intimately mixed with the lactose and reduced to a fine powder.

Species—*Species*

This is a class of preparations, usually consisting of dried herbs, and intended for the making of medicinal teas or poultices. Similar teas, from home-grown herbs, are common household remedies. Three species are recognized in the National Formulary, as follows:

SPECIES EMOLLIENTES. N.F. Emollient Species

[Spec. Emoll.—Emollient Cataplasm]

	Metric	Alternative
Althea Leaves	**20 Gm.**	350 gr.
Mallow Leaves	**20 Gm.**	350 gr.
Melilot	**20 Gm.**	350 gr.
Matricaria	**20 Gm.**	350 gr.
Linseed	**20 Gm.**	350 gr.
To make	**100 Gm.**	4 oz. av.

Reduce the drugs to a coarse powder, and mix them uniformly.

Note—To prepare an *Emollient Poultice,* add a suitable quantity of hot water to this powder.

SPECIES LAXATIVÆ. N. F. Laxative Species

[**Spec. Lax.**—SPECIES LAXANTES, ST. GERMAIN TEA]

	Metric	Alternative
Senna, cut	40.0 Gm.	1 oz. av. 263 gr.
Sambucus	25.0 Gm.	1 oz. av.
Fennel, bruised	12.5 Gm.	219 gr.
Anise, bruised	12.5 Gm.	219 gr.
Potassium Bitartrate, in fine powder	10.0 Gm.	175 gr.
To make	100 Gm.	4 oz. av.

Moisten the senna with a small quantity of water; then sprinkle the potassium bitartrate over it as uniformly as possible. When the senna so treated has become dry, mix it lightly and uniformly with the other ingredients.

Uses—A laxative tea.

Average dose—20 grains (1.3 Gm.).

SPECIES PECTORALES. N. F. Pectoral Species

[**Spec. Pect.**—SPECIES AD INFUSUM PECTORALE, BREAST TEA]

	Metric	Alternative
Althea	40 Gm.	1 oz. av. 263 gr.
Coltsfoot	20 Gm.	350 gr.
Glycyrrhiza, peeled	15 Gm.	263 gr.
Anise	10 Gm.	175 gr.
Mullein Flowers	10 Gm.	175 gr.
Orris	5 Gm.	88 gr.
To make	100 Gm.	4 oz. av.

Cut, bruise, and intimately mix the ingredients.

Uses—Employed in the form of a tea for a catarrhal condition of the respiratory tract.

Average dose—1 drachm (4 Gm.).

Dentifricia—*Dentifrices*

Under this title many preparations are popularly sold for the cleansing of the teeth. They may take the form of powders, pastes, washes, or medicated soaps and are applied with a tooth brush. They are usually flavored with aromatic oils, frequently contain soap, and almost always some form of chalk. Typical formulas for a tooth powder and for a tooth wash (see page 339) are official in the N. F. Many unofficial formulas will be found in general formularies.

DENTIFRICIUM. N. F. Dentifrice

[**Dentif.**—TOOTH POWDER, OXIDIZING TOOTH POWDER]

	Metric	Alternative
Sodium Perborate	50.00 Gm.	1 oz. av. 334 gr.
Soap, in fine powder	50.00 Gm.	1 oz. av. 334 gr.
Sucrose, in fine powder	100.00 Gm.	3 oz. av. 231 gr.
Prepared Chalk	400.00 Gm.	14 oz. av. 48 gr.
Precipitated Calcium Carbonate	400.00 Gm.	14 oz. av. 48 gr.
Oil of Clove	0.50 cc.	8 min.
Oil of Cinnamon	1.75 cc.	28 min.
Menthol	1.75 Gm.	27 gr.
Methyl Salicylate	8.75 cc.	140 min.
Fluidextract of Baptisia	8.75 cc.	140 min.
To make about	1000 Gm.	35 oz. av. 120 gr.

Dissolve the menthol in the methyl salicylate, mix this solution with the oil of clove and oil of cinnamon, add this mixture and the fluidextract of baptisia to the sucrose, and

triturate until thoroughly mixed. Then add the soap and sodium perborate, mix well, and add the prepared chalk and precipitated calcium carbonate. Mix all together thoroughly.

Preserve the Powder in well-stoppered bottles or containers.

Other Flavors: Other flavors may be used in the preceding if preferred. The following combinations are suggested as suitable, but these may be varied as desired.

Flavor No. 1—	**Oil of Cinnamon**	**1.6 cc.**
	Oil of Clove	**0.4 cc.**
	Methyl Salicylate	**8.0 cc.**
Flavor No. 2—	**Oil of Spearmint**	**0.8 cc.**
	Menthol	**0.7 cc.**
	Methyl Salicylate	**8.0 cc.**
Flavor No. 3—	**Oil of Peppermint**	**2.0 cc.**
	Oil of Cinnamon	**1.6 cc.**
	Methyl Salicylate	**6.4 cc.**
Flavor No. 4—	**Oil of Cinnamon**	**2.0 cc.**
	Oil of Peppermint	**2.0 cc.**
	Oil of Clove	**4.0 cc.**

Massæ—*Masses*

Pill masses are official in the U. S. Pharmacopœia under the title of "Massa". As the official preparations are usually kept in bulk by pharmacists, and are permanent preparations, there is a manifest propriety in making a distinct class of them. Masses represent the preliminary treatment of materials for the making of pills, and their characteristics and method of manufacture are discussed under pills, Part XI. There are *two* official masses.

MASSA FERRI CARBONATIS. U. S. Mass of Ferrous Carbonate

[**Mass. Ferr. Carb.**—VALLET'S MASS]

Mass of Ferrous Carbonate contains not less than 35 per cent of $FeCO_3$ (115.85).

	Metric	Alternative
Ferrous Sulphate	**100 Gm.**	8 oz. av.
Monohydrated Sodium Carbonate	**46 Gm.**	3 oz. av. 298 gr.
Honey	**38 Gm.**	3 oz. av.
Sucrose, in coarse powder	**25 Gm.**	2 oz. av.
Syrup,		
Distilled Water, each, a sufficient quantity,		
To make	**100 Gm.**	8 oz. av.

Dissolve the ferrous sulphate and monohydrated sodium carbonate, each, separately, in 200 cc. [1 pint] of boiling distilled water, and, having added 20 cc. [1½ fl. oz.] of syrup to the solution of the iron salt, filter both solutions, and cool. Place the solution of sodium carbonate in a bottle having a capacity of about 500 cc. [3 pints] and gradually add the solution of the iron salt, rotating the bottle frequently, until carbon dioxide no longer escapes. Add sufficient distilled water to fill the bottle, stopper tightly, and set it aside so that the ferrous carbonate may subside. Pour off the supernatant liquid, and, having mixed syrup and distilled water in the proportion of 1 volume of syrup to 19 volumes of distilled water, wash the precipitate with the mixture by decantation until the washings no longer have a saline taste. Drain the precipitate on a muslin strainer, and express as much of the water as possible. Then mix the precipitate at once with the honey and sucrose in a tared dish, and by means of a water bath evaporate the mixture with constant stirring until it is reduced to 100 Gm. [8 oz. av.].

The tests, assay, and uses will be found on page 713.

MASSA HYDRARGYRI. U.S. Mass of Mercury

[Mass. Hydrarg.—Blue Mass, Blue Pill]

Mass of Mercury contains not less than 32 per cent and not more than 34 per cent of Hg (200.6).

	Metric	Alternative
Mercury	**33 Gm.**	5 oz. av. 122 gr.
Oleate of Mercury	**1 Gm.**	70 gr.
Glycyrrhiza, in very fine powder	**10 Gm.**	1 oz. av. 263 gr.
Althea, in very fine powder	**15 Gm.**	2 oz. av. 175 gr.
Glycerin	**9 Gm.**	1 oz. av. 193 gr.
Honey of Rose	**32 Gm.**	5 oz. av. 53 gr.
To make	**100 Gm.**	16 oz. av.

Triturate the oleate of mercury in a warm mortar, gradually add the mercury, then introduce a small amount of honey of rose, and triturate the mixture until globules of mercury are no longer visible under a lens magnifying ten diameters. Incorporate the remainder of the honey of rose and the glycerin, gradually add the glycyrrhiza and althea, and continue the trituration until the mass is homogeneous.

The tests, assay, and uses will be found on page 749.

MASSA COPAIBÆ. N.F. Mass of Copaiba

[Mass. Copaib.—Solidified Copaiba]

	Metric	Alternative
Copaiba	**94 Gm.**	3 oz. av. 332½ gr.
Magnesium Oxide	**6 Gm.**	105 gr.
To make about	**100 Gm.**	4 oz. av.

Triturate the magnesium oxide with a little water, in a dish until the powder is uniformly dampened throughout. Then gradually incorporate the copaiba with it so that a uniform mixture results, place the dish on a water bath and heat during half an hour, frequently stirring. Lastly, transfer the mixture to a suitable vessel, and set it aside until the mass has acquired a pilular consistence.

To prepare this mass a special Copaiba, high in resin content, is preferable. In ordering, specify that it is for "making the mass", if desired for this purpose.

Uses—Similar to copaiba; see page 997, dose, fifteen grains (1 Gm.).

Confectiones—*Confections*

Confections are saccharine, soft solids, in which one or more medicinal substances are incorporated with the object of providing an agreeable form for their administration, and a convenient method for their preservation. Under the old names of *conserves* and *electuaries*, these preparations have been in use for centuries. In the preparation of confections the basis is finely powdered sugar, and the medicinal ingredients must be brought to the condition of a smooth paste or introduced as a fine powder or liquid. Two confections are official in the N. F. Similar preparations, intended for administration by licking from a spoon or by sipping and swallowing slowly to form a protecting or remedial coating to the throat and bronchial region, are known as *linctuses* or *lohochs*.

CONFECTIO ROSÆ. N. F. Confection of Rose

[Confect. Ros.]

	Metric	Alternative
Rose, in fine powder	**80 Gm.**	2 oz. av. 245 gr.
Sucrose, in fine powder	**640 Gm.**	20 oz. av. 210 gr.
Honey	**120 Gm.**	3 oz. av. 367 gr.
Stronger Rose Water	**160 cc.**	5 fl. oz. 52 min.
To make about	**1000 Gm.**	32 oz. av.

Rub the rose with the stronger rose water, previously heated to 65° C., gradually add the sucrose and honey, and knead the mixture until a uniform mass is obtained.

Uses—An excipient for pills.

CONFECTIO SENNÆ. N. F. Confection of Senna

[Confect. Senn.]

	Metric	Alternative
Senna, in fine powder	**100 Gm.**	3 oz. av. 87½ gr.
Cassia Fistula, bruised	**160 Gm.**	5 oz. av. 52 gr.
Tamarind	**100 Gm.**	3 oz. av. 87½ gr.
Prune, sliced	**70 Gm.**	2 oz. av. 105 gr.
Fig, bruised	**120 Gm.**	3 oz. av. 368 gr.
Sucrose, in fine powder	**555 Gm.**	17 oz. av. 333 gr.
Oil of Coriander	**5 Gm.**	70 gr.
Water, a sufficient quantity,		
To make	**1000 Gm.**	32 oz. av.

Digest the cassia fistula, tamarind, prune and fig with 500 cc. [1 pint] of water in a covered vessel, on a water bath, for three hours. Rub the pulpy mass, first through a coarse sieve and then through a muslin cloth. Mix the residue with 150 cc. [4 fl. oz. 384 min.] of water, digest the mixture for a short time, then treat it as before, and add the strained product to the pulpy mass first obtained. Then, by means of a water bath, dissolve the sucrose in the mixture, and evaporate it, in a tared vessel, until it weighs 895 Gm. [29 oz. av. 384 gr.]. Lastly, add the senna and the oil of coriander, and incorporate them thoroughly with the other ingredients while they are yet warm.

History—This preparation was recognized in the first edition of the London Pharmacopœia in 1618, and at that time contained a number of additional ingredients. The formula has changed many times in the intervening centuries.

Uses—A laxative.

Average dose—60 grains (4 Gm.).

Unofficial Confections

Title	*Directions*
Confectio Guaiaci Composita (B. P. C.)	Mix 1 Gm. of guaiac resin, 2 Gm. of rhubarb powdered, 7.5 Gm. of acid potassium tartrate, 1 Gm. of powdered nutmeg, 14.5 Gm. of sublimed sulphur, and 74 Gm. of purified honey, and form a mass
Piperis, Br.	Mix 100 Gm. of black pepper, 150 Gm. of caraway fruit, and 750 Gm. of purified honey, and form into a mass
Sulphuris, Br.	Mix 450 Gm. of precipitated sulphur, 110 Gm. of acid potassium tartrate, 5 Gm. of tragacanth, 210 cc. of syrup, 55 cc. of tincture of orange and 170 cc. of glycerin, and form into a mass

Pilulæ—*Pills*

Pill making was one of the "arts" of the old-time pharmacist but, as an extemporaneous process at the prescription counter, it is today greatly reduced in importance. Pills manufactured on the large scale by machines and the modern compressed tablets have largely replaced freshly made pills as a form of medication. The general methods of manufacture and a discussion of pill making at the prescription counter will be found in Part XI. The formulas of the U. S. P. and N. F. are largely introduced for the purpose of establishing standards of strength for many well-known pills.

PILULÆ ALOES. U.S. Pills of Aloe

[Pil. Aloes]

	Metric	Alternative
Aloe, in fine powder	13 Gm.	201 gr.
Soap, in fine powder	13 Gm.	201 gr.
Water, a sufficient quantity,		
To make	100 Pills	100 Pills

Mix the powders intimately, then incorporate sufficient water to form a mass, and divide it into 100 pills.

Average dose—2 pills.

PILULÆ ASAFŒTIDÆ. U.S. Pills of Asafetida

[Pil. Asafœt.]

	Metric	Alternative
Asafetida	20 Gm.	309 gr.
Soap, in fine powder	6 Gm.	93 gr.
Water, a sufficient quantity,		
To make	100 Pills	100 Pills

Intimately incorporate the solids, using sufficient water to form a mass, and divide it into 100 pills.

Average dose—2 pills.

PILULÆ FERRI CARBONATIS. U.S. Pills of Ferrous Carbonate

[Pil. Ferr. Carb.—Chalybeate Pills, Blaud's Pills, Ferruginous Pills]

Each Pill contains not less than 0.06 Gm. of $FeCO_3$.

	Metric	Alternative
Granulated Ferrous Sulphate	16 Gm.	247 gr.
Potassium Carbonate	8 Gm.	124 gr.
Sucrose	4 Gm.	62 gr.
Tragacanth, in fine powder	1 Gm.	15 gr.
Althea, in fine powder	1 Gm.	15 gr.
Glycerin,		
Water, each, a sufficient quantity,		
To make	100 Pills	100 Pills

Triturate the potassium carbonate in a mortar with a sufficient quantity (about 5 drops each) of glycerin and water, then add the ferrous sulphate and sucrose, previously triturated together to a uniform, fine powder, and mix the mass thoroughly until it assumes a greenish color. When the reaction is complete, incorporate the tragacanth and althea, and add more water, if necessary, to obtain a mass of pilular consistence. Divide into 100 pills.

Assay—Dissolve three Pills in 15 cc. of diluted sulphuric acid and dilute the solution with distilled water to about 100 cc. Immediately titrate with tenth-normal potassium dichromate, potassium ferricyanide T.S. being used as indicator. Each cc. of tenth-normal potassium dichromate corresponds to 0.01159 Gm. of $FeCO_3$.

This assay is explained on page 1472.

Preserve in tightly-closed containers.

History—These pills were introduced in 1831 by Dr. J. Blaud, a French practitioner of medicine, as a remedy for chlorosis. Various excipients have been used in order to increase the stability of these pills which should not be dispensed if they are reddish brown in color within. When properly made and protected they are very stable.

Average dose—2 pills.

PILULÆ HYDRARGYRI CHLORIDI MITIS COMPOSITÆ. U.S. Compound Pills of Mild Mercurous Chloride

[Pil. Hydrarg. Chlor. Mit. Co.—Pilulæ Catharticæ Compositæ U.S.P. IX, Compound Cathartic Pills, Compound Pills of Calomel]

	Metric	Alternative
Compound Extract of Colocynth	80 Gm.	2 oz. av. 230 gr.
Mild Mercurous Chloride	60 Gm.	2 oz. av. 51 gr.
Resin of Jalap, in fine powder	20 Gm.	309 gr.
Gamboge, in fine powder	15 Gm.	231 gr.
Diluted Alcohol, a sufficient quantity,		
To make	1000 Pills	1000 Pills

Mix the powders intimately, then incorporate a sufficient quantity of diluted alcohol to form a mass, and divide it into 1000 pills.

Average dose—2 pills.

PILULÆ PHOSPHORI. U.S. Pills of Phosphorus

[Pil. Phosphor.]

	Metric	Alternative
Phosphorus	0.06 Gm.	1 gr.
Althea, in fine powder	6.00 Gm.	93 gr.
Acacia, in fine powder	3.00 Gm.	46 gr.
Chloroform,		
Glycerin,		
Water,		
Tolu,		
Ether, each, a sufficient quantity,		
To make	100 Pills	100 Pills

Dissolve the phosphorus in a test tube in 5 cc. [81 min.] of chloroform, with the aid of a very gentle heat, replacing from time to time any of the chloroform which may be lost by evaporation. Mix the althea and acacia in a mortar, next add the solution of phosphorus, then immediately afterwards a sufficient quantity (about 4 cc. [65 min.]) of a mixture of 2 volumes of glycerin and 1 volume of water, and quickly form a mass. Divide it into 100 pills.

Dissolve 10 Gm. [154 gr.] of tolu in 15 cc. [243 min.] of ether, shake the pills with a sufficient quantity of this solution until they are uniformly coated and put them on a plate to dry, occasionally rolling them about until the drying is completed.

Preserve in a well-stoppered bottle.

Average dose—1 pill.

PILULÆ ALOES ET ASAFŒTIDÆ. N.F. Pills of Aloe and Asafetida

[Pil. Aloe. et Asafœt.]

	Metric	Alternative
Aloe, in fine powder	9 Gm.	139 gr.
Asafetida	9 Gm.	139 gr.
Soap	9 Gm.	139 gr.
Water, a sufficient quantity,		
To make	100 Pills	100 Pills

Mix the ingredients intimately, form a mass and divide it into 100 pills.

Average dose—1 pill.

PILULÆ ALOES ET FERRI. N. F. Pills of Aloe and Iron

[Pil. Aloe. et Ferr.]

	Metric	Alternative
Aloe, in fine powder	7 Gm.	108 gr.
Exsiccated Ferrous Sulphate	7 Gm.	108 gr.
Aromatic Powder	7 Gm.	108 gr.
Confection of Rose, a sufficient quantity,		
To make	**100 Pills**	100 Pills

Mix the powders intimately, then incorporate sufficient confection of rose to form a mass and divide it into 100 pills.

History—These pills are in close resemblance in composition to the celebrated Hooper's Pills which attained fame as a patent medicine more than a century ago.

Average dose—2 pills.

PILULÆ ALOES ET MASTICHES. N. F. Pills of Aloe and Mastic

[Pil. Aloe. et Mastich.—Lady Webster Dinner Pill]

	Metric	Alternative
Aloe, in fine powder	13 Gm.	201 gr.
Mastic, in fine powder	4 Gm.	62 gr.
Rose, in fine powder	3 Gm.	46 gr.
Diluted Alcohol, a sufficient quantity,		
To make	**100 Pills**	100 Pills

Mix the powders intimately, then incorporate sufficient diluted alcohol to form a mass, and divide it into 100 pills.

History—Lady Webster's Dinner Pills were first official in the 1758 edition of the Paris Pharmacopœia, under the name *Pilulæ Stomachicæ* or *Pilulæ ante cibum.*

Average dose—2 pills.

PILULÆ ALOES ET MYRRHÆ. N. F. Pills of Aloe and Myrrh

[Pil. Aloe. et Myrrh.]

	Metric	Alternative
Aloe, in fine powder	13 Gm.	201 gr.
Myrrh, in fine powder	6 Gm.	93 gr.
Aromatic Powder	4 Gm.	62 gr.
Syrup, a sufficient quantity,		
To make	**100 Pills**	100 Pills

Mix the powders intimately, then incorporate sufficient syrup to form a mass and divide it into 100 pills.

History—These were originally known as *Pilulæ Rufi,* a pilular form of a Hiera invented by Rufus of Ephesus who lived in the second century A. D. Avicenna, an Arabian physician and pharmacist of the eleventh century, called them *Pilulæ Pestilentiales,* and in the early Edinburgh Pharmacopœias they were called *Pilulæ Communes.*

Average dose—2 pills.

PILULÆ ALOES ET PODOPHYLLI COMPOSITÆ. N. F. Compound Pills of Aloe and Podophyllum

[Pil. Aloe. et Podoph. Co.—Janeway's Pills]

	Metric	Alternative
Aloe	6.50 Gm.	100 gr.
Resin of Podophyllum	3.25 Gm.	50 gr.
Pilular Extract of Belladonna	1.60 Gm.	24½ gr.
Extract of Nux Vomica	1.60 Gm.	24½ gr.
To make	**100 Pills**	100 Pills

Uniformly mix the several ingredients, form a mass and divide it into 100 pills.

Average dose—1 pill.

PILULÆ ALOES, HYDRARGYRI ET PODOPHYLLI. N. F. Pills of Aloe, Mercury and Podophyllum

[Pil. Aloe. Hydrarg. et Podoph.—Pilulæ Triplices, Triplex Pills, Pilula Triplex]

	Metric	Alternative
Aloe	13.0 Gm.	201 gr.
Mass of Mercury	6.5 Gm.	100 gr.
Resin of Podophyllum	1.6 Gm.	24½ gr.
To make	100 Pills	100 Pills

Uniformly mix the several ingredients, form a mass and divide it into 100 pills.

Average dose—1 pill.

PILULÆ ALOINI COMPOSITÆ. N. F. Compound Pills of Aloin

[Pil. Aloin. Co.]

	Metric	Alternative
Aloin	3.25 Gm.	50 gr.
Resin of Podophyllum	0.80 Gm.	12 gr.
Pilular Extract of Belladonna	1.60 Gm.	24½ gr.
To make	100 Pills	100 Pills

Uniformly mix the several ingredients, form a mass and divide it into 100 pills.

Average dose—1 pill.

PILULÆ ALOINI, STRYCHNINÆ ET BELLADONNÆ. N. F. Pills of Aloin, Strychnine and Belladonna

[Pil. A. S. et B.]

	Metric	Alternative
Aloin	1.30 Gm.	20 gr.
Strychnine	0.05 Gm.	¾ gr.
Pilular Extract of Belladonna	0.80 Gm.	12 gr.
To make	100 Pills	100 Pills

Uniformly mix the several ingredients, form a mass and divide it into 100 pills.

Average dose—1 pill.
One pill contains about:
0.0005 Gm. or $\frac{1}{125}$ grain of Strychnine.

PILULÆ ALOINI, STRYCHNINÆ ET BELLADONNÆ COMPOSITÆ. N. F. Compound Pills of Aloin, Strychnine and Belladonna

[Pil. A. S. et B. Co.]

	Metric	Alternative
Aloin	1.30 Gm.	20 gr.
Strychnine	0.05 Gm.	¾ gr.
Pilular Extract of Belladonna	0.80 Gm.	12 gr.
Extract of Cascara Sagrada	3.25 Gm.	50 gr.
To make	100 Pills	100 Pills

Uniformly mix the several ingredients, form a mass and divide it into 100 pills.

Average dose—1 pill.
One pill contains about:
0.0005 Gm. or $\frac{1}{125}$ grain of Strychnine.

PILULÆ ANTIPERIODICÆ. N. F. Antiperiodic Pills

[Pil. Antiperiod.—Warburg's Pills]

	Metric	Alternative
Aloe, in fine powder	13.0 Gm.	201 gr.
Rhubarb, in fine powder	3.2 Gm.	49 gr.
Angelica Fruit, in fine powder	3.2 Gm.	49 gr.
Inula, in fine powder	1.6 Gm.	24½ gr.
Saffron, in fine powder	1.6 Gm.	24½ gr.
Fennel, in fine powder	1.6 Gm.	24½ gr.
Zedoary, in fine powder	0.8 Gm.	12¼ gr.
Cubeb, in fine powder	0.8 Gm.	12¼ gr.
Myrrh, in fine powder	0.8 Gm.	12¼ gr.
Agaric, in fine powder	0.8 Gm.	12¼ gr.
Camphor, in fine powder	0.8 Gm.	12¼ gr.
Quinine Sulphate	9.0 Gm.	139 gr.
Extract of Gentian, a sufficient quantity,		
To make	100 Pills	100 Pills

Mix the powders and quinine sulphate uniformly, make into a mass with the extract of gentian and divide it into 100 pills.

Average dose—1 pill.

PILULÆ ANTIPERIODICÆ SINE ALOE. N. F. Antiperiodic Pills without Aloe

[Pil. Antiperiod. s. Aloe—Warburg's Pills without Aloe]

Prepare the Pills as directed under Pilulæ Antiperiodicæ, omitting the Aloe.

Average dose—1 pill.

PILULÆ CATHARTICÆ VEGETABILES. N. F. Vegetable Cathartic Pills

[Pil. Cathart. Veget.]

	Metric	Alternative
Compound Extract of Colocynth	6.0 Gm.	93 gr.
Extract of Hyoscyamus	3.0 Gm.	46 gr.
Resin of Jalap, in fine powder	2.0 Gm.	31 gr.
Extract of Leptandra	1.5 Gm.	23 gr.
Resin of Podophyllum	1.5 Gm.	23 gr.
Oil of Peppermint	0.8 cc.	13 min.
Diluted Alcohol, a sufficient quantity,		
To make	100 Pills	100 Pills

Mix the compound extract of colocynth intimately with the resin of podophyllum, resin of jalap and extract of leptandra, and then add the oil of peppermint and the extract of hyoscyamus, form a mass with sufficient diluted alcohol and divide into 100 pills.

Average dose—2 pills.

PILULÆ DIGITALIS, SCILLÆ ET HYDRARGYRI. N. F. Pills of Digitalis, Squill and Mercury

[Pil. Digit. Scill. et Hydrarg.—Niemeyer Pills for Dropsy, Guy's Pills]

	Metric	Alternative
Digitalis, in fine powder	6.5 Gm.	100 gr.
Squill, in fine powder	6.5 Gm.	100 gr.
Mass of Mercury	6.5 Gm.	100 gr.
Honey, a sufficient quantity,		
To make	100 Pills	100 Pills

Uniformly mix the solid ingredients, form a mass with the aid of the honey and divide it into 100 pills.

Average dose—1 pill.

PILULÆ FERRI IODIDI. N.F. Pills of Ferrous Iodide

(U.S.P. IX)

[Pil. Ferr. Iod.]

	Metric	Alternative
Reduced Iron	4 Gm.	62 gr.
Iodine	5 Gm.	77 gr.
Glycyrrhiza, in fine powder	4 Gm.	62 gr.
Sucrose, in fine powder	4 Gm.	62 gr.
Extract of Glycyrrhiza, in fine powder	1 Gm.	15 gr.
Acacia, in fine powder	1 Gm.	15 gr.
Water,		
Tolu,		
Ether, each, a sufficient quantity,		
To make	100 Pills	100 Pills

Add 6 cc. [97 min.] of water to the reduced iron, contained in a small mortar, and then gradually add the iodine, stirring constantly until the liquid ceases to have a reddish tint. Then add the remaining powders, previously well triturated together, and mix the whole thoroughly. Transfer the mass to a porcelain dish, evaporate the excess of moisture on a water bath, with constant stirring, and when the mass has acquired a pilular consistence, divide it into 100 pills.

Dissolve 10 Gm. [150 gr.] of tolu in 15 cc. [½ fl. oz.] of ether, and proceed as directed under Tolu coating (Part XI).

Preserve the pills in a well-stoppered bottle.

Triturate a few of the pills with water, and filter the liquid; the filtrate does not assume more than a light blue tint upon the addition of starch T.S. (absence of more than traces of *free iodine*).

Pills of Ferrous Iodide are free from odor of iodine.

Average dose—2 pills.

PILULÆ FERRI, QUININÆ, ALOES ET NUCIS VOMICÆ. N.F. Pills of Iron, Quinine, Aloe and Nux Vomica

[Pil. Ferr. Quin. Aloe. et Nuc. Vom.—PILULÆ QUADRUPLICES, QUADRUPLEX PILLS, PILULÆ FERRI ET QUININÆ COMPOSITÆ]

	Metric	Alternative
Exsiccated Ferrous Sulphate	6.5 Gm.	100 gr.
Quinine Sulphate	6.5 Gm.	100 gr.
Aloe	6.5 Gm.	100 gr.
Extract of Nux Vomica	1.6 Gm.	24½ gr.
Extract of Gentian, a sufficient quantity,		
To make	100 Pills	1000 Pills

Mix the extract of nux vomica with the aloe, thoroughly incorporate the ferrous sulphate and quinine sulphate, then form a mass with the extract of gentian and divide it into 100 pills.

Average dose—1 pill.

PILULÆ FERRI, QUININÆ, STRYCHNINÆ ET ARSENI FORTIORES. N.F. Stronger Pills of Iron, Quinine, Strychnine and Arsenic

[Pil. Fer. Quin. Strych. et Arsen. Fort.—PILULÆ METALLORUM, METALLIC PILLS, PILULÆ METALLORUM AMARÆ, BITTER METALLIC PILLS]

	Metric	Alternative
Reduced Iron	6.50 Gm.	100 gr.
Quinine Sulphate	6.50 Gm.	100 gr.
Strychnine	0.32 Gm.	4 9/10 gr.
Arsenic Trioxide	0.32 Gm.	4 9/10 gr.
Honey, a sufficient quantity,		
To make	100 Pills	100 Pills

Mix the ingredients intimately, form a mass and divide it into 100 pills.

Average dose—1 pill.

One pill contains about:

0.0032 Gm. or 1/20 grain of Strychnine.

0.0032 Gm. or 1/20 grain of Arsenic Trioxide.

PILULÆ FERRI, QUININÆ, STRYCHNINÆ ET ARSENI MITES. N.F. Mild Pills of Iron, Quinine, Strychnine and Arsenic

[Pil. Ferr. Quin. Strych. et Arsen. Mit.—AITKEN TONIC PILLS]

	Metric	Alternative
Reduced Iron	4.50 Gm.	69½ gr.
Quinine Sulphate	6.50 Gm.	100 gr.
Strychnine	0.13 Gm.	2 gr.
Arsenic Trioxide	0.13 Gm.	2 gr.
Honey, a sufficient quantity, To make	100 Pills	100 Pills

Mix the ingredients intimately, form a mass and divide it into 100 pills.

Average dose—1 pill.

One pill contains about:

0.0013 Gm. or 1/50 grain of Strychnine.

0.0013 Gm. or 1/50 grain of Arsenic Trioxide.

PILULÆ LAXATIVÆ COMPOSITÆ. N.F. Compound Laxative Pills

[Pil. Lax. Co.]

	Metric	Alternative
Aloin	1.30 Gm.	20 gr.
Strychnine	0.05 Gm.	¾ gr.
Pilular Extract of Belladonna	0.80 Gm.	12 gr.
Ipecac, in fine powder	0.40 Gm.	6 gr
Glycyrrhiza, in fine powder	4.60 Gm.	71 gr.
Syrup, a sufficient quantity, To make	100 Pills	100 Pills

Triturate the aloin, strychnine, ipecac, and glycyrrhiza together thoroughly, so as to produce a uniform powder. Incorporate with this the extract of belladonna leaves and sufficient syrup to form a mass and divide it into 100 pills.

Average dose—2 pills.

One pill contains about:

0.0005 Gm. or 1/125 grain of Strychnine.

PILULÆ OPII, DIGITALIS ET QUININÆ. N.F. Pills of Opium, Digitalis and Quinine

[Pil. Opii, Digit. et Quin.—NIEMEYER'S PILLS FOR PHTHISIS]

	Metric	Alternative
Powdered Opium	1.0 Gm.	15 gr.
Digitalis, in fine powder	6.5 Gm.	100 gr.
Quinine Sulphate	6.5 Gm.	100 gr.
Honey, a sufficient quantity, To make	100 Pills	100 Pills

Mix the ingredients intimately, form a mass and divide it into 100 pills.

Average dose—1 pill.

One pill contains about:

0.010 Gm. or ⅙ grain of Powdered Opium.

PILULÆ OPII ET CAMPHORÆ. N.F. Pills of Opium and Camphor

[Pil. Opii et Camph.]

	Metric	Alternative
Powdered Opium	6.5 Gm.	100 gr.
Camphor	13.0 Gm.	200 gr.
Honey, a sufficient quantity, To make	100 Pills	100 Pills

Mix the ingredients intimately, form a mass and divide it into 100 pills.

Average dose—1 pill.

One pill contains about:

0.065 Gm. or 1 grain of Powdered Opium.

PILULÆ OPII ET PLUMBI. N. F. Pills of Opium and Lead

[Pil. Opii et Plumb.]

	Metric	Alternative
Powdered Opium	6.5 Gm.	100 gr.
Lead Acetate	6.5 Gm.	100 gr.
Honey, a sufficient quantity,		
To make	100 Pills	100 Pills

Mix the ingredients intimately, form a mass and divide it into 100 pills.

Average dose—1 pill.

One pill contains about: 0.065 Gm. or 1 grain of Powdered Opium.

PILULÆ RHEI. N. F. Pills of Rhubarb

[Pil. Rhei.]

	Metric	Alternative
Rhubarb, in very fine powder	20 Gm.	309 gr.
Soap, in fine powder	6 Gm.	93 gr.
Water, a sufficient quantity,		
To make	100 Pills	100 Pills

Form a mass and divide it into 100 pills. *Average dose*—1 pill.

PILULÆ RHEI COMPOSITÆ. N. F. Compound Pills of Rhubarb

(U. S. P. IX)

[Pil. Rhei Co.]

	Metric	Alternative
Rhubarb, in fine powder	13.0 Gm.	200 gr.
Aloe, in fine powder	10.0 Gm.	154 gr.
Myrrh, in fine powder	6.0 Gm.	93 gr.
Oil of Peppermint	0.5 cc.	8 min.
Water, a sufficient quantity,		
To make	100 Pills	100 Pills

Mix the oil of peppermint intimately with the powders, then incorporate sufficient water to form a mass; divide it into 100 pills. *Average dose*—2 pills.

Some Unofficial Pills

Pilulæ Ad Prandium (N. F. IV) (Chapman's Dinner Pills)	Prepare a mass from 9.7 Gm. aloe, 9.7 Gm. mastic, 6.5 Gm. ipecac, and 1.5 cc. of fennel; divide into 100 pills
Ad Prandium (Coles's Dinner Pills)	Prepare a mass from 7.8 Gm. aloe, 7.8 Gm. mass of mercury, 7.8 Gm. jalap and 0.13 Gm. antimony and potassium tartrate; divide into 100 pills
Ad Prandium (Hall's Dinner Pills)	Prepare a mass from 6.5 Gm. aloe, 6.5 Gm. extract of glycyrrhiza, and 6.5 Gm. soap; divide into 100 pills
Aloes, Hydrargyri et Scammonii Compositæ (N. F. IV)	Prepare a mass, with the aid of tincture of aloe and myrrh, from 5.5 Gm. aloe, 5.5 Gm. resin of scammony, 5.5 Gm. mass of mercury, 0.32 Gm. croton oil, and 1.6 cc. oil of caraway; divide into 100 pills
Antidyspepticæ (N. F. IV)	Prepare a mass from 0.16 Gm. strychnine, 0.65 Gm. ipecac, 0.65 Gm. extract of belladonna leaves, 13 Gm. mass of mercury, and 13 Gm. compound extract of colocynth; divide into 100 pills
Antimonii Compositæ (N. F. IV)	Prepare a mass, with the aid of castor oil from 4 Gm. of sulphurated antimony, 4 Gm. mild mercurous chloride, and 8 Gm. guaiac; divide into 100 pills
Colocynthidis Compositæ (N. F. IV)	Prepare a mass with the aid of diluted alcohol, from 1.1 Gm. extract of colocynth, 13 Gm. aloe, 13 Gm. resin of scammony, and 1.5 cc. oil of clove; divide into 100 pills
Colocynthidis et Hyoscyami (N. F. IV)	Prepare a mass from 0.65 Gm. extract of colocynth, 9.7 Gm. aloe, 9.7 Gm. resin of scammony, 9.7 Gm. extract of hyoscyamus, and 1 cc. oil of clove; divide into 100 pills
Colocynthidis et Podophylli (N. F. IV)	Prepare a mass from 16.2 Gm. compound extract of colocynth, and 1.6 Gm. resin of podophyllum; divide into 100 pills
Glycerylis Nitratis (N. F. IV)	Mix 6.5 Gm. spirit of glyceryl trinitrate with 6.5 Gm. althea, expose to the air to evaporate the alcohol, mass with confection of rose and divide into 100 pills
Pilulæ Ipecacuanhæ cum Scillæ (Br. 1914)	Prepare a mass from 30 Gm. compound powder of ipecac, 10 Gm. squill, 10 Gm. ammoniac, with the aid of syrup of glucose Dose: 4 to 8 grains (0.25 to 0.50 Gm.)
Ipecacuanhæ cum Urgineæ (Br. 1914)	Prepare a mass from 30 Gm. compound powder of ipecac, 10 Gm. urginea and 10 Gm. ammoniac, with the aid of syrup of glucose Dose: 4 to 8 grains (0.25 to 0.50 Gm.)
Laxativæ Post Partum (N. F. IV)	Prepare a mass from 11 Gm. compound extract of colocynth, 5.5 Gm. aloe, 2.5 Gm. extract of nux vomica, 0.5 Gm. resin of podophyllum, 0.5 Gm. ipecac, and 8 Gm. extract of hyoscyamus; divide into 100 pills
Quininæ Sulphatis (Br. 1914)	Prepare a mass from 82 Gm. of quinine sulphate, 3 Gm. of tartaric acid, 12 Gm. glycerin, and 3 Gm. tragacanth Dose: 2 to 8 grains (0.125 to 0.50 Gm.)

Some Unofficial Pills—*Continued*

Saponis Compositæ (Br. 1914)	Prepare a mass from 20 Gm. opium, 60 Gm. hard soap, and 20 Gm. syrup of glucose Dose: 2 to 4 grains (0.125 to 0.25 Gm.)
Scillæ Compositæ (Br. 1914)	Prepare a mass from 20 Gm. each of ginger and ammoniac, 15 Gm. hard soap, and 20 Gm. syrup of glucose Dose: 4 to 8 grains (0.25 to 0.50 Gm.)
Urgineæ Compositæ (Br. 1914)	Prepare a mass from 25 Gm. urginea, 20 Gm. ginger, 15 Gm. hard soap, and 20 Gm. syrup of glucose Dose: 4 to 8 grains (0.25 to 0.50 Gm.)

Trochisci—*Troches*

Troches or *lozenges* are forms of medication suitable for dissolving in the mouth, usually for the medication of the throat and bronchial area. Their manufacture and extemporaneous preparation are discussed in Part XI. Formulas are given here.

TROCHISCI ACIDI TANNICI. U.S. Troches of Tannic Acid
[Troch. Acid. Tann.]

	Metric	Alternative
Tannic Acid	6 Gm.	93 gr.
Sucrose, in fine powder	65 Gm.	2 oz. av. 128 gr.
Tragacanth, in fine powder	2 Gm.	31 gr.
Orange Flower Water, a sufficient quantity, To make	100 Troches	100 Troches

Triturate the powders until they are thoroughly mixed, form a mass with orange flower water, and divide it into 100 troches.

TROCHISCI AMMONII CHLORIDI. U.S. Troches of Ammonium Chloride
[Troch. Ammon. Chlor.]

	Metric	Alternative
Ammonium Chloride, in fine powder	10 Gm.	154 gr.
Extract of Glycyrrhiza, in fine powder	20 Gm.	309 gr.
Tragacanth, in fine powder	2 Gm.	31 gr.
Sucrose, in fine powder	40 Gm.	1 oz. av. 180 gr.
Syrup of Tolu, a sufficient quantity, To make	100 Troches	100 Troches

Triturate the powders until they are thoroughly mixed; form a mass with syrup of tolu, and divide it into 100 troches.

TROCHISCI EUCALYPTI GUMMI. N.F. Troches of Eucalyptus Gum
[Troch. Eucalypt. Gum.—Troches of Red Gum]

	Metric	Alternative
Eucalyptus Gum, in fine powder	6.0 Gm.	93 gr.
Tragacanth, in fine powder	6.0 Gm.	93 gr.
Acacia, in fine powder	12.0 Gm.	185 gr.
Sucrose, in fine powder	40.0 Gm.	1 oz. av. 180 gr.
Oil of Orange	0.3 cc.	5 min.
Fluidextract of Rose	3.0 cc.	49 min.
Water, a sufficient quantity, To make	100 Troches	100 Troches

Triturate the powders together until well mixed, then incorporate the oil and fluidextract and form a mass with water. Divide this into 100 troches and dry them in a current of warm air.

TROCHISCI ULMI. N.F. Troches of Elm
[Troch. Ulmi]

	Metric	Alternative
Elm, in very fine powder	20.0 Gm.	309 gr.
Tragacanth, in fine powder	1.0 Gm.	15 gr.
Sucrose, in fine powder	79.0 Gm.	2 oz. av. 344 gr.
Methyl Salicylate	0.2 cc.	3 min.
Water, a sufficient quantity, To make	100 Troches	100 Troches

Triturate the powders together until uniformly mixed, then incorporate the methyl salicylate and form a mass with water. Divide this into 100 troches and dry them in a current of warm air. *Average dose*—1 troche.

Some Unofficial Troches

Trochisci Acidi Benzoici (Br. 1914)	Mix 0.03 Gm. benzoic acid with fruit basis[4] to form a lozenge
Acidi Carbolici (Br. 1914)	Mix 15 Gm. phenol, 500 Gm. sugar, 45 Gm. acacia, 15 Gm. tragacanth, and 45 cc. lemon juice; make into 500 troches and dry
Antacidi (B. P. C.)	Mix 22.68 Gm. precipitated calcium carbonate, 16.2 Gm. magnesium carbonate, 6.48 Gm. sodium chloride, with simple basis[1] to form a mass; divide into 100 troches
Bismuthi Compositi (Br. 1914)	Mix 0.15 Gm. each of bismuth oxycarbonate and heavy magnesium carbonate, and 0.30 Gm. of precipitated calcium carbonate with rose basis[3] to form a troche
Carbonis Ligni (N. F. IV)	Prepare a mass from 30 Gm. wood charcoal, 4 Gm. tragacanth, 66 Gm. powdered sugar, 0.3 Gm. vanillin, and divide into 100 troches
Catechu (Br. 1914)	Mix 0.06 Gm. catechu with fruit basis[4] to form a troche
Cubebæ (U. S. P. IX)	Prepare a mass with the aid of syrup of tolu from 25 Gm. extract of glycyrrhiza, and 12 Gm. of acacia with which 2 Gm. of oleoresin of cubeb and 1 cc. of oil of sassafras have been thoroughly incorporated; divide it into 100 troches
Ferri Redacti (Br. 1914)	Mix 0.06 Gm. reduced iron with simple basis[1] to form a troche
Gambir (N. F. IV)	Prepare a mass from 6 Gm. gambir, 91 Gm. sugar, 0.3 Gm. tragacanth, and 0.2 cc. oil of cinnamon; divide it into 100 troches
Guaiaci Resinæ (Br. 1914)	Mix 0.2 Gm. guaiacum resin with fruit basis[4] to form a troche
Kino Eucalypti (Br. 1914)	Mix 0.06 Gm. of eucalyptus kino with fruit basis[4] to form a troche
Krameriæ (Br. 1914)	Mix 0.06 Gm. of extract of krameria with fruit basis[4] to form a troche
Krameriæ et Cocainæ (Br. 1914)	Mix 0.06 Gm. of extract of krameria and 0.003 Gm. of cocaine hydrochloride with fruit basis[4] to form a troche
Menthæ Piperitæ (N. F. IV)	Prepare a mass with the aid of mucilage of tragacanth from 1 cc. of oil of peppermint and 100 Gm. of sugar; divide it into 100 troches
Mentholis Compositi (B. P. C.)	Mix 4.86 Gm. potassium chlorate, 1.62 Gm. menthol, and 0.16 Gm. benzamine (betaeucaine) hydrochloride with fruit basis[4]; divide into 100 troches
Morphinæ (Br. 1914)	Mix 0.002 Gm. morphine hydrochloride with tolu basis[2] to form a troche
Morphinæ et Ipecacuanhæ (Br. 1914)	Mix 0.002 Gm. morphine hydrochloride and 0.006 Gm. ipecac, with tolu basis[2] to form a troche
Phenolphthaleini (N. F. IV)	Prepare a mass from 6 Gm. phenolphthalein, 10 Gm. acacia, 84 Gm. sugar, 0.3 Gm. vanillin, and 0.1 Gm. carmine; divide it into 100 troches
Potassii Chloratis (U. S. P. IX)	Prepare a mass from 15 Gm. of potassium chlorate, 60 Gm. sugar, and 3 Gm. of tragacanth; divide it into 100 troches
Santonini (N. F. IV)	Prepare a mass from 3 Gm. of santonin, 54 Gm. sugar, 40 Gm. cocoa, 0.1 Gm. vanillin, and 3 Gm. tragancath; divide into 100 troches
Trochisci Santonini Compositi (N. F. IV)	Prepare a mass from 3 Gm. santonin, 3 Gm. mild mercurous chloride, 3 Gm. tragacanth, 51 Gm. sugar, 40 Gm. cocoa, and 0.1 Gm. vanillin; divide into 100 troches
Sodii Bicarbonatis (U. S. P. IX)	Prepare a mass with the aid of mucilage of tragacanth, from 18 Gm. sodium bicarbonate, 54 Gm. sugar, and 1 Gm. myristica; divide it into 100 troches
Sulphuris (Br. 1914)	Mix 150 Gm. precipitated sulphur, 30 Gm. acid potassium tartrate; 275 Gm. of sugar, and 30 Gm. of acacia. Thoroughly incorporate 30 cc. of tincture of orange and form a mass with the aid of mucilage of acacia and divide it into 500 troches
Sulphuris et Potassii Bitartratis (N. F. IV)	Prepare a mass from 30 Gm. washed sulphur, 6 Gm. of potassium bitartrate, 4 Gm. of tragacanth, 60 Gm. sugar, and 0.5 cc. oil of orange; divide into 100 troches

Tabellæ—*Tablets*

Tablets are small, disk-shaped forms of medication, either molded or compressed in a special machine. Their manufacture is discussed in Part XI. The following formulas are official in the U. S. P. and N. F.:

---

1. *Preparation of Lozenges with Simple Basis*—(Br. 1914)—Mix 500 times the quantity of drug ordered for one lozenge with 496 Gm. of powdered sugar and 19.5 Gm. of powdered gum acacia. Form a mass with the aid of 35 cc. of mucilage of acacia and sufficient distilled water, and divide it into 500 lozenges. Dry.

2. *Preparation of Lozenges with Tolu Basis*—(Br. 1914)—Take 500 times the quantity of drug ordered for one lozenge, dissolve alkaloids, if present, in 10 cc. of water, mixing the solution thoroughly with 482 Gm. of powdered sugar and 19.5 Gm. of powdered gum acacia, then incorporate any other ingredients ordered and 10 cc. of tincture of balsam of tolu, form into a mass with 35.5 cc. of mucilage of acacia and sufficient distilled water, and divide it into 500 lozenges. Dry them.

3. *Preparation of Lozenges with Rose Basis*—(Br. 1914)—Mix 500 times the quantity of drug ordered for one lozenge with 496 Gm. of powdered sugar and 19.5 Gm. of powdered gum acacia, form into a mass with the aid of 35 cc. of mucilage of acacia and 0.025 cc. of oil of rose, and divide into 500 lozenges. Dry.

4. *Preparation of Lozenges with Fruit Basis*—(Br. 1914)—Mix 500 times the quantity of drug ordered for one lozenge with 26 Gm. of powdered sugar and 6.5 Gm. of tragacanth, form into a mass with the aid of sufficient black-currant paste of commerce, to make 650 Gm., and divide into 500 lozenges. Dry them.

TOXITABELLÆ HYDRARGYRI CHLORIDI CORROSIVI U. S. Poison Tablets of Corrosive Mercuric Chloride

[Toxitabel. Hydrarg. Chlor. Corr.—Corrosive Sublimate Tablets, Bichloride Tablets]

Tablets of an angular shape, not discoid, each having the word "POISON" and the skull and cross bones design distinctly stamped upon it. Each tablet weighs about 1 Gm. and contains not less than 0.45 Gm. and not more than 0.55 Gm. of corrosive mercuric chloride ($HgCl_2$), the remainder consisting chiefly of either sodium chloride [NaCl] or ammonium chloride [NH_4Cl]. The tablets are to be colored blue, preferably with sodium indigotindisulphonate. Poison Tablets of Corrosive Mercuric Chloride are to be dispensed in securely stoppered glass containers on the exterior of which is placed a red label bearing the word "POISON" and a statement indicating that the Tablets contain the required amount of corrosive mercuric chloride.

Assay—Proceed as directed under *Hydrargyri Chloridum Corrosivum*, pages 752 and 1479, using one tablet and washing the sulphide with distilled water until the filtrate is colorless and until a 5 cc. portion of the washings, acidulated with nitric acid, yields no turbidity on the addition of a few drops of silver nitrate T.S. The weight of the mercuric sulphide obtained, multiplied by 1.167, indicates its equivalent in corrosive mercuric chloride. Tablets of Corrosive Mercuric Chloride may also be assayed as directed under the electrolytic method, page 1515.

TABELLÆ CARBONIS ANIMALIS. N. F. Tablets of Animal Charcoal

(Replacing Trochisci Carbonis Ligni, N. F. IV)

[Tab. Carb. Anim.—Tablets of Charcoal]

	Metric	Alternative
Purified Animal Charcoal, in coarse powder	**30.0 Gm.**	1 oz. av. 26 gr.
To make	**100 Tablets**	100 Tablets

Compress in a tablet machine, using a 9.5 mm. (3/8 inch) die and punch to make 100 tablets.

Each tablet contains about 0.30 Gm. or 4 9/10 grains of Purified Animal Charcoal.

Average dose—1 tablet.

TABELLÆ HYDRARGYRI CHLORIDI MITIS. N. F. Tablets of Mild Mercurous Chloride

[Tab. Hydrarg. Chlor. Mit.—Calomel Tablets]

	Metric	Alternative
Mild Mercurous Chloride	**0.65 Gm.**	10 gr.
Carmine	**0.05 Gm.**	⅘ gr.
Light Liquid Petrolatum	**1.40 cc.**	23 min.
Starch, in fine powder	**4.00 Gm.**	62 gr.
Sucrose, in fine powder	**12.00 Gm.**	185 gr.
To make	**100 Tablets**	100 Tablets

Thoroughly triturate the mild mercurous chloride with the sucrose, add the carmine and triturate until the color of the mixture is uniform. Separately mix the starch and liquid petrolatum, then add this mixture to the calomel mixture and mix by gentle trituration. Compress in a tablet machine, using 8 mm. (5/16 inch) die and punch to make 100 tablets.

Average dose—10 tablets, usually taken at fifteen to thirty minute intervals.

TABELLÆ PHENOLPHTHALEINI. N. F. Tablets of Phenolphthalein

(Replacing Trochisci Phenolphthaleini, N. F. IV)

[Tab. Phenolphthal.]

	Metric	Alternative
Phenolphthalein, in fine powder	**6.00 Gm.**	93 gr.
Gluside	**0.15 Gm.**	2¼ gr.
Spirit of Cinnamon	**0.15 cc.**	2¼ min.
Cocoa, in fine powder	**6.00 Gm.**	93 gr.
Sucrose, in fine powder	**18.00 Gm.**	278 gr.
To make	**100 Tablets**	100 Tablets

Mix the phenolphthalein and gluside and add the spirit of cinnamon. Gradually add the sucrose and cocoa and mix thoroughly by trituration in a mortar.

Compress in a tablet machine, using a 9.5 mm. (⅜ inch) die and punch to make 100 tablets.

Average dose—1 tablet.

Each tablet contains about:

0.06 Gm. or 1 grain of Phenolphthalein.

TABELLÆ SANTONINI, N. F. Tablets of Santonin

(Replacing Trochisci Santonini, N. F. IV)

[Tab. Santonin.]

	Metric	Alternative
Santonin, in fine powder	**3.00 Gm.**	46 gr.
Gluside	**0.06 Gm.**	1 gr.
Tincture of Vanilla	**1.50 cc.**	25 min.
Cocoa, in fine powder	**6.00 Gm.**	93 gr.
Sucrose, in fine powder	**21.00 Gm.**	324 gr.
To make	**100 Tablets**	100 Tablets

Mix the gluside with the tincture of vanilla in a mortar, add the santonin and allow the alcohol to partially evaporate. Then gradually add the cocoa and sucrose and mix by thorough trituration.

Compress in a tablet machine, using a 9.5 mm. (⅜ inch) die and punch to make 100 tablets.

Caution—Because of the pleasant flavor of these tablets and the possibility of their being mistaken for candy, it is advisable to order only a very few at a time, preferably not more than three, since 0.13 Gm. of Santonin has caused the death of a child.

Average dose—1 tablet.

Each tablet contains about:

0.03 Gm. or ½ gr. of Santonin.

TABELLÆ SANTONINI COMPOSITÆ. N. F. Compound Tablets of Santonin

(Replacing Trochisci Santonini Compositi, N. F. IV)

[Tab. Santonin. Co.—TABLETS OF SANTONIN AND CALOMEL]

	Metric	Alternative
Santonin, in fine powder	**3.00 Gm.**	46 gr.
Mild Mercurous Chloride	**3.00 Gm.**	46 gr.
Gluside	**0.06 Gm.**	1 gr.
Tincture of Vanilla	**1.50 cc.**	25 min.
Cocoa, in fine powder	**6.00 Gm.**	93 gr.
Sucrose, in fine powder	**18.00 Gm.**	278 gr.
To make	**100 Tablets**	100 Tablets

Mix the santonin, mild mercurous chloride and gluside, add the tincture of vanilla and allow the alcohol to partially evaporate. Then gradually add the sucrose and cocoa, and mix thoroughly by trituration in a mortar.

Compress in a tablet machine, using a 9.5 mm. (⅜ inch) die and punch to make 100 tablets.

Caution—Because of the pleasant flavor of these tablets and the possibility of their being mistaken for candy, it is advisable to order only a very few at a time, preferably not more than three, since 0.13 Gm. of Santonin has caused the death of a child.

Average dose—1 tablet.

Each tablet contains about:

0.03 Gm. or ½ gr. of Santonin.

TABELLÆ SODII BICARBONATIS. N. F. Tablets of Sodium Bicarbonate

(Replacing Trochisci Sodii Bicarbonatis, U. S. P. IX)

[Tab. Sod. Bicarb.—SODA-MINT TABLETS]

	Metric	Alternative
Sodium Bicarbonate	**25.0 Gm.**	1 oz. av. 48 gr.
Oil of Peppermint	**0.3 cc.**	5 min.
Light Liquid Petrolatum	**1.0 cc.**	16 min.
Starch, in fine powder	**4.0 Gm.**	62 gr.
To make	**100 Tablets**	100 Tablets

Mix the oil of peppermint and liquid petrolatum with the starch, add the sodium bicarbonate and mix thoroughly by gentle trituration.

Compress in a tablet machine, using 8 mm. (5/16 inch) die and punch to make 100 tablets.

Average dose—1 tablet, repeated as required.

TABELLÆ SULPHURIS ET POTASSII BITARTRATIS. N.F. Tablets of Sulphur and Potassium Bitartrate

(Replacing Trochisci Sulphuris et Potassii Bitartratis, N.F. IV)

[Tab. Sulphur. et Pot. Bitart.—Tablets of Sulphur and Cream of Tartar]

	Metric	Alternative
Washed Sulphur	**20.0 Gm.**	309 gr.
Potassium Bitartrate	**6.0 Gm.**	93 gr.
Oil of Orange	**0.3 cc.**	5 min.
Starch	**4.0 Gm.**	62 gr.
To make	**100 Tablets**	100 Tablets

Triturate the washed sulphur, potassium bitartrate and starch together until thoroughly mixed, then incorporate the oil.

Compress in a tablet machine, using an 8 mm. (5/16 inch) die and punch to make 100 tablets.

Average dose—Several tablets.

Unguenta—*Ointments*

Ointments or *salves* are soft, fatty preparations intended for external application. They are discussed more fully in Part XI. The official formulas are given below.

UNGUENTUM. U.S. Ointment

[Ung.—Simple Ointment]

	Metric	Alternative
Yellow Wax	**200 Gm.**	1 oz. av.
Benzoinated Lard	**800 Gm.**	4 oz. av.
To make about	**1000 Gm.**	5 oz. av.

Melt the yellow wax, add the benzoinated lard, heat gently until liquefied, and stir the mixture until it congeals.

Note—For use in southern latitudes and during the warm season in other localities, 50 Gm. [109 gr.] of the benzoinated lard (or more if necessary) may be replaced by an equal quantity of yellow wax.

U.S.P. Preparations—Unguentum Acidi Tannici; Unguentum Gallæ.
N.F. Preparations—Unguentum Calaminæ; Unguentum Hydrargyri Chloridi Mitis.

Uses—Emollient, also a vehicle for other ointments.

UNGUENTUM ACIDI BORICI. U.S. Ointment of Boric Acid

[Ung. Acid. Bor.]

	Metric	Alternative
Boric Acid, in fine powder	**100 Gm.**	44 gr.
Yellow Wax	**50 Gm.**	22 gr.
Petrolatum	**850 Gm.**	372 gr.
To make about	**1000 Gm.**	1 oz. av.

Melt the yellow wax, add the petrolatum, and heat gently until liquefied. Gradually add the warm liquid to the boric acid, contained in the warm mortar, triturating thoroughly, and stir the mixture until it congeals.

Uses—A mild antiseptic dressing and an application for burns.

UNGUENTUM ACIDI TANNICI. U.S. Ointment of Tannic Acid
[Ung. Acid. Tan.]

	Metric	Alternative
Tannic Acid	20 Gm.	88 gr.
Glycerin	20 Gm.	88 gr.
Ointment	60 Gm.	262 gr.
To make about	100 Gm.	1 oz. av.

Dissolve the tannic acid in the glycerin with the aid of a gentle heat, and mix the solution thoroughly with the ointment, avoiding the use of iron utensils.

Uses—An application for hemorrhoids.

UNGUENTUM AQUÆ ROSÆ. U.S. Ointment of Rose Water
[Ung. Aq. Ros.]

	Metric	Alternative
Spermaceti	125 Gm.	2 oz. av.
White Wax	120 Gm.	1 oz. av. 403 gr.
Expressed Oil of Almond	560 Gm.	8 oz. av. 420 gr.
Sodium Borate, in fine powder	5 Gm.	35 gr.
Stronger Rose Water	190 Gm.	3 oz. av. 17 gr.
To make about	1000 Gm.	16 oz. av.

Reduce the spermaceti and the white wax to fine pieces and melt them on a water bath, add the expressed oil of almond, and stir, continuing the heat until the mixture is uniformly melted. Dissolve the sodium borate in the stronger rose water warmed on a water bath to the temperature of the melted wax and fat, and add the warm solution gradually to the melted mixture, stirring rapidly and continuously until it congeals and becomes of uniform consistence.

Ointment of Rose Water must be free from rancidity. If the ointment has been chilled, warm it slightly before attempting to incorporate other ingredients with it.

NOTE—The official requirement to keep and dispense only in tin tubes is based upon the evidence that this ointment will not decompose or dry under such conditions. It will rapidly lose its neutrality and consistence in an open container.

Preserve in pure tin, collapsible tubes.

History—This was originated by Galen, the famous Roman physician-pharmacist of the first century A.D., and was known for many centuries by the name of *Unguentum* or *Ceratum Refrigerans*. It has changed but little in proportions or method of preparation throughout many centuries.

Uses—An emollient and ointment base.

UNGUENTUM BELLADONNÆ. U.S. Belladonna Ointment
[Ung. Bellad.]

	Metric	Alternative
Pilular Extract of Belladonna	10 Gm.	44 gr.
Diluted Alcohol	5 cc.	30 min.
Wool Fat	30 Gm.	131 gr.
Yellow Wax	5 Gm.	22 gr.
Petrolatum	50 Gm.	219 gr.
To make about	100 Gm.	1 oz. av.

Triturate the extract with the diluted alcohol until a smooth mixture is obtained, add the wax, wool fat, and petrolatum, which have been melted together on a water bath, and mix thoroughly.

Uses—An anodyne.

UNGUENTUM CHRYSAROBINI. U. S. Chrysarobin Ointment

[Ung. Chrysarob.]

	Metric	Alternative
Chrysarobin	6 Gm.	26 gr.
Hydrous Wool Fat	94 Gm.	412 gr.
To make about	100 Gm.	1 oz. av.

Triturate the chrysarobin with the hydrous wool fat, previously melted, heat the mixture on a water bath for twenty minutes, with occasional stirring, strain and stir until the Ointment congeals.

Uses—An antiparasitic.

UNGUENTUM GALLÆ. U. S. Nutgall Ointment

[Ung. Gall.]

	Metric	Alternative
Nutgall, in very fine powder	20 Gm.	88 gr.
Ointment	80 Gm.	350 gr.
To make about	100 Gm.	1 oz. av.

Rub the nutgall with the ointment, gradually added, until they are thoroughly mixed. Avoid the use of iron utensils.

Uses—An application for hemorrhoids.

UNGUENTUM HYDRARGYRI AMMONIATI. U. S. Cintment of Ammoniated Mercury

[Ung. Hydrarg. Ammon.—White Precipitate Ointment]

	Metric	Alternative
Ammoniated Mercury, in very fine powder	10 Gm.	44 gr.
Liquid Petrolatum	10 Gm.	44 gr.
Hydrous Wool Fat	40 Gm.	175 gr.
White Petrolatum	40 Gm.	175 gr.
To make about	100 Gm.	1 oz. av.

Triturate the ammoniated mercury with the liquid petrolatum until the mixture is smooth, add the white petrolatum, previously melted, mix thoroughly with the hydrous wool fat, and stir the mixture until it congeals.

Uses—A stimulant and parasiticide in cutaneous eruptions.

UNGUENTUM HYDRARGYRI FORTIUS. U. S. Stronger Mercurial Ointment

[Ung. Hydrarg. Fort.—Unguentum Hydrargyri U. S. P. IX]

Stronger Mercurial Ointment contains not less than 49 per cent and not more than 51 per cent of Hg.

	Metric	Alternative
Mercury	500 Gm.	219 gr.
Oleate of Mercury	20 Gm.	9 gr.
Prepared Suet	230 Gm.	101 gr.
Benzoinated Lard	250 Gm.	109 gr.
To make about	1000 Gm.	1 oz. av.

Triturate the oleate of mercury in a warm mortar, with the mercury added gradually, and when the globules are completely divided and distributed, set it aside for about fifteen minutes. Melt the lard and suet, allow the mixture to partially cool, add about 25 Gm. [11 gr.] of it to the mercurial mixture, and continue the trituration until globules of mercury are no longer visible under a lens magnifying ten diameters. Then add the remainder of the lard and suet, and mix thoroughly.

Assay—Mix about 1 Gm. of Stronger Mercurial Ointment, accurately weighed, in a suitable flask with 20 cc. of water and 20 cc. of nitric acid, and warm the mixture gently until red fumes cease to be evolved and the solution is colorless. Cool, add 100 cc. of distilled water and 2 cc. of ferric ammonium sulphate T.S., and titrate with tenth-normal potassium thiocyanate until a permanent reddish color is produced. Each cc. of tenth-normal potassium thiocyanate corresponds to 0.01003 Gm. of Hg.

This assay is explained on page 1462.

U. S. P. Preparation—Unguentum Hydrargyri Mite.

Uses—An antisyphilitic by inunction.

UNGUENTUM HYDRARGYRI MITE. U. S. Mild Mercurial Ointment

[**Ung. Hydrarg. Mit.**—Unguentum Hydrargyri Dilutum U. S. P. IX., Diluted Mercurial Ointment, Blue Ointment, Hydrargyri Unguentum P. I.]

Mercurial Ointment contains not less than 29 per cent and not more than 31 per cent of Hg.

	Metric	Alternative
Stronger Mercurial Ointment	600 Gm.	263 gr.
Petrolatum	200 Gm.	88 gr.
Ointment	200 Gm.	88 gr.
To make about	1000 Gm.	1 oz. av.

Mix the ingredients thoroughly.

Assay—Proceed as directed under *Unguentum Hydrargyri Fortius.*

Uses—An antiparasitic.

UNGUENTUM HYDRARGYRI OXIDI FLAVI. U. S. Ointment of Yellow Mercuric Oxide

[**Ung. Hydrarg. Oxid. Flav.**]

Note—The strength of this Ointment has been reduced from 10 per cent of Yellow Mercuric Oxide to 1 per cent.

	Metric	Alternative
Yellow Mercuric Oxide, in very fine powder	1 Gm.	4 gr.
Liquid Petrolatum	1 Gm.	4 gr.
Hydrous Wool Fat	10 Gm.	44 gr.
Petrolatum	88 Gm.	286 gr.
To make about	100 Gm.	1 oz. av.

Triturate the yellow mercuric oxide with the liquid petrolatum until the mixture is smooth, add the hydrous wool fat in divided portions, and incorporate the mixture thoroughly with the petrolatum. All contact with iron utensils or containers must be avoided.

Uses—A stimulant and antiseptic, chiefly in inflammation of the eye-lids.

UNGUENTUM IODI. U. S. Iodine Ointment

[**Ung. Iodi**]

	Metric	Alternative
Iodine	4 Gm.	17½ gr.
Potassium Iodide	4 Gm.	17½ gr.
Glycerin	12 Gm.	53 gr.
Wool Fat	80 Gm.	350 gr.
To make about	100 Gm.	1 oz. av.

Triturate the iodine and potassium iodide, preferably in a glass mortar, with the glycerin until dissolved, gradually incorporate the wool fat, and mix thoroughly. All contact with metallic utensils or containers must be avoided.

Uses—A counterirritant.

UNGUENTUM IODOFORMI. U. S. Iodoform Ointment

[Ung. Iodof.]

	Metric	Alternative
Iodoform	**10 Gm.**	44 gr.
Wool Fat	**20 Gm.**	88 gr.
Petrolatum	**70 Gm.**	306 gr.
To make about	**100 Gm.**	1 oz. av.

Triturate the Iodoform with the previously melted petrolatum until dissolved, incorporate the wool fat, and mix thoroughly.

Uses—An antiseptic dressing for wounds.

UNGUENTUM PHENOLIS. U. S. Ointment of Phenol

[Ung. Phenol.—Ointment of Carbolic Acid]

	Metric	Alternative
Phenol	**2 Gm.**	9 gr.
Yellow Wax	**5 Gm.**	22 gr.
Petrolatum	**93 Gm.**	407 gr.
To make about	**100 Gm.**	1 oz. av.

Melt the yellow wax and phenol on a water bath, add the petrolatum, and stir the mixture until it congeals.

Uses—An antiseptic dressing.

UNGUENTUM PICIS PINI. U. S. Tar Ointment

[Ung. Pic. Pin.—Unguentum Picis Liquidæ U. S. P. IX]

	Metric	Alternative
Pine Tar	**50 Gm.**	219 gr.
Yellow Wax	**15 Gm.**	66 gr.
Petrolatum	**35 Gm.**	153 gr.
To make about	**100 Gm.**	1 oz. av.

Melt the yellow wax, add the petrolatum, and to the melted mixture add the pine tar, previously warmed, and incorporate thoroughly. Strain the mixture through muslin, and stir until it congeals.

Uses—A stimulant application.

UNGUENTUM PLUMBI OLEATIS. U. S. Ointment of Lead Oleate

[Ung. Plumb. Ol.—Unguentum Diachylon U. S. P. IX]

	Metric	Alternative
Lead Oleate Plaster	**50 Gm.**	219 gr.
Oil of Lavender	**1 Gm.**	5 min.
White Petrolatum	**49 Gm.**	214 gr.
To make about	**100 Gm.**	1 oz. av.

Melt together the lead oleate plaster and the white petrolatum by applying a gentle heat, strain the mixture, allow it to cool but not congeal, add the oil of lavender, and stir the Ointment until it is cold.

Uses—Used in eczema and other skin diseases.

UNGUENTUM SULPHURIS. U. S. Sulphur Ointment

[Ung. Sulphur.]

	Metric	Alternative
Sublimed Sulphur	**15 Gm.**	66 gr.
Benzoinated Lard	**85 Gm.**	372 gr.
To make about	**100 Gm.**	1 oz. av.

Rub the sublimed sulphur, which must be free from gritty particles, with a small portion of the benzoinated lard until smooth, and incorporate uniformly the remainder of the benzoinated lard with the sulphur mixture.

Uses—An antiparasitic.

UNGUENTUM ZINCI OXIDI. U.S. Ointment of Zinc Oxide

[Ung. Zinc. Ox.—Zinc Ointment]

	Metric	Alternative
Zinc Oxide, in very fine powder	20 Gm.	88 gr.
Paraffin	15 Gm.	66 gr.
White Petrolatum	65 Gm.	284 gr.
To make about	100 Gm.	1 oz. av.

Rub the zinc oxide, which must be free from gritty particles, with about one-fourth of the melted paraffin and white petrolatum in a previously warmed container, and with this incorporate the remainder of the melted mixture. If necessary, strain the Ointment while warm, and stir until it congeals.

Uses—A mildly antiseptic and astringent dressing.

UNGUENTUM BITUMINIS SULPHONATI. N.F. Ointment of Sulphonated Bitumen

[Ung. Bitum. Sulphon.]

	Metric	Alternative
Sulphonated Bitumen	10 Gm.	175 gr.
Petrolatum	90 Gm.	3 oz. av. 263 gr.
To make	100 Gm.	4 oz. av.

Thoroughly incorporate the sulphonated bitumen with the petrolatum.

Uses—An antiseptic and emollient.

UNGUENTUM CALAMINÆ. N.F. Calamine Ointment

[Ung. Calamin.—Unguentum Calaminare, Turner's Cerate]

	Metric	Alternative
Prepared Calamine, in very fine powder	17 Gm.	298 gr.
Ointment	83 Gm.	3 oz. av. 140 gr.
To make	100 Gm.	4 oz. av.

Mix the prepared calamine intimately with the ointment, by trituration, so as to produce a smooth and homogeneous product.

History—This preparation was introduced about 200 years ago by Dr. Daniel Turner of Devonshire, England, under the name of *Ceratum de Lapide Calaminari*. It was official for many years under the name *Ceratum Calaminæ* or *calaminare*.

Uses—A protective dressing.

UNGUENTUM CAMPHORÆ. N.F. Camphor Ointment

[Ung. Camph.]

	Metric	Alternative
Camphor, in coarse powder	22 Gm.	385 gr.
White Wax	11 Gm.	192 gr.
Lard	67 Gm.	2 oz. av. 297 gr.
To make	100 Gm.	4 oz. av.

Melt the white wax and lard on a water bath, then dissolve the camphor in the melted mixture without further heating and stir the ointment until it is cold.

Uses—An anodyne and counterirritant.

UNGUENTUM CAPSICI. N.F. Capsicum Ointment

[Ung. Capsic.]

	Metric	Alternative
Oleoresin of Capsicum	5 Gm.	87 gr.
Paraffin	10 Gm.	175 gr.
Petrolatum	85 Gm.	3 oz. av. 176 gr.
To make	100 Gm.	4 oz. av.

Melt the paraffin, add the petrolatum and continue the heat until the whole is liquefied. Then remove from the heat, add the oleoresin of capsicum, mix thoroughly, and stir frequently until the ointment congeals.

Uses—A rubefacient.

UNGUENTUM FUSCUM. N. F. Brown Ointment

[Ung. Fusc.—Unguentum Matris, Mother's Salve]

	Metric	Alternative
Camphorated Brown Plaster	50 Gm.	2 oz. av.
Olive Oil	25 Gm.	1 oz. av.
Prepared Suet	25 Gm.	1 oz. av.
To make	100 Gm.	4 oz. av.

Melt together the several ingredients and stir the ointment until it congeals.

History—Under the name of *Mother's Ointment* an empiric preparation for promoting suppuration was made by a nun named *La Mere Thecle* at the *Hotel Dieu*, Paris, during the 18th century. The formula was simplified after the preparation received official recognition.

Uses—An antiphlogistic.

UNGUENTUM HYDRARGYRI CHLORIDI MITIS. N. F. Ointment of Mild Mercurous Chloride

[Ung. Hydrarg. Chlor. Mit.—Prophylactic Ointment, Calomel Ointment]

	Metric	Alternative
Mild Mercurous Chloride	30 Gm.	1 oz. av. 88 gr.
White Petrolatum	70 Gm.	2 oz. av. 350 gr.
To make	100 Gm.	4 oz. av.

Mix them intimately.

Uses—A prophylactic.

UNGUENTUM HYDRARGYRI NITRATIS. N. F. Ointment of Mercuric Nitrate (U. S. P. IX)

Ung. Hydrarg. Nit.—Citrine Ointment]

	Metric	Alternative
Mercury	7.0 Gm.	123 gr.
Nitric Acid	17.5 Gm.	306 gr.
Lard, free from water	76.0 Gm.	3 oz. av. 17 gr.
To make about	100 Gm.	4 oz. av.

Warm the lard in a capacious porcelain dish until it has just melted, or to about 45° C. Add 7 Gm. [123 gr.] of the nitric acid all at once and continue the heat until the characteristic reaction is complete. Hold an inverted glass funnel over the dish during the reaction. Withdraw the heat immediately after the rapid rise of froth which accompanies the end reaction and cool the treated lard, stirring it until it assumes a bright citrine color. Dissolve the mercury in the remainder of the nitric acid, warming it if necessary to prevent crystallizing, and mix the solution with the previously prepared lard. All contact with metallic utensils or containers must be avoided.

History—The first preparation under this name appeared in the London Pharmacopœia of 1650. It contained no mercury however, but was made from a number of mineral ingredients including coral, quartz, sea shells, marble, white lead, and tragacanth incorporated with lard, suet, and chicken fat. The first ointment of record containing mercuric nitrate was in the Edinburgh Pharmacopœia of 1722. Other formulas for a similar product appeared later in the London, the Dublin, and the Paris Pharmacopœias and a variety of ingredients and processes have appeared in the many revisions down to the present time.

Uses—An antiparasitic.

UNGUENTUM HYDRARGYRI OXIDI RUBRI. N. F. Ointment of Red Mercuric Oxide

[Ung. Hydrarg. Oxid. Rub.]

	Metric	Alternative
Red Mercuric Oxide, in very fine powder	10 Gm.	175 gr.
Water	10 cc.	175 min.
Hydrous Wool Fat	40 Gm.	1 oz. av. 262 gr.
Petrolatum	40 Gm.	1 oz. av. 262 gr.
To make	100 Gm.	4 oz. av

Triturate the red mercuric oxide with the water until the mixture is smooth and absolutely free from gritty particles, then add the hydrous wool fat in divided portions, and finally incorporate thoroughly with the petrolatum. Contact with metallic utensils must be avoided.

Uses—A stimulant and antiparasitic.

UNGUENTUM IODI DENIGRESCENS. N. F. Stainless Iodine Ointment

[Ung. Iod. Denig.]

	Metric	Alternative
Iodine, in moderately coarse powder	50 Gm.	87½ gr.
Paraffin	50 Gm.	87½ gr.
Oleic Acid	200 Gm.	350 gr.
Petrolatum	700 Gm.	2 oz. av. 350 gr.
To make about	1000 Gm.	4 oz. av.

Dissolve the iodine in the oleic acid by aid of heat, not exceeding 70° C. Add the paraffin and continue the heat until the iodine is absorbed, as shown by the absence of a reddish color, and the paraffin is melted, then add the petrolatum, and when all is liquefied remove from the heat and stir frequently until it congeals.

Uses—An alterative.

UNGUENTUM PICIS COMPOSITUM. N. F. Compound Tar Ointment

[Ung. Pic. Co.]

	Metric	Alternative
Rectified Oil of Tar	40 Gm.	70 gr.
Tincture of Benzoin	20 Gm.	35 gr.
Zinc Oxide	30 Gm.	52 gr.
Yellow Wax	250 Gm.	1 oz. av.
Lard	320 Gm.	1 oz. av. 122 gr.
Cottonseed Oil	340 Gm.	1 oz. av. 158 gr.
To make	1000 Gm.	4 oz. av.

Melt the yellow wax and lard with the cottonseed oil at a gentle heat, and add the tincture of benzoin. Then withdraw the heat, add the rectified oil of tar, and finally the zinc oxide, and incorporate the latter thoroughly, so that, on cooling, a smooth, homogeneous ointment results.

Uses—An antiparasitic.

UNGUENTUM PLUMBI IODIDI. N. F. Ointment of Lead Iodide

[Ung. Plumb. Iod.]

	Metric	Alternative
Lead Iodide, in very fine powder	10 Gm.	175 gr.
Benzoinated Lard	90 Gm.	3 oz. av. 262 gr.
To make	100 Gm.	4 oz. av.

Rub the lead iodide with the benzoinated lard, gradually added, until they are thoroughly mixed.

Uses—An alterative.

UNGUENTUM POTASSII IODIDI. N. F. Ointment of Potassium Iodide

[Ung. Pot. Iod.]

	Metric	Alternative
Potassium Iodide	10 Gm.	175 gr.
Sodium Thiosulphate	1 Gm.	17 gr.
Water	9 Gm.	158 gr.
Benzoinated Lard	80 Gm.	3 oz. av. 87 gr.
To make	100 Gm.	4 oz. av.

Dissolve the potassium iodide and sodium thiosulphate in the water, then add the benzoinated lard and incorporate thoroughly. This ointment should not be dispensed unless it has been freshly prepared.

Uses—An alterative.

UNGUENTUM RESORCINOLIS COMPOSITUM. N. F. Compound Resorcinol Ointment

[Ung. Resorcin. Co.—Unguentum Resorcini Compositum]

	Metric	Alternative
Resorcinol	60 Gm.	105 gr.
Zinc Oxide	60 Gm.	105 gr.
Bismuth Subnitrate	60 Gm.	105 gr.
Rectified Oil of Birch Tar	60 Gm.	105 gr.
Yellow Wax	100 Gm.	175 gr.
Petrolatum	250 Gm.	1 oz. av.
Wool Fat	280 Gm.	1 oz. av. 52 gr.
Glycerin	130 Gm.	227 gr.
To make	1000 Gm.	4 oz. av.

Melt the yellow wax and wool fat in a dish on a water bath. Rub the zinc oxide and bismuth subnitrate with the petrolatum until smooth and add it to the melted mixture. Dissolve the resorcinol in the glycerin, incorporate the solution with the warm mixture just prepared, then add the oil and stir the ointment until it congeals.

Uses—An antiseptic and astringent.

UNGUENTUM SINAPIS. N. F. Mustard Ointment

[Ung. Sinap.—Ointment of Oil of Mustard]

	Metric	Alternative
Volatile Oil of Mustard	2 Gm.	35 gr.
White Wax	15 Gm.	262 gr.
Lard	83 Gm.	3 oz. av. 140 gr.
To make	100 Gm.	4 oz. av.

Melt the white wax, add the lard and heat gently until liquefied. Remove from the heat, stir the mixture until it begins to congeal, then add the volatile oil of mustard and continue the stirring until the ointment congeals.

Uses—A counterirritant.

UNGUENTUM STRAMONII. N. F. Stramonium Ointment

(U. S. P. IX)

[Ung. Stramon.]

	Metric	Alternative
Pilular Extract of Stramonium	10 Gm.	175 gr.
Diluted Alcohol	5 cc.	87 min.
Hydrous Wool Fat	20 Gm.	350 gr.
Benzoinated Lard	65 Gm.	2 oz. av. 262 gr.
To make	100 Gm.	4 oz. av.

Triturate the extract with the diluted alcohol until a smooth mixture is obtained; with this incorporate the hydrous wool fat, then add the benzoinated lard, and mix thoroughly.

Uses—An anodyne; for painful ulcers, hemorrhoids, etc.

UNGUENTUM SULPHURIS ALKALINUM. N. F. Alkaline Sulphur Ointment

[Ung. Sulphur. Alk.]

	Metric	Alternative
Sublimed Sulphur	20 Gm.	350 gr.
Potassium Carbonate	10 Gm.	175 gr.
Water	5 cc.	87 min.
Benzoinated Lard	65 Gm.	2 oz. av. 267 gr.
To make	100 Gm.	4 oz. av.

Rub the sulphur with the potassium carbonate and the water, until a smooth, homogeneous mixture results, then gradually add the benzoinated lard, and mix thoroughly.

Uses—An antiparasitic and to relieve itching.

UNGUENTUM SULPHURIS COMPOSITUM. N. F. Compound Sulphur Ointment

[Ung. Sulphur. Co.—Wilkinson's Ointment, Hebra's Itch Ointment]

	Metric	Alternative
Precipitated Calcium Carbonate	10 Gm.	175 gr.
Sublimed Sulphur	15 Gm.	262 gr.
Oil of Cade	15 Gm.	262 gr.
Soft Soap	30 Gm.	1 oz. av. 87 gr.
Lard	30 Gm.	1 oz. av. 87 gr.
To make	100 Gm.	4 oz. av.

Melt the lard with the soft soap and oil of cade, then gradually incorporate the sublimed sulphur and precipitated calcium carbonate and rub the ointment until it is smooth.

Uses—An antiparasitic and to relieve itching.

UNGUENTUM VERATRINÆ. N. F. Veratrine Ointment

[Ung. Veratrin.]

	Metric	Alternative
Veratrine	4 Gm.	70 gr.
Expressed Oil of Almond	6 Gm.	105 gr.
Benzoinated Lard	90 Gm.	3 oz. av. 262 gr.
To make	100 Gm.	4 oz. av.

Rub the veratrine with the expressed oil of almond, then gradually add the benzoinated lard, and mix thoroughly.

Uses—An anodyne and counterirritant.

UNGUENTUM ZINCI STEARATIS. N. F. Ointment of Zinc Stearate

[Ung. Zinc. Stear.]

	Metric	Alternative
Zinc Stearate, in fine powder	500 Gm.	2 oz. av.
White Petrolatum	500 Gm.	2 oz. av.
To make	1000 Gm.	4 oz. av.

Rub the zinc stearate with the white petrolatum until a smooth ointment is produced.

Uses—An antiseptic, emollient and protective.

Some Unofficial Ointments

Title	*Directions*
Unguentum Acidi Salicylici (Br. 1914)	Mix 2 Gm. salicylic acid with 98 Gm. paraffin ointment
Aconitinæ (Br. 1914)	Dissolve 2 Gm. aconitine in 16 Gm. of oleic acid, with the aid of a gentle heat, and mix the solution with 82 Gm. of lard
Atropinæ (Br. 1914)	Dissolve 2 Gm. of atropine in 8 Gm. of oleic acid, with the aid of a gentle heat, and mix the solution with 90 Gm. of lard
Cantharidini (Br. 1914)	Dissolve 0.1 Gm. cantharidin in 10 cc. chloroform, add the solution to 290 Gm. melted benzoinated lard, and stir until cool
Capsici (Br. 1914)	Digest on a water bath, stirring occasionally, 25 Gm. of capsicum fruit, 10 Gm. hard paraffin, 75 Gm. soft paraffin, and 10 Gm. prepared lard, strain, and cool without stirring
Cetacei (Br. 1914)	Melt together 20 Gm. spermaceti, 8 Gm. white wax, and 72 Gm. liquid paraffin, and stir until cold
Chaulmoogræ (Br. 1914)	Melt together 40 Gm. hard paraffin and 50 Gm. soft paraffin, add 10 Gm. chaulmoogra oil, and stir until cold
Cocainæ (Br. 1914)	Dissolve 4 Gm. cocaine in 16 Gm. oleic acid, with the aid of a gentle heat, and mix the solution with 80 Gm. of prepared lard
Creosoti (Br. 1914)	Melt 40 Gm. hard paraffin and 50 Gm. of soft white paraffin together, add 10 Gm. creosote, and stir until cold
Eucalypti (Br. 1914)	Melt 40 Gm. hard paraffin and 50 Gm. soft white paraffin together, add 10 Gm. oil of eucalyptus, and stir until cold
Gallæ cum Opio (Br. 1914)	Thoroughly mix 92.5 Gm. gall ointment, 7.5 Gm. opium, in powder
Hamamelidis (Br. 1914)	Mix 10 cc. liquid extract of hamamelis with 60 Gm. wool fat, and 30 Gm. soft paraffin
Hydrargyri Compositum (Br. 1914)	Mix 24 Gm. yellow wax, 24 Gm. olive oil, and 40 Gm. mercury ointment, with the aid of heat. Add 12 Gm. camphor and stir until cold
Hydrargyri Iodidi Rubri (Br. 1914)	Mix 4 Gm. mercuric iodide with 96 Gm. benzoinated lard
Hydrargyri Nitratis Dilutum (Br. 1914)	Mix 20 Gm. mercuric nitrate ointment with 80 Gm. soft paraffin

Some Unofficial Ointments—*Continued*

Title	*Directions*
Unguentum Hydrargyri Oleatis (Br. 1914)	Mix 25 Gm. mercuric oleate with 75 Gm. benzoinated lard
Hydrargyri Subchloridi (Br. 1914)	Mix 20 Gm. mercurous chloride with 80 Gm. benzoinated lard
Lanæ Compositum (Br. 1914)	Melt together 40 Gm. prepared lard, 40 Gm. wool fat, and 20 Gm. paraffin ointment, and stir until cold
Myrobalani (Br. 1914)	Mix 20 Gm. myrobalans and 80 Gm. benzoinated lard by trituration, until a smooth mixture results
Myrobalani cum Opio (Br. 1914)	Triturate 7.5 Gm. powdered opium with 92.5 Gm. myrobalans ointment until a smooth mixture results
Paraffini (Br. 1914)	Melt 27 Gm. hard paraffin, 70 Gm. soft paraffin, and 3 Gm. white wax, and stir constantly during the cooling. White soft paraffin may replace the yellow if desired
Plumbi subacetatis (Br. 1914)	Melt 25 Gm. wool fat, 21.5 Gm. hard paraffin, and 50 Gm. soft paraffin. Cool, add 12.5 Gm. strong solution lead subacetate, and stir until cold
Resinæ (Br. 1914)	Melt 26 Gm. resin, 26 Gm. yellow wax, 26 Gm. olive oil, 22 Gm. prepared lard, strain, and stir until cold
Staphisagriæ (Br. 1914)	Digest 20 Gm. crushed stavesacre seeds in 85 Gm. benzoinated lard, on a water bath, during two hours, strain, add 10 Gm. yellow wax, heat until uniform, and stir during cooling
Zinci Oleatis (Br. 1914)	Dissolve 30 Gm. zinc sulphate in 60 cc. distilled water, and 90 Gm. of hard soap in 600 cc. of distilled water. Mix the solution, heat to boiling, allow the melted zinc oleate thus formed to rise to the surface, cool, pour off the aqueous solution, and boil the zinc oleate with successive portions of distilled water. Then reduce the product to a fine powder and mix with an equal weight of melted white soft paraffin

Inuncta—*Inunctions*

The N. F. has introduced two preparations, under this class name. They are really ointments and are intended for local application and quick absorption.

INUNCTUM MENTHOLIS. N. F. Menthol Inunction

[Inunct. Menthol.]

	Metric	Alternative
Menthol	**5 Gm.**	87 gr.
Hydrous Wool Fat	**95 Gm.**	3 oz. av. 350 gr.
To make	**100 Gm.**	4 oz. av.

Rub the menthol with a portion of the hydrous wool fat until a perfectly smooth mixture is obtained, then thoroughly incorporate the remainder of the hydrous wool fat.

Menthol inunction should be stored in collapsible metal tubes, well sealed, or in small, tightly-stoppered, wide-mouthed bottles.

INUNCTUM MENTHOLIS COMPOSITUM. N. F. Compound Menthol Inunction

[Inunct. Menthol. Co.]

	Metric	Alternative
Menthol	**5 Gm.**	87 gr.
Methyl Salicylate	**10 Gm.**	175 gr.
Hydrous Wool Fat	**85 Gm.**	3 oz. av. 175 gr.
To make	**100 Gm.**	4 oz. av.

Dissolve the menthol in the methyl salicylate and thoroughly incorporate the mixture in the hydrous wool fat.

Compound Menthol Inunction should be stored in collapsible metal tubes, well sealed, or in small, tightly stoppered, wide-mouthed bottles.

Cerata—*Cerates*

Cerates are unctuous substances of such consistence that they may be easily spread, at ordinary temperatures, upon muslin or similar material with a spatula, and yet not so soft as to liquefy and run when applied to the skin. They are mostly used as dressings for inflamed surfaces, and are generally made with oil, lard, or petrolatum for a basis, with sufficient wax to give the desired consistence. Owing to the presence of wax (*Cera*) they are

called *Cerates*. Paraffin, spermaceti, and resin are also used to raise the melting points of oils and fats.

Cerates are made either by *fusion* or by *incorporation*. In the first method, the ingredients are melted together, and the mixture strained, to separate mechanical impurities, and stirred until cold, to render it homogeneous. By incorporation is meant the process which consists in placing the fatty ingredients upon an ointment slab or pill tile, or in a mortar, and gradually mixing in the other ingredients, with a spatula or pestle, until a uniform preparation results.

The following cerates are official:

CERATUM. U.S. Cerate

[Cerat.—Simple Cerate]

	Metric	Alternative
White Wax	300 Gm.	3 oz. av.
Benzoinated Lard	700 Gm.	7 oz. av.
To make	1000 Gm.	10 oz. av.

Melt the white wax by the heat of a water bath, add the benzoinated lard, continue the heat until the mixture is liquefied, strain if necessary, and stir constantly until it congeals.

For use in southern latitudes and during the heated season in other localities, 50 Gm. [219 gr.] of benzoinated lard (or more, if necessary) may be replaced by an equal quantity of white wax.

CERATUM CANTHARIDIS. U.S. Cantharides Cerate

[Cerat. Canthar.—Blistering Cerate]

	Metric	Alternative
Cantharides, in very fine powder	350 Gm.	5 oz. av. 263 gr.
Glacial Acetic Acid	25 cc.	182 min.
Oil of Turpentine	150 cc.	2 fl. oz. 182 min.
Yellow Wax	175 Gm.	2 oz. av. 350 gr.
Rosin	175 Gm.	2 oz. av. 350 gr.
Benzoinated Lard	200 Gm.	3 oz. av. 88 gr.
To make	1000 Gm.	16 oz. av.

Moisten the cantharides with the oil of turpentine and the glacial acetic acid, previously mixed, and set the mixture aside in a well-covered container in a warm place for forty-eight hours. Melt together the rosin, yellow wax, and benzoinated lard, strain the mixture through muslin, add the macerated cantharides, and keep the mixture in a liquid condition by heating it on a water bath with occasional stirring until it is reduced in weight to 1000 Gm. [16 oz. av.]. Then withdraw the heat, and stir the Cerate until it becomes firm.

U. S. P. Preparation—Emplastrum Cantharidis.

CERATUM RESINÆ. U.S. Rosin Cerate

[Cerat. Res.—Basilicon Ointment]

	Metric	Alternative
Rosin	350 Gm.	3½ oz. av.
Yellow Wax	150 Gm.	1½ oz. av.
Lard	500 Gm.	5 oz. av.
To make	1000 Gm.	10 oz. av.

Melt the rosin, add the yellow wax and lard, and continue the heat until liquefied, then strain the liquid through muslin, and allow it to congeal, stirring occasionally.

NOTE—In cold weather 530 Gm. [5 oz. av. 132 gr.] of lard and 120 Gm. [1 oz. av. 87 gr.] of yellow wax may be used.

CERATUM CAMPHORÆ. N.F. Camphor Cerate

[Cerat. Camph.]

	Metric	Alternative
Camphor Liniment	**100 Gm.**	1 oz. av. 262 gr.
White Wax	**350 Gm.**	5 oz. av. 262 gr.
White Petrolatum	**150 Gm.**	2 oz. av. 175 gr.
Benzoinated Lard	**400 Gm.**	6 oz. av. 175 gr.
To make	**1000 Gm.**	16 oz. av.

Melt the white wax, add the white petrolatum, then the benzoinated lard, and continue the heat until the mixture is liquefied. Add the camphor liniment and stir the mixture until it congeals.

CERATUM PLUMBI SUBACETATIS. N.F. Cerate of Lead Subacetate

[Cerat. Plumb. Subacet.—GOULARD'S CERATE]

	Metric	Alternative
Solution of Lead Subacetate	**20 Gm.**	350 gr.
Wool Fat	**20 Gm.**	350 gr.
White Wax	**20 Gm.**	350 gr.
White Petrolatum	**38 Gm.**	1 oz. av. 227 gr.
Camphor	**2 Gm.**	35 gr.
To make	**100 Gm.**	4 oz. av.

Melt the white petrolatum and white wax in a dish on a water bath, remove the heat and dissolve the camphor in the warm mixture. Add the wool fat, mix thoroughly and then gradually incorporate the solution of lead subacetate by continuous stirring.

CERATUM RESINÆ COMPOSITUM. N.F. Compound Rosin Cerate

[Cerat. Resin. Co.—DESHLER'S SALVE]

	Metric	Alternative
Rosin	**225 Gm.**	3 oz. av. 262 gr.
Yellow Wax	**225 Gm.**	3 oz. av. 262 gr.
Prepared Suet	**300 Gm.**	4 oz. av. 350 gr.
Turpentine	**115 Gm.**	1 oz. av. 367 gr.
Linseed Oil	**135 Gm.**	2 oz. av. 70 gr.
To make about	**1000 Gm.**	16 oz. av.

Melt the rosin, yellow wax, turpentine, and prepared suet, add the linseed oil, and continue the heat until the mixture is liquefied. Strain it through coarse muslin, stirring until it begins to congeal.

Glycerogelatina—*Glycerogelatins*

Glycerogelatins are soft masses, melting at the body temperature, composed of gelatin, glycerin, water, and a medicament suitable for application in dermatological practice, such as salicylic acid, iodoform, resorcinol, chrysarobin, etc., either by themselves, or with the addition of zinc oxide. They are prepared with Glycerinated Gelatin (U. S. P.) as the vehicle. The formulas which follow serve as types of Glycerogelatins modified to produce masses of different consistence and melting points. Glycerogelatins are usually molded into small blocks for dispensing and are to be softened with heat before the

medication is applied. Under the title *gelatinum* the B. P. Codex includes preparations some of which are similar to glycerogelatins, others more closely resembling dermatologic pastes, and still others intended for internal administration. The latter are called *jellies*.

GLYCEROGELATINUM ACIDI SALICYLICI. N. F. Salicylic Acid Glycerogelatin

[Glycerogel. Acid. Salicyl.]

	Metric	Alternative
Glycerinated Gelatin	20 Gm.	350 gr.
Glycerin	35 Gm.	1 oz. av. 175 gr.
Distilled Water	35 cc.	1 fl. oz. 175 min.
Salicylic Acid, in very fine powder	10 Gm.	175 gr.
To make	100 Gm.	4 oz. av.

Mix the salicylic acid thoroughly with the glycerin, add the distilled water, and incorporate this mixture with the glycerinated gelatin previously melted on a water bath. Continue the heat, with stirring, until a homogeneous mixture is obtained, then pour it into chilled molds and allow it to congeal.

GLYCEROGELATINUM IODOFORMI. N. F. Iodoform Glycerogelatin

[Glycerogel Iodof.]

	Metric	Alternative
Glycerinated Gelatin	10 Gm.	175 gr.
Glycerin	15 Gm.	262 gr.
Distilled Water	65 cc.	2 fl. oz. 262 min.
Iodoform, in very fine powder	10 Gm.	175 gr.
To make	100 Gm.	4 oz. av.

Mix the iodoform thoroughly with the glycerin, add the distilled water and incorporate this mixture with the glycerinated gelatin, previously melted on a water bath. Continue the heat with stirring, until a homogeneous mixture is obtained, then pour it into chilled molds and allow it to congeal.

GLYCEROGELATINUM ZINCI DURUM. N. F. Firm Zinc Glycerogelatin

[Glycerogel. Zinc. Dur.]

	Metric	Alternative
Glycerinated Gelatin	30 Gm.	1 oz. av. 87 gr.
Glycerin	25 Gm.	1 oz. av.
Distilled Water	35 cc.	1 fl. oz. 175 min.
Zinc Oxide, in fine powder	10 Gm.	175 gr.
To make	100 Gm.	4 oz. av.

Mix the zinc oxide thoroughly with the glycerin, add the water and incorporate this mixture with the glycerinated gelatin, previously melted on a water bath. Continue the heat, with stirring, until a homogeneous mixture is obtained, then pour it into chilled molds and allow it to congeal.

GLYCEROGELATINUM ZINCI MOLLE. N. F. Soft Zinc Glycerogelatin

[Glycerogel. Zinc. Mol.]

	Metric	Alternative
Glycerinated Gelatin	20 Gm.	350 gr.
Glycerin	35 Gm.	1 oz. av. 175 gr.
Distilled Water	35 cc.	1 fl. oz. 175 min.
Zinc Oxide, in fine powder	10 Gm.	175 gr.
To make	100 Gm.	4 oz. av.

Mix the zinc oxide thoroughly with the glycerin, add the water and incorporate this mixture with the glycerinated gelatin, previously melted on a water bath. Continue the heat, with stirring, until a homogeneous mixture is obtained, then pour it into chilled molds and allow it to congeal.

Pastæ Dermatologicæ—*Dermatologic Pastes*

Dermatologic Pastes are medicaments for external use, employed in the practice of dermatologists. They are ointment-like mixtures of starch, dextrin, zinc oxide, sulphur, calcium carbonate or other medicinal substances made into a smooth paste with glycerin, soft soap, petrolatum, lard or other fats, medicated with antiseptic or astringent agents. Dermatologic Pastes should be free from gritty particles. The formulas which follow serve as examples.

PASTA BETANAPHTHOLIS. N.F. Betanaphthol Paste

[**Past. Betanaphth.**—Pasta Naphtholis, Lassar; Lassar's Naphthol Paste]

	Metric	Alternative
Betanaphthol, in very fine powder	**10 Gm.**	175 gr.
Precipitated Sulphur	**50 Gm.**	2 oz. av.
Petrolatum	**20 Gm.**	350 gr.
Soft Soap	**20 Gm.**	350 gr.
To make	**100 Gm.**	4 oz. av.

Triturate the betanaphthol and sulphur with the petrolatum and incorporate the soft soap with the mixture.

PASTA DEXTRINATA. N.F. Dextrinated Paste

[**Past. Dextrin.**]

	Metric	Alternative
White Dextrin	**33 Gm.**	1 oz. av. 140 gr.
Glycerin	**33 Gm.**	1 oz. av. 140 gr.
Water, a sufficient quantity,		
To make	**100 Gm.**	4 oz. av.

Dissolve the dextrin in the glycerin and 33 cc. [1 fl. oz. 27 min.] of water, in a tared dish with the aid of heat, and add sufficient water to make the product weigh 100 Gm.

PASTA RESORCINOLIS FORTIS. N.F. Strong Resorcinol Paste

[**Past. Resorcin. Fort.**—Lassar's Stronger Resorcinol Paste]

	Metric	Alternative
Resorcinol	**20 Gm.**	350 gr.
Zinc Oxide	**20 Gm.**	350 gr.
Starch	**20 Gm.**	350 gr.
Light Liquid Petrolatum	**40 Gm.**	1 oz. av. 262 gr.
To make	**100 Gm.**	4 oz. av.

Thoroughly triturate the zinc oxide with sufficient of the liquid petrolatum to make a thin, smooth paste. Reduce the resorcinol to a very fine powder, mix it with the starch, add the mixture to the zinc oxide paste and triturate until a uniformly smooth product is obtained. Then gradually incorporate the remainder of the liquid petrolatum.

PASTA RESORCINOLIS MITIS. N.F. Mild Resorcinol Paste

[**Past. Resorcin. Mit.**—Pasta Resorcini Mitis, Lassar; Lassar's Mild Resorcinol Paste]

	Metric	Alternative
Resorcinol	**10 Gm.**	175 gr.
Zinc Oxide	**25 Gm.**	1 oz. av.
Starch	**25 Gm.**	1 oz. av.
Light Liquid Petrolatum	**40 Gm.**	1 oz. av. 262 gr.
To make	**100 Gm.**	4 oz. av.

Thoroughly triturate the zinc oxide with sufficient of the liquid petrolatum to make a thin, smooth paste. Reduce the resorcinol to a very fine powder, mix it with the starch, add the mixture to the zinc oxide paste and triturate until a uniformly smooth product is obtained. Then gradually incorporate the remainder of the liquid petrolatum.

PASTA ZINCI. N.F. Zinc Paste

[Past. Zinc.—Pasta Zinci, Lassar; Lassar's Zinc Paste]

	Metric	Alternative
Salicylic Acid, in fine powder	2 Gm.	35 gr.
Zinc Oxide	24 Gm.	420 gr.
Starch	24 Gm.	420 gr.
Petrolatum	50 Gm.	2 oz. av.
To make	100 Gm.	4 oz. av.

Thoroughly triturate the zinc oxide with a portion of the petrolatum; then add the salicylic acid, starch, and the remaining petrolatum, and rub them until a smooth mixture is obtained.

PASTA ZINCI MOLLIS. N.F. Soft Zinc Paste

[Past. Zinc. Moll.—Pasta Zinci Mollis, Unna; Unna's Soft Zinc Paste]

	Metric	Alternative
Zinc Oxide, in very fine powder	25.0 Gm.	1 oz. av.
Precipitated Calcium Carbonate	25.0 Gm.	1 oz. av.
Oleic Acid	2.5 Gm.	44 gr.
Linseed Oil	25.0 Gm.	1 oz. av.
Solution of Calcium Hydroxide	22.5 Gm.	394 gr.
To make about	100 Gm.	4 oz. av.

Thoroughly triturate the zinc oxide and precipitated calcium carbonate with the linseed oil and oleic acid to form a smooth mixture, then gradually incorporate the solution of calcium hydroxide.

PASTA ZINCI SULPHURATA. N.F. Sulphurated Zinc Paste

[Past. Zinc. Sulphur.—Pasta Zinci Sulphurata, Unna; Unna's Sulphurated Zinc Paste]

	Metric	Alternative
Zinc Oxide, in very fine powder	15 Gm.	262 gr.
Precipitated Sulphur	10 Gm.	175 gr.
Purified Siliceous Earth	5 Gm.	87 gr.
Benzoinated Lard	70 Gm.	2 oz. av. 350 gr.
To make	100 Gm.	4 oz. av.

Mix the powders and triturate them with about an equal weight of benzoinated lard until a smooth mixture is obtained. Then incorporate the remainder of the benzoinated lard.

Cataplasmæ—*Poultices*

Only one poultice is official. They are usually used in domestic practice and made in the home. The materials for *spice poultice* are recognized in the N. F. under the title Pulvis Aromaticus Rubefaciens (see page 482).

The terms *fomentum* and *fotus* are applied to a hot aqueous solution applied to an inflamed area by means of a saturated cloth. A saturated solution of magnesium sulphate is frequently used in this manner.

CATAPLASMA KAOLINI. N.F. Cataplasm of Kaolin

[Catapl. Kaolin.]

	Metric	Alternative
Kaolin, recently dried at 110° C. and cooled, and in very fine powder	565.0 Gm.	9 oz. av. 18 gr.
Boric Acid, in very fine powder	45.0 Gm.	315 gr.
Thymol	0.5 Gm.	3½ gr.
Methyl Salicylate	2.0 Gm.	14 gr.
Oil of Peppermint	0.5 Gm.	3½ gr.
Glycerin, recently heated to 100° C.	387.0 Gm.	6 oz. av. 84 gr.
To make about	1000 Gm.	16 oz. av.

Mix the kaolin with the boric acid and thoroughly incorporate the warm glycerin. Add the thymol, dissolved in the methyl salicylate, the oil of peppermint, and make into a homogeneous mass. Preserve it in well-closed containers.

Uses—The large demand for an external application containing glycerin led to the introduction of this cataplasm in the U. S. P. VIII, but it has now been transferred to the N. F.; it is used to allay inflammation in the treatment of pneumonia, boils, carbuncles, etc., and in dermatological practice. Care should be taken to thoroughly dry both the kaolin and the glycerin for this preparation, as its value largely depends upon its ability to absorb moisture, and this is greatly increased when all ingredients are anhydrous. The heating also sterilizes the kaolin and decomposes any carbonate which may be present. In fact, it is desirable to heat the cataplasm, agitating it with mechanical stirrers, for some time before the oils are added, to eliminate the tendency to effervesce. The boxes in which it is sold should be of the so-called seamless type, as other styles are likely to leak.

Some Unofficial Poultices

Title	*Directions*
Cataplasma Amyli (B. P. C)	Make 10 Gm. of starch into paste with cold water, then add with constant stirring the remainder of 100 cc. of water, heated to boiling, and again boil
Amyli et Acidi Borici (B. P. C.)	Mix 10 Gm. of starch and 6 Gm. of boric acid, and proceed as above
Lini (B. P. C.)	Add 28 Gm. of ground linseed gradually to 72 cc. of boiling water
Sinapis (B. P. C.)	Add 28 Gm. of ground linseed gradually to about 70 cc. of boiling water, then add 2 Gm. of powdered mustard, previously rubbed to a paste with a little cold water
Ulmi Fulvæ (B. P. C.)	Mix 24 Gm. of powdered slippery elm with 4 Gm. each of boric acid and wood charcoal, and gradually add 68 cc. of boiling water

Emplastra—*Plasters*

Modern plasters are practically all machine made. The official formulas are chiefly intended to serve as standards for manufacturers to insure uniformity of products. The spreading of plasters at the prescription counter as a pharmaceutical art and a general discussion of manufactured plasters will be found in Part XI. The following formulas and standards are official:

EMPLASTRUM ADHÆSIVUM. U. S. Adhesive Plaster

[Emp. Adhæs.—Emplastrum Elasticum, U. S. P. IX, Rubber Adhesive Plaster]

A mixture of rubber, resins, and waxes, with a filler of an absorbent powder, such as zinc oxide, orris root, or starch, mechanically mixed and spread upon cotton cloth.

The plaster mass should contain about 30 per cent of pure rubber. When zinc oxide is used, it should represent at least 20 per cent of the plaster mass.

The mass must be free from nodules and spread evenly on a cotton fabric backing having not less than 62 threads to each square cm., each piece of 100 square cm. weighing not less than 1.18 Gm.

One hundred square cm. of the Plaster should contain not less than 1.50 Gm. of the plaster mass.

A strip of the Plaster 5 cm. by 6.5 cm., applied to a hard wood surface for thirty minutes at a constant temperature of 37° C., should resist a tension of not less than 40 pounds when applied by a tensile strength machine or other suitable device, the pull being exerted parallel with the warp and with the longer dimension of the Plaster. An instrument used in the application of this test is shown in Fig. 743.

EMPLASTRUM BELLADONNÆ. U. S. Belladonna Plaster

[Emp. Bellad.]

Belladonna Plaster contains extract of belladonna corresponding to not less than 0.25 per cent and not more than 0.30 per cent of the alkaloids of belladonna leaves.

Assay—Introduce 10 Gm. of Belladonna Plaster into a 100 cc. flask. (If the plaster is spread on fabric, cut the portion to be assayed into strips, weigh accurately, and introduce it into the flask.) Now add 50 cc. of chloroform, and shake the mixture until the plaster is dissolved. Pour the chloroform solution into a 250 cc. beaker, and wash the cloth upon which the plaster was

spread with two successive portions of 25 cc. each of chloroform, adding the washings to the chloroform solution in the beaker. Then wash this cloth with 80 cc. of alcohol containing 1 cc. of ammonia T.S., and pour the washings into the chloroform solution in the beaker. Stir the mixture gently and allow it to stand until the rubber has separated into a compact mass. Dry the cloth upon which the plaster was spread, weigh it, and subtract its weight from the first weight of the plaster. Pour the chloroform-alcohol solution into a 250 cc. separator, rinse the beaker and rubber with 10 cc. of alcohol, and add the rinsing to the separator. Completely extract the alkaloids from the chloroform-alcohol solution by shaking out repeatedly with weak sulphuric acid. Collect the acid washings in a separator, and add ammonia T.S. until the solution is decidedly alkaline to litmus paper, and completely extract the alkaloids by shaking out repeatedly with chloroform. Filter the chloroform solution through a pledget of purified cotton, evaporate it to dryness and dissolve the alkaloids from the residue in exactly 5 cc. of tenth-normal sulphuric acid, and titrate the excess of acid with fiftieth-normal potassium hydroxide.

Each cc. of tenth-normal sulphuric acid corresponds to 0.02893 Gm. of the alkaloids of belladonna leaves (Proximate Assays, page 1497).

EMPLASTRUM CANTHARIDIS. U. S. Cantharides Plaster

[Emp. Canthar.—Fly Blister]

Cantharides Cerate,
Adhesive Plaster, spread on fabric, each, a sufficient quantity.

Spread cantharides cerate upon the plaster, leaving a margin around the edges. It may also be spread on muslin, paper, or other suitable material.

Each square cm. of spread plaster should contain 0.1 Gm. of cantharides cerate.

EMPLASTRUM CAPSICI. U. S. Capsicum Plaster

[Emp. Capsic.]

Capsicum Plaster contains not less than 0.25 Gm. of oleoresin of capsicum in each 15 square cm.

EMPLASTRUM PLUMBI OLEATIS. U. S. Lead Oleate Plaster

[Emp. Plumb. Oleat.—Emplastrum Plumbi U. S. P. IX, Lead Plaster, Diachylon Plaster]

	Metric	Alternative
Lead Monoxide	1000 Gm.	1 lb. av.
Olive Oil	1000 Gm.	1 lb. av.
Lard	1000 Gm.	1 lb. av.

Boiling Water, a sufficient quantity.

Heat the olive oil and lard by a gentle heat until liquefied, in a bright copper or other suitable vessel of a capacity of not less than four times the bulk of the ingredients, sift the lead monoxide through a fine sieve, upon the surface of the hot liquid, and mix thoroughly. Then gradually add 350 cc. (about 6 fluid ounces) of boiling water, and boil the mixture, constantly stirring with a wooden spatula, and adding sufficient boiling water from time to time to replace that lost by evaporation, until the mass is homogeneous and a small portion removed and dipped into cold water is found to be pliable and tenacious. Then remove it from the fire, and wash several times with warm water to remove the glycerin. Finally knead the mass until it is free from water, roll it into cylinders of suitable size, and wrap them in paper.

U. S. P. Preparations—Emplastrum Resinæ; Unguentum Diachylon.
N. F. Preparation—Emplastrum Saponis.

History—Diachylon Plaster was the name first applied to a plaster made from oil, litharge and certain plant juices by Menecrates, a physician to the Caesars. The name *diachylon* means prepared from juices. The preparation has not contained any plant juices for many centuries but the name still persists. Some of the older formulas were complicated examples of polypharmacy. It was known for a time under the name of *Emplastrum Commune* or *common plaster.*

EMPLASTRUM SINAPIS. U. S. Mustard Plaster

[Emp. Sinap.—Mustard Paper]

A uniform mixture of powdered black mustard (deprived of its fixed oil) and a solution of rubber, spread on paper, cotton cloth, or other fabric.

Each 100 square centimeters of spread plaster contains not less than 2.5 Gm. of black mustard deprived of its fixed oil.

When moistened thoroughly with tepid water and applied to the skin, the Plaster produces a decided warmth and reddening of the skin within five minutes.

Preserve in tightly-closed containers.

Before Mustard Plaster is applied, moisten it thoroughly with tepid water.

Uses—(See page 993).

EMPLASTRUM FUSCUM CAMPHORATUM. N. F. Camphorated Brown Plaster

[Emp. Fusc. Camph.—Camphorated Mother Plaster]

	Metric	Alternative
Red Lead Oxide	**30 Gm.**	1 oz. av. 25 gr.
Olive Oil	**60 Gm.**	2 oz. av. 51 gr.
Yellow Wax	**15 Gm.**	231 gr.
Camphor	**1 Gm.**	15 gr.

Triturate the red oxide of lead with 55 Gm. [1 oz. av. 411 gr.] of the oil in a suitable kettle until a smooth paste results, and boil the mixture over a fire, with constant stirring, until gas bubbles rise, or until the red color of the mixture begins to turn brown. Then moderate the heat, but continue the stirring until the mixture has acquired a dark-brown color. From time to time allow a few drops of it to fall into cold water to test its condition, and when it congeals to a firm consistence remove the vessel from the fire, add the wax cut into small pieces, and finally the camphor, previously rubbed to a smooth paste with the rest of the olive oil. Mix thoroughly, allow the mixture to partly cool, and while still warm pour it into paper molds, previously coated with mucilage of acacia containing about five per cent of glycerin and allowed to dry.

EMPLASTRUM SAPONIS. N. F. Soap Plaster

[Emp. Sapon.]

	Metric	Alternative
Soap, dried, and in coarse powder	**10 Gm.**	175 gr.
Lead Oleate Plaster	**90 Gm.**	3 oz. av. 262 gr.
Water, a sufficient quantity,		
To make about	**100 Gm.**	4 oz. av.

Rub the soap with enough water to reduce it to a semi-liquid, mix it with the lead oleate plaster, previously melted, incorporate thoroughly by stirring, and evaporate the mixture to the consistence of a plaster.

Some Unofficial Plasters

Title	*Directions*
Emplastrum Adhæsivum Elasticum (B. P. C.)	India rubber, kneaded into fine strips, 20.31 Gm., wool fat 53.12 Gm., copaiba 6.25 Gm., orris root, powder, 20.31 Gm., thymol 0.40 Gm., methyl salicylate 0.60 Gm., solvent mineral naphtha, a sufficient quantity
Belladonnæ (Br. 1914)	Liquid extract of belladonna 50 cc. and resin plaster 137.5 Gm.
Belladonnæ Viride (B. P. C.)	Dry extract of belladonna 25 Gm., chlorophyll sufficient to color, rubber adhesive plaster to make 100 Gm.
Calefaciens (warming plaster) (Br. 1914)	Dissolve 0.2 Gm. of Cantharidin in 20 cc. of chloroform, add 40 cc. of olive oil, and 940 Gm. melted resin plaster
Cantharidini (Br. 1914)	Melt together 450 Gm. yellow wax and 1000 Gm. wool fat, and add 2 Gm. cantharidin, dissolved in 100 cc. of chloroform
Cantharidini Mite (B. P. C.)	Melt together 50 Gm. yellow wax and 50 Gm. wool fat and add 0.10 Gm. cantharidin, dissolved in chloroform
Capsici (B. P. C.)	Liquid extract of capsicum 10 Gm., and resin plaster to make 100 Gm.
Capsici Elasticum (B. P. C.)	Liquid extract of capsicum 10 Gm., and rubber adhesive plaster 95 Gm.

Some Unofficial Plasters—*Continued*

Title	*Directions*
Emplastrum Hydrargyri (Br. 1914)	Heat 2 Gm. sublimed sulphur with 18 Gm. olive oil until a reddish-brown liquid is obtained; triturate 328 Gm. mercury until it is extinguished, and then add 652 Gm. of melted lead plaster
Menthol (Br. 1914)	Melt 100 Gm. yellow wax and 750 Gm. resin together, at about 70° C., and dissolve 150 Gm. menthol in the melted mixture
Plumbi (Br. 1914)	Lead oxide 400 Gm., olive oil 800 Gm., distilled water 400 cc., or a sufficient quantity (See U. S. P. X for process)
Resinæ (U. S. P. IX)	Resin 140 Gm., lead plaster 800 Gm., yellow wax 60 Gm., melt together
Resinæ (Br. 1914)	Resin 100 Gm., lead plaster 850 Gm., hard soap 50 Gm., melt together
Salicylicum Compositum (B. P. C.)	Salicylic acid 20 Gm., extract of Indian hemp 10 Gm., rubber adhesive plaster 70 Gm.
Salicylicum Compositum Fortius (B. P. C.)	Salicylic acid 40 Gm., extract of Indian hemp 5 Gm., India rubber, kneaded into fine strips, 15 Gm., wool fat 40 Gm., copaiba 5 Gm., thymol 0.3 Gm., methyl salicylate 0.45 Gm., solvent mineral naphtha, a sufficient quantity
Salicylicum Elasticum (B. P. C.)	Salicylic acid 10 Gm., rubber adhesive plaster, 90 Gm.
Saponis (Br. 1914)	Hard soap 140 Gm., lead plaster 835 Gm., resin 25 Gm.
Zinci oxidi (B. P. C.)	Zinc oxide 20 Gm., rubber adhesive plaster 80 Gm.

Manufacturers' Standards for India Rubber Base Plasters

This consists of a mass containing approximately thirty-three per cent of plastic India rubber, Burgundy pitch, olibanum and waxes and thirty-three per cent of orris root and other fillers with which the drugs are incorporated.

Arnica Plaster—5 per cent solid extract of arnica.

Belladonna Plaster—0.25 to 0.30 per cent of the alkaloids of belladonna.

Belladonna and Capsicum Plaster—0.125 of the alkaloids of belladonna and 3.5 per cent of powdered capsicum.

Breast Plaster—0.25 per cent of the alkaloids of belladonna.

Cantharides Plaster (Blister Plaster)—30 per cent of powdered cantharides.

Capsicum Plaster—5 per cent of powdered capsicum.

Mercurial Plaster—30 per cent of metallic mercury.

Salicylic Acid Plaster—Made in two strengths, 10 per cent and 20 per cent of salicylic acid.

Salicylic Acid and Cannabis Indica Plaster—10 per cent of extract of cannabis indica and 40 per cent of salicylic acid.

Strengthening Plaster—2 per cent of ferric oxide.

Thapsia Plaster—6 per cent of resin of thapsia garganica.

Mullæ—*Mulls*

[Salve Mulls—Steatins]

Mulls are ointments of high fusing points, containing the desired medicinal agent, and spread on soft muslin or "mull", in a manner similar to the ordinary spread plasters. Although these mulls are more conveniently produced with the aid of special mechanical appliances, it is quite practicable to prepare them on a limited scale as follows:

Spread a sheet of moistened parchment paper on a smooth surface, wipe off the excess of moisture with a cloth, stretch evenly a corresponding piece of unsized mull upon the parchment paper and hold it in place with thumb-tacks. Then spread the previously melted and partly cooled ointment evenly on the mull by means of a broad, flat bristle brush, and, when a sufficient layer has been applied in this way, smooth the surface by the aid of two elastic spatulas, heated by immersion in hot water, wiped dry, and used alternately to expedite the operation. A smooth surface having been produced, remove the thumb-tacks and withdraw the mull from the parchment paper, the operation being facilitated by fastening the uncoated end of the mull upon a flat stick of wood. Then suspend the mull on a string in a cool room, and when thoroughly chilled, cover it with paraffin paper and roll it into a cylinder.

The most suitable base for preparing Mulls is a mixture of suet and lard, in suitable proportions, with the occasional addition of wax or lead oleate plaster—this depending upon the nature of the medicinal component, or the intended use. The following formulas serve as examples:

MULLA ACIDI SALICYLICI. N. F. Salicylic Acid Mull

[Mull. Ac. Salicyl.—Unguentum Salicylatum Extensum]

	Metric	Alternative
Salicylic Acid	10 Gm.	175 gr.
Benzoinated Suet	80 Gm.	3 oz. av. 87 gr.
Benzoinated Lard	10 Gm.	175 gr.
To make	100 Gm.	4 oz. av.

Mix the salicylic acid intimately with the benzoinated lard and then incorporate the benzoinated suet. Spread the mull as needed.

MULLA CREOSOTI SALICYLATA. N. F. Salicylated Creosote Mull

[Mull. Creosot. Salicyl.—Unguentum Creosoti Salicylatum Extensum]

	Metric	Alternative
Salicylic Acid	10 Gm.	175 gr.
Creosote	20 Gm.	350 gr.
Yellow Wax	5 Gm.	87 gr.
Benzoinated Suet	65 Gm.	2 oz. av. 262 gr.
To make	100 Gm.	4 oz. av

Melt the yellow wax, add the benzoinated suet, incorporate the creosote and salicylic acid, and stir until the product congeals. Spread the mull as needed.

MULLA HYDRARGYRI CHLORIDI CORROSIVI. N. F. Corrosive Mercuric Chloride Mull

[Mull. Hydrarg. Chlor. Corros.—Unguentum Hydrargyri Chloridi Corrosivi Extensum]

	Metric	Alternative
Corrosive Mercuric Chloride	2 Gm.	3½ gr.
Alcohol	60 cc.	105 min.
Benzoinated Suet	900 Gm.	3 oz. av. 262 gr.
Benzoinated Lard	50 Gm.	88 gr.
To make about	1000 Gm.	4 oz. av.

Dissolve the corrosive mercuric chloride in the alcohol, mix this with the benzoinated lard, and then incorporate the benzoinated suet. Avoid contact with metallic implements or containers. Spread the mull as needed.

MULLA ZINCI. N. F. Zinc Mull

[Mull. Zinc.—Unguentum Zinci Extensum]

	Metric	Alternative
Zinc Oxide	10 Gm.	175 gr.
Benzoinated Suet	70 Gm.	2 oz. av. 350 gr.
Benzoinated Lard	20 Gm.	350 gr.
To make	100 Gm.	4 oz. av.

Mix the zinc oxide intimately with the benzoinated lard and incorporate the benzoinated suet. Spread the mull as needed.

Chartæ—*Papers*

Papers are preparations intended principally for external application, made either by saturating paper with medicinal substances or by applying the latter to the surface of the paper by the addition of some adhesive liquid. One paper is official in the N. F. (see Charta Potassii Nitratis, page 523).

CHARTA POTASSII NITRATIS. N. F. Potassium Nitrate Paper

[Chart. Pot. Nit.]

	Metric	Alternative
Potassium Nitrate	**200 Gm.**	7 oz. av. 24 gr.
Water	**800 cc.**	27 fl. oz. 24 min.

Dissolve the potassium nitrate in the water. Immerse strips of white, unsized paper in the solution, and dry them. Keep the paper in well-closed containers.

Suppositoria—*Suppositories*

Suppositories are largely prepared extemporaneously, at the prescription counter, only a few formulas being official. An extended presentation of the entire subject will be found in Part XI. The formula for Glycerinated Gelatin has also been included here as it is the basis for one type of suppositories.

SUPPOSITORIA GLYCERINI. U. S. Suppositories of Glycerin

[Supp. Glycerin.]

	Metric	Alternative
Glycerin	**80 Gm.**	2 oz. av. 360 gr.
Monohydrated Sodium Carbonate	**2 Gm.**	31 gr.
Stearic Acid	**8 Gm.**	123 gr.
Water	**10 cc.**	154 gr.
To make about	**30 Suppositories**	30 Suppositories

Dissolve the monohydrated sodium carbonate in the water and add it to the glycerin contained in a suitable vessel, placed in a water bath in such a way that the vessel is well immersed in the boiling water and its contents protected as much as possible from the steam of the bath. Add the stearic acid and heat the mixture for fifteen minutes or until the carbon dioxide ceases to be evolved, and the liquid is clear. Then pour the melted mass into suitable molds, remove the suppositories when they are completely cold, and preserve them in tightly-stoppered glass vessels in a cool place.

SUPPOSITORIA BOROGLYCERINI. N. F. Suppositories of Boroglycerin

[Supp. Boroglycerin.]

	Metric	Alternative
Glycerinated Gelatin	**20 Gm.**	309 gr.
Glycerite of Boroglycerin	**15 Gm.**	231 gr.
Glycerin	**15 Gm.**	231 gr.

To make 12 (twelve) rectal suppositories.

Melt the glycerinated gelatin on a water bath, add the glycerite of boroglycerin and glycerin and mix well. Pour the uniform mixture into well-oiled molds of the required size, which should be slightly warmed, and allow it to stand until the suppositories are firm. Dispense the suppositories in glass containers.

Some Unofficial Suppositories

Title	*Directions*
Suppositoria Acidi Carbolici (Br. 1914)	Dissolve 0.8 Gm. of phenol in 0.5 Gm. of white wax and enough oil of theobroma, previously melted, to make 12 suppositories, and pour into molds
Acidi Tannici (Br. 1914)	Mix, with trituration, 2.4 Gm. of tannic acid with sufficient melted oil of theobroma to make 12 suppositories, and pour into molds
Belladonnæ (Br. 1914)	Prepare as directed for tannic acid, using 1.7 cc. of liquid extract of belladonna
Iodoformi (Br. 1914)	Prepare as directed for tannic acid, using 2.4 Gm. of iodoform
Morphinæ (Br. 1914)	Prepare as directed for tannic acid, using 0.2 Gm. of morphine hydrochloride
Plumbi Composita (1914)	Prepare as directed for tannic acid, using 2.4. Gm. of lead acetate and 0.8 Gm. of opium

Since Glycerinated Gelatin is largely used in suppositories the formula is placed below:

GELATINUM GLYCERINATUM. U.S. Glycerinated Gelatin

[Gelat. Glycerin.]

	Metric	Alternative
Gelatin	100 Gm.	4 oz. av.
Glycerin	100 Gm.	4 oz. av.
Water, a sufficient quantity,		
To make	200 Gm.	8 oz. av.

Pour upon the gelatin sufficient water, which has been previously boiled and cooled, to cover it, allow it to stand one hour, pour off the water, and allow the gelatin to drain for a few minutes. Then transfer it to a dish, add the glycerin, and heat on a water bath until the gelatin is dissolved. Strain the solution while hot, transfer to a tared dish, and continue the heat on the water bath until the product weighs 200 Gm. [8 oz. av.]. When cold, cut the mass into pieces, and preserve in well-closed containers.

STILI MEDICAMENTORUM—Medicated Pencils

[**Stil. Medic.**—UNNA PENCILS, PASTE PENCILS, STILUS DISSOLUBILIS, STILUS UNGUENTIS, STILI DILUBILES, N. F. IV]

Pencils for the direct application of medicinal agents to the skin, used in dermatologic practice. The medicinal agent is incorporated with a paste consisting of starch, dextrin, tragacanth and sucrose, with sufficient water to form a plastic mass. This is rolled into cylinders, of about 5 mm. diameter, which are cut into sections about 5 cm. long, dried on parchment paper at room temperature, and wrapped in tin-foil. Medicated pencils, intended as a caustic application, as sticks of silver nitrate, are sometimes referred to as *escharotica*. The following formula serves as an example:

STILI ACIDI SALICYLICI. N.F. Salicylic Acid Pencils

[**Stil. Acid. Salicyl.**—STILUS ACIDI SALICYLICI DILUBILIS]

	Metric	Alternative
Salicylic Acid, in fine powder	10 Gm.	154 gr.
Tragacanth, in fine powder	5 Gm.	77 gr.
Starch, in fine powder	30 Gm.	1 oz. av. 25 gr.
White Dextrin, in fine powder	35 Gm.	1 oz. av. 103 gr.
Sucrose, in fine powder	20 Gm.	309 gr.
Distilled Water, a sufficient quantity to make a firm plastic mass		

One hundred Gm. of this material is sufficient to make from 40 to 45 pencils.

Miscellaneous Unofficial Preparations

Applicatio—An old term used to imply preparations for external use.

Auristilla—This term is applied to preparations intended for the treatment of the internal ear. The National Formulary Compound Oil of Hyoscyamus is an illustration of the type.

Insufflatio—Insufflations are powders used for blowing into the nose, preferably by means of one of the various kinds of insufflators made for the purpose. They may also be applied in the way in which snuff is usually taken.

The formula for compound menthol snuff of the Br. Phar. Codex, as follows, is typical:

Menthol, in powder	5.00
Ammonium chloride, in powder	10.00
Boric acid, in powder	20.00
Lycopodium	65.00

Mix the powders.

Moxa—This term is used to indicate a soft wooly mass prepared from the young leaves of a Chinese wormwood, and used as a cautery by burning it on the skin; hence, any substance used in a like manner as a counterirritant.

Miscellaneous Unofficial Preparations—*Continued*

Pigmentum—Paints, also referred to as *Litus*, are liquid preparations usually medicated with substances possessing antiseptic, caustic, soothing, or stimulating properties. They are prepared with vehicles which render their consistence suitable for application to the skin or mucous surfaces by means of a brush. The character of the bases differs considerably, their selection depending upon the nature of the medicament to be applied, the duration of contact desired, and the degree of absorption required. Paints intended to remain in contact with a specified surface are usually prepared with collodion, glycerin, glycerin and water, solution of egg albumen in alcohol, or a solution of gutta percha. Paints intended to be absorbed are prepared with oleic acid or fatty oils. Caustic substances when employed as paints are usually applied dissolved in distilled water, and occasionally in alcohol or ethereal vehicles. Resinous substances, such as benzoin, storax, balsam of tolu, or sandarac, dissolved in ether, are employed as bases for medicated varnishes, and used for application to the skin and raw mucous surfaces. Bottles fitted with glass stoppers are usually most suitable as containers for paints. Paints containing chromic acid are applied by means of glass brushes.

Sinapismus—This is an old term applied to a vesicant or blistering agent. A number of substances are used to produce this effect, such as a mustard poultice or mustard plaster (see page 520), or some form of cantharides (see page 519), or thapsia (see page 521).

Vaporis—This term is used as the class name for a number of preparations in the Br. Phar. Codex. These preparations are intended to be vaporized, usually through the aid of heat, although in some instances, an atomizer or nebulizer is employed. They perform their function through inhalation.

A typical preparation is *benzoin inhalation* in which a teaspoonful of compound tincture of benzoin is added to about 1 quart of hot water and the vapor inhaled to relieve a bronchial congestion.

Another type of preparation is illustrated by the formula for *compound eucalyptus inhalation* or vapor in which 16.5 parts of oil of eucalyptus, 8.25 parts of pinus pumilionus, and the same quantity of a strong tincture of iodine, also 16.5 parts of camphor, are dissolved in 34 parts of 10 per cent spirit of ammonia. Pine sawdust is saturated with the mixture which is then used by inhalation. Other formulas will be found in the Codex.

When the material to be inhaled is not liquid, it is known as *vapor siccus*, an illustration being well-known dry smelling salts.

PART IV

INORGANIC CHEMICAL COMPOUNDS

CHAPTER XXXIX

THEORY OF INORGANIC CHEMISTRY

UP TO the present chapter of this book numerous fundamental facts have been considered covering definitions of importance in the study of pharmacy, and the description and discussion of various operations and processes which are necessary in the preparation and compounding of medicines.

At this point will begin the detailed consideration of the substances actually used in pharmacy and medicine.

The group of substances known commonly as chemical compounds or "chemicals" will be taken up at first, beginning with those classified as *inorganic* and later taking up those belonging to the *organic* groups.

It is not to be understood that the following introductory pages are intended to take the place of a complete textbook on chemistry. The discussion of the subject will serve, however, to render the chemical portions of the text intelligible to an apprentice or student who does not happen to possess a textbook on elementary chemistry and also as a review to the student or graduate pharmacist, and for the sake of such persons this section is included.

Chemistry is the science that concerns itself with matter and the changes that takes place in its composition. *Matter* is anything that occupies space and possesses weight. *Matter* as we ordinarily know it is *indestructible*. We may change its form but we cannot annihilate it by any means known to science. The *changes* which matter undergoes may be either *physical* or *chemical*. *Matter* is existent in three physical states—*solid*, *liquid*, and *gaseous*. If a substance changes from one of these states to the other, or undergoes solution, or any other kind of change which does not affect its identity, it is said to be subject to *physical change*. The change of water to ice, on one hand, or to steam, on the other, is in each case a physical change. When however, a change is produced in a substance that affects its identity, it is known as a *chemical change*. The rusting of iron and the striking of a match to kindle a flame are examples of chemical changes. Examples of physical and chemical changes applied to the same substance are afforded by the case of sulphur. If sulphur is heated in a closed vessel, without application of flame, it undergoes vaporization, and sublimes, depositing sulphur in microcrystalline form with no change of identity. If, however, sulphur is heated in the open air to the ignition point, it burns with a characteristic blue flame and loses its identity as elemental sulphur, being converted into a compound of sulphur with oxygen, known as sulphur dioxide.

Chemical change may include (1) *direct combination*, as when sulphur attaches itself to oxygen, as described in the preceding experiment; (2) *rearrangement of fundamental factors*, in which new substances may be formed by *chemical reaction*, as it is called; (3) *by decomposition*, in which complex bodies may be resolved into these that are simpler, as would be illustrated by resolving sulphur dioxide back again into sulphur and oxygen.

The decomposition or subdivision of matter cannot be carried on indefinitely. A point is reached in which substances of great stability known as *elements* are encountered. The fundamental factors of elements in connection with the study of chemical properties and chemical changes are *molecules* and *atoms*. The atom is the normal unit of chemical activity.

The smallest particle into which matter can be subdivided and retain its identity, is the *atom*.[1] The atom possesses an invariable weight and a definite power of attraction. The *atoms* combine with each other to form *molecules*.[2] Molecules when composed of like atoms are simple molecules, and matter composed of such molecules is called an elemental substance or an *element*. Molecules may also be composed of unlike atoms. Such products are known as *chemical compounds*. When the elements are arranged in the order of their atomic weights, they show certain groupings in which elements of similar chemical character are brought together. Several such arrangements were proposed nearly a century ago, but the one that has proved to be of the greatest value is known as the *periodic system* of *Mendelejeff*. (See table of Elements, page 531.)

When the composition of a compound body is ascertained by separating it into simpler factors, the process is called *analysis*. *Proximate analysis* is where a complex product is resolved into simpler factors which are not elemental, any one of these factors being quantitatively determined, as in the estimation of morphine in opium, or of potassium iodide in Lugol's solution. *Ultimate analysis* is when the elemental factors themselves are sought, as in the analysis of quicklime to determine the amounts of calcium and oxygen, or of sugar to determine the amounts of carbon, hydrogen, and oxygen.

The opposite of analysis is *synthesis*. This is the process of combining simpler substances to form those that are more complex. The word *synthetic* is applied to certain compounds that have been produced in this manner to distinguish them from similar compounds of natural origin. The word *artificial* is

---

[1] *The Atom.*

Modern researches on the structure of the atom indicate that all elements have a common relationship, in that there are only two factors present in the atom, i.e., the *nucleus*, and the *electron*. The mass or weight of the atom is concentrated almost entirely in the nucleus, which is near the center of the atom. The electrons are spaced about the nucleus in a systematic manner, but whether the electrons revolve about the nuclei or are merely in a state of constant oscillation has not been decided. The electron is not matter at all but is a manifestation of force. It is the same factor or unit that produces certain phenomena of electricity and radio activity. The simplest and lightest atom is that of hydrogen which contains a single nucleus and a single electron. The nucleus in the case of the hydrogen atom is called the *proton*. The most complex atom of elemental matter and the heaviest is uranium. According to the interpretation of the periodic system, in the light of modern atomic theories, there are 92 possible elements, of which all but three have been discovered. Those most recently discovered were Hafnium, Masurium and Rhenium.

All nuclei are charged with, or may consist of positive electricity. All electrons consist of negative electricity. The balance between these forces is the cause of the stability of the atom. The spontaneous disintegration of *radium* to yield *helium* and *lead* as products of its dissociation has renewed a belief in the theoretical transmutation of the elements, or conversion of one element into another one closely related in the atomic scale. The open structure of the atom is another of the astonishing discoveries of modern physical research. It has not been possible to draw a diagram of the hydrogen atom to scale, for if the nucleus were magnified to a size visible to the naked eye, the electron would have to be placed several hundreds of miles distant to be in proportion.

Atomic structure therefore may be compared to our solar system as regards density.

[2] *The Molecule.*

The size and numbers of molecules as well as their weight have been determined during recent years by physical chemists, with astonishing accuracy.

If a single drop of water were to be magnified to the size of the earth, the molecules would be only about the size of oranges, and would be separated from each other by great open spaces in which they would be free to vibrate or oscillate by the mysterious force known as molecular motion. These molecules themselves are composed of atoms whose open structure is also described in the note under the atom. The speed of this vibration or oscillation (which is independent of the motion of the atomic nuclei and electrons, elsewhere described), is greater than that of a rifle bullet, and it is estimated that each molecule collides with another one about five billion times in every second.

A single glass of water (about 250 cc.). contains about 10,000,000,000,000,000,000 molecules. The significance of this figure cannot be grasped even when written out, but physicists have suggested another means of comparison. If a single glass of water were to be dipped out of the ocean, and then poured back; and, if it is possible to conceive of this original glassful of water being uniformly diffused throughout all the oceans of the world, and another glassful of the same size were then dipped from the ocean, about 2000 molecules which were originally in the first glass of water would be found in the second, if there were means of recognizing them.

sometimes confused with the word *synthetic* in its usage. Artificial means prepared by art and does not signify identity of constitution, but similarity of character or use. Synthetic means identical chemical character but prepared by chemical process and not of natural origin.

Chemists have never been able to isolate or render visible either atoms or molecules, but they have established some fundamental rules that have served admirably to develop chemistry into an exact or mathematical science. Among the general principles of importance are the following:

1. *The atom of each element has a constant and definite weight in its relation to the other elements.* This factor is called the *atomic weight* and is of great importance in chemical calculations.
2. *The atom of hydrogen is the lightest of all atoms,* and is taken as unity in the determination of atomic weights.
3. *Combination takes place between atoms in consequence of an attractive force called chemical affinity.*
4. *Every chemical compound is definite in its nature, and the proportion of its constituents is always constant.*

This is known as the law of constant proportions.

Pure water always consists of 11.2 per cent of hydrogen and 88.8 per cent of oxygen, by weight, corresponding to two atoms of hydrogen and one atom of oxygen.

5. *Elements may combine in more than one set of proportions.* With each change in proportions, however, a different chemical compound results.

This has given rise to a second rule as follows: *When elements combine in more than one proportion, the higher proportions are simple multiples of the lower.* This is known as the law of multiple proportions. Thus two compounds of carbon and oxygen are known in which the first consists of one atom of carbon and one atom of oxygen, written CO, the second consists of one atom of carbon and two atoms of oxygen, written CO_2.

Chemistry, in order to be easily understandable and at the same time mathematically exact, has for many years employed a *system of notation,* which might be called chemical shorthand. A *chemical symbol* is an abbreviation of the name of an element. In many cases an initial letter is used, as H for hydrogen, O for oxygen, C for carbon, S for sulphur, etc. Where more than one element has the same initial letter, the proper distinction is attained by assigning the single initial letter to the most frequently occurring or important element and attaching appropriate small letters to the initial letters in other conflicting cases. Thus Os stands for Osmium to distinguish it from oxygen, and Cl for Chlorine, Ca for Calcium, Co for Cobalt, are several instances of avoiding confusion with the C for carbon.

In some cases the symbol is derived from the Latin name of the element. Thus iron is represented by Fe for *ferrum;* lead by Pb for *plumbum;* silver by Ag for *argentum;* potassium by K for *kalium,* and sodium by Na for *natrium,* to exemplify a few of the more common instances. The student of chemistry should memorize the names and symbols of all of the important elements as a fundamental step in his studies in order that he may be able to read and understand chemical formulas and equations.

To express the combination of elements, so as to indicate with absolute mathematical certainty the composition of a compound body, the symbols are written together like the letters of a word. A properly arranged collection of symbols representing a definite chemical compound is called a *formula.* In a chemical formula the symbol represents a single atom of the element. Where

more than one atom of an element is present the fact is indicated by placing a small number on the lower right hand side of the symbol to which it applies. Thus CaO is the chemical formula for one molecule of calcium oxide or quicklime, in which one atom each of calcium and oxygen are present, while CaO_2 is the formula for one molecule of calcium peroxide which contains one atom of calcium and two atoms of oxygen. In case several atoms are multiplied by the same number, a large figure is placed in front or the group is placed in a parenthesis and a small figure attached to the lower right hand, as in the case of single elements. Thus 4 H_2O might also be written $(H_2O)_4$ as they are mathematically identical The large figures used to precede a formula are usually employed to indicate the number of complete molecules, while the parenthetical grouping is used to indicate the number of certain groups, sometimes called radicles. The following complex formula of an official chemical compound will serve to illustrate all of the possibilities of these uses of modifying numbers:

$$(MgCO_3)_4.Mg(OH)_2.5H_2O.$$

If the foregoing formula were written in the most condensed form possible, it would be given as follows: $Mg_5C_4O_{19}H_{12}$. Such a formula is called an *empiric* or *empirical formula*. It is frequently meaningless in comparison with a formula written as previously given, which is known as a *rational formula*, because it shows, by the use of the reasoning power of the observer, the compound to consist of four molecules of normal magnesium carbonate, one molecule of magnesium hydroxide and five molecules of water, this entire combination constituting *official magnesium carbonate*.

Several other types of formulas are in use besides those described. In a *structural formula*, sometimes called a *graphic formula*, the symbols of the elements are so arranged as to show by bonds of attachment the structural relationship of the elements in a compound. Thus CO_2 is the common empiric formula of carbon dioxide (in such simple compounds the empiric and the rational formulas are usually identical), while, when the same compound is written: O=C=O, it shows the structural relationships of the carbon to the oxygen. Structural formulas have their most important use in organic chemistry and are very complex at times.

Still another type of formula is called the *stereochemical formula* in which attempts are made to show the three or dimensional relationship of the atoms in space. This type will be discussed in the introductory chapter to organic chemistry.

Valence—The combining power of an atom or a group of atoms to indicate the number of hydrogen atoms with which it might combine or might displace, is known as valence. It is sometimes called *replacing value* or *saturating power*. In some elements the valence is indirect or comparative, because there is no known compound of the element with hydrogen. In such cases valence is determined by indirect comparison. Degrees of valence are indicated by Greek or Latin names or prefixes and Roman numerals, the latter being placed to the upper right hand of the symbol.

I indicates a monad, the element being referred to as monovalent, or univalent.
II indicates a dyad (bivalent).
III indicates a triad (trivalent).
IV indicates a tetrad (tetravalent, or quadrivalent).
V indicates a pentad (pentavalent, or quinquevalent).
VI indicates a hexad (hexavalent).
VII indicates a heptad (heptavalent).

Valence has nothing to do with energy or chemical activity. It is a measure of combining capacity only. Degrees of valency are a matter of established record, the same as are atomic weights. They must be correctly learned, for a knowledge of the valence of the elements is the key to the composition of all chemical compounds and enables chemical formulas and equations to be comprehended and written with ease.

When elements are combined in such proportion that their valences are equalized, compounds are said to be *saturated*. *Unsaturated* compounds are represented by groups known as *radicles*.

The following list of the more important elements gives the valences:

Table of the Elements with their Symbols, Valences, and Atomic Weights
Adopted by the International Committee on Chemical Elements[1]

The basis for this table is **Oxygen = 16**

Name	Symbol	Valence		Atomic[2] Weight 1921	Atomic Weight 1925
		Positive	Negative		
Aluminum	Al	III	—	27.0	26.97
Antimony	Sb	III and V	III	120.2	121.77
Argon	A	O	—	39.9	39.91
Arsenic	As	III and V	III	74.96	74.96
Barium	Ba	II	—	137.37	137.37
Bismuth	Bi	III	—	209.0	209.0
Boron	B	III	III	10.9	10.82
Bromine	Br	I, III, V and VII	I	79.92	79.916
Cadmium	Cd	II	—	112.40	112.41
Calcium	Ca	II	—	40.07	40.07
Carbon	C	IV	IV	12.005	12.000
Cerium	Ce	III and IV	—	140.25	140.25
Cesium	Cs	I	—	132.81	132.87
Chlorine	Cl	I, III, V and VII	I	35.46	35.457
Chromium	Cr	II, III and VI	—	52.0	52.01
Cobalt	Co	II and III	—	58.97	58.97
Columbium	Cb	III and V	—	93.1	93.1
Copper	Cu	I and II	—	63.57	63.57
Dysprosium	Dy	III	—	162.5	162.52
Erbium	Er	III	—	167.7	167.7
Europium	Eu	III	—	152.0	152.0
Fluorine	F	—	I	19.0	19.0
Gadolinium	Gd	III	—	157.3	157.26
Gallium	Ga	III	—	70.1	69.72
Germanium	Ge	IV	—	72.5	72.60
Glucinum	Gl	II	—	9.1	9.02
Gold	Au	I and III	—	197.2	197.2
Helium	He	O	—	4.0	4.00
Holmium	Ho	III	—	163.5	163.4
Hydrogen	H	I	—	1.008	1.008
Indium	In	III	—	114.8	114.8
Iodine	I	I, III, V and VII	I	126.92	126.932
Iridium	Ir	II, III and IV	—	193.1	193.1
Iron	Fe	II and III	—	55.84	55.84
Krypton	Kr	O	—	82.92	82.92
Lanthanum	La	III	—	139.0	139.0
Lead	Pb	II and IV	—	207.2	207.2
Lithium	Li	I	—	6.94	6.94
Lutecium	Lu	III	—	175.0	175.0
Magnesium	Mg	II	—	24.32	24.32

[1] A new element has recently been discovered in monazite residues by Prof. B. S. Hopkins, of the University of Illinois. Its isolation and identification have been made possible by means of X-ray photographs and the spectroscope. This element belongs to the group of rare earth elements and has been given the name, *Illinium*, and the symbol, Il.

[2] The 1921 atomic weights are used in the U. S. P. X. and in the N. F. V., as the 1925 table was not available in time.

Table of the Elements with their Symbols, Valences and Atomic Weights—*Continued*

Name	Symbol	Valence		Atomic Weight 1921	Atomic Weight 1925
		Positive	Negative		
Manganese	Mn	II, III, IV and VII	—	54.93	54.93
Mercury	Hg	I and II	—	200.6	200.61
Molybdenum	Mo	III, IV and VI	—	96.0	96.0
Neodymium	Nd	III	—	144.3	144.27
Neon	Ne	O	—	20.2	20.2
Nickel	Ni	II and III	—	58.68	58.69
Niton (Radon)	Nt	O	—	222.4	222.4
Nitrogen	N	III and V	III	14.008	14.008
Osmium	Os	II, III, IV and VI	—	190.9	190.8
Oxygen	O	—	II	16.0	16.00
Palladium	Pd	II and IV	—	106.7	106.7
Phosphorus	P	III and V	III	31.04	31.027
Platinum	Pt	II and IV	—	195.2	195.23
Potassium	K	I	—	39.1	39.096
Praseodymium	Pr	III	—	140.9	140.92
Radium	Ra	II	—	226.0	225.95
Rhodium	Rh	II and IV	—	102.9	102.91
Rubidium	Rb	I	—	85.45	85.44
Ruthenium	Ru	II and IV	—	101.7	101.7
Samarium	Sa	III	—	150.4	150.43
Scandinum	Sc	III	—	45.1	45.1
Selenium	Se	II, IV and VI	—	79.2	79.2
Silicon	Si	IV	IV	28.1	28.06
Silver	Ag	I	—	107.88	107.88
Sodium	Na	I	—	23.0	22.997
Strontium	Sr	II	—	87.63	87.63
Sulphur	S	II, IV and VI	II	32.06	32.064
Tantalum	Ta	III and V	—	181.5	181.5
Tellurium	Te	IV and VI	II	127.5	127.5
Terbium	Tb	III	—	159.2	159.2
Thallium	Tl	I and III	—	204.0	204.39
Thorium	Th	IV	—	232.15	232.15
Thulium	Tm	III	—	169.8	169.4
Tin	Sn	II and IV	—	118.7	118.7
Titanium	Ti	IV	—	48.1	48.1
Tungsten	W	II, IV and VI	—	184.0	184.0
Uranium	U	IV and VI	—	238.2	238.17
Vanadium	V	III and V	—	51.0	50.96
Xenon	Xe	O	—	130.2	130.2
Ytterbium	Yb	III	—	173.5	173.5
Yttrium	Yt	III	—	89.33	89.33
Zinc	Zn	II	—	65.37	65.37
Zirconium	Zr	IV	—	90.6	91.0

Several Facts of Interest about the Elements.

Although ancient civilizations and early peoples were familiar with the metallic elements, gold, silver, iron, copper, mercury, lead, etc., and with a few of the non-metallic elements, such as sulphur and carbon which occur free in nature, they seem to have had no conception of their fundamental character and ascribed elemental properties to earth, air, fire, and water.

It was not until about 1803 that the work of Dalton resulted in the formulation of an atomic theory, which, while presupposing the indestructibility of the atom concerning which there is now grave doubt, served the important purpose of developing chemistry into an exact mathematical science of inestimable practical and economic value.

Most of the elements are uncommon and even their names are not familiar except to the scientific workers. Some are of greater industrial importance than others, such as iron and copper. A few are valued for their rarity and stability, such as gold and platinum.

Chemists and geologists have made a survey of the estimated composition of the earth's crust and the frequency of the occurrence of the elements together, with their approximately relative amounts, and the results are somewhat surprising. Ten elements make up over 99 per cent of the earth's crust. They are oxygen, silica, aluminum, iron, calcium, magnesium, sodium, potassium, carbon, and phosphorus. Sulphur, hydrogen, chlorine, and nitrogen come next, and the 78 remaining elements, some of which are among the commonest in pharmacy and in every day life, make up the very small proportion remaining.

A few of the elements are associated intimately with life processes and are found in what are known as organic compounds which are primarily compounds of carbon. These compounds will be further discussed under the heading—Introduction to Organic Chemistry.

Monad elements combine in equal atomic proportions. Examples, NaCl, HI, KBr, etc.

Dyad elements combine in equal atomic proportions also, as FeS, CaO, etc.

When a dyad element combines with a monad element, it requires two of the latter to each one of the former. Examples H_2O, $HgCl_2$, etc.

Triad elements follow analogous combining rules. It requires three monads for each triad as in $SbCl_3$ or three dyads for each two triads as in As_2O_3.

Valence is sometimes expressed for purposes of instruction and in structural formulas by means of hypothetical bonds attached to the symbol.

Examples:

H—(monad) —O—or O = (dyad)

—A—or As≡(triad) —C—or =C= or C≣ tetrad

and so on similarly to the end of the list.

The degrees of valence are not invariable. A number of elements (such as chlorine for example) exhibit more than one valence. When an element changes its valence, either increasing or diminishing, the change is by two degrees at a time. Thus chlorine may be univalent, trivalent, pentavalent, or septivalent:

Cl— Cl≡ Cl≣ Cl≣

Instances where an apparent change of one degree occurs are accounted for by the assumption that the atoms have the power of combining with their own kind. For example, mercury is ordinarily a bivalent element, combining with chlorine to form mercuric chloride, $HgCl_2$ exhibiting normal valence, Cl—Hg—Cl. To account for mercurous chloride (Hg_2Cl_2) the following structural relationship must be assumed: Cl—Hg—Hg—Cl.

Exceptions of this kind are not very numerous and may be easily remembered.

Valence variations are distinguished by the use of appropriate terminations, *ous* indicating a lower and *ic* indicating a higher valence. There is thus ferrous (dyad) and ferric (triad); cuprous (monad) and cupric (dyad); and numerous similar instances which the student needs to learn and remember in order to understand the theory of chemistry.

After having learned the names and symbols of the elements and the mathematical rules governing their use in formulas, the student must next learn the system of nomenclature, or naming of compounds, which when once mastered enables a person to name the compound accurately even though he may have never seen the particular formula before.

Chemical compounds which contain only two elements are known as *binary* compounds. They are named by joining the names of the elements in proper sequence and changing the name of the latter element to terminate in *ide* (written *id* in much of the chemical literature). Numerical modifications are indicated by proper Greek or Latin prefixes. To express the formula of such a compound, the symbols are simply placed together in the proper order, the more strongly electro-positive element being named first and with the proper modifying numerals, if necessary. For example, sulphur and oxygen combine to form several compounds. The simplest of these is called sulphur dioxide (*dioxide* meaning two atoms of oxygen) and is written SO_2, and the second is called sulphur trioxide (*trioxide* meaning three atoms of oxygen), and is written SO_3. The compound of sodium and chlorine (common salt) thus becomes sodium chloride (NaCl) and so on indefinitely.

In some of the older works on pharmacy and chemistry these same compounds are named in a slightly different manner as ZnO—monoxide of zinc; NaCl, chloride of sodium, etc. Other appropriate prefixes are used in special cases. Thus Cu_2O is called copper suboxide. The following list gives a range of examples of the previously discussed types:

Hg_2O—mercury suboxide—usually called mercurous oxide.
HgO—mercury oxide—usually called mercuric oxide.
NO_2—nitrogen dioxide—sometimes called nitrogen peroxide.
SO_3—sulphur trioxide—sometimes called sulphur oxide.
CCl_4—carbon tetrachloride.
PCl_5—phosphorus pentachloride.
SF_6—sulphur hexafluoride.

An intermediate form where the elements are present in the proportion of two of the first to three of the second takes the prefix *sesqui* (meaning one and one-half) as Fe_2O_3, iron sesquioxide.

The foregoing terminations apply to the second element. In the case of a series of compounds other terminations, applicable to the first element, are known.

Cl_2O—chlorine monoxide is known as hypochlorous oxide.
Cl_2O_3—chlorine sesquioxide is known as chlorous oxide.
Cl_2O_5—chlorine pentoxide is known as chloric oxide.
Cl_2O_7—chlorine heptoxide is known as perchloric oxide.

All of the foregoing rules apply to binary compounds, or those containing two elements, only.

There are some few compounds containing more than two elements in which the foregoing rules are applicable. Thus KOH is potassium hydroxide, looking upon the group represented by OH as though it were elemental; KCN is potassium cyanide, because the group CN, called the cyanogen radicle enters into compounds much like a single element. Another such group commonly seen, which combines as a single element, is the ammonium group, NH_4.

Compounds containing three or more elements are called *ternary compounds*. For these and still more complex compounds, special rules of nomenclature are necessary. Among the more frequently occurring classes of compounds in chemistry are what are known as *acids*, *bases*, and *salts*.

An *acid* is a compound of an electro-negative element, or group of elements, with hydrogen. Oxygen may or may not be present. Acids are sometimes called salts of hydrogen. Some acids are simple binary compounds, as HCl (hydrochloric acid) which is also known as hydrogen chloride. Others are ternary compounds and usually contain oxygen. As examples of a series of acids derived from the oxides of chlorine just discussed we have the following:

HClO—hypochlorous acid.
$HClO_2$—chlorous acid.
$HClO_3$—chloric acid.
$HClO_4$—perchloric acid.

An acid is often produced by the union of an oxide of an electro-negative element with water.

The relationship between the two foregoing tables can be illustrated by the following groupings of chemical symbols in what are known as chemical equations, which serve to show the value of the symbols and figures in express-

ing chemical combinations or reactions and changes definitely and mathematically.

$$\underset{\text{hypochlorous oxide}}{Cl_2O} + \underset{\text{water}}{H_2O} = \underset{\text{hypochlorous acid}}{2HClO}$$

$$\underset{\text{chlorous oxide}}{Cl_2O_3} + \underset{\text{water}}{H_2O} = \underset{\text{chlorous acid}}{2HClO_2}$$

$$\underset{\text{chloric oxide}}{Cl_2O_5} + \underset{\text{water}}{H_2O} = \underset{\text{chloric acid}}{2HClO_3}$$

$$\underset{\text{perchloric oxide}}{Cl_2O_7} + \underset{\text{water}}{H_2O} = \underset{\text{perchloric acid}}{2HClO_4}$$

The number of acids is very great and many of them are of importance in pharmacy and chemistry. They possess many properties in common, among which are the power to neutralize bases or alkalies, to alter the colors of certain solutions known as indicators (as litmus which is turned red by acids) the power of reacting with metals, usually with the liberation of the hydrogen of the acid. They usually possess a sour taste, and in the concentrated condition are frequently destructive of animal and vegetable tissues.

Bases are usually compounds of electro-positive elements with the combination of oxygen and hydrogen written (OH) and known as *hydroxyl*. They are frequently called alkalies, or hydroxides. Examples of commonly occurring bases are:

KOH — potassium hydroxide.
$NaOH$ — sodium hydroxide.
$(NH_4)OH$ — ammonium hydroxide.
$Ca(OH)_2$ — calcium hydroxide.

Some of the hydroxides are produced from the oxides by the combining action of water as in the following cases:

$$K_2O + H_2O = 2\,KOH.$$
$$CaO + H_2O = Ca(OH)_2.$$

The characteristic properties of bases are the power to react with acids and neutralize them to form salts, to act upon indicators such as litmus in a distinctly different manner from acids (as litmus which is turned blue by bases), and the possession of a characteristic alkaline and disagreeable taste.

Salts are compounds formed by the union of bases and acids or by the action of alkalies upon metals or sometimes by the direct union of the elements themselves. They are compounds in which the hydrogen of an acid has been replaced in whole or in part by a positive element. The generic name *salt* must not be confused with the specific name of sodium chloride. In the following equations examples of salts are illustrated as produced in several different ways.

1. By neutralization of an acid by a base.

$$\underset{\text{hydrochloric acid}}{HCl} + \underset{\text{sodium hydroxide}}{NaOH} = \underset{\text{sodium chloride}}{NaCl} + \underset{\text{water}}{H_2O}$$

2. By direct combination of the elements.

$$\underset{\text{iron}}{Fe} + \underset{\text{iodine}}{I_2} = \underset{\text{ferrous iodide}}{FeI_2}$$

3. By action upon a metal by an acid with the formation of a salt and the liberation of hydrogen.

$$\underset{\text{iron}}{Fe} + 2\,\underset{\text{hydrochloric acid}}{HCl} = \underset{\text{ferrous chloride}}{FeCl_2} + \underset{\text{hydrogen}}{H_2}$$

Binary salts are named according to the rules previously discussed. Ternary salts are named by changing the terminal syllable of the acid in a definite manner and adding to the name any prefix which may have been used to distinguish the acid. Acids whose names end in *ic* form salts with names ending in *ate*. Acids whose names end in *ous* form salts with names ending in *ite*.

Taking the series of chlorine acids previously discussed:

Hypochlorous acid, $HClO$, forms hypochlorites,
Example: $NaClO$, sodium hypochlorite.

Chlorous acid, $HClO_2$, forms chlorites,
Example: $NaClO_2$, sodium chlorite.

Chloric acid, $HClO_3$, forms chlorates,
Example: $NaClO_3$, sodium chlorate.

Perchloric acid, $HClO_4$, forms perchlorates,
Example: $NaClO_4$, sodium perchlorate.

There are several types of salts which are distinguished by appropriate designations.

Normal salts, in which the replaceable hydrogen of an acid is entirely replaced by a metal or a positive group.

Examples:

$NaCl$ —sodium chloride.
$(NH_4)_2SO_4$ —ammonium sulphate.
Na_3PO_4 —sodium phosphate.
Na_2CO_3 —sodium carbonate.

Acid salts, in which the available hydrogen of an acid is only partly replaced by a metal.

Examples:

$NaHSO_4$ —acid sodium sulphate (sodium bisulphate).
NaH_2PO_4 —acid sodium phosphate (sodium biphosphate).
$NaHCO_3$ —acid sodium carbonate (sodium bicarbonate).

Mixed or double salts, in which the replaceable hydrogen of an acid is replaced by two different metals.

Examples:

$KNaC_4H_4O_6$ — potassium and sodium tartrate.

The term double salts is sometimes applied to combinations of two complete salts which crystallize together to form a definite chemical compound, as $K_2SO_4.Al_2(SO_4)_3$. Potassium aluminum sulphate (anhydrous alum).

Basic salts, also called sub- or oxy-salts are those in which not all of the hydroxyl or the oxygen of the underlying base has been replaced by an acid radicle.

Examples:

$BiONO_3$ — bismuth oxynitrate (bismuth subnitrate or basic bismuth nitrate).

$Ca(OH)Cl$ — basic calcium chloride or calcium subchloride.

Nomenclature—In the older nomenclature the basic or electro-positive elements had names ending in *um*, and it was customary to give the termination *a* to the oxide or hydroxide. Thus Mg was magnesi*um*, while MgO was magnesi*a*; K was potassi*um* while KOH was potass*a*; Na was sodi*um* while NaOH was sod*a*; Al was alumin*um*, while Al_2O_3 was alumin*a*, etc.

Prefixes from the Greek were formerly used in place of *ous* and *ic* terminations. Thus *proto*chloride of mercury was used for mercur*ous* chloride or calomel, and *deuto*chloride of mercury for mercur*ic* chloride or corrosive sublimate. *Proto* means first and *deuto* means second.

Chemical Reactions—Chemical Equations

A chemical equation is a collection of symbols or formulas and arithmetical signs so arranged as to give to one who understands the notation an exact picture of a chemical change which has been or can be produced. Such a change is called a chemical reaction.

It requires a number of words to express the fact that when sodium bicarbonate and hydrochloric acid are brought together, several new compounds are produced, *i. e.*, sodium chloride, carbon dioxide, and water. The same may be graphically and briefly expressed as follows:

$$NaHCO_3 + HCl = NaCl + H_2O + CO_2.$$

Furthermore, the symbolic equation gives more information than appears at first glance for it is also an accurate mathematical statement, and can be used as a basis for chemical calculations in either laboratory experiments or in manufacturing operations for ascertaining costs and yield.

This is made possible by the use of *molecular weights* in connection with a reaction like the foregoing. A molecular weight is the sum of the weights of the atoms composing a compound. Turning to the atomic weight table and using the figures therein given the following molecular weights for the substances mentioned are found by calculation:

$NaHCO_3$—

Na	$- 1 \times 23$	$=$	23.000
H	$- 1 \times 1.008$	$=$	1.008
C	$- 1 \times 12.005$	$=$	12.005
O_3	$- 3 \times 16$	$=$	48.000
			84.013 = The molecular weight of sodium bicarbonate.

HCl

H	$- 1 \times 1.008$	$=$	1.008
Cl	$- 1 \times 35.46$	$=$	35.460
			36.468 = The molecular weight of hydrochloric acid.

NaCl

Na	$- 1 \times 23$	$=$	23.00
Cl	$- 1 \times 35.46$	$=$	35.46
			58.46 = The molecular weight of sodium chloride.

H_2O

$H_2 - 2 \times 1.008 = 2.016$
$O - 1 \times 16 = 16.000$

18.016 = The molecular weight of water.

CO_2

$C - 1 \times 12.005 = 12.005$
$O_2 - 2 \times 16 = 32.000$

44.005 = The molecular weight of carbon dioxide.

Now rewriting the equation and giving each substance its appropriate molecular weight the following is found:

$$\underset{84.013}{NaHCO_3} + \underset{36.468}{HCl} = \underset{58.46}{NaCl} + \underset{18.016}{H_2O} + \underset{44.005}{CO_2}$$

If the figures on each side of the equation are now added it is found that $84.01 + 36.468 = 120.481$ and also that $58.46 + 18.016 + 44.005 = 120.481$. Therefore the equation balances mathematically as well as atomically and opens to the intelligent student a vista of what chemistry really means.

Following this logical train of thought, it is realized that as chemical compounds are invariable in their composition, for every 84.013 parts by weight of $NaHCO_3$ we will always require 36.486 parts of HCl for its neutralization, and that the resultant amount of NaCl will be 58.46 parts by weight. By arithmetical proportion these quantities may be translated into any units desired.

Suppose it is necessary to know how many ounces av. of NaCl will be yielded by the decomposition of 16 oz. av. of $NaHCO_3$—the proportion would be as follows:

$84.013 : 58.46 :: 16 : x$, or, by rounding off the decimals, and working out the proportion we obtain the answer 11.14 oz. av.

If there is occasion to know how many grams of $NaHCO_3$ will be required to produce 100 grams of NaCl, the proportion, rounding off the decimals, would be as follows:

$58.5 : 84 :: 100 : x$ and the working out of this proportion gives the answer 143.6 grams.

The student who fully and clearly understands the principles involved in the foregoing calculations and the mathematical deductions which have resulted from a close study of it need have no fear that chemistry will prove a difficult subject, for the entire science is based upon the same principles and similar deductions. Chemical calculations are sometimes included in a separate branch of study known by the formidable name of *stoichiometry*. The subject of stoichiometry need have no terrors for those who know simple arithmetic and the rules of proportion.

Other methods are used in chemical literature to express chemical reactions besides equations. The equality sign (=) is not always correct in showing the trend or direction of a reaction and has been replaced according to some authorities with an arrow indicating that the materials on the left hand side pass, in chemical transformation, into those on the right hand side.

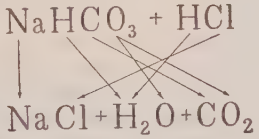
By this system the previous reaction would be expressed in the following manner:

$$NaHCO_3 + HCl \longrightarrow NaCl + H_2O + CO_2$$

Sometimes a reversal of reaction may be expected or a state of equilibrium occurs, in which case two arrows, pointing in opposite directions, are used as in the following equation:

$$MnCl_4 \rightleftharpoons Mn\ Cl_2 + Cl_2$$

Another manner of expressing reactions, which is excellent for the student to practice frequently enough to familiarize himself with the principle of balancing equations, is by placing the formulas opposite each other and drawing connecting lines between the similar atoms on each side of the equation until all are accounted for. This is illustrated by the following diagram applied to the equation previously studied.



It must be remembered that an equation or reaction must always balance; that is, the number of atoms of each kind must be the same on each side of the equation.

Volume Combination.

If equal volumes of elements in the gaseous state are weighed under similar conditions, the relative weights will be in proportion to the atomic weight of each element.

This has resulted in the establishment of a general principle which is known as Avogadro's law, to the effect that: *Equal volumes of elementary gases contain equal numbers of molecules.*

Atomic and molecular weights are determined by the practical application of this law.

Other laws relating to combinations of gases were formulated by Gay-Lussac and are as follows: (1) *Gases combine by volume in simple numerical ratios.* (2) *The resulting volume of the compound, if a gas, bears a simple ratio to the volumes of the original constituents.*

Thus: 1 volume of H combines with 1 volume of Cl to produce 2 volumes of HCl; 2 volumes of H combine with 1 volume of O to produce 2 volumes of H_2O (vapor); 3 volumes of H combine with 1 volume of N to produce 2 volumes of NH_3.

Electrical Properties of the Elements—and Ionic Dissociation.

Energy or *force* is manifested in a number of different ways, such as *motion, heat, light, chemical action,* or *electricity.* Just as matter is indestructible so is energy persistent. The great fundamental law of physics is that known as the *conservation of energy,* in which it is assumed that *the total energy of the universe is constant,* no energy being created or destroyed in any of the processes of nature.

Electricity is more closely related to chemistry than is any other manifestation of energy. Electricity is frequently referred to as static or dynamic. Static electricity is that which requires activation, as by friction; dynamic electricity is the electricity of action, producing power, light, and heat.

Electrical excitement, as it is called, is exhibited in two conditions known respectively as *positive* and *negative.* In any apparatus developing electricity

the points at which these conditions are manifested are known as poles or electrodes. The positive pole is usually designated by the + sign and is known as the *anode*. The negative pole is designated by the − sign and is called the *cathode*.

Similarly charged electrical bodies or particles repel each other and bodies possessing dissimilar charges show an attractive effect.

From a study of the principles governing these facts has developed much valuable knowledge of the relations existing between the elements.

In the older works in chemistry the elements were always arranged in an electrical series. Those which were at the negative end of the series were observed to yield acids when their oxides united with water, while those at the opposite or positive end of the series yielded bases under similar conditions.

The more recent investigations have been directed toward the study of what has come to be called *electrical properties*.

Thus if a current of electricity is passed through a solution of HCl in water, Cl is given off at the anode or positive pole, and hydrogen at the cathode or negative pole. Distilled water, when freshly prepared and free from all traces of impurities, does not conduct electricity to any appreciable extent. Solutions of acids, bases, and salts, however, are ready conductors of electricity.

The substances whose aqueous solutions are capable of conducting electricity are known as *electrolytes*. There are many chemical compounds known, usually organic bodies like sugar, albumen, etc., which do not conduct electricity. These are known as *non-electrolytes*. It has been found that electrolytes during the simple act of solution in water undergo a certain degree of *dissociation* with the separation of elements or groups such as would be attracted to the respective poles if a current of electricity were traversing the solution. These elements or groups have been called *ions*, and the condition of electrolytic dissociation without the use of an actual current of electricity has come to be known as *ionization*.

These *ions* are believed to move about in a solution just the same as independent molecules (the word *ion* is from the Greek root word meaning to roam or wander). Positive ions are denoted by a + sign placed above or to the right of the symbol or group, and negative ions by a − sign similarly placed.

The molecule and the ion differ in this respect—the former are electrically balanced while the latter carry charges of free electricity, either positive or negative. An important law of ionic dissociation is to the effect that the *sum of the positive charges is always equal to the sum of the negative charges* in dissociation phenomena.

Elements or groups of elements, in the form of ions, carry electrical charges according to their valences. An electrolyte in solution is only partially ionized and the molecules and ions are more or less in equilibrium. The degree of ionization is dependent upon temperature and concentration and the nature of the dissolved substance.

Thus in a solution of sodium chloride there are undissociated molecules of NaCl, positively charged ions of Na and negatively charged ions of Cl. The dissociation that occurs is expressed by the following equation:

$$NaCl = Na^{+} Cl^{-}$$

As the positive Na *ion* equalizes the negative Cl *ion*, the solution is electrically neutral.

The following examples are added with equations, to illustrate the dissociation shown by other electrolytes in solution:

In a solution of ferrous chloride.

$$FeCl_2 = Fe^{+2}2Cl^-$$

and in a solution of ferric chloride.

$$FeCl_3 = Fe^{+++}3Cl^-$$

Groups of atoms, or radicles, also show this electrical behavior in the form of ions. For example, in a solution of sodium nitrate the dissociation is expressed:

$$NaNO_3 = Na^+ NO_3^-$$

and in a solution of sodium sulphate as:

$$Na_2SO_4 = 2Na^+ SO_4^{--}$$

In considering the foregoing facts regarding ionization it must be clearly understood that *atoms* and *ions are not identical.* Atoms are never free but are combined to form molecules. Ions are atoms or groups plus an electrical charge. These charges are assumed only in the liquid phase so that ions are only possible in solution or when the electrolyte is fused.

The degree of ionic dissociation varies with the concentration of the solution and with the nature of the dissolved substance. In the dry condition the substance is assumed to exist entirely in the molecular state, in concentrated solutions there is slight dissociation, while it is in dilute solutions that the greatest degree of dissociation is found.

Dissociation is a reversible phenomenon, as illustrated by the following equations:

$$HCl \rightleftarrows H^+ Cl^-$$

$$NaOH \rightleftarrows Na^+ (OH)^-$$

The degree of ionic dissociation has a marked influence upon the intensity and speed of chemical reactions. The student who has comprehended the foregoing summary of the subject will understand why it is that strong sulphuric acid has a very feeble action upon metallic iron, while the addition of water intensifies the reaction markedly until a certain degree of dilution occurs when the action again diminishes.

The degree of ionization, measured in terms of acidity or alkalinity, is known as the pH value and is more thoroughly discussed in the following pages.

The Determination of Ionic Dissociation

Ionic dissociation may be measured in terms of acidity or alkalinity.

Acids in the presence of water yield positively charged *hydrogen* (H+) *ions,* sometimes called *hydrions,* and negatively charged simple or grouped *anions.* Each acid possesses its characteristic anion.

EXAMPLE: $HCl = H^+ + Cl^-$ $\quad H_2SO_4 = H_2^{++} + SO_4^{--}$

Bases in the presence of water yield negatively charged *hydroxyl* (OH^-) *ions,* called *hydroxidions,* and positively charged simple or compound *cations.* Each base possesses its characteristic cation.

EXAMPLE: $KOH = K^+ + OH^-$ $\quad NH_4OH = NH_4^+ + OH^-$

$Ca(OH)_2 = Ca^{++} + (OH)_2^{--}$

Acid or alkaline properties are mainly dependent upon the degree of dissociation, or the proportion of H^+ or OH^- ions respectively that are liberated in the presence of water. The degree to which a substance is ionized is expressed as its "pH *factor*" which is a measure of intensity rather than of concentration.

The sour taste and intensity of action of acids is entirely dependent upon this factor. Thus, in dilute solutions sulphuric, hydrochloric, and nitric acids are all highly ionized, while acetic acid is ionized to a much lesser degree, and boric acid undergoes scarcely any ionization at all. These facts account for what is commonly called the strength of acids, which has little to do with either composition or concentration.

The same is true of alkalies. Alkalinity of soluble carbonates is due first to hydrolytic dissociation, followed by ionization. Sodium carbonate in solution first dissociates into NaOH and H_2CO_3. These respective compounds then ionize, and, as the former ionizes more strongly than the latter, the resulting solution is always alkaline.

The ionic theory explains neutralization reactions on the ground that the H^+ ions of the acid solution and the OH^- ions of the alkaline solution recombine to form nonionized H_2O.

The symbol used to denote the ionization factor of acids and alkalies is pH, meaning "hydrogen potential". Two methods of determination are possible, *i. e.*, electrical and colorimetric. The electrical method requires the skilful use of an instrument known as the *potentiometer* in connection with a specialized terminal known as the hydrogen electrode. The colorimetric method is more frequently used because of its greater convenience and lower cost, but the accuracy is not so great as with the electrical method.

The expression of the pH value is given mathematical exactness within a fairly wide range of acidity and alkalinity as may be seen by a study of the following table, taken from an article upon the subject by Prof. F. X. Moerk. The first column contains the unit pH values. In the second column will be found the equivalents given in terms of H ions (acidity) and OH ions (alkalinity). In the third column the results are translated into normality of the acid or alkali respectively.

pH value[1]	1 Gm. H ions in	Equivalent to
0.0	1 liter	A normal acid V.S.
1.0	10 liters	0.1 normal acid V.S.
2.0	100 liters	0.01 normal acid V.S.
3.0	1000 liters	0.001 normal acid V.S.
4.0	10000 liters	0.0001 normal acid V.S.
5.0	100000 liters	0.00001 normal acid V.S.
6.0	1000000 liters	0.000001 normal acid V.S.
7.0	10000000 liters	Perfect neutrality
pH value	**17 Gm. (OH) ions in**	**Equivalent to**
8.0	1000000 liters	0.000001 normal alkali V.S.
9.0	100000 liters	0.00001 normal alkali V.S.
10.0	10000 liters	0.0001 normal alkali V.S.
11.0	1000 liters	0.001 normal alkali V.S.
12.0	100 liters	0.01 normal alkali V.S.
13.0	10 liters	0.1 normal alkali V.S.
14.0	1 liter	A normal alkali V.S.

[1] The figures in this column are the logarithms of the reciprocals of the H ion concentration, expressed on the basis of a definite volume concentration. The pH of neutral water is 7, since water contains 00.0000001 Gm. of hydrogen per liter or 10^{-7}.

In the application of the colorimetric method, certain uncommon indicators must be used and certain specified conditions of applying the tests must be rigidly adhered to. These are described in detail in a comprehensive book upon the subject by M. W. Clark, entitled " The Determination of Hydrogen Ions". The indicators given in Clark's list, together with their respective ranges, are as follows:

Indicator	pH range
Thymol blue	1.2 — 2.8
Brom phenol blue	3.0 — 4.6
Methyl red	4.4 — 6.0
Brom cresol purple	5.4 — 7.0
Bromthymol blue	6.0 — 7.6
Phenol red	6.6 — 8.2
Cresol red	7.2 — 8.8
Thymol blue	8.2 — 9.8

The intelligent application of research in this line has developed many new fields in which the determination of pH values has been found to be of great practical use. Among these are the study of enzymes, soils, culture media, body fluids, germicides, and disinfectants.

The *potentiometer* and its use. If a piece of one of the noble metals is coated with platinum black, it will adsorb and hold large amounts of hydrogen and thus serve as a hydrogen electrode. When such a hydrogen laden electrode is immersed in a solution containing hydrogen ions, a difference of electric potential is exhibited, which is proportionate to the hydrogen ion concentration or the pH value.

The measurement of this difference is accomplished by the use of the instrument known as the potentiometer which makes use of the principles of the Wheatstone bridge in connection with a certain type of cell which acts as a standard of electromotive force.

An apparatus of this kind enables determinations of differences in potential to be made by the application of Ohm's law:

$$\text{Current (in amperes)} = \frac{\text{Difference in potential (in volts)}}{\text{Resistance (in Ohm's)}}$$

Catalogues describing various types of potentiometers and their uses and applications, may be had upon application to Leeds and Northrup, Philadelphia, Pa.

CHAPTER XL

HYDROGEN, OXYGEN, WATER, AND NITROGEN

H; 1.008. O; 16.00. H_2O; 18.016. N; 14.008.

Hydrogen is from Greek words meaning "to produce," or "to generate," water. Water is the product of its combustion. It is a colorless, inodorous, combustible gas; it is the lightest of all substances. Chemically, it is one of the most important and interesting of the elements, and it was used as unity for many years in fixing the atomic weights of other elements. However, oxygen at 16.00 has now been generally adopted as the basis for atomic weights, thus making hydrogen 1.008, the change being made chiefly because, with oxygen as the basis, a larger number of the elements became whole numbers. Pharmaceutically, in its uncombined state, it is of very little importance, and the reader is referred, for further information, to chemical textbooks.

Nitrogen is from the Greek "nitron" (saltpetre) and "gen", meaning "I produce", indicating that the gas is a constituent of saltpetre. It is a colorless, tasteless and odorless gas of a density slightly less than air. In the free state it constitutes about four-fifths of the weight of the atmosphere. It shows little activity towards other elements. Many of its compounds, however, are intensely active, such as nitric acid, the alkaloids, cyanides, etc. Nitrogen itself is of little pharmaceutical importance, but many of its compounds are official.

Oxygen is from the Greek meaning, "I produce sour", to denote that in many cases the combustion of substances in this gas produces acids. It is a colorless, inodorous gas which aids combustion; it is the most abundant of the elements, forming about one-fifth of the total weight of the atmosphere, where it exists in the free or uncombined state. Combined oxygen constitutes nearly ninety per cent by weight of water, and is present in varying quantities in most vegetable and animal substances. The compounds which it forms with other bodies are termed oxides; those which are of pharmaceutical interest will be considered hereafter under their appropriate heads. Oxygen in a state of purity is frequently used medicinally and is now official. It is chiefly supplied in compressed form in cylinders.

OXYGENIUM. U.S. Oxygen

[Oxygen.]

It contains not less than 98 per cent by volume of O (16). For convenience it is usually furnished in compressed form in metallic cylinders.

Preparation—Among the processes used for preparing oxygen is one that involves the liquefying of air with extreme cold and great pressure. When the liquid air is allowed to vaporize, the nitrogen escapes first because of its greater volatility, and the gas that comes off last is nearly pure oxygen.

Another commercial method is based upon the electrolysis of water whereby the water is decomposed into its constituent elements, namely, oxygen and hydrogen, which separate at opposite electrodes.

An older method, now largely replaced, involved heating barium monoxide (BaO) in a current of air to form barium dioxide (BaO_2). Upon increasing the temperature, the barium dioxide is decomposed, giving off free oxygen and again forming barium monoxide.

Description and Physical Properties—A colorless, odorless, and tasteless gas. It supports combustion more readily than air.

One volume of Oxygen dissolves in about 34 volumes of water and in about 3.6 volumes of alcohol, at 25° C.

Test for Identity—A glowing splinter of wood held in Oxygen bursts into flame.

Tests for Purity—Pass 2000 cc. of the gas, measured under normal atmospheric pressure at about 25° C., through 100 cc. of barium hydroxide T.S. at a rate not exceeding 4000 cc. per hour: the turbidity produced, if any, is not greater than that produced by 1 cc. of a solution prepared by dissolving 0.2 Gm. of sodium bicarbonate in 100 cc. of freshly boiled and cooled distilled water (*carbon dioxide*).

Pass 2000 cc. of Oxygen, under the conditions described above, through a mixture of 100 cc. of distilled water and 1 cc. of silver nitrate T.S.: no opalescence is produced (*halogens*).

Pass 2000 cc. of Oxygen through 100 cc. of distilled water, colored with a few drops of litmus T.S., under the conditions described above: the color of the liquid is not changed (*acids or alkalies*).

Pass 2000 cc. of Oxygen through 100 cc. of a freshly prepared starch-potassium iodide T.S.: the color of the liquid is not changed (*oxidizing substances*).

Assay—Mix about 50 cc. of Oxygen, accurately measured in a calibrated tube, with 10 cc. of alkaline pyrogallol T.S.: not less than 98 per cent by volume is absorbed, corresponding to not less than 98 per cent by volume of O.

This assay is explained on page 1482.

History—Oxygen was discovered independently by Priestly in 1774 and Scheele about the time of the American Declaration of Independence.

Uses—Medicinally, Oxygen is used in grave cases of sickness to supply sufficient oxygen to the blood or to prevent cyanosis during the administration of anesthetics. It is sold in cast-steel cylinders, under about 120 to 130 atmospheres pressure, and when used the pressure is regulated by a special attachment. It is also largely used industrially in the oxy-hydrogen or oxy-acetylene blow-pipe for welding platinum, cutting structural iron work, etc., in oxidizing oils in varnish manufacture, and in many other industrial operations.

AQUA. U.S. Water

$H_2O = 18.016$

Water is the most important and useful compound known to the pharmacist. It corresponds to about 88.8 parts of oxygen and 11.2 parts of hydrogen, by weight.

The purity of water is specified in the official description, which is as follows:

Description and Physical Properties—A colorless, limpid liquid, practically tasteless and odorless.

Tests for Purity—Water is neutral to litmus paper.

When heated nearly to the boiling point and agitated, no disagreeable odor is evolved.

The residue obtained upon evaporating 100 cc. of Water in a platinum dish does not exceed 0.03 Gm. (*solids*), and this residue, when carefully heated to redness, evolves no visible fumes and shows no appreciable charring (*organic impurities*).

Add 1 cc. of hydrochloric acid to 100 cc. of Water and then add 50 cc. of hydrogen sulphide T.S.: no darkening occurs after standing for fifteen minutes (*lead or copper*).

Add 1 cc. of hydrochloric acid to 100 cc. of Water and then add 1 cc. of potassium ferrocyanide T.S.: no blue coloration is produced immediately (*iron*).

Add 0.5 cc. of tenth-normal silver nitrate to 200 cc. of Water, heat to boiling, filter, and add to the filtrate 3 drops of potassium chromate T.S.: a red precipitate is produced (*limit of chloride*).

Add successively 1 drop of acetic acid, 1 cc. of sulphanilic acid T.S., and 1 cc. of naphthylamine acetate T.S. to 100 cc. of Water in a Nessler tube, stirring with a glass rod after each addition. Closely cover the tube with a glass plate, place it upon a white surface, and view it from above: no pink coloration appears within five minutes (*nitrite*).

Add 1 cc. of sodium carbonate T.S. to 100 cc. of Water, and evaporate the liquid in a small porcelain dish just to dryness. Moisten the residue thoroughly with 2 cc. of phenoldisulphonic acid T.S., gently warm the dish, add 20 cc. of ammonia T.S. and sufficient distilled water to measure 100 cc. Any yellow color produced is not greater than that obtained by evaporating 0.0021 Gm. of potassium nitrate, dissolved in 3 cc. of distilled water and 1 cc. of sodium carbonate T.S., to dryness and treating the residue in the same manner as the residue from the Water. The comparison of colors must be made in Nessler tubes of the same diameter and size (*nitrate*).

Add 2 cc. of alkaline mercuric potassium iodide T.S. to 100 cc. of Water in a Nessler tube, and mix thoroughly. Place the tube on a white surface, and view the contents from above:

the water does not at once assume a deep yellow or orange color (*ammonium salts and nitrogenous impurities*).

Mix 100 cc. of Water with 10 cc. of diluted sulphuric acid in a clean porcelain dish, and heat it rapidly to boiling; then add 0.4 cc. of tenth-normal potassium permanganate, and boil the liquid for ten minutes: the color of the liquid is not completely destroyed (*oxidizable substances*).

Potable Water or Drinking Water—Potable water is water which is fit to drink. Since water dissolves a part of nearly everything with which it comes in contact it is impossible to find, in nature, water which is absolutely pure.

The water for drinking and domestic purposes is generally supplied by rivers, lakes, wells, and springs. Such waters commonly contain salts of magnesium, calcium, iron, potassium, and sodium, with organic matter from falling leaves and twigs, traces of ammonia, and other gases from the atmosphere. There is also a variety of suspended matter in natural water such as fine particles of clay, sand, microscopic organisms including bacteria and fragments of vegetation. Drinking waters that contain small amounts of dissolved salts and only traces of inert suspended matter are not directly injurious to health.

Drinking water is rendered more agreeable, or palatable, because of the dissolved gas which it contains. To most people the taste of boiled water is insipid or flat. This is because the air has been removed in the boiling. The taste of water is also influenced by the presence of dissolved salts, and waters having appreciable amounts of these salts in solution are always more acceptable for drinking than those free from solids, but good drinking water should not contain an excessive amount of dissolved salts and must be free from disease-producing organisms and from sewage contamination. Most cities and towns have established plants for purifying water. This is usually accomplished by slowly filtering the water through large beds of sand and gravel. The suspended matter is removed from the water mechanically and many impurities are decomposed by the micro-organisms which form on the surface of the filter. The filter bed must be frequently cleaned.

Turbid water is sometimes clarified by treatment with alum. In solution the alum undergoes dissociation, especially in the presence of a little lime water, forming flocculent, microscopic particles of aluminum hydroxide which settle and carry with them the suspended impurities. A simpler method used in some localities is to allow the water to remain in large settling basins or reservoirs where the suspended matter slowly settles by gravity.

The purification of potable water is one of the most important chemical problems of the present time. In some cases treatment of the filtered water with traces of such chemicals as ozone, chlorine, sodium hypochlorite, or copper sulphate is employed. Such chemical treatment is the most effective means of destroying organic matter, especially bacteria and algæ. Sometimes the water is freed from objectionable odors, ferrous salts, etc., by the simple process of oxidation that involves spraying the water into the air. An electrolytic method of purification consists in removing the temporary hardness of the water with lime, after which it is passed between electrodes and subjected to the action of ozone (nascent hydrogen and oxygen), whereby the unstable organic matter is oxidized and the bacteria destroyed. Following this treatment the water is sedimentized and filtered according to standard practice.

One of the latest processes for water purification consists of the action of ultra violet light. By this method filtered water is exposed in thin layers and at short range, to the light of an electric mercury vapor lamp with walls of quartz.

During recent years filtered water is required, in many states, to be treated with a very small amount of chlorine which is an effective germicide. Ozone is a very desirable purifying agent because of its harmless nature, its insolubility,

which prevents an excessive amount from going into solution, and the fact that it effectively removes odor and taste due to organic pollution. These purification methods have greatly diminished the death rate due to water-borne diseases such as typhoid fever.

Everyone should know how to purify water on a small scale for household consumption. At times pure water may not be obtainable and in an emergency, or during an epidemic purification will be imperative. This can be done by boiling the water for fifteen or twenty minutes and storing it in bottles or jars which have also been sterilized by boiling. Containers must be closed with a pledget of absorbent cotton to prevent contamination. An effective chemical method of purification is the addition of a drop of tincture of iodine to a quart of water, mixing and allowing it to stand for fifteen or twenty minutes before using.

A product developed by Dakin during the World War for the extemporaneous purification of drinking water is sold under the name *Halazone*. It is one of the dichloramine group and is said to be a powerful disinfectant. A tablet containing 0.004 Gm. is added to a quart of water and allowed to stand a short while. For other efficient methods for purifying water for camp use, see the Hospital Corps Handbook, U. S. Navy.

Some knowledge of the origin of a water supply is important, especially because of possible contamination with sewage. Usually the presence of sodium chloride indicates sewage unless its presence can otherwise be explained. The presence of ammonia, nitrites, and nitrates are of themselves harmless in drinking water, but they are usually assumed to be evidence of sewage contamination, having been the product of gradual oxidation of nitrogenous matter. (See Water Supply, by Mason, John Wiley & Sons.)

Uses—The powers and uses of water as a solvent have been already noted in the previous chapters. The United States Pharmacopœia directs water, distilled water or sterilized distilled water, to be used according to the necessities of the occasion. The solid matter and traces of various salts in solution or suspension in ordinary water would often seriously interfere with the purity of many chemical substances if such water were used in their preparation. The official processes direct distilled water in all cases where the use of ordinary water might be injurious or of doubtful propriety. In some sections of the country, the drinking water might be pure enough for the processes, or at least not contain serious impurities; in other sections the water would be totally unfit for use. The purity of official distilled water is beyond question, and its use therefore removes all doubts.

AQUA DESTILLATA. U. S. Distilled Water
[Aq. Dest.]

Water [$H_2O = 18.016$] purified by distillation.

For manufacture, see page 254. The official tests for the purity of distilled water are, of course, much more exacting than those for water (see below).

Description and Physical Properties—A colorless, limpid liquid, without odor or taste, and neutral to phenolphthalein T.S. and to methyl orange T.S.

Tests for Purity—Evaporate 100 cc. of Distilled Water to dryness on a water bath, and subsequently dry the residue in an oven to constant weight at 100° C.: not more than 0.001 Gm. of residue remains.

Separate portions of 100 cc. each of Distilled Water are not affected by the addition of barium chloride T.S. (*sulphate*); silver nitrate T.S. (*chloride*); ammonium oxalate T.S. (*calcium*); hydrogen sulphide T.S. (*metals*).

Distilled Water shows no deep yellow, orange or brown coloration when 1 cc. of alkaline mercuric potassium iodide T.S. is added to a 100 cc. portion (*ammonia*).

Add 50 cc. of calcium hydroxide T.S. to 25 cc. of Distilled Water: the mixture remains clear and transparent (*carbon dioxide*).

Heat 100 cc. of Distilled Water to boiling, acidulate with 10 cc. of diluted sulphuric acid, and subsequently add 0.1 cc. of tenth-normal potassium permanganate: the color of the liquid is not completely destroyed by boiling for ten minutes (*oxidizable substances*).

Uses—Distilled water is used in pharmacy principally as a solvent for chemical salts, in filling prescriptions, and for purposes for which ordinary water is unfitted (see page 546).

LIQUOR HYDROGENII DIOXIDI. U.S. Solution of Hydrogen Dioxide

[Liq. Hydrog. Diox.—Aqua Hydrogenii Dioxidi, Solution of Hydrogen Peroxide]

Solution of Hydrogen Dioxide is an aqueous solution containing not less than 3 per cent by weight of H_2O_2(34.02), representing approximately 10 volumes of available oxygen. Preserve it in a cool place protected from light. Upon removing the stopper from the bottle, not more than a slight pressure should be observed.

Preparation—Solution of Hydrogen Dioxide is made commercially on a large scale. The H_2O_2 for medicinal use is prepared by the action of an acid on hydrated barium dioxide. The acids used are phosphoric, sulphuric, or hydrofluoric. When the correct molecular proportion of the acid is used, practically all of the undesirable barium is precipitated as phosphate, sulphate, or fluoride, respectively, leaving hydrogen dioxide in solution.

A largely used commercial process employs both phosphoric and sulphuric acids. Finely divided barium dioxide, after having been washed, is hydrated by thorough agitation with water. The hydrated barium dioxide is made to react with phosphoric acid at a low temperature, since excessive heat causes decomposition and loss of the hydrogen dioxide. The cost of production is considerably reduced by also using sulphuric acid which regenerates the phosphoric acid from the barium phosphate and this phosphoric acid again reacts with more barium dioxide.

After allowing the mixture to settle, the clear solution is decanted or siphoned off from the insoluble barium compounds and brought to the required strength by dilution.

The final insoluble residue of barium sulphate, after washing it free from hydrogen dioxide, is disposed of as a mineral pigment.

The main reactions of the process are illustrated by the following equations:

$$\underset{\text{barium dioxide}}{BaO_2} + \underset{\text{phosphoric acid}}{H_3PO_4} = \underset{\text{secondary barium phosphate}}{BaHPO_4} + \underset{\text{hydrogen dioxide}}{H_2O_2}$$

$$\underset{\text{barium dioxide}}{BaO_2} + \underset{\text{secondary barium phosphate}}{BaHPO_4} + \underset{\text{sulphuric acid}}{2H_2SO_4} = \underset{\text{barium sulphate}}{2BaSO_4} + \underset{\text{hydrogen dioxide}}{H_2O_2} + \underset{\text{phosphoric acid}}{H_3PO_4}$$

Any trace of barium salt remaining in the solution of hydrogen dioxide after the decomposition, is removed by the cautious addition of sulphuric acid, which precipitates insoluble barium sulphate, a minute excess of sulphuric acid being permitted.

Oxalic acid in small amount was formerly added to the solution by manufacturers, thus fraudulently raising its indicated strength when assayed, but this is now detected by a special test.

Owing to the readiness with which this solution ordinarily undergoes decomposition, many attempts have been made to render it more stable. Acetanilid is generally used as a preservative and the Pharmacopœia permits the use of this or other harmless preservatives in amounts not exceeding 0.04 Gm. in each 100 cc. In solutions where acetanilid has been introduced, a bitter almond-like odor sometimes develops. This indicates decomposition of the preservative. It has been found that one of the most efficient preservatives for hydrogen dioxide solution is quinine sulphate. Benzoic, salicylic, and boric acids have also been used for this purpose.

The stability of hydrogen dioxide solution depends, to some extent, upon the character of the bottle in which it is stored. Alkali, due to the solubility of the glass bottle used, accelerates decomposition. Blue glass should be avoided because it favors deterioration.

A commercial method for the preparation of solution of hydrogen dioxide is as follows:

Barium Dioxide	3 lbs. av.
Phosphoric Acid (85 per cent)	2½ oz. av.
Sulphuric Acid (32 per cent)	
Barium Hydroxide (saturated solution)	
Ice,	
Distilled Water, of each, a sufficient quantity,	
To make	1 gal.

The barium dioxide, which must be of the purest quality and very finely ground, is hydrated by stirring with 6 pints of water, for ten minutes. The mixture is allowed to settle and the supernatant liquid siphoned off. This washing with stirring is repeated twice and distilled water is then added to restore the original volume. The mixture is then subjected to prolonged agitation or stirring by a mechanical stirrer, to effect complete hydration of the barium dioxide. This will probably require a full day.

The phosphoric acid added to 3 pints of water is then mixed with ice and treated with about three-eighths of the hydrated barium dioxide mixture, after first reserving about ½ ounce of the mixture for the final neutralization. The mixing is done with constant mechanical stirring. After an interval of about ten minutes an equal amount of the hydrated barium dioxide mixture is again added with constant stirring. At this point the reaction should be acid but not too strongly so, otherwise more of the barium mixture should be added. The temperature throughout should be kept between 90° and 110° F.

Sufficient of the sulphuric acid is then added to regenerate about 85 per cent of the phosphoric acid, keeping the temperature down and adding more of the hydrated barium dioxide mixture until again almost neutral. The remainder of the hydrated barium dioxide mixture is then added to the reaction mixture, still reserving the half ounce for final neutralization. The reaction should now be slightly acid and should not be allowed to become alkaline, otherwise sulphuric acid should be added.

The reserved portion is then slowly added to convert the acid phosphates of barium into normal phosphate, and sulphuric acid may be added to render the mixture just faintly acid. An alkaline reaction favors decomposition.

The mixture is now filtered and should yield about 6 pints of filtrate, and the precipitate is washed with distilled water until the filtrate and washings measure 1 gallon.

The saturated barium hydroxide solution is then heated and carefully added until a faintly alkaline reaction is produced and the mixture is quickly filtered. This precipitates and removes any iron or free phosphoric acid.

Sulphuric acid is then added to precipitate the slight excess of barium and to render the liquid faintly acid. After allowing the mixture to stand overnight, the clear solution is siphoned off. This is then assayed and the strength, in terms of H_2O_2, is adjusted to 3 per cent by proper dilution with distilled water.

Three grains of acetanilid to each pint of solution may be added as a preservative, or in its place 0.3 grain of quinine sulphate to each pint of solution.

Description and Physical Properties—A colorless liquid, odorless, or having an odor suggesting ozone. It is slightly acid to the taste and produces a peculiar sensation and froth in the mouth. It is prone to deteriorate upon keeping or upon protracted agitation, and rapidly decomposes by contact with many oxidizing as well as reducing substances.

When exposed to the air at the ordinary temperature or when heated on a water bath at a temperature not exceeding 60° C., the Solution loses chiefly water. When rapidly heated, it frequently decomposes suddenly.

Solution of Hydrogen Dioxide is acid to litmus paper.

Test for Identity—Shake 1 cc. of Solution of Hydrogen Dioxide with 10 cc. of distilled water containing 1 drop of diluted sulphuric acid, and add 2 cc. of ether: the subsequent addition of a drop of potassium dichromate T.S. produces a blue color in the aqueous layer. Upon agitation and standing, this blue color passes into the ether layer.

Tests for Purity—Not more than 0.03 Gm. of residue remains on evaporating 20 cc. of the Solution to dryness on a water bath (*non-volatile matter*).

It requires not more than 2 cc. of tenth-normal sodium hydroxide, phenolphthalein T.S. being used as indicator, to neutralize 25 cc. of Solution of Hydrogen Dioxide (*free acid*).

Add 1 cc. of ammonia T.S. to 1 cc. of the Solution and evaporate the liquid to dryness on a water bath: the residue meets the requirements of the test for *arsenic*, page 1512.

Evaporate 1 cc. of the Solution to dryness on a water bath, and dissolve the residue in 10 cc. of distilled water containing 1 cc. of diluted hydrochloric acid: the liquid meets the requirements of the test for *heavy metals*, page 1519.

To 50 cc. of the Solution add sodium hydroxide T.S. until it is alkaline, then evaporate it on a water bath, and transfer the dry residue to a platinum crucible. Moisten the residue with sulphuric acid, and cover the crucible with a watch glass, the convex side of which is coated with a thin layer of beeswax which is scratched so as to expose the glass. Cool the watch glass by placing water in the concave side and standing in this a small beaker which must be kept filled with cold water. Now heat the crucible and contents on a water bath for one hour: the surface of the watch glass after the removal of the wax shows no sign of corrosion (*hydrofluoric acid*).

The addition of 2 drops of diluted sulphuric acid to 10 cc. of the Solution produces no turbidity or precipitate within ten minutes (*barium*).

Add 4 drops of sodium acetate T.S. to 10 cc. of the Solution, and follow with 4 drops of calcium chloride T.S.: no turbidity or precipitate is produced within ten minutes (*oxalic acid*).

Shake out 100 cc. of Solution of Hydrogen Dioxide in a separator with a mixture of 3 volumes of chloroform and 2 volumes of ether, using 50 cc., 25 cc., and 25 cc., respectively, and evaporate the combined solutions to dryness at room temperature in a tared glass dish: the residue, if any, weighs not more than 0.04 Gm. (*limit of preservative*).

Assay—Dilute about 2 cc. of Solution of Hydrogen Dioxide, accurately weighed, with 20 cc. of distilled water, add 20 cc. of diluted sulphuric acid, and titrate with tenth-normal potassium permanganate. Each cc. of tenth-normal potassium permanganate corresponds to 0.001701 Gm. of H_2O_2.

This assay is explained on page 1474.

History—The substance H_2O_2 which constitutes the activity of this preparation was discovered by Thenard, a French pharmacist in the early part of the 19th century.

Uses—Solution of hydrogen dioxide (or "peroxide", as it is usually termed) is an energetic antiseptic and disinfectant. As found in commerce it is designated as a 100 vol., 30 vol., 15 vol., 10 vol., 8 vol. solution, etc., by which is meant a solution of the hydrogen dioxide which will yield 100 volumes, 30 volumes, 15 volumes, 10 volumes, or 8 volumes of active oxygen when used. The official 3 per cent solution yields approximately 10 volumes of available oxygen under normal conditions of temperature and pressure. The 100 volume, or 30 per cent by weight solution, is being used medicinally under the name *perhydrol*, and is said to be less irritating than weaker solutions because of the absence of free acid. In this form it is relatively permanent, but when diluted with water it rapidly deteriorates. Diluted solutions are employed as local applications and in inflammations of mucous membranes. Solution of Hydrogen Dioxide is believed to be free from poisonous properties.

Preservation—*Great care must be exercised to prevent decomposition; the bottles containing the solution must be kept in a cool place protected from light*

and dust, and the stoppers may be coated with paraffin or replaced by a pledget of cotton, as this relieves pressure and retards decomposition.

Average dose—1 fluidrachm (4 cc.).

Unofficial Peroxides

Calcium Peroxide CaO_2 (N. N. R.)	It contains not less than 60 per cent of CaO_2, equivalent to 13.3 per cent of available oxygen, a cream-colored, odorless and tasteless powder; practically insoluble in water. It is decomposed by dilute acids, liberating H_2O_2 used for its oxidizing effect. Dose, 1 to 5 grains (0.06 to 0.3 Gm.), in water or with sodium bicarbonate
Magnesium Peroxide, Magnesium Superoxide MgO_2 (N. N. R.)	It contains not less than 15 per cent of MgO_2, equivalent to 4.3 per cent of available oxygen A white powder; practically insoluble in water. Decomposed by dilute acids, liberating H_2O_2 Used in dentifrices and for oxidizing effects. Dose, 4 to 8 grains (0.25 to 0.5 Gm.)
Sodium Peroxide, Bioxidum Natrii Na_2O_2 (N. N. R.)	It contains not less than 90 per cent of Na_2O_2, equivalent to 18.4 per cent of available oxygen. A white or yellowish powder; soluble in water, with decomposition and heat, liberating oxygen and forming NaOH. It does not react with alcohol but ignites ether. It is a powerful oxidizing agent and is never used internally. Mixed with liquid petrolatum or soap to form a paste it is used for acne
Strontium Peroxide SrO_2 (N. N. R.)	It contains not less than 80 per cent of SrO_2 similar to calcium peroxide. Used in ointments and as a dusting powder, also in dentifrices
Zinc Peroxide ZnO_2 (N. N. R.)	It contains not less than 45 per cent of ZnO_2, equivalent to 7.4 per cent of available oxygen. Similar to calcium peroxide. Used as a dusting powder, either alone or mixed with tannin, or in the form of gauze or in a 10 per cent ointment

Nitrogen, N; 14.008

Tests for Nitrates and Nitrites

Nitrates—When a solution of a nitrate is mixed with an equal volume of sulphuric acid, the mixture cooled, and a solution of ferrous sulphate superimposed, a brown color is produced at the junction of the two liquids. When a nitrate is heated with sulphuric acid and metallic copper, brownish-red fumes are evolved.

Nitrites—When treated with diluted mineral acids or with acetic acid, nitrites yield brownish-red fumes. On adding a few drops of potassium iodide T.S. and a few drops of dilute sulphuric acid to a solution of a nitrite, iodine is liberated which colors starch T.S. blue.

NITROGENII MONOXIDUM. U. S. Nitrogen Monoxide

[**Nitrogen. Monox.**—Nitrous Oxide]

Nitrogen Monoxide gas [$N_2O = 44.02$].

Preparation—It is usually prepared by heating ammonium nitrate to about 170° C., when the following reaction occurs:

$$\underset{\text{ammonium nitrate}}{NH_4NO_3} = \underset{\text{nitrogen monoxide}}{N_2O} + \underset{\text{water}}{2H_2O}$$

The gas has also been produced by heating a mixture of ammonium sulphate and sodium nitrate, according to the following equation:

$$\underset{\text{ammonium sulphate}}{(NH_4)_2SO_4} + \underset{\text{sodium nitrate}}{2NaNO_3} = \underset{\text{sodium sulphate}}{Na_2SO_4} + \underset{\text{nitrogen monoxide}}{2N_2O} + \underset{\text{water}}{4H_2O}.$$

Description and Physical Properties—A colorless gas, having a slight characteristic odor and a somewhat sweet taste. It supports the combustion of many substances. For convenience in handling and use, Nitrogen Monoxide is compressed in metallic cylinders.

It is quite soluble in water at low temperatures; 1 volume of water dissolves about 1.3 volumes of nitrous oxide at 25° C.

Tests for Purity—(See the U.S.P. X.)

Uses—For convenience in handling and use, it is furnished in compressed form in metallic cylinders. It is used as a surgical anesthetic by inhalation. During its administration some patients become hysterical and because of this characteristic it is often called *laughing gas.*

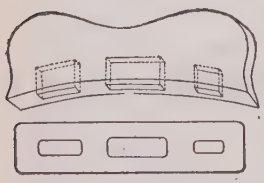
CHAPTER XLI

THE INORGANIC ACIDS

The official inorganic acids form one of the most important classes of compounds used in pharmacy. They will be considered in the following order: 1. Those which do not contain oxygen or *hydracids*, and which are derived from non-metallic elements—*viz.*: hydrochloric, hydriodic, and hydrobromic acids. 2. The non-metallic oxygen acids—nitric, nitrohydrochloric, sulphuric, hypophosphorous, and phosphoric acids. Arsenic trioxide and chromium trioxide (formerly known as arsenous and chromic acids) and boric acid will not be discussed in this chapter, but will be described under the headings of the elements from which they are derived.

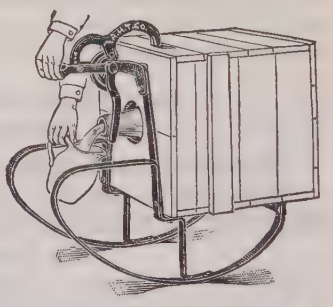
Practical Points in Handling Strong Acids—The strong inorganic acids are never made by the pharmacist for commercial purposes, as they can be manufactured much more economically upon the large scale. They are corrosive in their action, and must be handled very cautiously to avoid personal injury. They are usually sent out by manufacturers in one pound, or in five pint, glass-stoppered bottles, or in carboys holding about ten gallons. One of the common annoyances is the liability of the glass stopper to become so tightly fastened in the neck of the bottle that it is extracted with difficulty. Should this occur, place the container in a vessel, such as an enameled kettle, before attempting to force the stopper. This will prevent a serious accident, should the bottle be broken. Frequently the stopper may be removed by grasping the bottle firmly, and, after cleaning off the lute, carefully tapping the stopper *gently* with a stick of wood. If very moderate measures do not succeed, the stopper wrench (Fig. 424) should be used. This is made of hard wood, of the shape shown in the cut, the lower cut giving the end view and showing the relative sizes of three holes in the wrench. These should be made somewhat larger than the stoppers of the bottles for which the wrench is likely to be used. The refractory stopper is placed in the hole, and the operator grasps the wrench with the right hand and endeavors to twist the stopper out. If it does not yield to moderate treatment, the neck of the bottle may be cautiously heated by wrapping it in a cloth wet with hot water, or by means of a spirit-lamp or Bunsen burner with a low flame, passing the flame quickly around it several times so that it shall be uniformly heated. This will cause expansion of the neck, and if the right moment be seized, which is just before the outer surface of the stopper becomes correspondingly heated, the stopper may be easily extracted. If these means do not succeed, the bottle should be inverted in a vessel of warm water to a depth sufficient to cover the neck and allowed to remain several hours; if the

Fig. 424



Stopper wrench

Fig. 425



Carboy inclinator

wrench is then used, success is generally assured. Corks should not be used as stoppers for the strong acids, because of the corrosive action of the latter—the cork almost invariably contaminating and discoloring the acid.

The handling of carboys containing strong acids is sometimes attended with difficulty and danger. The simplest method is by the use of the "Universal Carboy Inclinator" (Fig. 425). This consists of a steel frame of the shape shown in the cut. It is clamped to the carboy while the latter is standing on the floor and the carboy can then be tilted easily and without spilling the contents. The last drop can be poured out readily.

Quality of Commercial Acids—Several grades of acids are found in commerce. The designation "U. S. P." is attached to those which are of the quality indicated by the U. S. Pharmacopœia for use in making preparations and for tests, etc. The designation "Chemically Pure" is usually meaningless, and acids are now sold as of "U. S. P." or "Reagent" quality or as "Analysed", which means that the impurities which are present are expressed in terms of actual amounts upon the label of each package of acid.

Too much importance cannot be attached to the duty of procuring pure and strong acids. Loss and annoyance in making many preparations will surely follow the use of acids deficient in strength and purity.

Strength of the Official Acids—The official inorganic acids are aqueous solutions of the respective acids and there is no uniformity in strength. For instance, hydrochloric acid contains from 31 to 33 per cent of HCl, nitric acid contains from 67 to 69 per cent of HNO_3, and sulphuric acid contains from 93 to 95 per cent of H_2SO_4. These respective strengths are the most practicable from the commercial standpoint. On the other hand, the *diluted acids* are purposely made uniform—diluted hydriodic, hydrochloric, phosphoric, and sulphuric acids each containing from 9.5 to 10.5 per cent of what is sometimes referred to as the *absolute* acid. Diluted acetic acid (6 per cent) and diluted hydrocyanic acid U. S. P. IX (2 per cent) are exceptions.

FIG. 426

Acid dropper

Medical Properties—The inorganic acids are generally tonic and refrigerant when administered in a diluted condition; externally, if applied undiluted, they are caustic and corrosive, and should be used with the greatest care. Brushes made of spun glass are sometimes employed to apply strong acids externally to ulcers. Test bottles with elongated stoppers, or the form of bottle shown in Fig. 426, are also advantageously used. One of the principal difficulties attendant upon the internal administration of acids is their injurious action upon the teeth. To avoid the destructive contact with the enamel, the acid should be highly diluted and should be taken through a narrow glass tube.

Antidotes—See Part XV, Toxicology and Antidotes.

ACIDUM HYDROCHLORICUM. U. S. Hydrochloric Acid
[Acid. Hydrochl.]

Hydrochloric Acid is an aqueous solution containing not less than 31 per cent and not more than 33 per cent of HCl (36.47).

Preparation—Hydrochloric acid, the only known compound of chlorine and hydrogen, is made on a very large scale both abroad and in this country. It is obtained as a by-product resulting from the manufacture of soda-ash, by decomposing common salt heated to a high temperature with sulphuric acid. Sodium sulphate is formed, and gaseous hydrochloric acid is liberated.

The latter is conducted into a tall tower filled with coke, called a coke scrubber, the ascending gas being met by a descending flow of water, which readily dissolves the gas.

The sodium sulphate from the above process is itself afterward used in the manufacture of sodium carbonate by the Leblanc process. When sulphuric acid is employed, two steps are recognized. In this first reaction a relatively low temperature is used to heat the pan containing the mixture, the heat being obtained from the furnace gases. During this period but one-half of the sodium chloride reacts, as follows:

$$\underset{\text{sodium chloride}}{2NaCl} + \underset{\text{sulphuric acid}}{H_2SO_4} = \underset{\text{hydrochloric acid}}{HCl} + \underset{\text{sodium chloride}}{NaCl} + \underset{\text{acid sodium sulphate}}{NaHSO_4}$$

In the second step the mass is heated to redness by the direct action of the flame and yields the rest of the hydrochloric acid:

$$\underset{\text{sodium chloride}}{NaCl} + \underset{\text{acid sodium sulphate}}{NaHSO_4} = \underset{\text{hydrochloric acid}}{HCl} + \underset{\text{sodium sulphate}}{Na_2SO_4}$$

The hydrochloric acid gas from the first reaction is purer than that obtained from the second, as the latter is mixed with the furnace gases. The product from each process is therefore separately led into batteries of earthenware jars, similar to Woulff's bottles, containing water, and is there absorbed. Hydrochloric acid is also a by-product in the electrolytic production of sodium hydroxide from sodium chloride. The liberated chlorine is heated with steam to 1000° C. (1832° F.), in the presence of an excess of carbon:

$$\underset{\text{chlorine}}{Cl_2} + \underset{\text{water}}{H_2O} + \underset{\text{carbon}}{C} = \underset{\text{hydrochloric acid}}{2HCl} + \underset{\text{carbon monoxide}}{CO}$$

The yellow color of the common acid (*muriatic acid*) is generally due to organic substances or a trace of iron. This variety is sometimes called for by plumbers and tinsmiths under the very old name of *spirit of salt.*

The white fumes produced when the acid is exposed to the air are caused by the gaseous acid combining with the moisture in the air, and also with a trace of ammonia usually present, forming ammonium chloride.

Description and Physical Properties—A colorless, fuming liquid having a pungent odor. The fumes and odor disappear on diluting the Acid with 2 volumes of water.

On distilling Hydrochloric Acid at normal barometric pressure, a stronger acid passes over first, until at 110° C. an acid of about 20 per cent remains, and this distils unchanged.

Specific gravity: about 1.155 at 25° C.

Tests for Identity—It is strongly acid to litmus paper, even when highly diluted.

When Hydrochloric Acid is heated with manganese dioxide, chlorine is evolved.

Hydrochloric Acid responds to the reactions for chlorides, page 567.

Tests for Purity—Hydrochloric Acid when diluted with 2 volumes of water conforms to the following tests:

Evaporate 25 cc. of the dilution and dry at 110° C.: not more than 0.003 Gm. of residue remains.

Add 1 cc. of chloroform to 10 cc. of the dilution, and cautiously add, a drop at a time with constant agitation, chlorine T.S. which has been diluted with an equal volume of distilled water: the chloroform remains free from even a transient yellow, orange, or violet color (*bromide or iodide*).

Add 1 cc. of potassium iodide T.S. and 1 cc. of chloroform to 10 cc. of the dilution and agitate the mixture: the chloroform remains free for at least one minute from any violet coloration (*free chlorine or bromine*).

A 2 cc. portion of the dilution further diluted with 14 cc. of distilled water meets the requirements of the test for *heavy metals*, page 1519.

A 5 cc. portion of the dilution further diluted with 12 cc. of distilled water (without the treatment with sulphuric and sulphurous acids) meets the requirements of the test for *arsenic*, page 1512.

Add 5 drops of barium chloride T.S. to a mixture of 3 cc. of the dilution and 5 cc. of distilled water: neither turbidity nor precipitation appears within one hour (*sulphuric acid or sulphate*).

At the end of this period, the further addition to the liquid of 2 drops of tenth-normal iodine produces neither turbidity nor decoloration of the iodine (*sulphurous acid*).

Assay—Proceed as directed under the assay for acids, page 1514, using about 3 cc. of the Acid, accurately weighed, and methyl orange T.S. as indicator. Each cc. of normal sodium hydroxide corresponds to 0.03647 Gm. of HCl.

This assay is explained on page 1453.

Preserve in glass stoppered bottles.

U. S. P. Preparations—Acidum Hydrochloricum Dilutum; Resina Podophylli; Sulphur Præcipitatum.

N. F. Preparations—Acidum Nitrohydrochloricum; Acidum Nitrohydrochloricum Dilutum; Liquor Chlori Compositus; Tinctura Sanguinariæ.

History—This acid was first prepared commercially by Glauber in the seventeenth century by distilling sea salt with sulphuric acid, hence the common name *Spirit of Salt* which attached to it for many years.

Uses—Hydrochloric acid is largely used in making chlorides and other preparations. Medicinally it is usually prescribed in the diluted form in stomach disorders. The dose is five to ten minims (0.3 to 0.6 cc.). (For antidotes, see Part XV.)

ACIDUM HYDROCHLORICUM DILUTUM. U.S. Diluted Hydrochloric Acid
[Acid. Hydrochl. Dil.]

Diluted Hydrochloric Acid is an aqueous solution containing not less than 9.5 per cent and not more than 10.5 per cent of HCl (36.47).

	Metric	Alternative
Hydrochloric Acid	**313 Gm.**	4½ fl. oz.
Distilled Water	**687 Gm.**	11½ fl. oz.
To make	**1000 Gm.**	16 fl. oz.

Mix them.

Description and Physical Properties—A colorless, odorless liquid.

Specific gravity: about 1.049 at 25° C.

Tests for Identity and Purity—Diluted Hydrochloric Acid is strongly acid to litmus paper.

Diluted Hydrochloric Acid conforms to the tests for identity and purity under *Acidum Hydrochloricum*.

Assay—Proceed as directed under the assay for acids, page 1514, using 10 cc. of Diluted Hydrochloric Acid, accurately weighed, and methyl orange T.S. as indicator. Each cc. of normal sodium hydroxide corresponds to 0.03647 Gm. of HCl.

This assay is explained on page 1453.

Preserve in glass-stoppered bottles.

U. S. P. Preparation—Liquor Acidi Arsenosi.

N. F. Preparations—Elixir Chloridorum; Elixir Pepsini; Extractum Conii; Glyceritum Pepsini; Liquor Pepsini; Liquor Pepsini Antisepticus; Liquor Pepsini Aromaticus.

Uses—Diluted hydrochloric acid is used as in the treatment of certain types of dyspepsia in doses of fifteen minims (1 cc.), largely diluted with water. It should be drawn through a glass tube or straw, to avoid injury to the teeth.

ACIDUM HYDRIODICUM DILUTUM. U.S. Diluted Hydriodic Acid
[Acid. Hydriod. Dil.]

Diluted Hydriodic Acid is an aqueous solution containing not less than 9.5 per cent and not more than 10.5 per cent of HI (127.93).

	Metric	Alternative
Potassium Iodide	**135 Gm.**	4 oz. av. 420 gr.
Hypophosphorous Acid	**20 cc.**	338 min.
Tartaric Acid	**122 Gm.**	4 oz. av. 210 gr.
Distilled Water,		
Diluted Alcohol, each, a sufficient quantity,		
To make	**1000 Gm.**	2 pints

Dissolve the potassium iodide in 250 cc. [8 fl. oz.] of distilled water and the tartaric acid in 400 cc. [12 fl. oz.] of diluted alcohol. Pour the solu-

tion of tartaric acid into a bottle of about 1000 cc. [2 pints] capacity, add the solution of the potassium iodide and the hypophosphorous acid, and shake the mixture briskly. Cool to about 5° C. for several hours, and, having fitted a pledget of purified cotton tightly into a funnel, transfer the contents of the bottle to the funnel. When all of the liquid has passed through, wash the bottle and crystalline precipitate with several small portions of diluted alcohol until the filtrate weighs 1000 Gm. [or measures 2 pints]. Warm the liquid at a moderate temperature on a water bath until all of the alcohol has evaporated, and add sufficient distilled water to make the product weigh 1000 Gm. [or measure 2 pints].

Diluted hydriodic acid was introduced into the U. S. Pharmacopœia for the purpose of quickly preparing syrup of hydriodic acid (see page 265).

This is a modification of the Wade or Fothergill process. The potassium iodide is decomposed by tartaric acid, acid potassium tartrate crystallizing out; the use of diluted alcohol and the cooling of the liquid are depended upon to assist in separating the crystals.

$$\underset{\text{potassium iodide}}{KI} + \underset{\text{tartaric acid}}{H_2C_4H_4O_6} = \underset{\text{hydriodic acid}}{HI} + \underset{\text{acid potassium tartrate}}{KHC_4H_4O_6}$$

Hypophosphorous acid is added to protect the diluted acid from discoloration through the possible liberation of iodine. If any free iodine is liberated, the hypophosphorous acid is oxidized to phosphoric acid and hydriodic acid is produced by the action on the iodine, both products being colorless.

$$\underset{\text{hypophosphorous acid}}{H_3PO_2} + \underset{\text{iodine}}{2I_2} + \underset{\text{water}}{2H_2O} = \underset{\text{hydriodic acid}}{4HI} + \underset{\text{phosphoric acid}}{H_3PO_4}$$

The formula for diluted hydriodic acid, page 555, may also be used for preparing *Diluted Hydrobromic Acid*, in which case the potassium iodide is replaced by 108.2 Gm. of potassium bromide.

Traces of potassium iodide, acid potassium tartrate, or hypophosphorous acid will not affect the medicinal action of the finished product.

Description and Physical Properties—A colorless or not more than pale yellow, odorless liquid.

Specific gravity: about 1.100 at 25° C.

Tests for Identity—It is strongly acid to litmus paper.

Diluted Hydriodic Acid responds to the reactions for iodides, page 575.

Tests for Purity—A 5 cc. portion of Diluted Hydriodic Acid, when evaporated to dryness on a water bath and ignited at dull red heat (about 750° C.), leaves not more than 0.165 Gm. of residue.

No blue color is produced on adding a few drops of starch T.S. to 5 cc. of the Acid (*free iodine*).

The addition of 1 cc. of potassium sulphate T.S. to 10 cc. of the Acid causes no turbidity (*barium*).

Mix 0.5 cc. of Diluted Hydriodic Acid with 10 cc. of distilled water, add 8 cc. of silver nitrate T.S. and 6 cc. of ammonium carbonate T.S., digest the mixture for ten minutes on a water bath, cool, and filter: the filtrate upon supersaturation with nitric acid shows no more *chloride* than corresponds to 0.5 cc. of fiftieth-normal hydrochloric acid, page 1520.

A 10 cc. portion of Diluted Hydriodic Acid shows no more *sulphate* than corresponds to 1.0 cc. of fiftieth-normal sulphuric acid, page 1520.

A 10 cc. portion of Diluted Hydriodic Acid without further acidulation meets the requirements of the test for *heavy metals*, page 1519.

Mix 5 cc. of Diluted Hydriodic Acid with 1 cc. of nitric acid, and evaporate the liquid to dryness on a water bath: the residue meets the requirements of the test for *arsenic*, page 1512.

Assay—Pour about 5 cc. of Diluted Hydriodic Acid into a tared flask, weigh accurately, dilute with 20 cc. of distilled water, add 50 cc. of tenth-normal silver nitrate, and shake the mixture well. Then add 5 cc. of nitric acid, heat the mixture on a water bath until the precipitate has a bright yellow color, cool, add 2 cc. of ferric ammonium sulphate T.S., and determine the

residual silver nitrate by titration with tenth-normal potassium thiocyanate. Each cc. of tenth-normal silver nitrate corresponds to 0.01279 Gm. of HI.

This assay is explained on page 1462.

Preserve in amber-colored, glass-stoppered bottles, protected from light. Do not dispense if it contains free iodine.

U. S. P. Preparation—Syrupus Acidi Hydriodici.

Uses—Although this liquid is used mainly for dilution with syrup (see Syrupus Acidi Hydriodici, page 266), it is sometimes given internally in doses of eight minims (0.5 cc.).

ACIDUM NITRICUM. U. S. Nitric Acid
[Acid. Nitric.]

Nitric Acid contains not less than 67 per cent and not more than 69 per cent of HNO_3 (63.02).

Preparation—Nitric acid is prepared from N_2O_5, one of the five compounds of nitrogen and oxygen; these are nitrogen monoxide, or hyponitrous oxide (laughing gas), N_2O; nitrogen dioxide, N_2O_2 or $(NO)_2$; nitrous oxide, N_2O_3; nitrogen tetroxide or peroxide, N_2O_4; and nitric oxide, N_2O_5. From this latter, by the addition of water, nitric acid is formed, $N_2O_5 + H_2O = (HNO_3)_2$. Nitric acid is prepared commercially by reacting on sodium nitrate or *Chili saltpetre* with sulphuric acid. Sodium nitrate is preferred as the source, because it is cheaper than potassium nitrate, and, in addition, it affords a larger proportion of nitric acid. If two molecules of the sodium salt and one of the sulphuric acid are taken, the reactions will be as follows:

$$\underset{\text{sodium nitrate}}{NaNO_3} + \underset{\text{sulphuric acid}}{H_2SO_4} = \underset{\text{acid sodium sulphate}}{NaHSO_4} + \underset{\text{nitric acid}}{HNO_3}$$

It is possible, by raising the heat, to bring about a second reaction in which the acid sodium sulphate acts upon the second molecule of sodium nitrate as follows:

$$\underset{\text{sodium nitrate}}{NaNO_3} + \underset{\text{acid sodium sulphate}}{NaHSO_4} = \underset{\text{sodium sulphate}}{Na_2SO_4} + \underset{\text{nitric acid}}{HNO_3}$$

Commercially, however, it has not been found desirable to force this second reaction and the process is concluded with the production of the acid sodium sulphate.

Nitric acid is also being made from atmospheric nitrogen in enormous quantities by means of the electric furnace, especially in Norway where the electric current is produced cheaply by water power. The nitric acid so obtained, being weak, is transformed directly into calcium nitrate and this, in turn, treated with sulphuric acid, the operation being started by the addition of a little nitric acid. Even in the cold, concentrated nitric acid is formed and the insoluble calcium sulphate is separated by filtration. Many other processes for preparing nitric acid from atmospheric nitrogen have been proposed and a number of them are in successful operation.

The specific gravity of the official acid, or, as it is technically termed "43 degree" acid, is 1.40 at 25° C. That which is usually furnished in commerce is not so strong as this, but has the specific gravity of 1.355, and is known as "38 degree" acid. Care should always be observed to specify "U. S. P. strength" in ordering from the manufacturing chemist or dealer, for if official preparations are to be made, like the solutions of iron, success cannot be expected if acids of official strength are not used. The reddish acid, called *nitrous acid*,

is nitric acid containing more or less nitrogen tetroxide (N_2O_4). The same acid may be formed by passing nitrogen dioxide (N_2O_2) into nitric acid. When exposed to sunlight the pure acid soon undergoes decomposition, developing N_2O_4 and a red color. It should therefore be kept in a dark place.

Description and Physical Properties—A fuming liquid, very caustic and corrosive and having a characteristic, highly irritating odor.

It boils at about 120° C., but volatilizes completely when heated on a steam bath.

Specific gravity: about 1.40 at 25° C.

Tests for Identity—Nitric Acid is strongly acid to litmus paper, even when highly diluted.

Nitric Acid responds to the reactions for nitrates, page 551.

Nitric Acid acts upon copper, mercury, silver, and many other metals, with the evolution of brownish-red fumes, and stains woolen fabrics and animal tissues a bright yellow.

Tests for Purity—Evaporate 20 cc. of Nitric Acid from a platinum or porcelain dish, and dry at 110° C.: not more than 0.003 Gm. of residue remains (*non-volatile substances*).

Shake 2.5 cc. of Nitric Acid, diluted with 7.5 cc. of distilled water, with 2 cc. of chloroform: the latter remains colorless (*iodine or bromine*) even after the introduction of a small piece of metallic tin (*iodic or bromic acid*).

Nitric Acid diluted with 25 volumes of distilled water and neutralized with ammonia T.S. meets the requirements of the test for *heavy metals*, page 1519.

The residue remaining from the evaporation of 0.5 cc. of Nitric Acid to dryness on a water bath meets the requirements of the test for *arsenic*, page 1512.

Separate portions of Nitric Acid diluted with 10 volumes of distilled water do not yield a precipitate upon the addition of barium chloride T.S. (*sulphate*), or of silver nitrate T.S. (*chloride*).

Assay—Proceed as directed under the assay for acids, page 1514, using 2 cc. of the Acid, accurately weighed, and methyl orange T.S. as indicator. Each cc. of normal sodium hydroxide corresponds to 0.06302 Gm. of HNO_3.

This assay is explained on page 1453.

Preserve in dark amber-colored, glass-stoppered bottles, protected from light.

U. S. P. Preparation—Liquor Ferri Tersulphatis.

N. F. Preparations—Acidum Nitrohydrochloricum; Acidum Nitrohydrochloricum Dilutum; Glyceritum Bismuthi; Liquor Ferri Sulphatis; Magma Bismuthi; Unguentum Hydrargyri Nitratis.

History—Both nitric acid and nitro-hydrochloric acid were described by Geber in the seventh century, A.D.

Uses—Nitric acid, sometimes called *aqua fortis*, is used in pharmaceutical operations to form nitrates and as an oxidizing agent. Free nitric acid, however, will evolve oxygen when heated to a high temperature, according to the following reaction:

$$\underset{\text{nitric acid}}{4HNO_3} = \underset{\substack{\text{nitrogen}\\\text{tetroxide}}}{2N_2O_4} + \underset{\text{oxygen}}{O_2} + \underset{\text{water}}{2H_2O}$$

It oxidizes sulphur and phosphorus (giving rise to sulphuric and phosphoric acids) and all of the metals, with a few exceptions. It combines with salifiable bases and forms nitrates. Medicinally, nitric acid is used chiefly as a caustic. It is occasionally given internally in stomach and intestinal disorders in doses of five to ten minims (0.3 to 0.6 cc.). When applied to the skin it produces a yellow stain, due to the formation of *xanthoproteic acid*. When used as a caustic, the surrounding area should be well greased to prevent its action from spreading. (For Antidotes, see Part XV.)

Diluted nitric acid is no longer official but will be found among the reagents (see Chapter XCII).

ACIDUM SULPHURICUM. U. S. Sulphuric Acid
[Acid. Sulphuric.]

Sulphuric Acid contains not less than 93 per cent and not more than 95 per cent of H_2SO_4 (98.08).

Preparation—The reaction by which sulphuric acid is obtained in the "lead chamber process" has been the subject of careful investigation. The term "lead chamber process" is derived from the fact that the reaction takes

place in lead lined rooms. According to one theory, which has been recognized for many years, the sulphur dioxide, SO_2, obtained by burning sulphur or iron pyrites, FeS_2, is allowed to mix with nitrous fumes obtained from the decomposition of sodium nitrate, which changes SO_2 into sulphur trioxide, SO_3, and this uniting with steam yields sulphuric acid H_2SO_4. If the sulphur were burned by itself, the product would be sulphur dioxide, which contains only two-thirds as much oxygen as sulphur trioxide. The object of the sodium nitrate is to furnish, by its decomposition, the requisite additional quantity of oxygen. To understand the process, it is necessary to remember that several of the oxides of nitrogen have oxidizing power. The reactions are thus expressed:

$$\underset{\text{sulphur dioxide}}{2SO_2} + \underset{\text{nitrogen tetroxide}}{N_2O_4} = \underset{\text{sulphur trioxide}}{2SO_3} + \underset{\text{nitrogen dioxide}}{N_2O_2};$$

then

$$\underset{\text{nitrogen dioxide}}{N_2O_2} + \underset{\text{oxygen}}{O_2} = \underset{\text{nitrogen tetroxide}}{N_2O_4};$$

then

$$\underset{\text{sulphur trioxide}}{SO_3} + \underset{\text{water}}{H_2O} = \underset{\text{sulphuric acid}}{H_2SO_4};$$

in which the sulphur dioxide, from the burning pyrites or sulphur, is oxidized to sulphur trioxide by the nitrogen tetroxide, which readily parts with two atoms of oxygen to such bodies as sulphur dioxide, and then takes two atoms of oxygen again from the atmosphere, regenerating the original tetroxide. The nitrogen tetroxide thus acts simply as a carrier of atmospheric oxygen, whereby the SO_2 is changed into SO_3. This latter compound then unites with steam to form H_2SO_4, the final product.

According to a later theory, advanced by Lunge and Naef, the sulphur dioxide combines with nitrogen trioxide, N_2O_3, oxygen from the air, and water, in the form of steam, to produce an intermediate crystalline product termed *nitrosylsulphuric acid*. This, in turn, in the presence of steam, is immediately decomposed into sulphuric acid, the nitrogen trioxide being again regenerated. The reactions are as follows:

$$\underset{\text{sulphur dioxide}}{2SO_2} + \underset{\text{nitrogen trioxide}}{N_2O_3} + \underset{\text{oxygen}}{O_2} + \underset{\text{water}}{H_2O} = \underset{\text{nitrosylsulphuric acid}}{2SO_2\begin{matrix}\diagup OH \\ \diagdown ONO\end{matrix}}$$

then

$$\underset{\text{nitrosylsulphuric acid}}{2SO_2\begin{matrix}\diagup OH \\ \diagdown ONO\end{matrix}} + \underset{\text{water}}{H_2O} = \underset{\text{sulphuric acid}}{2H_2SO_4} + \underset{\text{nitrogen trioxide}}{N_2O_3}$$

This acid is made on an immense scale and a great deal of sulphur dioxide formed in the smelting of sulphide ores, and formerly wasted, is now converted into sulphuric acid by this method. Sulphur is used most largely in the United States as the source of production, while pyrites is used almost exclusively abroad. As the latter nearly always contains arsenical compounds, the foreign commercial product is contaminated with them. The "lead chamber acid" is only suitable for technical purposes when highly purified.

Sulphuric acid is now made on a large scale by what is termed the "con-

tact method", in which a purified mixture of air and sulphur dioxide, from burning sulphur, is cooled to a temperature between 380° and 450° C. (716° and 842° F.) and then caused to pass over what is termed a catalytic agent, resulting in the extraction of oxygen from the air and the production of SO_3, which in turn is dissolved in water or, for complete absorption, in concentrated sulphuric acid. As much as 99 per cent of the theoretical yield of sulphuric acid is thus obtained. Various substances have been used as the catalytic agents, which are themselves not altered during the reaction. Platinized asbestos, finely subdivided platinum distributed over a magnesium salt, vanadium pentoxide, and the sulphates of thorium, cerium, and praseodymium have all been employed. This process is more easily operated than the "lead chamber process" and the pure acid can be produced at less cost.

The reactions involved in making the acid by the "contact method" are expressed as follows:

$$\underset{\text{sulphur}}{S_2} + \underset{\text{oxygen}}{2O_2} = \underset{\text{sulphur dioxide}}{2SO_2}$$

$$\underset{\text{sulphur dioxide}}{2SO_2} + \underset{\text{oxygen}}{O_2} = \underset{\text{sulphur trioxide}}{2SO_3} \quad \text{then} \quad \underset{\text{sulphur trioxide}}{2SO_3} + \underset{\text{water}}{2H_2O} = \underset{\text{sulphuric acid}}{2H_2SO_4}$$

Description and Physical Properties—A colorless, odorless liquid of oily consistence, very caustic and corrosive.

Sulphuric Acid is miscible with water and with alcohol with the evolution of much heat. The Acid must be added with great caution to the diluent.

When strongly heated, the Acid is vaporized with the evolution of dense, white fumes.

Specific gravity: about 1.83 at 25° C.

Tests for Identity—It is strongly acid to litmus paper even when highly diluted.

Sulphuric Acid responds to the reactions for sulphates, page 581.

Sulphuric Acid with or without the aid of heat chars cane sugar, wood, and many other organic substances.

Tests for Purity—No precipitate is formed within an hour on mixing 1 volume of Sulphuric Acid with 5 volumes of alcohol (*lead*).

Sulphuric Acid diluted with 15 volumes of distilled water conforms to the following tests:

Evaporate 25 cc. of the dilution from a platinum or porcelain dish, and ignite: not more than 0.0015 Gm. of residue remains after ignition (*non-volatile substances*).

A 10 cc. portion of the dilution does not at once discharge the color of 0.1 cc. of tenth-normal potassium permanganate (*sulphurous or nitrous acid*).

Mix 5 cc. of the dilution with an equal volume of ferrous sulphate T.S. and superimpose it upon reagent sulphuric acid: the zone of contact does not assume a brown or brownish-red color (*nitrate*).

The dilution is not immediately affected by silver nitrate T.S. (*chloride*).

A 10 cc. portion of the dilution meets the requirements of the test for *heavy metals*, page 1519.

A 2 cc. portion of the dilution meets the requirements of the test for *arsenic*, page 1512.

Assay—Proceed as directed under the assay for acids, page 1514, using about 1 cc. of the Acid, accurately weighed, and methyl orange T.S. as indicator. Each cc. of normal sodium hydroxide corresponds to 0.04904 Gm. of H_2SO_4.

This assay is explained on page 1453.

Preserve in glass-stoppered bottles.

U. S. P. Preparations—Acidum Sulphuricum Aromaticum; Acidum Sulphuricum Dilutum; Liquor Ferri Tersulphatis.

N. F. Preparations—Liquor Ferri Subsulphatis; Oleum Æthereum.

Sulphuric acid is generally known by the old name of *oil of vitriol*. A commercial variety of sulphuric acid which contains an extra molecule of SO_3 and which is sometimes given the formula $H_2S_2O_7$, is known sometimes by the name of *Nordhausen Sulphuric Acid*, and in some of the industries is referred to by the dangerously misleading name of *oleum*. An acid of 66° B. (about 93 per cent H_2SO_4) is known to the trade as "*O. V.*"

History—The sulphates were all originally termed *vitriols*. *Green vitriol* or *vitriol of Mars* contained iron; *blue vitriol* or *vitriol of Venus* contained copper, and *white vitriol* was known to be in some way connected with calamine. *Albertus Magnus* in the thirteenth century first used these terms

and found that when a vitriol was subjected to a high temperature in a retort an oily liquid distilled over which was called *oil of vitriol.*

Uses—Sulphuric acid is the most powerful of the official inorganic acids. It is employed in making many preparations, mostly on account of its energetic action in decomposing salts, and the large use made of its compounds with metals, alkaloids, and other bodies. It is rarely used in the pure state as an escharotic, owing to its tendency to spread. When accidentally dropped upon the skin, a quick and profuse application of magnesia will prove effective. Unless the quantity of acid is very small, care should be used in applying water, except when a very large quantity can be applied at once, as the amount of heat produced when water is mixed with sulphuric acid increases the pain. Internally, sulphuric acid is administered either in its diluted form or as aromatic sulphuric acid. (See also Antidotes, Part XV.)

ACIDUM SULPHURICUM AROMATICUM. U. S. Aromatic Sulphuric Acid [Acid. Sulph. Arom.]

Aromatic Sulphuric Acid contains free sulphuric acid and ethyl-sulphuric acid together equivalent to not less than 19 per cent and not more than 21 per cent of H_2SO_4 (98.08).

	Metric	Alternative
Sulphuric Acid	109 cc.	3 fl. oz. 234 min.
Tincture of Ginger	50 cc.	1 fl. oz. 288 min.
Oil of Cinnamon	1 cc.	15 min.
Alcohol, a sufficient quantity,		
To make	1000 cc.	2 pints

Add the sulphuric acid gradually and with great caution to 700 cc. [22½ fl. oz.] of alcohol, and allow the mixture to cool. Then add to it the tincture of ginger and the oil of cinnamon, and afterwards enough alcohol to make the product measure 1000 cc. [2 pints].

If the acid-alcohol mixture is not cooled, as directed, before adding the oil and tincture, the finished product will be much darker in color than normally, due to greater caramelization than occurs in the cold.

Description and Physical Properties—A clear, reddish-brown liquid having a pleasant aromatic odor.

Specific gravity: about 0.94 at 25° C.

Tests for Identity—Aromatic Sulphuric Acid is strongly acid to litmus paper.

Aromatic Sulphuric Acid responds to the reactions for sulphates, page 581.

Assay—Transfer about 5 cc. of Aromatic Sulphuric Acid, accurately weighed, to a tall beaker. Add exactly 30 cc. of normal sodium hydroxide, and evaporate the mixture to complete dryness on a sand bath. Dissolve the residue in 30 cc. of distilled water, and titrate the excess of alkali with normal sulphuric acid, using methyl orange T.S. as indicator. Each cc. of normal sodium hydroxide corresponds to 0.04904 Gm. of H_2SO_4.

This assay is explained on page 1454.

Preserve in glass-stoppered bottles.

Alcohol content, by volume, 82 to 85 per cent.

History—This preparation was devised by Dr. Adrian Mynsicht of Germany in the early part of the seventeenth century and was used by him under the name *Elixir Vitrioli Mynsichti.* The original formula which was adopted in the P. L. 1721 was quite complex and contained eleven vegetable drugs. The formula was simplified in 1746 and the name changed to *Elixir Vitrioli Acidum* which was changed during the last century to the present title.

Uses—This preparation, known as *elixir of vitriol,* is employed principally as a remedy for diarrhea. It is used sometimes as an excipient for quinine pills, to reduce their size and render them more soluble. The introduction of the acid sulphate of quinine has diminished this use. The dose is eight minims (0.5 cc.).

ACIDUM SULPHURICUM DILUTUM. U. S. Diluted Sulphuric Acid

[Acid. Sulph. Dil.]

Diluted Sulphuric Acid is an aqueous solution containing not less than 9.5 per cent and not more than 10.5 per cent of H_2SO_4 (98.08).

	Metric	Alternative
Sulphuric Acid	107 Gm.	1 fl. oz.
Distilled Water	893 Gm.	15 fl. oz.
To make	1000 Gm.	16 fl. oz.

Pour the Acid gradually, with constant stirring, into the distilled water, and allow the solution to cool.

The strong acid is added gradually to the water, to guard against the too sudden production of heat, which might cause the fracture of a glass vessel. If "lead chamber" sulphuric acid which has not been purified by redistillation is diluted with water, the liquid becomes slightly turbid, and in the course of a few days deposits a grayish-white powder, which is lead sulphate. Sulphuric acid prepared by the "contact method" will not show this precipitate.

The formation of this precipitate does not occur when official or "reagent" sulphuric acid is used, as the lead salt is present only when sulphuric acid has not been purified.

Description and Physical Properties—A colorless, odorless liquid having a strongly acid taste. Specific gravity: about 1.067 at 25° C.

Tests for Identity and Purity—Diluted Sulphuric Acid is strongly acid to litmus paper.

Diluted Sulphuric Acid conforms to the tests for identity and purity under *Acidum Sulphuricum*.

Assay—Proceed as directed under the assay for acids, page 1514, using 20 cc. of the Acid, accurately weighed, and methyl orange T.S. as indicator. Each cc. of normal sodium hydroxide corresponds to 0.04904 Gm. of H_2SO_4.

This assay is explained on page 1453.

Preserve in glass-stoppered bottles.

U. S. P. Preparations—Ferri Carbonas Saccharatus; Ferri Sulphas Granulatus.

N. F. Preparations—Infusum Rosæ Compositum; Syrupus Rosæ.

Uses—Diluted sulphuric acid has the same properties as the acid from which it is made, except those which are dependent upon the strength of the latter. It is given internally in gastric and intestinal disorders, properly diluted, in doses of fifteen minims (1 cc.).

ACIDUM PHOSPHORICUM. U. S. Phosphoric Acid

[Acid. Phos.]

Phosphoric Acid contains not less than 85 per cent and not more than 88 per cent of H_3PO_4 (98.06).

Phosphoric Acid is sometimes referred to as *syrupy phosphoric acid* on account of its consistence.

Preparation—A pure grade of phosphoric acid may be made by adding the proper equivalent of water to phosphorus pentoxide according to the following equation:

$$\underset{\text{phosphorus pentoxide}}{P_2O_5} + \underset{\text{water}}{3H_2O} = \underset{\text{phosphoric acid}}{2H_3PO_4}$$

The acid is made commercially by the action of sulphuric acid on bone ash, or crude calcium phosphate. The crude acid so obtained is unfit for medicinal use unless it is highly purified.

A very pure phosphoric acid, suitable for medicinal use, is made by oxidizing ordinary phosphorus with nitric acid. The following equation explains the reaction that takes place:

$$3P_4 + 20HNO_3 + 8H_2O = 12H_3PO_4 + 10N_2O_2$$

phosphorus — nitric acid — water — phosphoric acid — nitrogen dioxide

Description and Physical Properties—A colorless, odorless liquid of a syrupy consistence.

Phosphoric Acid is miscible with water and with alcohol.

When heated, the liquid loses water, and at 200° C. gradually changes to pyrophosphoric acid. At a still higher temperature (about 300° C.) it is converted into metaphosphoric acid, which either volatilizes as dense fumes, or forms, on cooling, a transparent mass of metaphosphoric acid.

Specific gravity: about 1.71 at 25° C.

Tests for Identity—Phosphoric Acid is strongly acid to litmus paper, even when highly diluted.

Phosphoric Acid carefully neutralized with sodium hydroxide T.S. responds to the reactions for phosphates, page 586.

Render 3 cc. of the dilution alkaline with ammonia T.S., and add magnesium sulphate T.S. (or magnesia mixture T.S.): a white, crystalline precipitate of magnesium-ammonium phosphate is produced. Collect this precipitate, wash it, and then dissolve it in diluted acetic acid: the solution yields a yellow precipitate with silver nitrate T.S. (*distinction from metaphosphoric or pyrophosphoric acid*).

Tests for Purity—Phosphoric Acid diluted with 14 volumes of distilled water conforms to the following tests:

Warm 5 cc. of the dilution gently, and add 2 cc. of silver nitrate T.S.: the mixture does not become brown (*phosphorous or hypophosphorous acid*).

A 10 cc. portion of the dilution meets the requirements of the test for *heavy metals*, page 1519.

A 2 cc. portion of the dilution meets the requirements of the test for *arsenic*, page 1512.

The dilution is not immediately affected by silver nitrate T.S. (*hydrochloric acid*), nor is it affected even after one hour by the addition of an equal volume of tincture of ferric chloride (*pyrophosphoric or metaphosphoric acid*).

Mix 1 cc. of the dilution with 6 cc. of distilled water, and add 1 cc. of barium chloride T.S.: no precipitate is produced immediately (*sulphate*).

Mix 5 cc. of the dilution with an equal volume of ferrous sulphate T.S., and superimpose the mixture upon 3 cc. of sulphuric acid contained in a test tube: the zone of contact does not assume a brown or brownish-red color (*nitrate*).

Transfer 1 cc. of Phosphoric Acid to a graduated cylinder, and add 6 cc. of ether and 2 cc. of alcohol: no turbidity appears (*phosphates*).

Assay—Pour about 1 Gm. of Phosphoric Acid into a tared, 100 cc. volumetric flask, weigh accurately, and add enough distilled water to make 100 cc. Transfer 10 cc. of this solution to a 100 cc. volumetric flask, add a drop of phenolphthalein T.S., and neutralize the mixture with special sodium hydroxide T.S. (page 1550). Add 50 cc. of tenth-normal silver nitrate from a burette while gently shaking. Mix a small amount of reagent zinc oxide (page 1543) with distilled water and gradually add the mixture, in small portions, until the liquid is neutral to litmus paper. Now add distilled water to make the liquid measure 100 cc., mix well, and filter through a dry filter, rejecting the first 5 cc. Transfer 50 cc. of the filtrate with a pipette to a flask, add 2 cc. of nitric acid and 2 cc. of ferric ammonium sulphate T.S., and determine the excess of silver nitrate by titration with tenth-normal potassium thiocyanate to the production of a permanent red color. Each cc. of tenth-normal silver nitrate corresponds to 0.003269 Gm. of H_3PO_4.

This assay is explained on page 1463.

Preserve in glass-stoppered bottles.

U. S. P. Preparation—Acidum Phosphoricum Dilutum.

N. F. Preparations—Elixir Calcii et Sodii Glycerophosphatum; Elixir Calcii Lactophosphatis; Elixir Gentianæ Glycerinatum; Liquor Phosphatum Acidus; Liquor Phosphatum Compositus; Syrupus Calcii Lactophosphatis; Syrupus Ferri, Quininæ et Strychninæ Phosphatum.

Uses—Phosphoric acid is used to make diluted phosphoric acid and in the galenical preparations indicated above. (For Antidotes, see Part XV.)

ACIDUM PHOSPHORICUM DILUTUM. U.S. Diluted Phosphoric Acid [Acid. Phos. Dil.]

Diluted Phosphoric Acid is an aqueous solution containing not less than 9.5 per cent and not more than 10.5 per cent of H_3PO_4 (98.06).

	Metric	Alternative
Phosphoric Acid	**116 Gm.**	**2¼ fl. oz.**
Distilled Water	**884 Gm.**	**29¾ fl. oz.**
To make	**1000 Gm.**	**2 pints**

Mix them.

The precipitation which sometimes occurs when phosphoric acid is mixed with tincture of ferric chloride is generally due to the presence of pyrophosphoric acid. Ferric pyrophosphate is precipitated in the form of an insoluble gelatinous precipitate.

Description and Physical Properties—A clear, colorless, odorless liquid.

Specific gravity: about 1.057 at 25° C.

Tests for Identity and Purity—Diluted Phosphoric Acid is strongly acid to litmus paper.

Evaporate 20 cc. of Diluted Phosphoric Acid on a water bath to a volume of 4 cc. Cool, transfer 2 cc. to a graduated cylinder, and add 6 cc. of ether and 2 cc. of alcohol: no turbidity appears (*phosphate*).

Diluted Phosphoric Acid conforms to the other tests for identity and purity under *Acidum Phosphoricum*.

Assay—Pour about 1 Gm. of Diluted Phosphoric Acid into a tared, 100 cc. volumetric flask, weigh accurately, add a drop of phenolphthalein T.S., and neutralize the mixture with special sodium hydroxide T.S. (page 1550). Add 50 cc. of tenth-normal silver nitrate, and proceed as directed in the assay under *Acidum Phosphoricum*. Each cc. of tenth-normal silver nitrate corresponds to 0.003269 Gm. of H_3PO_4.

This assay is explained on page 1463.

Preserve in well-stoppered bottles.

Uses—Diluted phosphoric acid is used as a tonic in doses of fifteen minims (1 cc.).

ACIDUM HYPOPHOSPHOROSUM. U. S. Hypophosphorous Acid

[Acid. Hypophos.]

Hypophosphorous Acid is an aqueous solution containing not less than 30 per cent and not more than 32 per cent of HPH_2O_2 (66.06).

Preparation—Hypophosphorous Acid may be made in several ways. Two satisfactory methods are based upon carefully decomposing barium hypophosphite with diluted sulphuric acid or through the decomposition of 17 parts of calcium hypophosphite with 13 parts of oxalic acid.

Another method is the one in which Fothergill's process is involved (page 556). Potassium hypophosphite is made to react with tartaric acid in the presence of diluted alcohol. After the precipitate of potassium bitartrate is removed and the alcohol has been evaporated, the liquid is brought up to the required volume by the addition of distilled water. The equation is expressed as follows:

$$\underset{\text{potassium hypophosphite}}{KPH_2O_2} + \underset{\text{tartaric acid}}{H_2C_4H_4O_6} = \underset{\text{hypophosphorous acid}}{HPH_2O_2} + \underset{\text{acid potassium tartrate}}{KHC_4H_4O_6}$$

Description and Physical Properties—A colorless or slightly yellow, odorless liquid.

When the Acid is heated in a suitable dish, water evaporates, leaving a more concentrated acid. On further heating between 130° and 140° C., it decomposes, forming spontaneously combustible hydrogen phosphide and phosphorous acid. The latter, between 160° and 170° C., decomposes into hydrogen phosphide and phosphoric acid. The pasty residue finally reddens, ignites, and the last portions of unoxidized phosphorus burn out at a higher temperature.

Specific gravity: about 1.130 at 25° C.

Tests for Identity and Purity—It is acid to litmus paper even when highly diluted.

Hypophosphorous Acid responds to the reactions for hypophosphites, see below.

Hypophosphorous Acid diluted with 3 volumes of water conforms to the following tests for identity and purity:

Neutralize 30 cc. of the dilution with ammonia T.S.: not more than a slight precipitate results. Filter, acidulate 10 cc. of the filtrate with hydrochloric acid, and add 2 cc. of potassium sulphate T.S.: no turbidity is produced (*barium*). Another 10 cc. portion of the filtrate shows no turbidity upon the addition of 1 cc. of calcium chloride T.S. (*oxalate*).

One cc. of the dilution mixed with 9 cc. of distilled water meets the requirements of the test for *heavy metals*, page 1519.

Mix 5 cc. of the dilution with 3 cc. of nitric acid and 10 cc. of distilled water, and evaporate the liquid to dryness on a water bath: the residue meets the requirements of the test for *arsenic*, page 1512.

Tests for Hypophosphites

Hypophosphites—When strongly heated, hypophosphites evolve spontaneously inflammable hydrogen phosphide. Hypophosphites in solution yield a white precipitate with mercuric chloride T.S. This precipitate becomes

gray when an excess of hypophosphite is present. Solutions of hypophosphites, acidulated with sulphuric acid and warmed with copper sulphate T.S., yield a red precipitate.

Assay—Proceed as directed under the assay for acids, page 1514, using about 7 cc. of the Acid, accurately weighed, and methyl orange T.S., as indicator. Each cc. of normal sodium hydroxide corresponds to 0.06606 Gm. of HPH_2O_2.

This assay is explained on page 1453.

Preserve in glass-stoppered bottles.

U. S. P. Preparation—Syrupus Ferri Iodidi.

N. F. Preparations—Syrupus Ammonii Hypophosphitis; Liquor Hypophosphitum Compositus; Syrupus Calcii et Sodii Hypophosphitum; Syrupus Calcii Hypophosphitis; Syrupus Hypophosphitum; Syrupus Hypophosphitum Compositus.

Uses—This acid is used as a reducing agent in syrup of ferrous iodide and in hydriodic acid to prevent discoloration through the decomposition of the iodides by light and air. It is used to assist in the solution of the hypophosphites, especially calcium hypophosphite, in various N. F. syrups, elixirs, and solutions. In addition to the official acid, a 10 per cent and a 50 per cent acid are also commercial articles. It has been credited, probably wrongly, with peculiar tonic and alterative powers.

ACIDUM NITROHYDROCHLORICUM. N. F. Nitrohydrochloric Acid

[**Acid. Nitrohydrochl.**—Nitromuriatic Acid]

A strong aqueous solution containing hydrochloric acid, nitric acid, nitrosyl chloride, and chlorine.

	Metric	Alternative
Nitric Acid	18 cc.	1 fl. oz.
Hydrochloric Acid	82 cc.	4½ fl. oz.
To make about	100 cc.	5½ fl. oz.

Mix the acids in a capacious glass vessel, and, when effervescence has ceased, pour the product into dark amber-colored, glass-stoppered bottles, which must not be more than half filled, and must be kept in a cool place.

Note—Do not dispense Nitrohydrochloric Acid which does not immediately liberate iodine when one drop of the Acid is added to 1 cc. of an aqueous solution of potassium iodide (1 in 5).

When Nitric acid is mixed with hydrochloric acid, mutual decomposition takes place, according to the reaction

$$\underset{\text{nitric acid}}{HNO_3} + \underset{\text{hydrochloric acid}}{3HCl} = \underset{\text{nitrosyl chloride}}{NOCl} + \underset{\text{chlorine}}{Cl_2} + \underset{\text{water}}{2H_2O}$$

and a liquid called *aqua regia* is formed, capable of dissolving gold.

The value of this acid depends upon the completion of the above reaction and the production of nitrosyl chloride and free chlorine. It should be kept in a cool dark place, on account of its liability to lose chlorine by heat, and to have its chlorine converted into hydrochloric acid by the action of light and the decomposition of water. Because of its tendency to decompose, it should not be made in large quantities, nor be kept on hand very long, and should always be tested as directed in the above "Note" before being dispensed. Care should be taken not to transfer it to the bottle in which it is to be dispensed until effervescence has ceased, lest the pressure within drive out the stopper or cause the bottle to explode violently.

Official Description—A golden-yellow, fuming, and very corrosive liquid.

Odor and Reaction—It has a strong odor of chlorine; intensely acid to litmus paper, afterwards bleaching it.

Test for Identity—It readily dissolves gold leaf.

Impurities and Tests for Impurities—Not more than 0.0035 Gm. of residue remains on evaporating 10 cc. of the Acid in a glass or porcelain dish and drying at 110° C.

Uses—Nitrohydrochloric acid, or, as it is still called, nitromuriatic acid, is given internally in hepatic and gastric affections, in doses of three minims (0.2 cc.) and upward, well diluted with water. Great care should be taken in dispensing this acid, particularly if directed in combination with infusions, tinctures, etc.; the reaction occurring upon mixing should be permitted to cease entirely before dispensing, to avoid the possibility of an explosion taking place when the preparation is in the patient's hands.

ACIDUM NITROHYDROCHLORICUM DILUTUM. N. F. Diluted Nitrohydrochloric Acid

[**Acid. Nitrohydrochl. Dil.**—Diluted Nitromuriatic Acid]

A diluted aqueous solution containing hydrochloric acid, nitric acid, nitrosyl chloride, and chlorine.

	Metric	Alternative
Nitric Acid	**10.0 cc.**	1 fl. oz.
Hydrochloric Acid	**45.5 cc.**	4½ fl. oz.
Distilled Water	**194.5 cc.**	19½ fl. oz.
To make about	**250 cc.**	25 fl. oz.

Mix the acids in a capacious glass vessel, and, when effervescence has ceased, add the distilled water; pour it into dark amber-colored glass-stoppered bottles and keep it in a cool place.

It should be made strictly according to the official directions. The acids must be mixed while concentrated, otherwise the nitrosyl chloride and chlorine are not produced. Also the "rapid method", so frequently used, of mixing the acids and immediately diluting with water, does not produce an official preparation, and is reprehensible in practice.

Note—Do not dispense Diluted Nitrohydrochloric Acid which does not immediately liberate iodine when five drops of the Acid are added to 1 cc. of an aqueous solution of potassium iodide (1 in 5).

Official Description—A colorless or pale yellow liquid.

Odor, Taste and Reaction—It has a faint odor of chlorine, a very acid taste and is strongly acid to litmus paper, afterwards bleaching it.

Test for Identity—Not more than 0.0015 Gm. of residue remains on evaporating 20 cc. of the Acid in a glass or porcelain dish and drying at 110° C.

Uses—Diluted nitrohydrochloric acid is given in various digestive disorders, in doses of fifteen minims (1 cc.), properly diluted.

Unofficial Inorganic Acids

Acidum Hydrobromicum Dilutum (U. S. P. IX) Diluted Hydrobromic Acid	Containing about 10 per cent of HBr (80.93). It may be prepared extemporaneously, see page 556, but most of the acid is made by distillation. It should conform to the descriptions and tests of the U. S. P. IX

Uses—A nerve sedative in doses of 15 minims (1 cc.).

CHAPTER XLII

PREPARATIONS OF THE HALOGENS

Chlorine, Bromine, Iodine, and Fluorine

Cl; 35.46. Br; 79.92. I; 126.92

Four elements, *chlorine*, *bromine*, *iodine*, and *fluorine*, are termed *halogens* (salt-producers). Fluorine is of little interest in pharmacy, but the other three are of great importance both to medicine and to pharmacy.

Chlorine Cl; 35.46

Chlorine is derived from a Greek word meaning greenish-yellow. It is a greenish-yellow, gaseous body, having a very suffocating odor; its specific gravity is 2.45. One of its most useful and characteristic properties is that of bleaching organic coloring principles; the presence of water is necessary to produce this effect. Chlorine is one of the most reliable disinfectants; it is extensively used in combination with lime as bleaching powder, the official name being calx chlorinata or chlorinated lime. It is also official as sodium hypochlorite in Labarraque's solution (page 569), and in a modified Dakin's solution (page 570). Chlorine in its free state is recognized in chlorine water which is now among the test solutions of the U. S. P. X, and also in compound solution of chlorine of the N. F. V. It is also used in water purification.

Chlorine combines with hydrogen and the metals, but has very little attraction for oxygen; its principal hydrogen compound is hydrochloric acid, HCl (see *Acidum Hydrochloricum*). The compounds of chlorine with metals and bases are termed chlorides; they will be considered under the heads of their respective bases.

Chlorine combines indirectly with oxygen, and the compounds produced by the union of the oxyacid, chloric acid, $HClO_3$, with metals or bases are termed chlorates. Perchlorates are also known.

Chlorine is now commercially available in compressed form in metallic cylinders for use in the preparation of Dakin's solution and in the manufacture of chloramine, chlorinated paraffin and similar products. Chlorine is also being offered in solution in ampuls to provide for bronchial treatments by inhalation.

Tests for Chlorides and Chlorates

Chlorides—Solutions of chlorides yield a white, curdy precipitate with silver nitrate T.S. This precipitate is insoluble in nitric acid, but is easily and completely dissolved by a slight excess of ammonia T.S.

Chlorates—Solutions of chlorates yield no precipitate with silver nitrate T.S. The addition of sulphurous acid to this mixture produces a white precipitate which is insoluble in nitric acid but soluble in ammonia T.S. Upon ignition, chlorates yield chlorides, recognizable by appropriate tests. When concentrated sulphuric acid is added to a dry chlorate, decrepitation occurs and a greenish-yellow gas is evolved.

Caution—Only a small amount of chlorate should be used for this test and extreme caution must be exercised in performing it.

Chlorates are recognized by the evolution of oxygen when heated, and by the reaction of the residue corresponding with that of chlorides.

The chlorate may also be reduced to chloride by warming with an acidified solution of ferrous sulphate, then applying the above test for chlorides.

Unofficial Chemical Compounds of Chlorine, Bromine, and Iodine

Acidum Hypochlorosum, HClO Hypochlorous Acid	The pure acid, free from water, is unknown. Its aqueous solution is used as an oxidizing agent. With bases it forms salts called hypochlorites. The acid is so weak that it is displaced from these salts by the carbon dioxide of the air. The odor of this acid is noted when bleaching powder is exposed to moist air
Acidum Chloricum, $HClO_3$ Chloric Acid	Its concentrated solution is a colorless, viscous liquid with a pungent odor. It is readily decomposed on exposure to light and when in contact with organic matter. This acid is a powerful bleaching agent and forms salts with bases, known as chlorates
Acidum Perchloricum, $HClO_4$ Perchloric Acid	A volatile, colorless, fuming liquid. It reacts with violence when in contact with organic matter or with carbon. It is a powerful oxidizing agent
Bromi Chloridum, BrCl Bromine Chloride	A reddish-yellow, mobile, very volatile, fuming liquid, having a powerful odor which causes the flow of tears. It has been used externally as a caustic and internally in the treatment of cancer
Acidum Bromicum, $HBrO_3$ Bromic Acid	Known only in solution. It decomposes, when concentrated, into bromine, oxygen, and water. The acid forms salts with bases that are called bromates. Like ch oric acid t is a powerful oxidizing and bleaching agent
Acidum Iodicum, HIO_3 Iodic Acid	A soluble, white, crystalline solid. A powerful oxidizing agent and a monobasic acid, the salts being known as iodates. The acid is decomposed by heat and by exposure to sunlight
Acidum Periodicum, HIO_4 Periodic Acid	Colorless, transparent, deliquescent crystals. The acid is a powerful oxidizing agent and is melted and decomposed by heat
Amylum Iodatum Iodized Starch	A dark blue to black powder containing about five per cent of iodine The formula $(C_6H_{10}O_5)_5I$ was at one time suggested for iodized starch, but it is doubtful if it is a definite chemical compound Iodized starch is a convenient preparation for administering iodine internally. The dose is two to four drachms (8 to 16 Gm.)

CALX CHLORINATA. U. S. Chlorinated Lime

[Calx Chlorin.—"Chloride of Lime"]

Chlorinated Lime is a product resulting from the action of chlorine upon calcium hydroxide, and yields not less than 30 per cent of available chlorine [Cl = 35.46].

Available chlorine is a term that applies to the amount of chlorine that can be liberated by the chlorinated lime upon treatment with an acid. A study of the equation given on the following page, showing the decomposition of chlorinated lime, shows that not only is the chlorine liberated from the hypochlorite radicle which is linked to the calcium but from the chloride also. This is due to the active character of the hypochlorite radicle which is capable of producing an oxidizing effect equal to twice its chlorine content (see equation, page 569). Available chlorine, therefore, is the "hypochlorite chlorine" multiplied by two, and is a potential rather than an actual factor as usually stated in terms of per cent.

Preparation—Chlorinated lime is made by exposing finely powdered, dry calcium hydroxide, which has been placed on trays in a suitable chamber, to the action of chlorine. The gas is absorbed by the lime, as indicated in the following equation:

$$Ca(OH)_2 + Cl_2 = Ca\begin{matrix}(OCl)\\Cl\end{matrix} + H_2O$$

calcium hydroxide — chlorine — calcium chloro-hypochlorite — water

This calcium chloro-hypochlorite together with some undecomposed calcium hydroxide and some calcium chloride constitutes the so-called "chloride of lime" of commerce. A condensation of the formula into $CaOCl_2$

is frequently used to designate chloride of lime in chemical equations. The calcium chloride is of no value in the product, but is a detriment, owing to its hygroscopic character and the fact that the absorbed water decomposes the chlorinated lime.

Free acids, such as hydrochloric, decompose chlorinated lime as follows:

$$Ca\begin{matrix}OCl\\Cl\end{matrix} + 2HCl = CaCl_2 + Cl_2 + H_2O$$

calcium chloro-hypochlorite — hydrochloric acid — calcium chloride — chlorine — water

Even the carbon dioxide of the air can decompose chlorinated lime with the liberation of its available chlorine, when it is exposed and this accounts, in part, for the deodorant and disinfectant properties for which it is so widely employed. The small packages of chlorinated lime usually sold in grocery stores or drug stores are rarely of full strength, in fact most of the packages only claim 25 per cent of available chlorine. Sealed zinc cans, holding 5 or 10 pounds, or more of full 30 per cent strength are, however, available. The better grade material should be insisted upon for the making of Dakin's solution.

Description and Physical Properties—A white, or grayish-white, granular powder, having the odor of chlorine. It becomes moist and gradually decomposes on exposure to air and when in such condition must not be used.

It is partially soluble in water and in alcohol, the insoluble portion settling readily when mixed with water.

Tests for Identity—Shake 1 Gm. of Chlorinated Lime with 50 cc. of distilled water, and filter: the filtrate at first turns litmus paper blue and then bleaches it.

Dissolve 0.5 Gm. of Chlorinated Lime in 5 cc. of diluted acetic acid: an abundance of chlorine gas is evolved and only a slight residue remains undissolved. Ammonium oxalate T.S. added to this solution yields a white precipitate insoluble in acetic acid, but soluble in hydrochloric acid.

Assay—Transfer to a mortar about 4 Gm. of Chlorinated Lime, accurately weighed in a tared weighing bottle, using 50 cc. of distilled water. Triturate thoroughly, and pour the mixture into a graduated liter flask, rinsing the mortar with distilled water to make 1000 cc. Stopper the flask, and allow it to stand for ten minutes. Shake thoroughly, add to 100 cc. of the mixture 1 Gm. of potassium iodide and 5 cc. of acetic acid, and titrate the liberated iodine with tenth-normal sodium thiosulphate, starch T.S. being used as indicator. Each cc. of tenth-normal sodium thiosulphate corresponds to 0.003546 Gm. of available chlorine (Cl).

This assay is explained on page 1465.

Preserve in air-tight containers, in a cool, dry place.

U. S. P. Preparations—Liquor Sodæ Chlorinatæ; Liquor Sodæ Chlorinatæ Chirurgicalis.

Uses—Chlorinated lime is used in the preparation of solution of chlorinated soda. It is a cheap and powerful disinfectant and deodorant and is used for sterilizing various infected materials; it is largely used for purifying drinking water (see page 546). It is rarely employed for any purpose around the body having been replaced by chlorinated soda. It is also an active bleaching agent. When an acid, even vinegar, is added to it, it evolves large volumes of chlorine. It is not given internally.

LIQUOR SODÆ CHLORINATÆ. U. S. Solution of Chlorinated Soda

[**Liq. Sod. Chlorinat.**—Labarraque's Solution]

An aqueous solution of chlorine compounds of sodium, containing not less than 2.6 per cent of NaOCl (74.46), equivalent to not less than 2.5 per cent of available chlorine.

	Metric	Alternative
Monohydrated Sodium Carbonate	**70 Gm.**	9 oz. av. 148 gr.
Chlorinated Lime	**100 Gm.**	13 oz. av. 149 gr.
Water, a sufficient quantity,		
To make	**1000 Gm.**	8 pints

Triturate the chlorinated lime with 500 cc. [4 pints] of water gradually added until a uniform mixture results. Dissolve the monohydrated sodium carbonate in 500 cc. [4 pints] of warm water, and add this solution to the chlorinated lime mixture contained in a suitable vessel. Stir or shake the mixture thoroughly, and if it becomes gelatinous warm the vessel very gently until its contents again liquefy. Then transfer the mixture to a wetted muslin strainer, and return the first portion until the liquid passes through clear. Add a few drops of sodium carbonate T.S. to 10 cc. [2½ fl. dr.] of this clear filtrate. If it remains clear on the addition of the reagent, continue the operation without further treatment. If the filtrate becomes cloudy, return the mixture to the vessel, add sufficient monohydrated sodium carbonate to precipitate the excess of lime and again filter, returning the first portions until the liquid passes through clear. When no more liquid drains from the filter, wash the precipitate with enough water to make the product weigh 1000 Gm. [or measure 8 pints].

Double decomposition results in the formation of insoluble calcium carbonate or precipitated chalk, while sodium hypochlorite and sodium chloride remain in solution.

$$Ca\begin{matrix}Cl\\OCl\end{matrix} + Na_2CO_3 = CaCO_3 + NaCl + NaOCl$$

calcium chloro-hypochlorite — sodium carbonate — calcium carbonate — sodium chloride — sodium hypochlorite

Description and Physical Properties—A clear, pale greenish liquid, having a faint odor suggesting chlorine, and a disagreeable, alkaline taste.

The Solution at first colors red litmus paper blue and then bleaches it.

Test for Identity—The addition of hydrochloric acid to the Solution causes an evolution of chlorine and carbon dioxide.

Assay—Mix in a flask about 7 cc. of Solution of Chlorinated Soda, accurately weighed, with 50 cc. of distilled water, add 1 Gm. of potassium iodide and 5 cc. of acetic acid, and titrate the liberated iodine with tenth-normal sodium thiosulphate, starch T.S. being used as indicator. Each cc. of tenth-normal sodium thiosulphate corresponds to 0.003546 Gm. of Cl.

This assay is explained on page 1468.

Preserve in well-stoppered bottles, in a cool place, protected from light.

Uses—Solution of chlorinated soda, or "Labarraque's solution", is principally employed as a disinfectant or bleaching solution. A similar preparation, formerly official in the N. F., in which potassium carbonate replaces sodium carbonate, is commonly known as *Javelle water*. The two solutions are identical for all practical purposes and hence the chlorinated potassa solution has been deleted from the N. F.

LIQUOR SODÆ CHLORINATÆ CHIRURGICALIS. U.S.
Surgical Solution of Chlorinated Soda

[**Liq. Sod. Chlorinat. Chir.**—Modified Dakin's Solution, frequently known as Carrel-Dakin Solution]

An aqueous solution of chlorine compounds of sodium, containing not less than 0.45 per cent and not more than 0.50 per cent of NaOCl (74.46), equivalent to from 0.43 to 0.48 per cent of available chlorine.

Chlorinated Lime,
Exsiccated Sodium Phosphate,
Water, each, a sufficient quantity,
To make ..... **1000 cc.**

Assay the chlorinated lime (page 569) and, having determined its percentage of available chlorine, prepare the solution as directed below, using the quantities of chlorinated lime and exsiccated sodium phosphate indicated in the following table:

Per cent of available chlorine in the chlorinated lime used	Gm. of chlorinated lime for each 1000 cc. of solution	Gm. of exsiccated sodium phosphate for each 1000 cc. of solution
20	29	38
21	28	36
22	27	34
23	26	32
24	25	30
25	24	28
26	23	26
27	22	24
28	21	22
29	20.5	21
30	20	20
31	19.5	20
32	19	20
33	18	20
34	17.5	20
35	17	20

Triturate the necessary amount of chlorinated lime, as indicated by the table, with 400 cc. of water, gradually added, until a uniform mixture results. Dissolve the required amount of exsiccated sodium phosphate, which has been recently dried, in 400 cc. of water, heated to 50° C., and add this solution to the chlorinated lime mixture. Shake thoroughly and allow it to stand for fifteen minutes. Transfer the mixture to a filter, returning the first portions of filtrate until it runs through clear, and when no more liquid drains from the filter, wash the precipitate with sufficient water to make the product measure 900 cc. Assay a portion as directed below, and dilute the remainder with sufficient water to make the finished Solution contain 0.48 per cent of NaOCl.

This solution was developed during the World War to provide an inexpensive but efficient germicide for the treatment of wounds. The alkalinity of Labarraque's solution rendered it unfit for such use and in the first attempts to develop a neutral solution, suitable for wound dressing, boric acid was employed. The alkali present in this solution is sodium hydroxide, resulting from the reaction between the sodium carbonate and the calcium hydroxide present in chlorinated lime.

Sodium bicarbonate was later suggested by Daufresne as a more efficient neutralizing agent. The detailed process is given below. Many other formulas have been suggested (see J. A. Ph. A. 1924, page 32), but the special pharmacopœial referee, Dr. E. F. Kelly, through the coöperation of the Johns Hopkins' Hospital, found sodium phosphate to be the most satisfactory substance for this purpose. Its special value depends upon its being a so-called "buffer salt", one which insures neutrality without careful adjustment. The third method suggested is admirably adapted to hospital practice, because of its cheapness and rapidity of preparation, but cannot be used unless special apparatus is provided.

It is of primary importance that the strength of this preparation be accurately adjusted and it should be retested if kept for more than a few days.

The equation for the development of sodium hypochlorite is shown on page 570.

The War Demonstration Hospital's modification of Daufresne's method, neutralizing with sodium bicarbonate, which was largely used throughout the World War, is as follows:

The percentage of available chlorine in the chlorinated lime to be employed is first determined.

To make about 40 liters: Place in a 20 liter container the amount of chlorinated lime indicated in the following table; mix this well with 5 liters of tap water and allow it to stand several hours.

"Available" Chlorine in Chlorinated Lime, per cent	Chlorinated Lime for 5 Liters Water, Gm.	Monohydrated Sodium Carbonate for 5 Liters Water, Gm.	Add Sodium Carbonate as directed below
20–26	800	700	
28–34	600	490	
36–42	500	390	

Dissolve the designated amount of monohydrated sodium carbonate in another 5 liters of water, and pour the solution into the bottle containing the chlorinated lime; mix thoroughly and allow the calcium carbonate to settle. (If all the calcium is not precipitated, add small amounts of sodium carbonate solution until precipitation is complete.) Siphon off the supernatant liquid through a double filter. This concentrated and alkaline solution will keep for several weeks. For use it is treated thus: A measured portion (20 to 50 cc.) is titrated with 10 per cent hydrochloric acid until the red color produced by the addition of solid phenolphthalein disappears (more solid phenolphthalein is added to determine that decolorization was not due to bleaching). The calculated amount of 10 per cent hydrochloric acid is then added to the original specimen, having a volume designated "V". After the acid has been added, a volume the same as "V" of 6.25 per cent sodium bicarbonate solution is added. The chlorine content of this concentrated solution is now determined by the method prescribed for the assay of solution of chlorinated soda (page 570) and it is then diluted to the proper strength.

Method of Preparing Dakin's Solution as suggested by Cullen and Austen and used at the Rockefeller Institute for Medical Research, New York City

This method requires initial expenditure for a tank and meter, but if these are procured, an absolutely reliable solution can be prepared in from fifteen to twenty-five minutes, at a very low cost, without filtration, and with no preliminary analysis. A final analysis for adjustment is all that is required.

To Prepare One Liter—Measure 1000 cc. of water into a tall cylinder. Dissolve in it 18 Gm. of monohydrated sodium carbonate (15 Gm. of anhydrous sodium carbonate, or 40 Gm. of crystallized sodium carbonate could be used instead).

Pass chlorine gas into the solution from a Wallace and Tiernan tank and meter, adapted for Dakin's solution, for three and one-half minutes at a rate of 500 cc. per minute as indicated on the meter. The gas must enter the solution through a gas diffuser attached to the meter by stethoscope tubing. This diffuser is supplied by the same company.

Test the hypochlorite concentration as follows:

Dilute 10 cc. of the solution with 50 cc. of distilled water, add about 1 Gm. of potassium iodide and 4 cc. of glacial acetic acid. Titrate the liberated iodine with tenth-normal sodium thiosulphate. When near the end point, add 0.5 cc. of starch T.S. and titrate until the blue color disappears. The number of cc. of tenth-normal sodium thiosulphate required, multiplied by the factor 0.0372, gives the percentage of NaOCl. It should contain not less than 0.45 per cent and not more than 0.5 per cent of NaOCl.

NOTE—The addition of 1 cc. of 0.5 per cent solution of potassium permanganate to every liter of Dakin's solution tends to stabilize the solution and imparts a pink color that is convenient for distinguishing it from other antiseptics.

Dakin's solution is also prepared from concentrated preparations, such as "*Hychlorite*" which is eight times the strength of the U. S. P. product.

Antiformin is a concentrated hypochlorite solution used as a disinfectant. It contains 5.68 Gm. of available chlorine in each 100 cc.

The solution, however prepared, must conform to the U. S. P. tests as follows:

Description and Physical Properties—A colorless or faintly yellow liquid having a slight odor suggesting chlorine.

Tests for Purity—Add about 0.02 Gm. of powdered phenolphthalein to 20 cc. of Surgical Solution of Chlorinated Soda: no red color is produced on agitation (*maximum alkalinity*).

Add about 0.5 cc. of phenolphthalein T.S. to 5 cc. of the Solution contained in a test tube: a momentary red flash is produced (*minimum alkalinity*).

Assay—Dilute 25 cc. of the Solution, accurately weighed with 50 cc. of distilled water, add 1 Gm. of potassium iodide and 5 cc. of acetic acid, and titrate the liberated iodine with tenth-normal sodium thiosulphate, using starch T.S. as indicator. Each cc. of tenth-normal sodium thiosulphate corresponds to 0.003723 Gm. of NaOCl.

This assay is explained on page 1468.

Preserve in well-stoppered bottles, preferably for not more than seven days, in a cool place, protected from light.

Uses—The N. N. R. describes its uses as follows: "Surgical solution of chlorinated soda is a rapid germicide and efficient antiseptic for infected

wounds, when it is used after free incision and cleansing, and applied by practically continuous irrigation, as in the Carrel technic.

Its strength and reaction are carefully adjusted so as to be practically non-irritant to wounds. The skin, however, is subject to irritation and must be protected by petrolatum. The solution does not precipitate proteins, but, on the contrary, dissolves necrotic tissues, and thus helps to keep the wound clean. On the other hand, it dissolves silk ligatures and loosens catgut, thus favoring secondary hemorrhage. The solution is practically non-toxic when used externally. It should not be injected into the peritoneum.

Dosage—For external use, full strength. It is claimed that below 0.4 per cent of sodium hypochlorite the clinical effect of hypochlorite solutions is nil, while above 0.5 per cent the irritating effect on the skin becomes serious."

A solution of chloramine in water is not identical with Dakin's solution and should not be dispensed as such.

LIQUOR CHLORI COMPOSITUS. N. F. Compound Solution of Chlorine

[Liq. Chlor. Co.—Chlorine Water]

An aqueous solution containing, when freshly made, a mixture of chlorine and chlorine oxides equivalent to about 0.35 Gm. of available chlorine in each 100 cc.

	Metric	Alternative
Potassium Chlorate, granulated	3.5 Gm.	51 gr.
Hydrochloric Acid	10.0 cc.	154 min.
Distilled Water, a sufficient quantity, To make	500 cc.	1 pint

Graduate a bottle of not less than 1000 cc. [2 pints] capacity to 500 cc. [1 pint] and fit it with a tightly fitting stopper having two perforations. Through one of these perforations pass a funnel tube fitted with a stop-cock and through the other a straight glass tube about 8 mm. [$\frac{5}{16}$ inch] in diameter and 7 cm. [about 3 inches] in length. Place the potassium chlorate in the bottle and add through the funnel tube the hydrochloric acid, previously mixed with 10 cc. [154 min.] of distilled water. Close the stop-cock and place the bottle on a water bath for a few moments or until the potassium chlorate is dissolved and the bottle completely filled with a gas having a greenish-yellow color. Then remove the bottle from the water bath and add cold distilled water in several portions through the funnel, agitating thoroughly after each addition to make the product measure 500 cc. [1 pint].

This Solution should not be dispensed unless it has been recently prepared and then only in well-filled, amber-colored bottles.

Official Description—A yellow liquid.

Odor, Taste, and Reaction—It has a strong odor and taste of chlorine.

Tests for Identity—One drop when added to 5 cc. of potassium iodide T.S., liberates iodine. When evaporated to dryness on a water bath it leaves a white residue consisting mainly of potassium chloride.

Chlorine water was official in the U. S. P. 1890 and the process is now included among the reagents of the U. S. P. (page 1545). In its preparation hydrochloric acid is heated with 10 Gm. of manganese dioxide and the generated chlorine conducted into 400 cc. of distilled water until a saturated solution is produced. The reaction is shown below:

$$\underset{\text{manganese dioxide}}{MnO_2} + \underset{\text{hydrochloric acid}}{4HCl} = \underset{\text{manganese chloride}}{MnCl_2} + \underset{\text{chlorine}}{Cl_2} + \underset{\text{water}}{2H_2O}$$

The chlorine water must be kept protected from light, to prevent its partial conversion into hydrochloric acid through the decomposition of the water by the union of the chlorine with its hydrogen.

The apparatus shown in Fig. 264 or 265 is well adapted for making small quantities of chlorine water rapidly. The N. F. process for compound solution of chlorine produces a "chlorine water" which is equally efficient for medical purposes and far more readily prepared. The slight traces of potassium chloride and the oxides of chlorine which are present when made in this way may be ignored when used medicinally; but it is not so well suited for reagent purposes and hence the introduction of "chlorine water" among the reagents.

Uses—Compound solution of chlorine, or chlorine water, was formerly largely used as an intestinal antiseptic and also as a gargle in diphtheria but has largely diminished in popularity. The dose is from thirty to sixty minims (2 to 4 cc.) diluted with water.

Bromine Br; 79.92

Tests for Bromides and Bromates

Bromides—In solutions of bromides, the addition of chlorine T.S., drop by drop, liberates bromine which is dissolved by shaking with chloroform, coloring the chloroform red to reddish-brown. Silver nitrate T.S., produces in solutions of bromides a yellowish precipitate which is insoluble in nitric acid, and only slightly soluble in dilute ammonia T.S.

Bromates—Sulphurous acid added drop by drop to a solution of a bromate produces a yellow color, which disappears upon the addition of an excess of sulphurous acid. Bromates, when gently ignited with charcoal, yield bromides which may be recognized by the characteristic reactions.

BROMUM. N.F. Bromine

Bromine is from a Greek word meaning "stench", suggesting its unpleasant odor. The official Bromine contains not less than 99 per cent of Br (79.92) and not more than 1 per cent of Cl. Bromine should be preserved in glass-stoppered bottles in a cool place, the bottle being enclosed in a larger vessel with the space between filled with some substance, such as lime, capable of absorbing and combining with any vapors which might escape.

Preparation—This non-metallic element, which is in the form of a dark red, volatile liquid, is produced largely in the United States, in Michigan, Ohio, West Virginia, and Pennsylvania. It is prepared from the brine obtained from salt-wells by the following process. The brine is concentrated to separate chlorides, sulphates, etc., by crystallization. The mother liquor, containing the bromine principally in the form of magnesium bromide, is decomposed by treating it with chlorine gas.

The manner of conducting this process is as follows: The original salt liquor, or brine, is pumped out of the ground and evaporated to about 15° B. in large iron pans, then allowed to settle, and is further evaporated to the point of crystallization in wooden tanks heated by steam pipes. These tanks, five in number, are placed at different elevations, one above the other. Each day the liquor is run off from No. 1, the highest, to No. 2, next day to No. 3, and so on until it reaches No. 5, the crystallized salt being removed from each tank after draining off the liquor. The brine which reaches No. 5 is termed *bittern*, and consists chiefly of calcium, magnesium, sodium, and aluminum chlorides, with varying percentages of sodium and calcium bromides.

The bittern marking 30° to 38° B. is evaporated to about 45° B. The liquor is then run into stone stills, materials for generation of bromine added, and heat applied by means of steam until the bromine, which comes over first, has all been vaporized. It is condensed and collected in cooled receivers.

$$\underset{\text{magnesium bromide}}{MgBr_2} + \underset{\text{chlorine}}{2Cl} = \underset{\text{magnesium chloride}}{MgCl_2} + \underset{\text{bromine}}{2Br}$$

A process has also been perfected for the separation of the bromine from the "bittern" by electrolytic methods and is being successfully conducted on a commercial scale. Bromine may also be prepared by distillation from a mixture of a bromide, manganese dioxide, and sulphuric acid as explained by the following equation:

$$\underset{\text{magnesium bromide}}{MgBr_2} + \underset{\text{sulphuric acid}}{2H_2SO_4} + \underset{\text{manganese dioxide}}{MnO_2} = \underset{\text{manganous sulphate}}{MnSO_4} + \underset{\text{magnesium sulphate}}{MgSO_4} + \underset{\text{water}}{2H_2O} + \underset{\text{bromine}}{Br_2}$$

The salts, termed bromides, are used very largely in medicine. They will be considered under the heads of their respective bases. *Bromates*, formed, like chlorates, by combination with the corresponding oxyacid, bromic acid, ($HBrO_3$), are rarely used.

Official Description—A heavy, dark brownish-red, mobile liquid, evolving, even at ordinary temperatures, reddish fumes, highly irritating to the eyes and lungs.

Odor, Taste, and Reaction—It has a peculiar, suffocating odor, resembling that of chlorine.

Specific gravity: about 3.1 at 25° C.

Boiling Point—About 63° C.

Solubility—One cc. dissolves in about 90 cc. of water; it is freely soluble in alcohol, ether, chloroform, or carbon disulphide.

Impurities and Tests for Impurities—*Organic Bromine Compounds*—Add 1 cc. of Bromine to 50 cc. of sodium hydroxide T.S.; it combines to form a permanently clear liquid, without the separation of oily drops.

Iodine—Shake 10 cc. of a saturated aqueous solution of Bromine with a slight excess of reduced iron until it becomes nearly colorless, filter the liquid and add 1 cc. of ferric chloride T.S. and 1 cc. of starch T.S.; it does not assume a blue color.

Assay—Dissolve 10 Gm. of potassium iodide in 25 cc. of distilled water, introduce the solution into a 100 cc. measuring flask, stopper and determine accurately the weight of the flask

and its contents. Add about 1 Gm. of Bromine to the contents of the flask, determine its exact weight and then fill the flask to the mark with distilled water and titrate 25 cc. of this solution with tenth-normal sodium thiosulphate, using starch T.S. as indicator.

The presence of free bromine in aqueous liquids may be detected by agitating the liquid with chloroform, or ether, and noting the color of the bromine in the immiscible layer that separates. Free bromine will also give a blue color with a trace of an iodide in the presence of starch.

Each cc. of tenth-normal sodium thiosulphate corresponds to 0.007992 Gm. of Br or 0.003546 Gm. of Cl. Each Gm. of Bromine (containing not more than 1 per cent of chlorine) corresponds to not more than 126.7 cc. of tenth-normal sodium thiosulphate.

This assay is explained on page 1467.

N. F. Preparation—Liquor Auri et Arseni Bromidi.

Uses—Bromine is used in the manufacture of bromides for medicine and photography. It is a powerful caustic and germicide but is, at present, rarely employed. The *utmost care* should be exercised in handling bromine; the vapor not only attacks the eyes and nostrils, but renders the air irrespirable. If exposed to the vapors of bromine the part should be washed with a solution of sodium bicarbonate. The vapor acts on metallic surfaces, and may ruin balances if permitted to remain in contact with them.

Unofficial Preparation

Liquor Bromi (N. F. IV) Solution of Bromine (Smith's Solution of Bromine)	Dissolve 12.5 Gm. (228 gr.) of potassium bromide in 80 cc. (3 fl. oz. 96 min.) of water, contained in a bottle, add 8.3 cc. (159 min.) of bromine, and shake the mixture until solution is effected. Finally add sufficient water to make the product measure 100 cc. (4 fl. oz.) Keep the Solution in glass-stoppered bottles in a dark place

Iodine I; 126.92

Tests for Iodides

Iodides—In solutions of iodides, the addition of chlorine T.S., drop by drop, liberates free iodine which colors the solution yellow to red, and on shaking with chloroform the latter is colored violet. The iodine thus liberated gives a blue color with starch. Silver nitrate T.S. produces in solutions of iodides a yellow, curdy precipitate which is insoluble in nitric acid and in ammonia T.S.

IODUM. U.S. Iodine

Iodine is from a Greek word meaning "violet-colored", alluding to the vapors of the element.

The official iodine contains not less than 99.5 per cent of I (126.92).

Preparation—Iodine is a non-metallic element widely distributed in nature. It was formerly exclusively obtained from *kelp*, *barilla*, or *varec*, the ashes of certain sea-weeds. In addition to this source, it is now made from the mother liquors obtained from the crystallization of sodium nitrate in South America. These contain the iodine in the form of sodium iodate. Iodine is precipitated from the sodium iodate by the action of a solution of sodium sulphite and bisulphite in calculated amount.

$$\underset{\text{sodium iodate}}{2NaIO_3} + \underset{\text{sodium sulphite}}{3Na_2SO_3} + \underset{\text{acid sodium sulphite}}{2NaHSO_3} = \underset{\text{sodium sulphate}}{5Na_2SO_4} + \underset{\text{iodine}}{I_2} + \underset{\text{water}}{H_2O}$$

The liberated iodine is then washed and purified by sublimation.

Iodine is prepared from iodides when they are decomposed by chlorine.

$$\underset{\text{sodium iodide}}{2NaI} + \underset{\text{chlorine}}{Cl_2} = \underset{\text{sodium chloride}}{2NaCl} + \underset{\text{iodine}}{I_2}$$

The iodides obtained by lixiviating kelp have long been used as sources of iodine by the above reaction or by distilling with sulphuric acid and manganese dioxide according to the following equation:

$$\underset{\text{sodium iodide}}{2NaI} + \underset{\text{sulphuric acid}}{2H_2SO_4} + \underset{\text{manganese dioxide}}{MnO_2} = \underset{\text{iodine}}{I_2} + \underset{\text{manganese sulphate}}{MnSO_4} + \underset{\text{sodium sulphate}}{Na_2SO_4} + \underset{\text{water}}{2H_2O}$$

The separated iodine may then be sublimed in glass or earthenware receivers.

Description and Physical Properties—Heavy, bluish-black, brittle, rhombic plates, having a metallic luster and a distinctive odor.

One Gm. of Iodine is soluble in 2950 cc. of water, 12.5 cc. of alcohol, 80 cc. of glycerin, and in 4 cc. of carbon disulphide, at 25° C. It is freely soluble in chloroform, carbon tetrachloride, and in ether, and is dissolved by aqueous solutions of iodides. Its solution in alcohol and in an aqueous solution of potassium iodide has a reddish-brown color. Its solution (1 in 1000) in chloroform, carbon tetrachloride, and in carbon disulphide is of a violet color.

Tests for Identity—Specific gravity: about 4.66 at 17° C.

Iodine imparts a deep brown, evanescent stain to the skin and slowly destroys vegetable colors.

Iodine volatilizes slowly at ordinary temperatures. When heated to about 114° C., it fuses and gradually vaporizes in the form of violet fumes.

Add starch T.S. to a saturated aqueous solution of Iodine: a blue color is produced. On boiling the mixture, the color vanishes but reappears as it cools, unless it has been subjected to long continued boiling.

Tests for Purity—When volatilized, Iodine leaves not more than 0.05 per cent of residue.

Triturate 0.5 Gm. of finely powdered Iodine with 20 cc. of distilled water, and filter the solution. To one-half of the filtrate carefully add tenth-normal sodium thiosulphate until the solution is just decolorized. Then add a few drops of ferrous sulphate T.S. and subsequently a little sodium hydroxide T.S., and heat the mixture gently: the liquid does not become blue upon the addition of a slight excess of hydrochloric acid (*cyanogen.*)

To the other half of the aqueous filtrate, add, drop by drop, sulphurous acid (free from chloride) previously diluted with several volumes of distilled water, until the iodine color just disappears. Add 5 cc. of ammonia T.S., and follow with 5 cc. of silver nitrate T.S. in small portions. Filter, and acidulate the filtrate with nitric acid: the resulting turbidity is not greater than that produced in a control test made with the same quantities of reagents to which 0.1 cc. of fiftieth-normal hydrochloric acid has been added, but omitting the sulphurous acid (*chloride or bromide*).

Assay—Place about 0.5 Gm. of powdered Iodine in a tared weighing-bottle, stopper, weigh accurately, and add 1 Gm. of potassium iodide dissolved in 5 cc. of distilled water. Dilute this solution with distilled water to about 50 cc., and titrate with tenth-normal sodium thiosulphate, starch T.S. being used as indicator. Each cc. of tenth-normal sodium thiosulphate corresponds to 0.01269 Gm. of I.

This assay is explained on page 1467.

Preserve in glass-stoppered bottles, in a cool place.

U. S. P. Preparations—Liquor Iodi Compositus; Syrupus Ferri Iodidi; Tinctura Iodi; Unguentum Iodi.

N. F. Preparations—Ampullæ Iodi; Dentilinimentum Aconiti et Iodi Compositum; Liquor Iodi et Zinci Phenolsulphonatis; Liquor Iodi Phenolatus (from Compound Solution); Petroxolinum Iodi; Petroxolinum Iodi Dilutum; Phenol Iodatum; Pilulæ Ferri Iodidum; Sulphuris Iodidum; Syrupus Calcii Iodidi; Syrupus Iodotannicus; Tinctura Iodidorum; Tinctura Iodi Fortior; Unguentum Iodi Denigrescens.

Iodine is largely used in the preparation of iodides, in the aniline color industry, and in the production of organic medicinal agents, such as iodoform.

Iodine is only slightly soluble in water but the addition of iodides greatly increases its solubility. Advantage is taken of this fact in the preparation of Lugol's Solution (see below). The iodides are largely used in medicine. The iodates, like the chlorates and bromates, are produced by combination with the oxyacids of iodine, iodic and periodic acids. They are of little interest pharmaceutically.

Uses—Iodine is very largely used in medicine. Internally it is a valuable alterative, useful in goiter, syphilis, rheumatism, and other chronic diseases. Locally it is used as a counterirritant, and as a germicide for sterilizing the skin and wounds. The average dose is one-twelfth grain (0.005 Gm.).

TINCTURA IODI. U.S. Tincture of Iodine

The formula and assays will be found on page 374.

LIQUOR IODI COMPOSITUS. U.S. Compound Solution of Iodine

[**Liq. Iodi Co.**—Lugol's Solution]

Compound Solution of Iodine is an aqueous solution containing, in each 100 cc., not less than 4.8 Gm. and not more than 5.2 Gm. of I and not less than 9.8 Gm. and not more than 10.2 Gm. of KI.

	Metric	Alternative
Iodine	5 Gm.	183 gr.
Potassium Iodide	10 Gm.	365 gr.
Distilled Water, a sufficient quantity,		
To make	100 cc.	8 fl. oz.

Dissolve the iodine and potassium iodide in a sufficient quantity of distilled water to make the product measure 100 cc. [8 fl. oz.].

The potassium iodide is added only to increase the solubility of the iodine.

Description and Physical Properties—A transparent liquid having a deep brown color, and an odor of iodine.

Test for Identity—A drop of Compound Solution of Iodine added to 1 cc. of starch T.S., diluted with 10 cc. of water, produces a deep blue color.

Assay for Potassium Iodide—Measure exactly 5 cc. of Compound Solution of Iodine, evaporate in a tared dish or watch-glass on a water bath, and add several small successive portions of distilled water, drop by drop, until all of the iodine has volatilized and a white residue remains: the residue should weigh not less than 0.490 Gm. and not more than 0.510 Gm. and should respond to the identity tests under *Potassii Iodidum*.

Assay for Iodine—Dilute exactly 5 cc. of Compound Solution of Iodine with 25 cc. of distilled water, and titrate with tenth-normal sodium thiosulphate, starch T.S. being used as indicator. Each cc. of tenth-normal sodium thiosulphate corresponds to 0.01269 Gm. of I.

This assay is explained on page 1468.

Preserve the solution in glass-stoppered bottles, protected from light.

N. F. Preparation—Liquor Iodi Phenolatus.

Uses—This Solution, containing about 3 grains of iodine in each fluidrachm, affords an efficient means of administering iodine internally. It is given in three-minim (0.2 cc.) doses, and, to prevent gastric irritation, it must be largely diluted.

SYRUPUS ACIDI HYDRIODICI. U. S. Syrup of Hydriodic Acid

[Syr. Acid. Hydriod.]

This is a syrupy liquid containing not less than 1.3 and not more than 1.45 Gm. of hydriodic acid [HI; 127.93] in each 100 cc. It has the specific gravity 1.185 and is prepared by dissolving 450 Gm. of sucrose in 130 cc. of diluted hydriodic acid and enough distilled water to make 1000 cc. (page 265).

The object of this preparation is to furnish an agreeable mode of administering hydriodic acid, and also a liquid which will be reasonably stable. *Hydriodic acid*, HI, is easily decomposed in simple aqueous solution (unless protected by hypophosphorous acid as in the official process), free iodine being liberated, and if taken internally, when in this condition, it is irritating to the alimentary tract. The sucrose or sugar used in this syrup should be of the highest grade obtainable. In time the syrup usually darkens due to the caramelization of the sucrose by the free acid.

Description and Physical Properties—A transparent, colorless, or not more than pale straw-colored, odorless, syrupy liquid, having a sweet and acidulous taste.

Specific gravity: about 1.185 at 25° C.

Test for Identity—Mix 5 cc. of Syrup of Hydriodic Acid with a few drops of starch T.S. and add 3 drops of chlorine T.S.: the liquid acquires a deep blue color.

Test for Purity—No blue color is produced in the syrup by starch T.S. alone (*free iodine*).

Assay—Place exactly 25 cc. of Syrup of Hydriodic Acid in a flask, dilute it with 100 cc. of distilled water, add 40 cc. of tenth-normal silver nitrate, agitate the mixture, add 5 cc. of diluted nitric acid and 2 cc. of ferric ammonium sulphate T.S., and determine the residual silver nitrate by titration with tenth-normal potassium thiocyanate. Each cc. of tenth-normal silver nitrate corresponds to 0.01279 Gm. of HI.

This assay is explained on page 1462.

Uses—Syrup of hydriodic acid is used as an alterative. The dose is twenty to sixty minims (1.3 to 4 cc.).

LIQUOR IODI ET ZINCI PHENOLSULPHONATIS. N.F. Solution of Iodine and Zinc Phenolsulphonate

[Liq. Iodi et Zinc. Phenolsul.—Pyorrhea Astringent]

	Metric	Alternative
Potassium Iodide	15 Gm.	261 gr.
Iodine	20 Gm.	365 gr.
Zinc Phenolsulphonate	15 Gm.	261 gr.
Glycerin	25 cc.	1 fl. oz.
Distilled Water, a sufficient quantity, To make	100 cc.	4 fl. oz.

Dissolve the potassium iodide in 20 cc. [384 min.] of distilled water, add the iodine and agitate the mixture at frequent intervals until the iodine is completely dissolved. Dissolve the zinc phenolsulphonate in the glycerin and 20 cc. [384 min.] of distilled water, add to the first solution, then add sufficient distilled water to make the product measure 100 cc. [4 fl. oz.].

This Solution should be recently prepared when dispensed.

Uses—For pyorrhea.

LIQUOR IODI PHENOLATUS. N.F. Phenolated Solution of Iodine

[Liq. Iod. Phenol.—Liquor Iodi Carbolatus, Carbolized Solution of Iodine, Boulton's Solution, French Mixture]

	Metric	Alternative
Compound Solution of Iodine	15 cc.	230 min.
Liquefied Phenol	6 cc.	92 min.
Glycerin	165 cc.	5 fl. oz. 134 min.
Water, a sufficient quantity, To make	1000 cc.	2 pints

Mix the liquefied phenol with the compound solution of iodine, add the glycerin and sufficient water to make the product measure 1000 cc. [2 pints]. Then expose the liquid to sunlight until it has become colorless.

Description and Tests—Phenolated Solution of Iodine is a colorless or faintly yellow solution, with a characteristic taste and odor.

Specific gravity: about 1.047 at 25° C.

The solution turns blue with starch T.S.

Evaporate 10 cc. of the Solution at a temperature not exceeding 100° C: it leaves not more than 0.202 Gm. of residue.

Incinerate the residue from 10 cc. of the Solution: it leaves not more than 0.0004 Gm. of ash.

Add mercuric chloride T. S. to a quantity of the solution: a red precipitate is formed.

Uses—This is an antiseptic solution suitable for application to wounds.

Unofficial Preparations of Iodine

A number of unofficial preparations of iodine have been developed within recent years. The more important of these are recognized by the N. N. R. in which they are classified and described, and from which the following facts are taken:

Iodine Preparations Containing Free Iodine—*Iodosticks, Iodoapplicators and Special Iodoapplicators (Iodine 60 per cent and Potassium Iodide 40 per cent)*—Wooden sticks, 3.8, 14.0, 16.5 and 30.5 cm. (1½, 5½, 6½ and 12 inches) long, respectively, tipped with a mixture of iodine, 60 per cent and potassium iodide, 40 per cent. Each stick is to be used but once. Prepared by the Tappan Zee Surgical Co.

Iocamfen—A liquid obtained by the interaction of iodine 10 parts, phenol 20 parts, and camphor 70 parts, containing about 7.25 per cent free of iodine.

A dark, reddish-brown, viscid liquid, having a camphoraceous odor. Insoluble in water, but soluble in all proportions in alcohol, ether, benzine and liquid petrolatum.

It is said to have the antiseptic and germicidal properties of iodine and also the analgesic, stimulating and antiphlogistic properties of camphor and phenol.

It is applied in small quantities directly to wounds, the skin, cavities, etc., or on tampons or drainage material. It should not be applied to wet surfaces. It is also sold as a 50 per cent ointment under the name *Camiofen Ointment*. Manufactured by Schering & Glatz, Inc.

Iodine Dusting Powders—Dusting-powders containing iodine in various combinations are widely used in the treatment of wounds, granulating surfaces, abscess cavities, etc., whether due to syphilis or tuberculosis or to other infections. The virtue of such preparations was formerly attributed to a germicidal action, but investigators have found such action very slight. The clinical results are now ascribed to a slight antiseptic action of the iodine, to a stimulation of phagocytosis, and to a diminished secretion of the wound which renders it a less favorable culture medium for germs. Under this class the U. S. P. Thymol Iodide and *Aristol*, a brand or thymol iodide, are referred to.

Fluorine F; 19.0

Unofficial Substances

FLUORINE

Fluorine is named from the mineral fluorite in which it is found. The name "fluorite" comes from the word "fluor" meaning to flow, because the mineral is easily melted and has long been used as a flux.

Fluorine (F = 19.0) is the most recently isolated member of the halogen group of elements.

Preparation—It is not official, but hydrofluoric acid (HF = 20.01) and some of its salts are proving of value in medicine and in textile trades. It was prepared by Moissan in 1886 by the electrolysis of anhydrous hydrogen fluoride containing acid potassium fluoride which served to conduct the electric current. It is not only the most active of the halogens but is the most reactive of all of the elements, since it combines with nearly all of them and possesses an unparalleled affinity for hydrogen. On account of this unusual activity, fluorine is not found in nature in the free state. In the combined state it is generally found as *fluorspar*, which is *calcium fluoride*, or in *cryolite*, the double *fluoride of aluminum and sodium*. It is also widely but sparingly distributed in other minerals and has been found in the enamel of the teeth.

Fluorine is a greenish-yellow gas, paler and more yellowish than chlorine. Its density is a little more than half that of chlorine. It is known only in the anhydrous condition because of the intensity with which it decomposes water, forming hydrogen fluoride and ozone. It combines with all of non-metals excepting oxygen, chlorine, nitrogen, and the members of the argon, or zenon, group. All metals are attacked by fluorine at ordinary temperatures with the exception of gold and platinum, and some of them, as in the case of copper, become covered with a protective film of fluoride.

Besides displacing chlorine from chlorides, fluorine forms a binary acid and binary salts; its behavior is not typical of the halogens. For example, its valence is practically always one, no compounds with oxygen are known, its silver salt is water-soluble, and its calcium salt is insoluble.

It is interesting to note that glass, if perfectly dry and clean, is not attacked by fluorine (compare the action of hydrofluoric acid).

HYDROGEN FLUORIDE—Hydrofluoric Acid

Hydrogen fluoride (HF = 20.1) is a very penetrating, corrosive gas that dissolves in water with strongly acid properties. The gas fumes strongly in air and can easily be liquefied by lowering its temperature. It is conveniently prepared by heating a mixture of calcium fluoride and strong sulphuric acid in a lead or platinum vessel.

The reaction is expressed by the following equation:

$$\underset{\text{calcium fluoride}}{CaF_2} + \underset{\text{sulphuric acid}}{H_2SO_4} = \underset{\text{calcium sulphate}}{CaSO_4} + \underset{\text{hydrogen fluoride}}{2HF}$$

The solution of hydrogen fluoride gas in water is commonly called *hydrofluoric acid*. This solution is poisonous and has a caustic action on the skin. Because of its corrosive character, hydrofluoric acid must be kept in bottles made of wax, gutta percha, or bakelite. Larger quantities of the acid are stored and shipped in lead containers.

Hydrofluoric acid is chiefly used for etching designs and various other markings on glass. The object to be etched is first coated with a film of substance impervious to hydrogen fluoride, like wax, paraffin, or a so-called etching varnish. The desired markings are then cut through this coating by means of a sharp instrument and the object is exposed to the hydrogen fluoride gas or dipped into its solution. Upon the removal of the coating the markings are etched upon the glass. The vapor of hydrogen fluoride leaves white and opaque tracings whereas the solution forms transparent lines.

The salts of hydrofluoric acid are known as the *fluorides*, and the soluble fluorides are poisonous. The best known fluoride, namely calcium fluoride, is used as a flux because it is easily melted. Other fluorides are used as preservatives, in various enamels for coating metals, and others are becoming extensively used as moth preventatives. (See Chapter on *Household Pests*.)

Sodium Fluoride (NaF)—A poisonous, soluble white powder. It is used in medicine, and as an antiseptic and antifermentative. It is also used as an insecticide (see Chapter on Household Pests), and has been employed in minute amounts as a food preservative, which, however, is prohibited by all food laws.

Test for Fluorides—When heated with concentrated sulphuric acid fluorides yield the gaseous hydrofluoric acid which, in turn, etches glass.

CHAPTER XLIII

SULPHUR AND PHOSPHORUS

S; 32.06. P; 31.04

THESE two elements furnish many important compounds to medicine. They present several analogies, both physically and chemically.

Sulphur S; 32.06

Sulphur—This name is derived from the Sanscrit "sulveri" through the Latin "sulphurium". It is found uncombined in Sicily and in other parts of the world. Vast deposits have been worked near Charles Lake, Louisiana, and all along the Texas coast. An ingenious method, devised by H. Frasch, has here been introduced whereby the sulphur, from a depth of about 400 feet, is brought to the surface in a molten condition by forcing superheated water, under pressure, at a temperature of about 155° C. (311° F.), down the bored well, through an iron pipe. The heat melts the sulphur deposit and the molten sulphur rises through smaller, enclosed tubes. In order to bring the melted sulphur to the surface, heated air is forced into it, thus lowering the specific gravity and causing the sulphur to rise to the surface without pumps. Then the melted sulphur is collected in large wooden boxes and allowed to solidify. The sulphur from this source is of exceptional quality, showing from 99 to 99.6 per cent pure sulphur. In the form of sulphates and sulphides sulphur is widely distributed. The sulphur found in Sicily is prepared for use by fusing it, allowing it to stand to permit the earthy impurities to settle, and then pouring it into cylindrical molds. The sulphur in cylinders is termed *roll sulphur*.

Large quantities of sulphur are also obtained as by-products from the Leblanc soda process and from gas works.

Three forms of sulphur are official in the U. S. P.,—sublimed, washed, and precipitated.

With hydrogen, sulphur forms a gas with an offensive odor which is known officially as *hydrogen sulphide*, H_2S. It is also termed *sulphuretted hydrogen* and *hydrosulphuric acid*. The formula for its preparation will be found under "Reagents" (see page 1535). It is used for proving the presence or absence of certain metallic salts, lead, bismuth, antimony, copper, mercury, zinc, etc., with which it produces characteristic precipitates. *Sulphides* are compounds of elements with sulphur and may be viewed as salts of hydrosulphuric acid. Some of the sulphides are analogous to acids, others to bases; and these different sulphides, by combining with one another, form compounds, which, from their analogy to salts, were called by Berzelius *sulpho-salts*. With oxygen sulphur forms two well defined oxides, *sulphur dioxide* (*sulphurous anhydride*), SO_2, and *sulphur trioxide* (*sulphuric anhydride*), SO_3. These oxides, by their union with water, form *sulphurous acid*, H_2SO_3, and *sulphuric acid*, H_2SO_4, respectively. These are considered in the chapter on inorganic acids. There is also known *hyposulphurous acid*, H_2SO_2, the corresponding oxide of which is not known, and *thiosulphuric acid* (frequently known as hyposulphurous acid), $H_2S_2O_3$, and a series of acids, $H_2S_2O_6$, $H_2S_3O_6$, $H_2S_4O_6$, $H_2S_5O_6$ and $H_2S_2O_8$, known as the *thionic series*. Sulphurous acid forms with bases salts which

are termed *sulphites*. The salts similarly produced from sulphuric acid are termed *sulphates*. The sulphates are much more important salts. Pharmaceutically and medicinally, the sulphites and sulphates have totally different properties. Those official will be considered under their respective bases.

Tests for Sulphates, Sulphides, and Sulphites

Sulphates—Solutions of sulphates yield with barium chloride T.S. a white precipitate, which is insoluble in hydrochloric or nitric acid.

Sulphides—When treated with an acid, many sulphides yield hydrogen sulphide, recognizable by its characteristic odor and by its blackening moist lead acetate test paper.

Sulphites—When treated with hydrochloric acid, sulphites and bisulphites yield colorless sulphur dioxide, recognizable by its pungent odor which resembles burning sulphur. This gas blackens filter paper moistened with mercurous nitrate T.S.

Unofficial Compounds and Preparations of Sulphur and Phosphorus

Acidum Hyposulphurosum, H_2SO_2 Hyposulphurous Acid	A yellow liquid that rapidly decomposes on exposure to air, forming water, sulphur, and sulphur dioxide. It is a powerful reducing and bleaching agent
Acidum Metaphosphoricum, HPO_3 Metaphosphoric Acid	A glassy, deliquescent, pasty solid. When boiled with water it is converted into orthophosphoric acid
Acidum Phosphorosum, H_3PO_3 Phosphorous Acid	A crystalline mass readily soluble in water. Heat decomposes this acid, forming phosphoretted hydrogen and phosphoric acid. The aqueous solution absorbs oxygen and the acid is a powerful reducing agent. The acid is dibasic in most of its reactions to form salts
Acidum Pyrophosphoricum, $H_4P_2O_7$ Pyrophosphoric Acid	It is generally found as a soft crystalline mass. Its solution, when heated yields orthophosphoric acid. All four of its hydrogen atoms are replaceable to form normal salts
Spiritus Phosphori Spirit of Phosphorus U. S. P. 1890	A volatile, alcoholic solution of phosphorus, made by dissolving yellow phosphorus in dehydrated alcohol. It was formerly used in preparing the elixir of phosphorus. It is prepared by weighing 1.2 Gm. of phosphorus in a tared dish containing water, drying it quickly with the aid of blotting paper, and transferring it at once to a flask containing 1000 cc. of dehydrated alcohol. Having connected the flask with an upright condenser, boil the liquid gently on a water bath until the phosphorus is dissolved, cool, and add enough absolute alcohol to make 1000 cc. Store in small dark-colored vials
Carbonei Disulphidum Carbon Disulphide, CS_2	A colorless, heavy, highly refractive liquid with a disagreeable odor which is largely due to other sulphide impurities. The vapors are poisonous and very imflammable. Carbon disulphide is an excellent immiscible solvent for a great variety of substances. It is widely used as a solvent, as a germicide and an insecticide
Hydrogen Sulphide, H_2S	A colorless gas with an offensive odor and sweetish taste. It is poisonous and inflammable. It is used as a reagent in analytical chemistry to precipitate metallic sulphides
Resina Phosphorata Phosphorated Rosin Phosphoretted Resin	A yellowish solid containing 4 per cent of ordinary phosphorus. It is used as a convenient means of keeping, handling, and incorporating ordinary phosphorus into various preparations such as a pill mass. It is prepared by melting together, by the aid of a sand bath, in a dry bottle having the nearly exact capacity of the ingredients, anhydrous rosin 96 parts, and phosphorus 4 parts. Keep the whole at a temperature of 200° C. until the phosphorus is dissolved, mix thoroughly, cool, and keep in bottles protected from light

SULPHUR SUBLIMATUM. U. S. Sublimed Sulphur

[Sulphur Sublim.—Flowers of Sulphur]

Sublimed Sulphur, when dried to constant weight over sulphuric acid, contains not less than 99.5 per cent of S (32.06).

Preparation—When vapors of sulphur are conducted into a chamber properly cooled, they are condensed in the form of a crystalline powder, which

collects on the sides and bottom of the chamber. The yellowish powder is known as sublimed sulphur, or *flowers of sulphur. Ground roll sulphur* is sometimes sold as "*flour of sulphur*"; it is not identical in physical properties with the official sublimed sulphur.

Description and Physical Properties—A fine, yellow powder having a faint odor and taste. Sublimed Sulphur is practically insoluble in water and nearly insoluble in alcohol. One Gm. dissolves slowly and usually incompletely in about 2 cc. of carbon disulphide. One Gm. is soluble in about 70 cc. of chloroform, in 150 cc. of ether, and in 100 cc. of olive oil.

Tests for Identity—At about 115° C. Sublimed Sulphur fuses to a yellow, mobile fluid, which upon further heating to about 162° C. becomes dark and viscid. In the air it burns to sulphur dioxide, which can be recognized by its characteristic odor.

Test for Purity—The residue on ignition does not exceed 0.5 per cent.

Assay—Dry about 1 Gm. of Sublimed Sulphur to constant weight over sulphuric acid, weigh accurately, and transfer to a flask containing 50 cc. of a solution of potassium hydroxide (1 in 10). Boil the mixture until the liquid is of a transparent, golden-yellow color, and then dilute it with distilled water to measure exactly 250 cc. Oxidize 25 cc. of this diluted solution by the addition of solution of hydrogen dioxide in excess (using about 50 cc.), heat on a water bath for thirty minutes, acidulate the liquid with hydrochloric acid, dilute it with 250 cc. of distilled water, heat to boiling and add hot barium chloride T. S., in small portions, to the resulting liquid until no further precipitation takes place. Heat this mixture on a water bath for thirty minutes, collect the resulting precipitate on a filter, wash, dry, ignite, and weigh the barium sulphate. Carry out a blank determination, using the same amount of all of the reagents but omitting the Sulphur, and before making the final calculation deduct the amount of barium sulphate thus obtained from that obtained in the assay. The weight of the barium sulphate thus obtained, multiplied by 0.1373 indicates its equivalent of sulphur. Each Gm. of Sublimed Sulphur, previously dried, corresponds to not less than 7.243 Gm. of $BaSO_4$.

This assay is explained on page 1480.

U. S. P. Preparations—Sulphur Lotum; Sulphur Præcipitatum; Unguentum Sulphuris.

N. F. Preparations—Liquor Calcis Sulphuratæ; Petroxolinum Sulphuratum; Unguentum Sulphuris Alkalinum; Unguentum Sulphuris Compositum.

Uses—Sublimed sulphur is preferred for the ointment of sulphur, because of the presence of a small quantity of sulphurous acid which renders it more efficient in parasitic skin diseases. It is not used internally as a medicine in its unpurified state.

SULPHUR LOTUM. U. S. Washed Sulphur
[Sulphur Lot.]

Washed Sulphur, when dried to constant weight over sulphuric acid, contains not less than 99.5 per cent of S (32.06).

	Metric	Alternative
Sublimed Sulphur	**100 Gm.**	16 oz. av.
Ammonia Water	**10 cc.**	1½ fl. oz.
Water, a sufficient quantity.		

Pass the sublimed sulphur through a No. 30 sieve, mix it thoroughly with 100 cc. [1 pint] of water, add the ammonia water, and set the mixture aside for three days in a closed vessel, agitating occasionally. Then add 100 cc. [1 pint] of water, transfer the mixture to a strainer, and wash the sulphur with water until the washings cease to impart a blue color to red litmus paper. Then allow it to drain, press the residue strongly, dry it rapidly at a moderate heat in a drying closet, and pass it through a No. 30 sieve.

Sublimed Sulphur is frequently contaminated on exposure with small quantities of sulphurous acid and sulphuric acid, and the object of the ammonia in the above process is to neutralize any acid that may be present, the ammonium salts being subsequently washed out, and also to wash out any arsenic sulphide.

Description and Physical Properties—A fine yellow powder, without odor or taste.

Tests for Identity and Purity—It meets the requirements for solubility and identity under *Sulphur Sublimatum.*

Agitate 2 Gm. of Washed Sulphur with 10 cc. of distilled water and filter: the filtrate is neutral to litmus paper (*acid or alkali*).

The residue on ignition does not exceed 0.5 per cent.

Digest 0.5 Gm. of Washed Sulphur for three hours with 10 cc. of ammonia T.S., filter the liquid, and evaporate the clear filtrate to dryness on a water bath. Add 1 cc. of nitric acid, and again evaporate to dryness. This residue meets the requirements of the test for *arsenic*, page 1512.

Assay—Dry Washed Sulphur to constant weight over sulphuric acid and proceed as directed under *Sulphur Sublimatum*.

This assay is explained on page 1480.

Preserve in well-closed containers.

U. S. P. Preparation—Pulvis Glycyrrhizæ Compositus.

N. F. Preparations—Sulphuris Iodidum; Tabellæ Sulphuris et Potassii Bitartratis.

Uses—Washed sulphur is employed internally as a laxative, especially in compound licorice powder or combined with potassium bitartrate. It was formerly credited with alterative powers and used in rheumatism and other chronic disorders, a tradition which still survives among the laity. Sulphur is also a valuable local agent in various skin diseases. The dose is 1 drachm (4 Gm.).

SULPHUR PRÆCIPITATUM. U. S. Precipitated Sulphur

[**Sulphur Præc.**—Lac Sulphuris, Milk of Sulphur]

Precipitated Sulphur, when dried to constant weight over sulphuric acid, contains not less than 99.5 per cent of S (32.06).

	Metric	Alternative
Sublimed Sulphur	**100 Gm.**	16 oz. av.
Lime	**50 Gm.**	8 oz. av.
Hydrochloric Acid,		
Water, each, a sufficient quantity.		

Slake the lime, and mix it thoroughly with 500 cc. [5 pints] of water. Add the sublimed sulphur, previously sifted, and, after thorough mixing add 1000 cc. [10 pints] of water, and boil the mixture in a porcelain or glass vessel during one hour, stirring or agitating the mixture very frequently, and replacing the water lost by evaporation. Then cover the vessel, and allow it to stand until the contents are cool and the supernatant liquid becomes clear. Carefully draw off the clear solution, and filter the remainder.

To the united liquids add gradually and with constant stirring hydrochloric acid, previously diluted with an equal volume of water, until the liquid is nearly neutralized but still retains an alkaline reaction and a yellow color. Collect the precipitate on a strainer, and wash it until the washings are neutral to litmus paper and no longer give a precipitate upon the addition of ammonium oxalate T.S. Then dry the product rapidly, and keep it in well-closed containers.

In the above process the lime and sulphur react to form soluble polysulphides of calcium. The reaction is usually given as follows:

$$\underset{\text{sulphur}}{6S_2} + \underset{\substack{\text{calcium}\\\text{hydroxide}}}{3Ca(OH)_2} = \underset{\substack{\text{calcium}\\\text{pentasulphide}}}{2CaS_5} + \underset{\substack{\text{calcium}\\\text{thiosulphate}}}{CaS_2O_3} + \underset{\text{water}}{3H_2O}$$

On the addition of hydrochloric acid, the sulphur is precipitated:

$$\underset{\substack{\text{calcium}\\\text{pentasulphide}}}{2CaS_5} + \underset{\substack{\text{calcium}\\\text{thiosulphate}}}{CaS_2O_3} + \underset{\substack{\text{hydrochloric}\\\text{acid}}}{6HCl} = \underset{\substack{\text{calcium}\\\text{chloride}}}{3CaCl_2} + \underset{\text{sulphur}}{6S_2} + \underset{\text{water}}{3H_2O}$$

In some processes sulphuric acid is used instead of hydrochloric acid, and calcium sulphate is precipitated with the sulphur. This furnishes an inferior

article which should not be confused with the official product. In carrying out the official process it is important to follow the instructions exactly. If the mixture is boiled longer than one hour, soluble polysulphides are formed and the final yield is lessened. If the hydrochloric acid is added in excess, the precipitated sulphur becomes coarse, reduced in quantity, and contaminated with arsenic.

A convenient test readily applied to distinguish between the pure and the inferior product consists of simply igniting a small portion of the material on porcelain over a Bunsen flame. The appearance of any residue after the sulphur has burned away is evidence of impurity.

Description and Physical Properties—A fine, amorphous powder, of a pale yellow color, without odor or taste.

Tests for Identity and Purity—Precipitated Sulphur meets the requirements for solubility and identity under *Sulphur Sublimatum*, but it is more readily and completely soluble in carbon disulphide than the other forms of sulphur.

Agitate 2 Gm. of Precipitated Sulphur with 10 cc. of distilled water, and filter: the filtrate is neutral to litmus paper (*acid or alkali*).

The residue on ignition does not exceed 0.3 per cent.

Digest 1 Gm. of Precipitated Sulphur for three hours with 10 cc. of ammonia T.S., and filter the liquid. Evaporate the clear filtrate to dryness on a water bath, add 1 cc. of nitric acid, and again evaporate to dryness: this residue meets the requirements of the test for *arsenic*, page 1512.

Assay—Dry Precipitated Sulphur to constant weight over sulphuric acid and proceed as directed under *Sulphur Sublimatum*

This assay is explained on page 1480.

N. F. Preparations—Pasta Betanaphtholis; Pasta Zinci Sulphurata.

Uses—Precipitated sulphur is much to be preferred to the other forms in liquid mixtures, as the particles are lighter and more easily suspended; the ointments made with it are smoother than those made with sublimed sulphur but are not considered as effective. The dose is 1 drachm (4 Gm.).

SULPHURIS IODIDUM. N. F. Sulphur Iodide

[Sulphur. Iod.]

	Metric	Alternative
Washed Sulphur	**20 Gm.**	60 gr.
Iodine	**80 Gm.**	240 gr.

Mix the sulphur and iodine thoroughly by trituration; introduce the mixture into a flask, close the orifice loosely, and, by means of a water bath, gradually apply a heat not exceeding 60° C. and occasionally agitate until the ingredients combine and become of a uniformly dark color throughout. Then increase the heat to the boiling point of water, so as to fuse the mass. Should any iodine sublime and condense on the glass, incline the flask so as to combine the iodine with the fused mass. Then pour the latter upon a porcelain plate or other suitable cold surface. When it is cold, break it into peices of suitable size, and preserve them in a glass-stoppered bottle, in a cool place.

This compound represents one of the instances of the direct chemical union of two elements, heat being the only agent used to effect the combination; it is sometimes called *subiodide of sulphur*, or *iodine disulphide*, S_2I_2. There is some doubt, however, as to its being a definite chemical compound.

As it is readily decomposed when exposed to air, it should be kept in tightly closed bottles.

Official Description—In brittle masses having a crystalline fracture and a grayish-black, metallic luster.

Odor and Taste—It has the odor of iodine and a somewhat acrid taste.

Solubility—Almost insoluble in water; soluble in about 60 parts of glycerin; very soluble in carbon disulphide. Alcohol, ether, or an aqueous solution of potassium iodide dissolve the iodine, leaving the sulphur. Continued boiling with water vaporizes all of the iodine, leaving about 20 per cent of sulphur as a residue.

Tests for Identity—On exposing sulphur iodide to the air, it gradually loses iodine. On heating it, some iodine sublimes at first; at a somewhat higher temperature a sublimate is formed, containing both iodine and sulphur. At a still higher temperature, it is almost completely volatilized, leaving only a trace of residue.

Assay—Mix 0.5 Gm. of finely powdered Sulphur Iodide with 1 Gm. of potassium iodide, and dissolve the mixture in 20 cc. of distilled water (the sulphur separating); it requires not less than 28 cc. of tenth-normal sodium thiosulphate for complete decolorization of the mixture, starch T.S. being used as an indicator.

This assay is explained on page 1467.

Uses—Sulphur Iodide is principally used externally in skin diseases in the form of an ointment.

Phosphorus P; 31.04

Tests for Phosphates

Phosphates—Neutral solutions of orthophosphates yield with silver nitrate T.S. a yellow precipitate, which is soluble in diluted nitric acid or in ammonia T.S. With ammonium molybdate T.S., a yellow precipitate is produced which is soluble in ammonia T.S.

Tests for Hypophosphites

Hypophosphites—When strongly heated, hypophosphites evolve spontaneously inflammable hydrogen phosphide. Hypophosphites in solution yield a white precipitate with mercuric chloride T.S. This precipitate becomes gray when an excess of hypophosphite is present. Solutions of hypophosphites, acidulated with sulphuric acid and warmed with copper sulphate T.S., yield a red precipitate.

PHOSPHORUS. U. S. Phosphorus
[Phosphor.]

Phosphorus is from the Greek "phos", meaning "light", and "phero", meaning "I carry", being derived from the fact that the ordinary phosphorus is phosphorescent.

The official phosphorus [P = 31.04] is the yellow allotropic form and must be carefully preserved under water, in strong, well-closed containers, in a secure and moderately cool place, protected from light.

Preparation—Phosphorus is now generally prepared by heating a mixture consisting of phosphatic minerals, coke and quartz sand to a high temperature in an electric furnace. The phosphorus vapors are condensed and the slag drawn off at the bottom, the process being continuous, fresh mixture being constantly added at the top of the furnace. The following reaction takes place:

$$\underset{\text{tricalcium phosphate}}{2Ca_3(PO_4)_2} + \underset{\text{carbon}}{10C} + \underset{\text{silicon dioxide}}{6SiO_2} = \underset{\text{carbon monoxide}}{10CO} + \underset{\text{calcium silicate}}{6CaSiO_3} + \underset{\text{phosphorus}}{P_4}$$

Since it is the effect of enormously high temperatures produced by the resistance of the electric current which brings about this decomposition, and not the direct action of the current itself, the reaction is distinctly an electrothermic and not an electrolytic one.

The ordinary phosphorus obtained by this method is white or yellowish-white, has a waxy consistence, and melts at 44° C. It is practically insoluble in water under which it is preserved. Its best solvent is carbon disulphide. Ordinary phosphorus fumes and oxidizes in moist air and is luminous in the dark. It is distinctly poisonous.

Red phosphorus, one of the allotropic forms of phosphorus, was at one time considered to be amorphous but has been crystallized in the hexagonal system and shown to be a polymer of yellow phosphorus. It is obtained by allowing phosphorus to remain for several days in an atmosphere of carbon dioxide at a temperature varying from 215° C. to 250° C.

Red phosphorus, which is extensively used in making safety matches, is not luminous and not poisonous until it is heated to 280° C. when it is converted into ordinary phosphorus.

With oxygen phosphorus forms two oxides,—*phosphorous oxide*, P_2O_3, or *phosphorous trioxide*, P_2O_3, and *phosphoric oxide*, or *phosphorous pentoxide*, P_2O_5. Corresponding to the last of these are three acids, known as *orthophosphoric* (tribasic phosphoric), H_3PO_4, *pyrophosphoric*, $H_4P_2O_7$, and *metaphosphoric*, HPO_3. Orthophosphoric acid is formed by dissolving P_2O_5 in boiling water, or by the action of nitric acid upon phosphorus itself; pyrophosphoric acid, by the heating of the tribasic phosphoric acid to 213° C. and metaphosphoric acid, by the ignition of the tribasic variety, or by dissolving P_2O_5 in the correct proportion of cold water. *Phosphorous acid*, H_3PO_3 is a dibasic acid, containing one hydrogen atom not replaceable by a metal. *Hypophosphorous acid*, H_3PO_2, is not capable of being derived directly from hypophosphorous oxide, but is prepared by heating yellow phosphorus with a concentrated solution of barium or calcium hydroxide to produce barium hypophosphite, as indicated by the following equation:

$$\underset{\text{barium hydroxide}}{3Ba(OH)_2} + \underset{\text{phosphorus}}{2P_4} + \underset{\text{water}}{6H_2O} = \underset{\text{barium hypophosphite}}{3Ba(H_2PO_2)_2} + \underset{\text{hydrogen phosphide}}{2PH_3}$$

The barium is then precipitated with sulphuric acid and the hypophosphorous acid concentrated in vacuo. It is monobasic, containing two hydrogen atoms not replaceable by a metal.

Description and Physical Properties—A translucent, nearly colorless solid, having a waxy luster, and a consistence at ordinary temperatures of about that of beeswax. After long keeping the surface becomes white or red, and occasionally black. It has a distinctive and disagreeable odor.

One Gm. of Phosphorus is soluble in about 400 cc. of dehydrated alcohol in about 40 cc. of chloroform, 102 cc. of absolute ether, 31.5 cc. of benzene, and in 0.9 cc. of carbon disulphide, at 25° C. It is sparingly soluble in fixed oils, and is practically insoluble in water, to which it imparts its characteristic, disagreeable odor and taste.

Specific gravity: about 1.830 at 10° C.

Tests for Identity—When exposed to the air, Phosphorus emits white fumes, which are luminous in the dark, and have an odor somewhat resembling that of garlic. On longer exposure to the air, it often takes fire spontaneously.

Tests for Purity—Add 1 Gm. of Phosphorus to 10 cc. of nitric acid diluted with 10 cc. of distilled water in a flask having a capacity of 50 cc. Digest the mixture at a gentle heat on a water bath until the Phosphorus is dissolved, maintaining an atmosphere of carbon dioxide in the flask during the heating. Transfer this solution to a dish, evaporate until nitrous vapors are no longer given off, and then dilute the solution to 250 cc. with distilled water. One cc. of this solution meets the requirements of the test for *arsenic*, page 1512.

A 50 cc. portion of the latter solution shows no more *sulphate* than corresponds to 0.5 cc. of fiftieth-normal sulphuric acid, page 1520.

Preserve carefully under water, in strong, well-closed containers, in a secure and moderately cool place, protected from light.

U. S. P. Preparation—Pilulæ Phosphori.

N. F. Preparations—Elixir Phosphori; Liquor Phosphatum Compositus; Oleum Phosphoratum.

Because of the difficulty and danger in handling phosphorus, the pharmacist may advantageously adopt the following plan suggested by C. F. Barth of Louisville, Ky. Instead of keeping the sticks under water, necessitating their drying before weighing and the exposing of the operator to the danger of spontaneous ignition and a possible burn, the sticks of yellow phosphorus are kept in an aqueous solution of copper sulphate. The phosphorus, due to its reducing action, is quickly covered by a coating of metallic copper and then becomes safe to handle and fireproof. The amount required may be easily cut off without danger and the remainder returned to the bottle of solution.

Uses—Phosphorus is administered internally in the treatment of chronic diseases of the bone and of the nervous system in doses of $\frac{1}{120}$ grain

(0.0005 Gm.). Its value in this connection depends upon its being administered in a free state. The oxide of phosphorus, phosphoric acid, does not have the same action; hence all pharmaceutical preparations of phosphorus must be protected from oxidation. (See Pilulæ Phosphori.) In large doses phosphorus is poisonous.

In addition to its use in medicine, phosphorus is largely employed in making compounds of phosphorus, especially the sulphide (P_4S_3) which is an essential ingredient in matches. Because of its combustibility and the readiness with which it combines with oxygen to form dense white clouds of P_2O_5, phosphorus is used as an ingredient of incendiary and smoke screen shells.

LIQUOR PHOSPHORI. N. F. Solution of Phosphorus

[Liq. Phosphor.—Thompson's Solution of Phosphorus]

	Metric	Alternative
Phosphorus	0.07 Gm.	1¼ gr.
Spirit of Peppermint	0.50 cc.	10 min.
Glycerin	64.50 cc.	2 fl. oz. 278 min.
Dehydrated Alcohol, a sufficient quantity,		
To make	100 cc.	4 fl. oz.

Weigh the phosphorus in a dish containing water (which should be counter-balanced after each trial weighing), dry it carefully and quickly with blotting paper, and introduce it into a flask containing 35 cc. [about 1½ fl. oz.] of dehydrated alcohol. Into the neck of the flask insert a perforated cork stopper fitted with a glass tube about 50 cm. [about 20 inches] in length, to serve as a condenser. Place the flask in a water bath and heat it so that the alcohol shall be kept boiling gently, until the phosphorus is dissolved. Allow the solution to cool and then add the spirit of peppermint and glycerin, and sufficient dehydrated alcohol to make the product measure 100 cc. [4 fl. oz.].

Description and Physical Properties—Solution of Phosphorus is a colorless, transparent liquid with the characteristic odor of phosphorus, inflammable with a peculiar silvery flame. Toward the close of the ignition, small particles are thrown off, leaving a trail of white vapor.

Test for Identity—Five cc. of the Solution is ignited in an open vessel, and the residue redissolved in 15 cc. of water, acidulated with 1 cc. of diluted nitric acid. This mixture is then heated almost to boiling and 5 cc. of ammonium molybdate T.S. added to the hot solution. A yellowish precipitate is formed.

Caution—These tests should be made with care, on account of possible danger to the person performing them.

Approximate alcohol content, by volume, 92 per cent.

Average dose—10 minims (0.6 cc.).

One average dose contains about:

0.00042 Gm. or $\frac{1}{160}$ grain of phosphorus.

CHAPTER XLIV

CARBON, BORON, AND SILICON

C; 12.005. B; 10.9. Si; 28.1

THESE three elements present some analogies, and, although the number of pharmaceutical preparations made from them is not great, they are of considerable interest.

Carbon is from the French word "carbone" or the Latin word "carbo" meaning a coal.

Carbon C; 12.005

Carbon is a very widely distributed element. It is a constituent of all organic substances, and is found in nature in the form of the diamond, graphite plumbago, coal, etc.

Two compounds with oxygen are known,—carbon dioxide, CO_2, and carbon monoxide, CO.

Carbon dioxide, CO_2, is a colorless, odorless gas with a slightly acid taste, heavier than ordinary air. It is not combustible, and not a supporter of combustion; indeed, it is used extensively as a means of putting out flames, and is generated for that purpose in fire extinguishers and other contrivances of the same character. Some pharmacists have fastened to the ceiling of their cellars a series of pipes with several outlets; a flexible pipe is connected with a soda water tank or cylinder, and thus one may always have a complete fire extinguisher in the cellar; nothing more is necessary to put out a small fire than to turn on the stop-cock and close all doors and windows. The ordinary "soda fountain" tank is an efficient portable fire extinguisher. Water is capable of absorbing its own volume of carbon dioxide, but several times its volume under pressure. Under a pressure of five atmospheres, water will absorb five volumes of carbon dioxide. This solution was formerly official, under the name of *Aqua Acidi Carbonici*, or carbonic acid water or "*soda water*".

Carbonic acid, H_2CO_3, is produced when carbon dioxide is brought into contact with water, as follows: $CO_2+H_2O=H_2CO_3$. This compound, however, is readily dissociated by heating.

Carbonates are widely distributed in nature, and many chemical processes are based upon their decomposition by strong acids. Carbonic acid is one of the weakest inorganic acids known.

Carbon Dioxide Snow—By allowing compressed CO_2 to escape from a cylinder into a woolen, cone-shaped receptacle, the intense cold causes a portion of it to solidify. This may be pressed into molds and may be kept for some time without sensible evaporation. It melts at about $-54°$ C. and is used for the destruction of warts and moles and in treating malignant ulcers, being applied for from thirty seconds to two minutes.

Carbon monoxide, CO, is of little interest in pharmacy. This is the gas produced by incomplete combustion of fuels. It is present in modern illuminating gas, as it is combustible, furnishing heat units but no light. It is one of the waste products of the internal combustion engine, such as the automobile engine, and is the cause of the death known as *petromortis*, in those who inhale these combustion waste products by remaining in a confined space where a gas or gasoline engine is running.

The compounds of carbon and hydrogen are very numerous, and of great importance. They are mostly obtained from organic substances, and these will be considered under Part V. With nitrogen, carbon forms cyanogen $(CN)_2$, the compound radical of hydrocyanic or prussic acid.

Tests for Carbonates

Carbonates—Carbonates or bicarbonates effervesce with acids, yielding a colorless gas, which when passed into calcium hydroxide T.S. produces a white precipitate. Carbonates in solution produce a reddish-brown precipitate with mercuric chloride T.S., while bicarbonates produce a white precipitate with the same reagent. A cold aqueous solution of a carbonate is reddened by phenolphthalein T.S., while a similar solution of a bicarbonate remains unchanged or is only slightly reddened.

Unofficial Compound of Carbon

Carbon Disulphide (see Sulphur, page 581)

CARBO LIGNI. U. S. Wood Charcoal

[Carbo Lig.—Charcoal]

Wood Charcoal prepared from soft wood, and very finely powdered.

Preparation—It is made by burning wood out of contact with air, either in iron cylinders or in stacks. In the former case, the volatile substances resulting from the destructive distillation are collected by condensation, and contribute valuable products to pharmacy (see *Acidum Aceticum*). In the latter, the charcoal is made in the neighborhood of a cheap wood supply. Billets of wood are piled in a conical form, and covered with earth and sod to prevent the free access of air, several holes being left at the bottom and one at the top of the pile in order to produce a draught to commence the combustion. The wood is kindled from the bottom, and soon after ignition the hole at the top is closed, and when the wood is all ignited the holes at the bottom are stopped. The result is that the combustible portions of the wood, hydrogen, oxygen, water, etc., are dissipated, carbon being left.

Description and Physical Properties—A black, odorless, and tasteless powder, free from gritty matter.

Tests for Purity—Wood Charcoal burns without a luminous flame, yielding not more than 7 per cent of ash.

Boil 1 Gm. of Wood Charcoal with a mixture of 3 cc. of potassium hydroxide T.S. and 10 cc. of distilled water for one-half minute, and filter: the filtrate has only a slight brown color.

Preserve in well-closed vessels.

Uses—Charcoal is used in medicine as an absorbent in stomach and intestinal fermentation. It is also useful as an emergency antidote in many forms of poisoning because of its adsorbing powers. In pharmacy it is used as a clarifying and decolorizing agent. It is given in the form of powder, in doses of fifteen grains to two drachms (1 to 8 Gm.). Owing to its absorbent powers, it should never be kept exposed to the air, as it will become unfit for use if subjected to the atmosphere of a laboratory or pharmacy. Tin cans with tightly fitting covers are appropriate containers.

CARBO ANIMALIS PURIFICATUS. N. F. Purified Animal Charcoal

Charcoal prepared from bone, and purified by removing the substances which were soluble in hot hydrochloric acid and water.

Description and Physical Properties—A dull black powder, odorless, tasteless and insoluble in water, alcohol, or other solvents.

Test for Purity—Boil 1 Gm. of Purified Animal Charcoal during three minutes in a mixture of 3 cc. of potassium hydroxide T.S., and 5 cc. of distilled water and filter: the filtrate is colorless.

The ash from 2 Gm. of Purified Animal Charcoal does not exceed 0.08 Gm. or 4 per cent (limit of Silica and other inorganic matter).

Preparation—Tabellæ Carbonis Animalis.

Uses—An absorbent and decolorizer. Dose, five grains (0.3 Gm.).

Boron B; 11.0

Boron is from the word "borax" which was used by the alchemists in a very vague manner. Like carbon it exists in two allotropic conditions,—amorphous and crystalline. Boron combines with hydrogen and oxygen, and boric (or boracic) acid is produced, H_3BO_3.

Tests for Borates

Borates—Solutions of borates, acidulated with hydrochloric acid, turn turmeric paper brownish-red, the color changing to greenish-black by moistening with ammonia T.S. When a borate is treated with sulphuric acid, alcohol added, and the mixture ignited, it burns with a green bordered flame.

Unofficial Compounds of Boron

Acidum Metaboricum, HBO_2 Metaboric Acid	A white powder of little importance. It is made by heating boric acid to 100° C. Its salts, the metaborates, are met with in blow pipe analysis
Acidum Pyroboricum, $H_2B_4O_7$ Pyroboric Acid	A glassy, brittle mass formed by the prolonged heating of boric acid at 140° C. Ordinary borax is the sodium salt of this acid
Boron Trisulphidum, B_2S_3 Boron Trisulphide	White, crystalline needles decomposed by cold water, forming boric acid and hydrogen sulphide

ACIDUM BORICUM. U. S. Boric Acid

[**Acid. Bor.**—Boracic Acid]

Boric Acid, when dried to constant weight over sulphuric acid, contains not less than 99.5 per cent of H_3BO_3 (61.92).

Preparation—The lagoons of the volcanic districts of Tuscany formerly furnished the greater part of the boric acid and borax of commerce. Borax is now found native in California and in some of the other Western States, and boric acid is produced by decomposing borax with hydrochloric or sulphuric acid.

$$\underset{\text{sodium borate}}{Na_2B_4O_7.10H_2O} + \underset{\text{hydrochloric acid}}{2HCl} = \underset{\text{sodium chloride}}{2NaCl} + \underset{\text{boric acid}}{4H_3BO_3} + \underset{\text{water}}{5H_2O}$$

Boric acid is required in very fine, what is known as *impalpable*, powder for most medicinal uses.

Description and Physical Properties—Transparent, colorless scales of a somewhat pearly luster, or six-sided, triclinic crystals, or a white, bulky powder, slightly unctuous to the touch. It is stable in the air.

One Gm. of boric Acid is soluble in 18 cc. of water, 18 cc. of alcohol, and in 4 cc. of glycerin, at 25° C. One Gm. is soluble in 4 cc. of boiling water and in 6 cc. of boiling alcohol.

Heated to 100° C., Boric Acid loses water, forming metaboric acid (HBO_2), which slowly volatilizes at that temperature. Heated to about 160° C., Boric Acid fuses to a glassy mass of tetraboric or pyroboric acid ($H_2B_4O_7$). At about 185° C. the fused mass swells, loses all of its water, and becomes boron trioxide (B_2O_3), which fuses into a transparent non-volatile, hygroscopic mass.

Boric Acid volatilizes from a boiling aqueous or alcoholic solution.

Tests for Identity—An aqueous solution of Boric Acid (1 in 50) is slightly acid to litmus paper.

Boric Acid responds to the reactions for borates (see above).

Tests for Purity—One Gm. of Boric Acid dissolves completely in 10 cc. of boiling alcohol (*insoluble substances*).

An aqueous solution of Boric Acid meets the requirements of the test for *heavy metals*, page 1519.

An aqueous solution of Boric Acid meets the requirements of the test for *arsenic*, page 1512.

Assay—Dry about 2.5 Gm. of Boric Acid to constant weight over sulphuric acid, weigh accurately, dissolve in 50 cc. of distilled water and 50 cc. of glycerin, and titrate with normal sodium hydroxide, phenolphthalein T.S. being used as indicator. Each cc. of normal sodium hydroxide corresponds to 0.06192 Gm. of H_3BO_3.

This assay is explained on page 1453.

U. S. P. Preparations—Glyceritum Boroglycerini; Unguentum Acidi Borici.

N. F. Preparations—Cataplasma Kaolini; Liquor Antisepticus; Pulvis Talci Compositus.

Uses—Boric acid is used as a mild antiseptic, either in the form of a wash or an ointment. Its use as a preservative in beverages and foods is prohibited by national and state legislation.

Average dose—8 gr. (0.5 Gm.).

Silicon Si; 28.1

Silicon is from the Latin "silex", or "silicis" meaning "a flint", suggestive of the occurrence of the element in this mineral.

Very few of the compounds of the non-metallic element silicon are used medicinally. Silicon, like carbon and boron, is obtained in two allotropic states,—amorphous and crystalline. In some of its combinations, notably in glass, earthenware, china, mortar, and cements of various kinds, it is of vast importance commercially. Silicon is found in nature combined with aluminum, magnesium, or calcium, in *pumice stone, meerschaum, asbestos, talc, soapstone,* etc.; or as an oxide (*silica*), in *sand, flint, agate, quartz,* etc.

Silica, SiO_2, may be obtained in a pure condition by treating a solution of sodium silicate with hydrochloric acid.

$$\underset{\text{sodium silicate}}{Na_2SiO_3} + \underset{\text{hydrochloric acid}}{2HCl} = \underset{\text{silica}}{SiO_2} + \underset{\text{sodium chloride}}{2NaCl} + \underset{\text{water}}{H_2O}$$

Test for Silicates

Silicates are insoluble in most reagents. If the soluble sodium and potassium silicates, in aqueous solution, are neutralized with hydrochloric acid, and ammonia water added in excess, a gelatinous precipitate of silicic hydroxide will separate.

Unofficial Compounds of Silicon

Silicon Dioxide, SiO_2, Silica	Quartz, used in making pottery and glass
The various physical forms of silicon dioxide are:	Amethyst, a gem. Smoky quartz, a gem
	Rose quartz, a gem. Flint, an abrasive
	Sand, used in the manufacture of pottery, glass, and for many other purposes
	Opal, a gem
	Agate, mortars for chemists' use
Glass, an artificially made product of great variety.[1]	Common glass is made by heating a mixture of sand, lime or limestone, and soda ash
	Blue glass is made by fusing into the glass mixture the oxide or silicate of cobalt
	Flint glass is made by the addition of lead oxide to the fused glass mixture. It is softer and more brilliant than other types and is used for cut glass ware
	Opal glass is made by adding a white insoluble substance to the fused mass such as bone-ash, cryolite or zinc oxide
	Amber glass is made by the introduction of carbon or sulphur to the fusion mixture
	Bohemian or potash-lime glass is made by substituting potassium carbonate in place of the soda ash of the common glass mixture
Meerschaum. Magnesium Silicate, Mg_2SiO_3	Used in making tobacco pipes and ornaments
Asbestos. Magnesium Silicate.	Used for resisting action of fire, or heat

[1] See "The Story of Glass", by J. W. Sturmer, American Journal of Pharmacy, January, 1923, page 8.

Unofficial Compounds of Silicon—*Continued*

Sodium Silicate Liquor Sodii Silicatis Solution of Sodium Silicate. (Water Glass)	Made by fusing one part of fine sand and two parts of dried sodium carbonate, mixed in powder, in an earthenware crucible, pouring out the fused mass on a stone slab to cool, powdering, dissolving the soluble matter in boiling water, filtering and concentrating so as to contain about 30 per cent of sodium silicate. This solution is largely used for the preservation of eggs. The eggs, as fresh as possible, are immersed in a liquid consisting of one volume of the commercial solution and nine volumes of cold, but freshly boiled, water

TALCUM PURIFICATUM. U.S. Purified Talc

[Talc. Purif.]

Purified Talc is a purified, native, hydrous magnesium silicate, sometimes containing a small amount of aluminum silicate.

Native Talc, also called *French chalk*, or *soapstone*, is found in various parts of the world; an excellent quality is now obtained from North Carolina.

Preparation—The U. S. P. VIII gave directions for preparing the purified product as follows: Mix 500 Gm. of powdered native talc with 2500 cc. of boiling water, gradually add 50 cc. of hydrochloric acid, and boil the mixture during fifteen minutes, then allow it to stand for fifteen minutes. Decant, and reject the supernatant liquid containing the finer particles of talc in suspension, and again boil the residue with 2500 cc. of water, mixed with 25 cc. of hydrochloric acid, and allow it to stand for fifteen minutes. Again decant, and reject the finer suspended particles, and wash the coarser residue with water by repeated decantation, until a portion of the wash-water, after filtering and acidifying with nitric acid, fails to become opalescent upon the addition of silver nitrate T.S. Then transfer the magma to a close linen or muslin strainer, allow it to drain, and dry it at 110° C.

Talc, as found in commerce, contains the impurities usually associated with native mineral substances. When treated with hydrochloric acid and water, as in this process, carbonates, aluminum, iron, calcium, and magnesium salts are removed.

Description and Physical Properties—A very fine, white or grayish-white powder. It adheres readily to the skin. It is entirely free from grittiness and is unctuous to the touch.

Test for Identity—Mix 0.5 Gm. of Purified Talc with about 2 Gm. of anhydrous sodium carbonate and 2 Gm. of anhydrous potassium carbonate, heat the mixture in a platinum crucible until fusion is complete, and treat the resulting fused mass with hot distilled water. Then neutralize the liquid with diluted sulphuric acid, add another 10 cc. of the diluted acid, and evaporate the mixture until white fumes of sulphuric anhydride are evolved, and cool. Add 20 cc. of distilled water, boil the mixture and filter. An insoluble residue of *silica* remains. The addition of ammonia T.S. and ammonium chloride T.S. to the filtrate may produce a white gelatinous precipitate of *aluminum hydroxide*, and the filtrate from this mixture on the addition of sodium phosphate T.S. yields a white, crystalline precipitate of magnesium ammonium phosphate.

Tests for Purity—Purified Talc, when ignited at a red heat, loses not more than 5 per cent of its weight.

Boil 10 Gm. of Purified Talc with 50 cc. of distilled water for one-half hour, adding water from time to time to maintain approximately the original volume, and filter. The filtrate is neutral to litmus paper. One-half of this filtrate, when evaporated and dried at 110° C., yields not more than 0.005 Gm. of residue (*soluble substances*). The remaining half of this filtrate, after slightly acidulating with hydrochloric acid, does not yield a blue color upon the addition of potassium ferrocyanide T.S. (*iron*).

Add 1 Gm. of Purified Talc to 20 cc. of diluted hydrochloric acid: no effervescence occurs (*carbonate*). Digest the mixture for fifteen minutes, and filter: a 10 cc. portion of the filtrate, evaporated to dryness and ignited, leaves a residue weighing not more than 0.005 Gm.

NOTE—Purified Talc is intended only as a filtering medium and for this purpose should not be finer than the powder which passes through a No. 80 sieve, but is retained by a No. 100 sieve.

U. S. P. Preparations—Filtering medium where required in aromatic waters, elixirs, syrups, etc.

N. F. Preparations—Pulvis Talci Compositus; also used as a filtering medium.

Uses—Purified Talc is used as a distributing and filtering medium in making medicated waters, elixirs, etc. Its medicinal value depends on its desiccant and lubricating effects.

When perfumed or medicated, it is also used extensively as a toilet powder under the name *talcum powder*. For toilet purposes it should be in the form of an impalpable powder, but when used as a filtering medium, the Pharmacopœia directs that it should not be finer than a No. 100 powder. The coarser powder is directed because the impalpable form passes through the pores of the filter paper and necessitates returning the first portions of the filtrate. As a filtering medium it may be used for all classes of preparations with no danger of adsorption and retention of active principles.

TERRA SILICEA PURIFICATA. U. S. Purified Siliceous Earth

[Ter. Sil. Purif.—Purified Kieselguhr, Purified Infusorial Earth]

A form of silica [SiO_2 60.10] consisting of the frustules and fragments of diatoms, purified by boiling with diluted hydrochloric acid, washing, and calcining. It contains not more than 10 per cent of water.

Large deposits of this substance are found in Virginia, Maryland, Nevada, Oregon, and California, usually in the form of masses of rocks, hundreds of feet in thickness. Under the microscope it is seen to consist largely of the minute siliceous structure of diatoms. It must be carefully purified in a manner similar to that directed for talc (see above) and thoroughly calcined, the latter treatment destroying the bacteria which are present in large quantities in the native earth.

Description and Physical Properties—A very bulky and very fine, odorless powder; white or light gray to pale buff in color. It readily absorbs moisture, retaining about four times its weight of water without the mixture becoming fluid.

Purified Siliceous Earth is insoluble in water, acids, or in dilute solutions of the alkali hydroxides.

Tests for Purity—When ignited its color is not darkened (*organic impurities*), nor does it lose more than 10 per cent of its weight (*moisture*).

Digest 1 Gm. of Purified Siliceous Earth for fifteen minutes with 20 cc. of diluted hydrochloric acid, and filter: a 10 cc. portion of the filtrate, evaporated to dryness and ignited, leaves not more than 0.005 Gm. of residue.

Boil 10 Gm. of Purified Siliceous Earth with 50 cc. of distilled water during ten minutes, replace any water lost by evaporation, and filter: the filtrate is colorless and neutral to litmus paper, and on adding 5 drops of potassium ferrocyanide T.S. to 5 cc. of the filtrate no blue color is produced (*soluble iron*).

Add 1 Gm. of Purified Siliceous Earth to 25 cc. of diluted hydrochloric acid: no effervescence occurs (*carbonate*). Boil the mixture for ten minutes, replacing any water lost by evaporation, and filter: the addition of a few drops of barium chloride T.S. to the filtrate produces no turbidity. (*sulphate*).

Preserve in tightly-closed containers.

U. S. P. Preparation—Filtering medium when required in aromatic waters.

N. F. Preparation—Pasta Zinci Sulphurata.

Uses—It has been introduced into the Pharmacopœia as a distributing and filtering medium for aromatic waters. It is better adapted for the filtration of elixirs. Like talc it may be used with no fear of its exerting an adsorptive power upon active constituents. The native Infusorial Earth is extensively used in metal polishing powders and pastes and as an absorbent for nitroglycerin to produce the explosive known as dynamite. It is difficult to obtain of U. S. P. quality.

KAOLINUM. N. F. Kaolin

A native hydrated aluminum silicate, powdered and freed from gritty particles by elutriation.

The name *Kaolin* is derived from the Chinese word "kaoling", meaning "high ridge"; it is sometimes called *China clay*, or *porcelain clay*, because of its use in pottery, and it is a

valuable commercial product. Besides aluminum silicate, it often contains small quantities of aluminum hydroxide, ferric oxide, magnesium oxide, and calcium carbonate. For pharmaceutical purposes it should be purified by treatment with hydrochloric acid if calcium carbonate is present, and afterwards with diluted sulphuric acid to remove the other impurities; the kaolin should be thoroughly washed with water to remove the chlorides and sulphates.

Official Description—A soft, white or yellowish-white powder, or in lumps.

Solubility—Insoluble in water, and in cold dilute acids and solutions of the alkali hydroxides.

Odor, Taste, and Reaction—It has an earthy or clay-like taste. When moistened with water, Kaolin assumes a darker color and develops a marked clay-like odor.

Tests for Identity—Mix 1 Gm. of Kaolin with 10 cc. of distilled water and 5 cc. of sulphuric acid in a porcelain dish; no effervescence occurs. Evaporate the mixture until the excess of water is removed, and further heat the residue until dense white fumes of sulphuric anhydride appear, then add 20 cc. of distilled water, boil for a few minutes and filter; there remains on the filter a gray residue of impure silica.

To one-half of the filtrate just obtained add ammonia water; a gelatinous precipitate of aluminum hydroxide is obtained which is insoluble in an excess of the reagent.

To the remaining half of the filtrate add sodium hydroxide T.S.; a gelatinous precipitate is produced which is completely or almost completely soluble in an excess of the reagent.

Impurities and Tests for Impurities—*Iron*—Rub 2 Gm. of Kaolin in a mortar with 10 cc. of distilled water; the mixture does not acquire more than a slight reddish tint on the addition of 0.5 Gm. of sodium salicylate.

Ignite Kaolin at a red heat; not less than 85 per cent of a non-volatile residue remains.

N. F. Preparation—Cataplasma Kaolini.

History—The clays were highly esteemed as remedial agents, given internally, since the time of Hippocrates. *Terra sigillata* or "the earth imprinted with a seal" was a form of clay collected, purified and authenticated under official supervision. Dr. Herman Schelenz, the eminent historian of pharmacy says that the use of the seal or imprint upon these clay tablets several thousand years ago was the origin of the trademark. Galen and other early authors wrote voluminously upon their properties. They were considered as *alexipharmics* or *alexiterics* which are terms used in ancient medicine and pharmacy to denote antidotes for certain purposes.

That there was some basis for this belief is shown by the modern theories of the adsorption properties of hydrated siliceous earths.

Uses—Kaolin forms the solid basis for the cataplasm of kaolin (Cataplasma Kaolini). It is occasionally employed as a protective and absorbent in diarrheal disorders. It has been used as a clarifying and decolorizing medium and as a filtering medium, but it must never be used as a filtering agent for liquids containing alkaloids, as it has been shown that it adsorbs alkaloids, separating them completely from the liquids filtered.

CHAPTER XLV

THE ALKALI METALS AND THEIR COMPOUNDS

The alkali metals are bodies having strongly marked physical and chemical properties. The hydroxides of these metals and of the ammonium group, comprise a group of powerful chemicals known as the alkalies. These alkalies combine with acids to form salts. They restore the color of reddened litmus paper, and change the colors of vegetable blues to green, and of vegetable yellows to brown. Their taste is never sour, but it is characteristic, and caustic if the alkali is in concentrated solution. The salts formed by their combinations with acids possess acid, alkaline, or neutral reactions according to the relative strength and proportion of the component parts.

The alkali metals which form compounds of pharmaceutical interest are potassium, sodium, and lithium. Chemically *Rubidium* and *Cæsium* are also classed with this group, but having no pharmaceutical interest they will be given no detailed consideration. The three important alkali metals, potassium, sodium, and lithium, are all univalent, and of a white color resembling that of silver, and are so prone to oxidation that they must be kept constantly immersed in a hydrocarbon, or in a liquid free from oxygen, such as naphtha or petroleum. They are so soft that they can be easily cut with a knife. They float upon water, and immediately react vigorously when brought in contact with it, causing decomposition of the water with the evolution of hydrogen and the production of the hydroxide of the metal. In the case of potassium the heat formed in this reaction is sufficient to ignite the escaping hydrogen.

The alkali metals are often called light metals, on account of their low specific gravity when compared with the others.

Their carbonates are all soluble in water, and each metal forms but one chloride.

Their oxides are strongly basic, quickly changing the color of red litmus to blue. The oxides are also very soluble in water, forming caustic and powerful alkali hydroxides, which cannot be decomposed by heat.

Their sulphates, phosphates, nitrates, sulphides, chlorides, bromides, iodides, and nearly all of their salts are soluble in water, are almost without exception colorless, or of an opaque white color, and many of them, if heated to redness, fuse without decomposition.

The processes for obtaining the metals are very similar, and formerly consisted in exposing their carbonates, intimately mixed with finely powdered charcoal, in suitable iron vessels, to an intense heat; carbon monoxide is liberated, and the vapors of the metals are condensed in flattened receivers. They are now largely made by electrolysis by subjecting the melted alkali hydroxide to a strong electric current.

Ammonium is a compound radical, NH_4, but its compounds have so many analogies with those of the alkali metals that it is classed with them.

Antidotes—See Part XV, Toxicology and Antidotes.

CHAPTER XLVI

THE POTASSIUM SALTS

K; 39.10.

Potassium is from "potash", the name formerly applied to crude potassium carbonate, especially that which was obtained by leaching wood ashes and fusing in iron pots. The salts of potassium are among the most important of any that are used in medicine. They are generally very soluble, and, with a few exceptions, are colorless or of an opaque white color. The sole source of the potassium salts was formerly wood ashes, but at present cheaper sources are employed. The wood ashes were lixiviated, the liquid containing the soluble salts evaporated to dryness, and the residue allowed to cool. This constituted the crude *potash* of commerce.

Potash is now made from the ashes from beet sugar residues, from *suint*, the residue obtained by evaporating the water used to scour the fleeces of sheep, and from impure potassium chloride and potassium sulphate obtained from the Stassfurt mines, which is now the principal source of the potassium compounds.

The impure salts of potash, as obtained from the various sources, may be simply purified or they may be passed through suitable chemical processes for the production of the several official salts. These detailed processes will be found under each title.

Tests for Potassium Salts

Potassium—Potassium compounds impart a violet color to a non-luminous flame, but the presence of small quantities of sodium masks the color. In neutral, concentrated or moderately concentrated solutions of potassium salts (depending upon the solubility and the potassium content of the salt), sodium bitartrate T.S. produces a white crystalline precipitate which is soluble in ammonia T.S., solutions of alkali hydroxides or carbonates. The formation of the precipitate, which is usually slow, is accelerated by stirring or rubbing the sides of the test tube with a glass rod. The addition of a little glacial acetic acid also promotes the formation of the precipitate.

POTASSA SULPHURATA. U. S. Sulphurated Potassa

[Pot. Sulphurat.—Liver of Sulphur]

Sulphurated Potassa is a mixture composed chiefly of potassium polysulphides and potassium thiosulphate and contains not less than 12.8 per cent of sulphur (S) in combination as sulphide.

Preparation—Sulphurated Potassa may be prepared by thoroughly mixing 1 part of sublimed sulphur with 2 parts of potassium carbonate and gradually heating the mixture in a covered iron crucible until the mass ceases to swell and is completely melted. It is then poured on a stone or glass slab and when cold, broken into pieces and preserved in tightly closed bottles. When the heat is properly regulated during its production, the reaction is approximately as follows:

$$\underset{\text{potassium carbonate}}{3K_2CO_3} + \underset{\text{sulphur}}{4S_2} = \underset{\text{potassium trisulphide}}{2K_2S_3} + \underset{\text{potassium thiosulphate}}{K_2S_2O_3} + \underset{\text{carbon dioxide}}{3CO_2}$$

The trisulphide is considered the most advantageous form.

As this product rapidly deteriorates through the absorption of moisture, oxygen, and carbon dioxide, it is desirable for the prescription pharmacist to secure it freshly prepared to produce satisfactory preparations.

Description and Physical Properties—Irregular pieces, liver-brown, when freshly made, changing to a greenish-yellow and finally to gray through absorption of moisture, oxygen, and carbon dioxide. It has an odor of hydrogen sulphide and a bitter, acrid, and alkaline taste.

Sulphurated Potassa is very soluble in water, usually leaving a slight residue. Alcohol dissolves only the sulphides.

Tests for Identity—An aqueous solution of Sulphurated Potassa (1 in 10) is light brown in color and is strongly alkaline to litmus paper. The addition of an excess of acetic acid to this solution causes a brisk evolution of hydrogen sulphide and a precipitation of sulphur. In the liquid thus treated, after filtration, an excess of sodium bitartrate T.S. produces within fifteen minutes an abundant, white, crystalline precipitate.

Assay—Dissolve 1 Gm. of crystallized copper sulphate, accurately weighed, in 15 cc. of distilled water and 1 Gm. of Sulphurated Potassa, accurately weighed, in 10 cc. of distilled water, in a flask. Add the copper sulphate solution to the Sulphurated Potassa solution in a stoppered bottle, stopper, shake for a few minutes, and filter. Acidulate the filtrate with acetic acid, refilter if necessary, and add an equal volume of hydrogen sulphide T.S. No black precipitate is produced.

This assay is explained on page 1482.

Preserve in well-closed containers.

Uses—It is extensively used in dermatologic practice, especially in what is commonly known as *Lotio Alba* or *White Lotion*. This preparation is not official, but the formula given below has been generally adopted. The reaction of the potassium trisulphide in preparing white lotion is as follows:

$$\underset{\text{zinc sulphate}}{ZnSO_4} + \underset{\text{potassium trisulphide}}{K_2S_3} = \underset{\text{zinc sulphide}}{ZnS} + \underset{\text{sulphur}}{S_2} + \underset{\text{potassium sulphate}}{K_2SO_4}$$

The mixture of insoluble zinc sulphide and sulphur gives it the creamy white appearance and the potassium sulphate goes into solution. Even weak acids cause the liberation of H_2S from sulphurated potassa.

White Lotion

(Lotio Alba)

	Metric	Alternative
Zinc Sulphate	**5 Gm.**	**75 gr.**
Sulphurated Potassa	**5 Gm.**	**75 gr.**
Distilled Water or Rose Water, sufficient, To make	**125 cc.**	**4 fl. oz.**

Dissolve the salts each separately in 60 cc. [2 fl. oz.] of distilled water or rose water, filter each solution, and slowly pour the zinc solution into the potassa solution. Finally add enough distilled water or rose water to make 125 cc. [4 fl. oz.].

POTASSII HYDROXIDUM. U. S. Potassium Hydroxide

[**Pot. Hydrox.**—Caustic Potash, Potassium Hydrate]

Potassium Hydroxide contains not less than 85 per cent of KOH (56.11).

Great caution is necessary in handling it, as it rapidly destroys organic tissues.

Preparation—It is prepared by adding milk of lime or calcium hydroxide to a hot solution of potassium carbonate, decanting the KOH solution from the precipitated calcium carbonate and concentrating it. The product of this method is called "*Potash by Lime*". The chemistry involved is explained by the equation:

$$\underset{\text{calcium hydroxide}}{Ca(OH)_2} + \underset{\text{potassium carbonate}}{K_2CO_3} = \underset{\text{potassium hydroxide}}{2KOH} + \underset{\text{calcium carbonate}}{CaCO_3}$$

It is also prepared on a large scale by electrolytic methods through the decomposition of a solution of potassium chloride, chlorine gas being the other product of the reaction. The electrolysis of this solution is carried out in the presence of a porous diaphragm which permits of the passage of the current but does not allow the liberated chlorine to react with the newly formed potassium hydroxide. The chemistry of this method is explained by two equations:

$$\underset{\text{potassium chloride}}{2KCl} = \underset{\text{potassium}}{K_2} + \underset{\text{chlorine}}{Cl_2}$$

$$\underset{\text{potassium}}{K_2} + \underset{\text{water}}{2H_2O} = \underset{\text{potassium hydroxide}}{KOH} + \underset{\text{hydrogen}}{H_2}$$

Potassium Hydroxide, called commercially caustic potash, is prepared in the form of sticks by evaporating a solution of potassium hydroxide rapidly in a silver or clean iron vessel until a fluid of oily consistence remains, a drop of which, when removed on a warm glass rod, solidifies on cooling. The hot caustic is poured into cylindrical molds, and while the sticks are still warm they are bottled quickly, to prevent deliquescence.

Pure caustic potassium hydroxide is sometimes prepared in the form of powder by stirring the fused mass rapidly with a silver spatula until a granulated powder is formed. This must be placed in warm dry bottles and quickly sealed hermetically.

The U. S. P. X has introduced an innovation in the recognition of a concentrated solution of KOH, ten times the strength of normal KOH and known as *Dekanormal Potassium Hydroxide* (see page 1558). It contains 561.1 Gm. of KOH in each 1000 cc. Its use is authorized as an alternative in the manufacture of soft soap, compound solution of cresol, etc. It is claimed that it does not deteriorate rapidly and is more reliable and more satisfactory to use than stick potash.

Potassa by alcohol and *potassa by barytes* are terms used to designate pure caustic potassium hydroxide made by purifying with alcohol and barium hydroxide, the alcohol dissolving only the potassium hydroxide, while the sulphate and carbonate are separated by treatment with baryta water, which is a solution of barium hydroxide, forming the insoluble barium salts of these respective acids.

Description and Physical Properties—Dry, white, or nearly white, fused masses, or sticks, hard and brittle, showing a crystalline fracture. When exposed to the air, it rapidly absorbs carbon dioxide and moisture, and deliquesces.

One Gm. of Potassium Hydroxide is soluble in 0.9 cc. of water, in about 3 cc. of alcohol, and in 2.5 cc. of glycerin, at 25° C. One Gm. is soluble in 0.6 cc. of boiling water. It is very soluble in boiling alcohol.

Tests for Identity—An aqueous solution of Potassium Hydroxide, even when greatly diluted, is strongly alkaline to litmus paper.

An aqueous solution of Potassium Hydroxide (1 in 25) responds to the reactions for potassium, page 596.

Tests for Purity—An aqueous solution of Potassium Hydroxide (1 in 20) is clear and colorless (*organic matter or insoluble impurities*).

An aqueous solution of Potassium Hydroxide (1 in 50) slightly acidulated with hydrochloric acid meets the requirements of the test for *heavy metals*, page 1519.

Assay—Place about 10 Gm. of Potassium Hydroxide in a glass-stoppered weighing bottle, weigh accurately, transfer to a 500 cc. graduated flask, and dissolve it in 250 cc. of recently boiled distilled water. Add 30 cc. of barium chloride T.S., fill the flask to the mark with recently boiled distilled water, and thoroughly agitate the liquid. Filter the liquid in the flask through a dry filter into a dry flask, rejecting the first 20 cc. and titrate 200 cc., of the clear filtrate with normal hydrochloric acid, using phenolphthalein T.S. as indicator. Each cc. of normal hydrochloric acid corresponds to 0.05611 Gm. of KOH.

This assay is explained on page 1459.

Preserve in air-tight containers. If bottles are used, they must be made of hard glass, and cork stoppers should be paraffined.

U. S. P. Preparations—Liquor Cresolis Compositus; Liquor Potassii Hydroxidi; Sapo Mollis.

Uses—Potassium hydroxide is used as a caustic, principally in veterinary practice; the end of the stick may be inserted into a section of rubber tubing, or wrapped several times with tin foil, to avoid cauterizing the finger of the operator. Allowance should be made for the moisture usually present in commercial caustic potash if the U. S. P. article is not available, as the latter product rarely contains less than 30 per cent of water.

Antidote—(see Part XV on Antidotes).

LIQUOR POTASSII HYDROXIDI. U. S. Solution of Potassium Hydroxide

[**Liq. Pot. Hydrox.**—Liquor Potassæ, Solution of Potassa]

Solution of Potassium Hydroxide contains, in each 100 cc., not less than 4.5 Gm. and not more than 5.5 Gm. of KOH.

	Metric	Alternative
Dekanormal Solution of Potassium Hydroxide	**90 cc.**	2 fl. oz. 422 min
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the dekanormal solution (page 1558), with sufficient distilled water to make 1000 cc. [2 pints].

Note—The 90 cc. [2 fl. oz. 422 min.] of dekanormal solution of potassium hydroxide may be replaced by 60 Gm. [2 oz. av.] of potassium hydroxide, containing 85 per cent of KOH.

If potassium hydroxide is used in this process, it should be of the full strength and quality directed by the Pharmacopœia (85 per cent). Potassium hydroxide of any other strength, however, may be used, if a proportionately larger or smaller quantity is taken, the proper amount for the above formula is ascertained by dividing 5100 by the percentage of absolute potassium hydroxide contained therein.

Description and Physical Properties—A clear, colorless, odorless liquid, strongly alkaline and caustic, readily absorbing carbon dioxide from the air.

Specific gravity: about 1.046 at 25° C.

Tests for Identity and Purity—It meets the requirements of the tests for identity and purity for an aqueous solution of potassium hydroxide under *Potassii Hydroxidum* when suitably concentrated.

Measure exactly 20 cc. of Solution of Potassium Hydroxide into a suitable flask and titrate directly with normal hydrochloric acid, using methyl orange T.S. as indicator: it shows in each 100 cc. not more than 5.5 Gm. of alkali, calculated as KOH (*carbonate*).

Assay—Measure exactly 50 cc. of Solution of Potassium Hydroxide into a 250 cc. measuring flask, add 20 cc. of barium chloride T.S., and fill the flask to the mark with recently boiled distilled water. Thoroughly agitate the liquid, filter it through a filter not previously moistened, reject the first 20 cc. and titrate 100 cc. of the filtrate, representing 20 cc. of the Solution, with normal hydrochloric acid, using phenolphthalein T.S. as indicator. Each cc. of normal hydrochloric acid corresponds to 0.05611 Gm. of KOH.

This assay is explained on page 1459.

Preserve in bottles made of hard glass, and provided with rubber stoppers or with glass stoppers coated with petrolatum.

N. F. Preparations—Elixir Catharticum Compositus; Mistura Copaibæ; Syrupus Eriodictyi Aromaticus.

Uses—Solution of potassium hydroxide is of little use as a medicine, although occasionally employed as a gastric antacid. If a large quantity should be swallowed accidentally, the proper antidotes would be mild acid liquids, like vinegar or lemon juice, accompanied with bland oils.

Average dose—15 minims (1 cc.) largely diluted with water.

POTASSII ACETAS. U. S. Potassium Acetate
[Pot. Acet.]

Potassium Acetate, when dried to constant weight at 150° C., contains not less than 99 per cent of $KC_2H_3O_2$ (98.13).

Preparation—This salt may be made by adding crystals of potassium bicarbonate to pure acetic acid until effervescence ceases, and after acidulating slightly with a few drops of the acid, cautiously evaporating to dryness in a porcelain evaporating dish by means of a sand bath. Great care is necessary to avoid contamination with iron, and it is not safe to use an enameled iron dish.

$$\underset{\text{potassium bicarbonate}}{KHCO_3} + \underset{\text{acetic acid}}{HC_2H_3O_2} = \underset{\text{potassium acetate}}{KC_2H_3O_2} + \underset{\text{carbon dioxide}}{CO_2} + \underset{\text{water}}{H_2O}$$

The manufacturer nearly always uses the carbonate in making potassium acetate, instead of the bicarbonate, because it is much cheaper. The product from the carbonate requires purification, however, because of the silica, sulphate, chlorides, etc., always present in the ordinary carbonate.

Description and Physical Properties—A white powder, or crystalline flakes, or masses of satin-like luster. It is odorless or has a faint, acetous odor, and a warming saline taste. It is very deliquescent on exposure to the air.

One Gm. of Potassium Acetate is soluble in 0.5 cc. of water and in 2.9 cc. of alcohol, at 25° C. One Gm. is soluble in about 0.2 cc. of boiling water.

Tests for Identity—When slightly heated, the salt fuses. On strong ignition it is decomposed with the evolution of inflammable empyreumatic vapors and leaves a black residue of potassium carbonate and carbon. This residue imparts to a non-luminous flame a violet color, is alkaline to litmus paper, and effervesces with acids.

An aqueous solution of Potassium Acetate (1 in 10) responds to the reactions for potassium, page 596, and for acetates, page 800.

Tests for Purity—An aqueous solution of the salt (1 in 20) is alkaline to litmus paper but does not affect phenolphthalein T.S.

An aqueous solution of the salt meets the requirements of the test for *heavy metals*, page 1519.

An aqueous solution of the salt meets the requirements of the test for *arsenic*, page 1512.

Assay—Dry the salt to constant weight at 150° C. and proceed as directed under the assay for alkali salts of organic acids, page 1514. Each cc. of half-normal sulphuric acid corresponds to 0.04907 Gm. of $KC_2H_3O_2$.

This assay is explained on page 1456.

Preserve in air-tight containers.

N. F. Preparations—Elixir Buchu et Potassii Acetatis; Elixir Buchu, Juniperi et Potassii Acetatis.

Uses—Potassium acetate is a diaphoretic and diuretic when given in doses of fifteen grains to one drachm (1 to 4 Gm.). In larger doses it acts as a cathartic.

POTASSII BICARBONAS. U. S. Potassium Bicarbonate
[Pot. Bicarb.]

Potassium Bicarbonate, when dried to constant weight over sulphuric acid, contains not less than 99 per cent of $KHCO_3$ (100.11).

Preparation—This salt is made by passing carbon dioxide through a solution of potassium carbonate until it is fully saturated, then filtering the liquid, and evaporating to the crystallizing point at a temperature below 71° C. (160° F.) to prevent decomposition. The crystals formed should be well washed and dried.

$$\underset{\text{potassium carbonate}}{K_2CO_3} + \underset{\text{carbon dioxide}}{CO_2} + \underset{\text{water}}{H_2O} = \underset{\text{potassium bicarbonate}}{2KHCO_3}$$

This salt was formerly made by suspending a dish containing a concentrated solution of potassium carbonate within the fermenting tuns of a

brewery; the carbon dioxide produced during fermentation was thus utilized. The crude salt obtained on evaporation was originally called *salæratus*. When purified by crystallization, it constituted the official bicarbonate.

Description and Physical Properties—Colorless, transparent, monoclinic prisms or a white, granular powder. It is odorless, and has a saline and slightly alkaline taste. It is stable in the air.

One Gm. of Potassium Bicarbonate is soluble in 2.8 cc. of water at 25° C. On Gm. is soluble also in 2 cc. of water at 50° C. It is almost insoluble in alcohol.

When heated above 50° C., an aqueous solution of the salt loses carbon dioxide and water and at boiling heat the salt is almost completely converted into normal carbonate.

The dry salt begins to lose carbon dioxide and water at 100° C., this loss increasing at a higher temperature until at a red heat there remains a residue of carbonate, which imparts a violet color to a non-luminous flame.

Tests for Identity—An aqueous solution of Potassium Bicarbonate (1 in 10) is slightly alkaline to litmus paper, but is neutral or very slightly alkaline to phenolphthalein T.S.

An aqueous solution of Potassium Bicarbonate (1 in 10) responds to the reactions for potassium, page 596, and for carbonates, page 589.

Tests for Purity—Add 2 cc. of tenth-normal hydrochloric acid and 2 drops of phenolphthalein T.S. to 1 Gm. of the salt, dissolved without agitation in 20 cc. of distilled water at a temperature not above 15° C.: a red tint does not appear immediately (*carbonate*).

An aqueous solution of the salt (1 in 50), mixed with a slight excess of hydrochloric acid, meets the requirements of the test for *heavy metals*, page 1519.

Assay—Dry about 4 Gm. of Potassium Bicarbonate to constant weight over sulphuric acid, weigh accurately, dissolve it in 25 cc. of distilled water, and titrate with normal sulphuric acid, methyl orange T.S. being used as indicator. Each cc. of normal sulphuric acid corresponds to 0.1001 Gm. of $KHCO_3$.

This assay is explained on page 1455.

Preserve in well-closed containers.

U. S. P. Preparations—Liquor Magnesii Citratis; Liquor Potassii Arsenitis; Liquor Potassii Citratis.

N. F. Preparation—Liquor Aromaticus Alkalinus.

Uses—This salt is largely used as affording the purest available source of the potassium salts. The large quantity of carbonic acid which it yields on decomposition renders it useful in beverages and laxative draughts, such as solution of magnesium citrate. It is occasionally used as a gastric antacid but less frequently than the sodium salt. The dose is from fifteen to thirty grains (1 to 2 Gm.).

POTASSII BITARTRAS. U. S. Potassium Bitartrate

[**Pot. Bitart.**—Cream of Tartar]

Potassium Bitartrate, when dried to constant weight at 100° C., contains not less than 99.5 per cent of $KHC_4H_4O_6$ (188.16).

Preparation—This well known salt is made by purifying *argol* or *tartar*, a substance deposited in wine casks during the fermentation of grape juice. (See Acid Saccharine Fruits, page 942.)

Description and Physical Properties—Colorless or slightly opaque, rhombic crystals, or a white, somewhat gritty powder. It is odorless, and has a pleasant, acidulous taste. It is stable in the air.

One Gm. of Potassium Bitartrate is soluble in 155 cc. of water and in 8820 cc. of alcohol, at 25° C. One Gm. is soluble in 16 cc. of boiling water.

Tests for Identity—A saturated aqueous solution of the salt is acid to litmus paper.

When Potassium Bitartrate is heated, it chars and emits inflammable vapors, having the odor of burning sugar. At a higher temperature and with free access of air, the carbon of the black residue is consumed, and a white, fused mass of potassium carbonate remains, which has an alkaline reaction, effervesces with acids, and colors a non-luminous flame violet.

A saturated aqueous solution of Potassium Bitartrate yields with sodium cobaltic nitrate T.S. a yellow precipitate.

Neutralize a saturated aqueous solution of the salt with sodium hydroxide T.S. in a test tube, add silver nitrate T.S., then just sufficient ammonia T.S. to dissolve the white precipitate, and boil the solution: silver is deposited on the inner surface of the test tube, forming a mirror.

Tests for Purity—When 0.5 Gm. of the salt is dissolved in 3 cc. of ammonia T.S., no insoluble residue remains (*starch, kaolin, calcium phosphate, or other insoluble matter*).

A 10 cc. portion of an aqueous solution of the salt (1 in 50), made with the aid of just sufficient hydrochloric acid, meets the requirements of the test for *heavy metals*, page 1519.

Ammonia is not evolved on heating the salt with a slight excess of sodium hydroxide T.S.

Mix 1 Gm. of Potassium Bitartrate in a platinum or silica crucible with 0.5 cc. of sulphuric acid and 1 cc. of nitric acid, and heat the mixture until fumes of sulphur trioxide begin to be liberated. Cool the resulting mass, treat it with 10 cc. of distilled water, and filter: the filtrate, made slightly alkaline with sodium hydroxide T.S. does not yield a gelatinous precipitate soluble in excess of the reagent (*alum*).

Heat 10 Gm. of Potassium Bitartrate with 15 cc. of distilled water, add hydrochloric acid until the salt is dissolved, then add 2 cc. of sulphurous acid, and boil the mixture until the odor of sulphur dioxide is barely perceptible. Cool the solution, mix it with 1 cc. of sodium cyanide T.S. and follow this immediately with stronger ammonia water until the precipitate first formed is redissolved and the solution has a slight odor of ammonia. When cold, transfer the solution to a 50 cc. graduated glass-stoppered cylinder, dilute it with sufficient distilled water to measure 50 cc., and add 3 drops of sodium sulphide T.S. After thorough mixing, the color produced in the solution, if any, when viewed downward against a white surface, is not greater than the color of a control solution prepared as follows: Dissolve 2 Gm. of reagent ammonium chloride in 20 cc. of distilled water, add 4 cc. of a solution containing 0.08 Gm. of lead nitrate in 1000 cc. of distilled water, and then 1 cc. of diluted hydrochloric acid. Treat this solution with the same quantities of hydrochloric acid, sulphurous acid, sodium cyanide T.S., and stronger ammonia water, as used above. Transfer it to another 50 cc. glass-stoppered cylinder, then dilute with sufficient distilled water to make 50 cc. and add 3 drops of sodium sulphide T.S. Before adding the sodium sulphide T.S. the liquid must possess a distinct odor of ammonia and the two cylinders used must be matched, be of practically colorless glass, and have the same internal diameter (*lead*).

Assay—Dry about 6 Gm. of Potassium Bitartrate to constant weight at 100° C., weigh accurately, dissolve in 100 cc. of boiling distilled water, and titrate with normal sodium hydroxide, using phenolphthalein T.S. as indicator. Each cc. of normal sodium hydroxide corresponds to 0.1882 Gm. of $KHC_4H_4O_6$.

This assay is explained on page 1453.

Preserve in well-closed containers.

The presence of lead, which may be introduced during the manufacturing process, through the use of sulphuric acid containing lead, is limited by the official tests to 10 parts in one million. This is the limit fixed by the U. S. Government for lead in food products and potassium bitartrate is classified as a food through its large use in baking powders.

U. S. P. Preparation—Pulvis Jalapæ Compositus.

N. F. Preparations—Liquor Cocci; Species Laxativæ; Tabellæ Sulphuris et Potassii Bitartratis.

Uses—This salt is the source of tartaric acid and some of the tartrates. It is diuretic and laxative, and is one of the ingredients in compound powder of jalap. The average dose is 30 grains (2 Gm.).

POTASSII BROMIDUM. U. S. Potassium Bromide

[Pot. Brom.]

Potassium Bromide, when dried to constant weight at 100° C., contains not less than 98.5 per cent of KBr (119.02).

Preparation—Two methods are used in making this salt. In the one which was formerly official, ferrous bromide, made by the action of bromine on iron, is treated with potassium carbonate; ferrous carbonate is precipitated, and potassium bromide remains in solution. The latter is filtered and evaporated, to form crystals.

$$\underset{\text{ferrous bromide}}{FeBr_2} + \underset{\text{potassium carbonate}}{K_2CO_3} = \underset{\text{ferrous carbonate}}{FeCO_3} + \underset{\text{potassium bromide}}{2KBr}$$

In the other method, bromine is added to solution of potassium hydroxide, producing potassium bromide and bromate, as illustrated by the following equation:

$$\underset{\text{potassium hydroxide}}{6KOH} + \underset{\text{bromine}}{3Br_2} = \underset{\text{potassium bromide}}{5KBr} + \underset{\text{potassium bromate}}{KBrO_3} + \underset{\text{water}}{3H_2O}$$

The solution is evaporated to dryness, mixed with charcoal, and heated to redness. The bromate is deoxidized and converted into bromide, carbon monoxide escaping.

$$2KBrO_3 + 3C_2 = 2KBr + 6CO$$

potassium bromate — carbon — potassium bromide — carbon monoxide

The presence of chlorides in potassium bromide, often to the extent of 3 per cent, is due to the difficulty of obtaining the bromine, which is used in making it, free from chlorine.

Formerly this salt was imported. It is now made in the United States upon a large scale, and is exported.

Description and Physical Properties—Colorless or white, odorless, cubical crystals or a granular powder. It is stable in the air.

One Gm. of Potassium Bromide is soluble in 1.5 cc. of water, in about 250 cc. of alcohol, and in 4.6 cc. of glycerin, at 25° C. One Gm. is soluble in 1 cc. of boiling water and in about 21 cc. of boiling alcohol.

An aqueous solution of Potassium Bromide (1 in 20) is neutral or faintly alkaline to litmus paper.

When the salt is heated upon platinum foil, it decrepitates; upon further heating (about 750° C.) it fuses without decomposition and at higher temperatures, it volatilizes, imparting a violet color to a non-luminous flame.

Tests for Identity—An aqueous solution of the salt (1 in 5) responds to the reactions for potassium, page 596, and for bromides, page 574.

Tests for Purity—Dissolve 1 Gm. of Potassium Bromide in 10 cc. of distilled water and add 0.1 cc. of tenth-normal sulphuric acid: no color is produced by the subsequent addition of a drop of phenolphthalein T.S. even after heating (*alkali*).

Add a few drops of ferric chloride T.S. to 10 cc. of an aqueous solution of the salt (1 in 20), shake the mixture, and add 1 cc. of chloroform: the latter does not acquire a violet tint (*iodide*).

Drop 1 cc. of diluted sulphuric acid upon about 1 Gm. of the powdered salt: no yellow color appears at once (*bromate*).

A 10 cc. portion of an aqueous solution of the salt (1 in 20), when acidulated with hydrochloric acid, is not immediately rendered turbid by the addition of 1 cc. of potassium sulphate T.S. (*barium*).

A solution of 2 Gm. of Potassium Bromide in 50 cc. of distilled water shows no more *sulphate* than corresponds to 0.5 cc. of fiftieth-normal sulphuric acid, page 1520.

An aqueous solution of the salt meets the requirements of the test for *heavy metals*, page 1519.

Assay—Dry the salt to constant weight at 100° C. and proceed as directed under the assay for bromides, page 574. Each cc. of tenth-normal silver nitrate corresponds to 0.01190 Gm. of KBr. Each Gm. of Potassium Bromide, previously dried, corresponds to not less than 82.8 cc. and not more than 84.8 cc. tenth-normal silver nitrate.

This assay is explained on page 1462.

Preserve in well-closed containers.

N. F. Preparations—Elixir Bromidorum Quinque; Elixir Bromidorum Trium; Elixir Potassii Bromidi; Mistura Chloralis et Potassii Bromidi Composita; Sal Potassii Bromidi Effervescens Compositum; Syrupus Bromidorum.

Uses—Potassium bromide is largely used as a nerve sedative and anodyne, in doses of fifteen grains (1 Gm.), frequently repeated.

SAL POTASSII BROMIDI EFFERVESCENS COMPOSITUM. N. F. Compound Effervescent Salt of Potassium Bromide

[**Sal Pot. Brom. Eff. Co.**—Pulvis Potassii Bromidi, Effervescens cum Caffeina, Effervescent Potassium Bromide with Caffeine]

	Metric	Alternative
Caffeine	8 Gm.	70 gr.
Potassium Bromide, in crystals	83 Gm.	1 oz. av. 289 gr.
Lithium Carbonate	42 Gm.	368 gr.
Sodium Bicarbonate, dried	587 Gm.	11 oz. av. 324 gr.
Tartaric Acid, dried	180 Gm.	3 oz. av. 263 gr.
Citric Acid, in unefflorescd crystals	250 Gm.	5 oz. av.
To make	1000 Gm.	20 oz. av.

Prepare an effervescent salt as directed in the General Process (see page 475).

Average dose—90 grains (6 Gm.).

Uses—This preparation is intended for the treatment of headache.

POTASSII CARBONAS. U. S. Potassium Carbonate

[Pot. Carb.—Salt of Tartar]

Potassium Carbonate, when dried to constant weight at 180° C., contains not less than 99 per cent of K_2CO_3 (138.21). It contains not more than 15 per cent of water.

Preparation—This salt, known commercially as *Salt of Tartar* (*Sal Tartar*), is made by dissolving pearlash, or impure potassium carbonate, in an equal weight of cold water, allowing the mixture to stand a day or two, filtering the solution, pouring it into a bright iron dish, and evaporating over a gentle fire until it thickens, then removing it from the fire and stirring constantly with an iron spatula, so as to form a granular salt.

A purer carbonate is produced by decomposing potassium bicarbonate by heating to redness, thus driving off water of crystallization and a portion of the carbon dioxide.

$$\underset{\text{potassium bicarbonate}}{2KHCO_3} = \underset{\text{potassium carbonate}}{K_2CO_3} + \underset{\text{carbon dioxide}}{CO_2} + \underset{\text{water}}{H_2O}$$

Perhaps the largest proportion of potassium carbonate at the present time is, however, obtained from native potassium chloride and sulphate from the Stassfurt mines in Germany. A process similar to that of Leblanc for producing sodium carbonate (see page 624) is used and a very pure potassium carbonate obtained.

Description and Physical Properties—A white, granular powder, odorless, and having a strongly alkaline taste. It is very deliquescent.

One Gm. of Potassium Carbonate is soluble in 0.9 cc. of water at 25° C. One Gm. is soluble in 0.7 cc. of boiling water. It is insoluble in alcohol.

When heated to 180° C., the salt loses all the water which it may have retained or absorbed. At a bright red heat it melts, and at a white heat it is volatilized.

Tests for Identity—An aqueous solution of Potassium Carbonate (1 in 20) is strongly alkaline to litmus paper and to phenolphthalein T.S. and effervesces with acids.

An aqueous solution of the salt (1 in 10) responds to the reactions for potassium, page 596.

Tests for Purity—No residue is left on dissolving 1 Gm. of Potassium Carbonate in 20 cc. of distilled water (*insoluble impurities*).

An aqueous solution of Potassium Carbonate (1 in 50), mixed with a slight excess of hydrochloric acid, meets the requirements of the test for *heavy metals*, page 1519.

Dry about 3 Gm. of Potassium Carbonate, accurately weighed, to constant weight, at 180° C.: the loss does not exceed 15 per cent (*water*).

Assay—Dry Potassium Carbonate to constant weight at 180° C., weigh accurately about 3 Gm. of the dried salt in a stoppered weighing bottle, dissolve the salt in 25 cc. of distilled water, and titrate with normal sulphuric acid, methyl orange T.S. being used as indicator. Each cc. of normal sulphuric acid corresponds to 0.06911 Gm. of K_2CO_3.

This assay is explained on page 1455.

Preserve in air-tight containers.

U. S. P. Preparations—Pilulæ Ferri Carbonatis; Syrupus Rhei; Syrupus Rhei Aromaticus.

N. F. Preparations—Liquor Cocci; Mistura Carminativa; Mistura Rhei Alkalina; Sal Vichyanum Factitium; Syrupus Asari Compositus; Tinctura Guaiaci Composita; Tinctura Rhei Aquosa; Unguentum Sulphuris Alkalinum.

Uses—Potassium carbonate is an antacid, but it is not suitable for internal use. In large doses it is an irritant caustic, the proper antidotes to administer being diluted vinegar, lemon juice, or weak acids.

POTASSII CHLORAS. U. S. Potassium Chlorate

[Pot. Chloras.]

Potassium Chlorate contains not less than 99 per cent of $KClO_3$ (122.56). *Great caution should be observed in handling it,* as dangerous explosions are liable to occur when it is heated or subjected to concussion or to trituration with organic substances such as cork, tannic acid, dust, sucrose, etc., or with

charcoal, sulphur, sulphides, hypophosphites, or other easily oxidizable substances.

Preparation—Chlorate of potash, as it is always termed commercially, was formerly made by passing chlorine gas into a solution of potassium hydroxide.

$$\underset{\text{potassium hydroxide}}{6KOH} + \underset{\text{chlorine}}{3Cl_2} = \underset{\text{potassium chloride}}{5KCl} + \underset{\text{potassium chlorate}}{KClO_3} + \underset{\text{water}}{3H_2O}$$

This is a very wasteful process, as only one-fifth of the potassium hydroxide is obtained as chlorate, the rest passing into potassium chloride. It is now more economically prepared by acting upon milk of lime, $Ca(OH)_2$ suspension, at high temperatures with an excess of chlorine. Any hypochlorite that is formed is promptly changed into chlorate, the reaction being expressed as follows:

$$\underset{\text{calcium hydroxide}}{6Ca(OH)_2} + \underset{\text{chlorine}}{6Cl_2} = \underset{\text{calcium chloride}}{5CaCl_2} + \underset{\text{calcium chlorate}}{Ca(ClO_3)_2} + \underset{\text{water}}{6H_2O}$$

When solution of calcium chlorate is heated in contact with potassium chloride, double decomposition takes place, as shown by the following equation:

$$\underset{\text{calcium chlorate}}{Ca(ClO_3)_2} + \underset{\text{potassium chloride}}{2KCl} = \underset{\text{potassium chlorate}}{2KClO_3} + \underset{\text{calcium chloride}}{CaCl_2}$$

The potassium chlorate is easily separated from the calcium chloride, because it is much less soluble than the latter.

This salt is now made by electrolysis by placing opposite to each other in a solution of potassium chloride, anodes and cathodes, without being separated by a porous diaphragm. The electric current causes the formation of potassium hypochlorite in the solution, which by boiling is converted into potassium chlorate and potassium chloride. The continued action of the electric current decomposes the newly formed chloride, changing it again, in part, into chlorate. By repeatedly passing through this cycle one can easily see how nearly all of the potassium chloride will ultimately become changed into potassium chlorate. The reactions involved may be expressed as follows:

$$\underset{\text{potassium chloride}}{2KCl} = \underset{\text{potassium}}{K_2} + \underset{\text{chlorine}}{Cl_2}$$

$$\underset{\text{potassium}}{K_2} + \underset{\text{water}}{2H_2O} = \underset{\text{potassium hydroxide}}{2KOH} + \underset{\text{hydrogen}}{H_2}$$

$$\underset{\text{potassium hydroxide}}{6KOH} + \underset{\text{chlorine}}{3Cl_2} = \underset{\text{potassium chloride}}{5KCl} + \underset{\text{potassium chlorate}}{KClO_3} + \underset{\text{water}}{3H_2O}$$

Description and Physical Properties—Colorless, odorless, lustrous, monoclinic prisms or plates, or a white, granular powder. It is stable in the air.

One Gm. of Potassium Chlorate is soluble in 16.5 cc. of water at 25° C. One Gm. is soluble in 1.8 cc. of boiling water. It is almost insoluble in alcohol but is soluble in glycerin.

Tests for Identity—When heated to about 360° C., the salt gives off oxygen and finally leaves a residue of potassium chloride which is readily soluble in water and which responds to the reactions for potassium, page 596, and for chlorides, page 567.

Add about 0.2 Gm. of Potassium Chlorate to 1. cc. of hydrochloric acid: the liquid assumes a deep greenish-yellow color, and chlorine and oxides of chlorine are evolved.

Tests for Purity—An aqueous solution of the salt (1 in 20) is neutral to litmus paper.

An aqueous solution of the salt meets the requirements of the test for *heavy metals*, page 1519.

Assay—Dissolve about 0.1 Gm. of Potassium Chlorate, accurately weighed, in 10 cc. of distilled water. Transfer to a 250 cc. flask, and add 50 cc. of acid ferrous sulphate T.S. to the solution. Prepare a valve stopper by taking a piece of rubber tubing of convenient diameter and

about 5 cm. in length, placing a piece of glass rod in one end and slipping the other end over a glass tube which passes through a perforated stopper of a convenient size to fit the flask used. Cut a longitudinal slit about 15 mm. long in one side of the rubber tube about half way up. Insert this stopper in the flask and boil the mixture for ten minutes. Cool the mixture, add 10 cc. of manganous sulphate T.S. and titrate the excess of ferrous sulphate with tenth-normal potassium permanganate. Conduct a blank experiment with another portion of 50 cc. of acid ferrous sulphate T.S. and subtract the result of the former titration from that of the latter. Each cc. of tenth-normal potassium permanganate corresponds to 0.002043 Gm. of $KClO_3$.

This assay is explained on page 1475.

Preserve in well-closed containers.

N. F. Preparations—Gargarisma Guaiaci Compositum; Liquor Chlori Compositus.

Uses—Potassium chlorate is used chemically as a source for obtaining oxygen. Medicinally it is employed as a local stimulant in inflammation of the mouth and the throat, etc., in doses of from four to twenty grains (0.25 to 1.3 Gm.).

POTASSII CITRAS. U. S. Potassium Citrate

[Pot. Cit.]

Potassium Citrate, when dried to constant weight over sulphuric acid, contains not less than 99 per cent of $K_3C_6H_5O_7.H_2O$ (324.39).

Preparation—This salt is made by adding potassium bicarbonate to a solution of citric acid until effervescence ceases, filtering the solution, evaporating to dryness, and granulating.

$$\underset{\text{potassium bicarbonate}}{3KHCO_3} + \underset{\text{citric acid}}{H_3C_6H_5O_7} = \underset{\text{potassium citrate}}{K_3C_6H_5O_7} + \underset{\text{water}}{3H_2O} + \underset{\text{carbon dioxide}}{3CO_2}$$

Manufacturers generally use the carbonate as the source of the potassium, as it is much cheaper than the bicarbonate. When carelessly made from the carbonate, silica may be present, which is to be suspected if the potassium citrate is not entirely soluble in water.

Description and Physical Properties—Transparent, prismatic crystals, or a white, granular powder. It is odorless, has a cooling, saline taste, and is deliquescent when exposed to moist air.

One Gm. of Potassium Citrate is soluble in 0.6 cc. of water at 25° C. It is almost insoluble in alcohol and is freely soluble in glycerin.

Tests for Identity—When heated above 100° C., the salt begins to lose water and at about 200° C. the water of crystallization is completely volatilized. At a higher temperature the salt begins to decompose, turns brown, and upon further heating carbonizes and emits inflammable gases which have a very pungent, acrid odor. After heating to redness, there remains a residue of carbon and potassium carbonate which has an alkaline reaction and effervesces with acids.

An aqueous solution of Potassium Citrate (1 in 10) responds to the reactions for potassium, page 596, and for citrates, page 944.

Tests for Purity—An aqueous solution of Potassium Citrate (1 in 20) is alkaline to litmus paper, but a 10 cc. portion of the solution is not reddened by 1 drop of phenolphthalein T.S.

A solution of 1 Gm. of Potassium Citrate in 1 cc. of distilled water does not deposit a crystalline precipitate on the addition of 1 cc. of acetic acid (*tartrate*).

An aqueous solution of the salt meets the requirements of the test for *heavy metals*, page 1519.

An aqueous solution of the salt meets the requirements of the test for *arsenic*, page 1512.

Assay—Dry the salt to constant weight over sulphuric acid and proceed as directed under the assay for alkali salts of organic acids, page 1514. Each cc. of half-normal sulphuric acid corresponds to 0.05407 Gm. of $K_3C_6H_5O_7.H_2O$.

This assay is explained on page 1456.

Preserve in well-closed containers.

U. S. P. Preparation—Potassii Citras Effervescens.

N. F. Preparations—Liquor Hypophosphitum Compositus; Syrupus Calcii Lactophosphatis et Ferri.

Uses—Potassium citrate is principally employed in medicine as a saline expectorant, diuretic, and diaphoretic. It is also of service as a systemic alkalizer, and in irritable bladder due to hyperacidity of the urine in doses of fifteen grains (1 Gm.). It is found in the official solution of potassium citrate.

POTASSII CITRAS EFFERVESCENS. U. S. Effervescent Potassium Citrate [Pot. Cit. Eff.]

	Metric	Alternative
Potassium Citrate	200 Gm.	4 oz. av.
Sodium Bicarbonate, dried and powdered	477 Gm.	9 oz. av. 236 gr.
Tartaric Acid, dried and powdered	252 Gm.	5 oz. av. 18 gr.
Citric Acid, uneffloresced crystals	162 Gm.	3 oz. av. 105 gr.
To make	1000 Gm.	20 oz. av.

Dry the potassium citrate on a water bath until it ceases to lose weight, and powder the dried salt. Mix intimately with the powdered citric acid and tartaric acid, and thoroughly incorporate the sodium bicarbonate. Place the mixed powders on a plate of glass or in a suitable dish in an oven heated between 93° and 104° C. Manipulate the mixture carefully with a wooden spatula until it becomes moist, rub it through a No. 6 tinned-iron sieve, and dry the granules at a temperature not exceeding 54° C. Immediately transfer the salt to suitable containers and seal them tightly. Care must be taken to prevent the product from coming in contact with air containing moisture.

Uses—This is diaphoretic and mildly laxative, containing sodium tartrate as well as potassium citrate; it is given in cold water in a dose of sixty grains (4 Gm.).

LIQUOR POTASSII CITRATIS. U. S. Solution of Potassium Citrate [Liq. Pot. Cit.]

Solution of Potassium Citrate contains, in each 100 cc. not less than 8 Gm. of $K_3C_6H_5O_7$ (306.37), with small amounts of citric and carbonic acids.

Caution—This preparation must not be dispensed unless it has been recently prepared.

	Metric	Alternative
Potassium Bicarbonate	8 Gm.	292 gr.
Citric Acid	6 Gm.	219 gr.
Distilled Water, a sufficient quantity, To make	100 cc.	8 fl. oz.

Dissolve the potassium bicarbonate and the citric acid, each, in 40 cc. [3 fl. oz.] of distilled water. Filter the solutions separately, and wash the filters with enough distilled water to obtain in each case 50 cc. [4 fl. oz.]. Mix the two solutions, and when effervescence has ceased, transfer to a bottle and stopper tightly.

Description and Physical Properties—A clear, colorless, odorless liquid, slightly acid to litmus paper.

It meets the requirements of the tests for identity and purity of an aqueous solution of potassium citrate under *Potassii Citras* when suitably concentrated.

Assay—Measure exactly 15 cc. of Solution of Potassium Citrate, evaporate to dryness, and proceed as directed under the Assay for alkali salts of organic acids, page 1514. Each cc. of half-normal sulphuric acid corresponds to 0.05106 Gm. of $K_3C_6H_5O_7$.

This assay is explained on page 1455.

For this preparation it will be found convenient in dispensing practice to keep the separate solutions of citric acid and potassium bicarbonate on hand ready to be mixed when the solution of potassium citrate is needed. The solutions keep moderately well.

This preparation is sometimes called *Neutral Mixture*, but in some localities Neutral Mixture is always understood to mean a more agreeable preparation than this solution, which is made by nearly saturating lemon juice with potassium bicarbonate. It was official in the U. S. P. 1880 under the name of *Mistura Potassii Citratis.*

Uses—Solution of potassium citrate is diuretic and diaphoretic, in doses of four fluidrachms (15 cc.).

POTASSII ET SODII TARTRAS. U. S. Potassium and Sodium Tartrate

[Pot. et Sod. Tart.—Rochelle Salt]

Potassium and Sodium Tartrate contains not less than 73.72 per cent and not more than 77.39 per cent of $KNaC_4H_4O_6$ (210.15), corresponding to not less than 99 per cent of the crystallized salt [$KNaC_4H_4O_6.4H_2O = 282.22$].

Preparation—This salt is made by adding potassium bitartrate to a solution of sodium carbonate; the proportions are shown by a former official process, which is as follows:

Take of sodium carbonate, 12 troyounces; potassium bitartrate, in fine powder, 16 troyounces; boiling water, 5 pints. Dissolve the sodium carbonate in the water, and gradually add the potassium bitartrate. Filter the solution, and evaporate until a pellicle begins to form; then set it aside to crystallize. Pour off the mother water, and dry the crystals on bibulous paper. Lastly, evaporate the mother water, that it may furnish more crystals.

It is advantageous to filter the solution after one-half of its volume has been evaporated and it has cooled and settled, in order to free it from the calcium tartrate which separates, otherwise the crystals will be contaminated.

The following equation shows the reaction:

$$\underset{\text{potassium bitartrate}}{2KHC_4H_4O_6} + \underset{\text{sodium carbonate}}{Na_2CO_3} = \underset{\text{potassium and sodium tartrate}}{2KNaC_4H_4O_6} + \underset{\text{water}}{H_2O} + \underset{\text{carbon dioxide}}{CO_2}$$

The chemical constitution of the tartrates will be fully explained under *Acidum Tartaricum*, but note that tartaric acid is a dibasic acid and is capable of forming double salts of which this is an example.

Description and Physical Properties—Colorless, transparent, rhombic prisms, or a white powder. It is odorless, and has a cooling, saline taste. The crystals effloresce slightly in dry air.

One Gm. of Potassium and Sodium Tartrate is soluble in 0.9 cc. of water at 25° C. It is practically insoluble in alcohol.

Tests for Identity—When heated to about 74° C. the salt fuses to a colorless liquid, which at a higher temperature froths, becomes brown, and is gradually carbonized, emitting inflammable vapors which have the odor of burning sugar. Finally a black residue is left, consisting of a mixture of potassium and sodium carbonates with carbon. To a non-luminous flame this residue imparts an intensely yellow color.

An aqueous solution of the salt (1 in 20) yields a white, crystalline precipitate with an equal volume of acetic acid within fifteen minutes.

An aqueous solution of the salt (1 in 10) responds to the reactions for tartrates, page 942.

Tests for Purity—An aqueous solution of Potassium and Sodium Tartrate (1 in 20) is alkaline to litmus paper, but a 10 cc. portion of the solution is not reddened by a drop of phenolphthalein T.S.

An aqueous solution of Potassium and Sodium Tartrate meets the requirements of the test for *heavy metals*, page 1519.

A 5 cc. portion of an aqueous solution of the salt (1 in 10) heated with sodium hydroxide T.S. does not evolve ammonia.

Dissolve 10 Gm. of Potassium and Sodium Tartrate in 20 cc. of distilled water, add 2 cc. of sulphurous acid, and boil the mixture until the odor of sulphur dioxide is barely perceptible. Cool the solution, mix it with 1 cc. of sodium cyanide T.S. and follow this immediately with stronger ammonia T.S. until the solution has a slight odor of ammonia. When cold, transfer the solution to a 50 cc. graduated glass-stoppered cylinder, dilute it with sufficient distilled water to measure 50 cc. and add 3 drops of sodium sulphide T.S. After thoroughly mixing, the color produced in the solution, if any, when viewed downward against a white surface, is not greater than the color of a control solution prepared as follows: Dissolve 2 Gm. of reagent ammonium chloride in 20 cc. of distilled water, add 4 cc. of a solution containing 0.08 Gm. of lead nitrate in 1000 cc. of distilled water, and then 1 cc. of diluted hydrochloric acid. Treat this solution with the same quantities of sulphurous acid, sodium cyanide T.S. and stronger ammonia T.S. as used above, transfer it to another 50 cc. glass-stoppered cylinder, then dilute it with sufficient distilled water to make 50 cc., and add 3 drops of sodium sulphide T.S. Before adding the sodium sulphide T.S. the liquid must possess a distinct odor of ammonia, and the two cylinders used must be matched and be of practically colorless glass, and have the same internal diameter (*lead*).

Assay—Proceed as directed under the assay for alkali salts of organic acids, page 1514. Each cc. of half-normal sulphuric acid corresponds to 0.05254 Gm. of $KNaC_4H_4O_6$.

This assay is explained on page 1456.

Preserve in well-closed containers.

U. S. P. Preparation—Pulvis Effervescens Compositus.

History—Rochelle Salt was named for the city in which it was first discovered and manufactured by Peter Seignette, an apothecary of the latter half of the 17th century. The secret of its composition was kept undivulged by him and his descendants for nearly a century and it was sold as a proprietary remedy or nostrum. He put it up in individual envelopes and called it *Sal Polychrestum,* or the Salt of Many Virtues. It has also been called Seignette's Salt in honor of its discoverer. The secret of its composition was divulged in 1731 in a paper by Boulduc, a noted Parisian pharmacist, which was deemed of sufficient importance to be published by the French Academy of Sciences and the Transactions of the Philosophical Society of Great Britain. The name Sal Polychrestum had previously been applied to potassium sulphate by Christopher Glaser, apothecary to Louis XIV of France. The first official name of Rochelle salt in the London Pharmacopœia of 1788 was *Natron Tartarizatum,* which in the edition of 1809 was changed to *Soda Tartarizata.*

Uses—Rochelle Salt, as it is habitually termed, is an efficient and not disagreeable saline cathartic. It is given in the dose of one-quarter ounce to an ounce (8 to 31 Gm.). It is an important ingredient in the well-known Seidlitz powders.

POTASSII IODIDUM. U. S. Potassium Iodide
[Pot. Iod.]

Potassium Iodide, when dried to constant weight at 100° C., contains not less than 99 per cent of KI (166.02).

Preparation—An aqueous solution of potassium hydroxide is treated with iodine in slight excess. The result is the formation of two salts, potassium iodide and potassium iodate.

$$\underset{\text{potassium hydroxide}}{6KOH} + \underset{\text{iodine}}{3I_2} = \underset{\text{potassium iodide}}{5KI} + \underset{\text{potassium iodate}}{KIO_3} + \underset{\text{water}}{3H_2O}$$

By evaporating the solution to dryness, the mixed salts are obtained; and if the dry mass is exposed to a red heat, the iodate will be converted into potassium iodide, thus removing this impurity.

The mixed salts, toward the close of their evaporation to dryness, should be mixed with powdered charcoal, which facilitates the reduction of the iodate. This is accomplished at a dull red heat, the potassium iodide being dissolved out of the mass, and the solution set aside to crystallize.

$$\underset{\text{potassium iodate}}{KIO_3} + \underset{\text{carbon}}{3C} = \underset{\text{potassium iodide}}{KI} + \underset{\text{carbon monoxide}}{3CO}$$

It may also be reduced with hydrogen dioxide as follows:

$$\underset{\text{potassium iodate}}{KIO_3} + \underset{\text{hydrogen dioxide}}{3H_2O_2} = \underset{\text{potassium iodide}}{KI} + \underset{\text{water}}{3H_2O} + \underset{\text{oxygen}}{3O_2}$$

It is also prepared by forming ferroso-ferric iodide, through the reaction between iron wire and iodine, adding a solution of pure potassium carbonate until the solution is faintly alkaline, boiling for a few moments, filtering, concentrating the filtrate, and setting it aside to crystallize.

The reactions are expressed separately as follows:

$$\underset{\text{iron}}{3Fe} + \underset{\text{iodine}}{4I_2} = \underset{\text{ferroso-ferric iodide}}{Fe_3I_8}$$

This solution is then decomposed by potassium carbonate which precipitates the iron and leaves potassium iodide in solution, thus:

$$Fe_3I_8 + 4K_2CO_3 = 8KI + Fe_3O_4 + 4CO_2$$

ferroso-ferric iodide — potassium carbonate — potassium iodide — ferroso-ferric oxide — carbon dioxide

Potassium iodide is always crystallized from an alkaline solution if the manufacturer expects to avoid loss through the discoloration of the product from the separation of free iodine. The official test permits the presence of a small excess of alkali.

Description and Physical Properties—Cubical crystals, either transparent and colorless or more or less opaque and white, or a white, granular powder. It is stable in dry air, but slightly deliquescent in moist air.

One Gm. of Potassium Iodide is soluble in 0.7 cc. of water, in 22 cc. of alcohol, and in 2 cc. of glycerin, at 25° C. One Gm. is soluble in 0.5 cc. of boiling water and in 8 cc. of boiling alcohol.

An aqueous solution of the salt (1 in 20) is neutral or slightly alkaline to litmus paper.

When heated, Potassium Iodide decrepitates. At a low red heat (about 684° C.) it fuses, and at a bright red heat (about 720° C.) it is volatilized without decomposition.

Tests for Identity—An aqueous solution of Potassium Iodide responds to the reactions for potassium, page 596, and for iodides, page 575.

Tests for Purity—Dissolve 1 Gm. of the salt in 10 cc. of distilled water and add 0.1 cc. of tenth-normal sulphuric acid: no color is produced by the subsequent addition of a drop of phenolphthalein T.S. (*alkali*).

Dissolve 0.5 Gm. of the salt in 10 cc. of distilled water, which has been previously boiled and cooled, and add two drops of diluted sulphuric acid: no distinct yellow color appears within half a minute (*iodate*), and no turbidity occurs (*thiosulphate*).

Add 5 cc. of sodium hydroxide T.S. and about 0.2 Gm. of aluminum wire to a solution of 1 Gm. of Potassium Iodide in 5 cc. of distilled water contained in a test tube of about 40 cc. capacity. Insert a pledget of purified cotton in the upper portion of the test tube and place a piece of moistened red litmus paper over its mouth: on heating the tube and contents upon a water bath for fifteen minutes, no blue coloration of the paper is discernible (*nitrate or nitrite*).

Acidulate slightly 10 cc. of an aqueous solution of the salt (1 in 20) with hydrochloric acid: it is not rendered turbid by the addition of 1 cc. of potassium sulphate T.S. (*barium*).

A 2 Gm. portion of the salt shows no more *sulphate* than corresponds to 0.5 cc. of fiftieth-normal sulphuric acid, page 1567.

Heat gently 5 cc. of an aqueous solution of the salt (1 in 10) with one drop of ferrous sulphate T.S. and 0.5 cc. of sodium hydroxide T.S.: no blue color appears after acidulating the mixture with hydrochloric acid (*cyanide*).

An aqueous solution of the salt meets the requirements of the test for *heavy metals*, page 1519.

Assay—Dry the salt to constant weight at 100° C. and proceed as directed under the assay for iodides, page 1515. Each cc. of tenth-normal silver nitrate corresponds to 0.01660 Gm. of KI. Each Gm. of Potassium Iodide, previously dried, corresponds to not less than 59.6 cc. and not more than 61.0 cc. of tenth-normal silver nitrate.

This assay is explained on page 1462.

Preserve in well-closed containers.

U. S. P. Preparations—Acidum Hydriodicum Dilutum; Liquor Iodi Compositus; Tinctura Iodi; Unguentum Iodi.

N. F. Preparations—Ampullæ Iodi; Elixir Corydalis Compositum; Elixir Sodii Salicylatis Compositum; Liquor Iodi et Zinci Phenolsulphonatis; Liquor Potassii Iodidi; Tinctura Iodidorum; Tinctura Iodi Fortior; Unguentum Potassii Iodidi.

Uses—This is a valuable alterative, useful in a host of chronic diseases including goiter, syphilis, rheumatism, arteriosclerosis, etc. It is used as an alterative in from 5 to 8 grain doses (0.32 to 0.5 Gm.); as an antisyphilitic, four drachms (16 Gm.), largely diluted, may be given.

LIQUOR POTASSII IODIDI. N.F. Solution of Potassium Iodide

[**Liq. Pot. Iod.**—Saturated Solution of Potassium Iodide]

An aqueous solution containing not less than 97 Gm. and not more than 103 Gm. of KI (166.02) in each 100 cc.

	Metric	Alternative
Potassium Iodide	**100.00 Gm.**	1 oz. av. 19 gr.
Sodium Thiosulphate	**0.05 Gm.**	¼ gr.
Distilled Water, a sufficient quantity,		
To make	**100 cc.**	1 fl. oz.

Dissolve the salts in 68 cc. [326 min.] of distilled water, warm the solution to 25° C. and add sufficient distilled water to make the product measure 100 cc. [1 fl. oz.]. Filter if necessary.

Solution of Potassium Iodide is a clear, colorless and odorless solution having a strongly saline taste. It is neutral or slightly alkaline to litmus paper.

Specific gravity: about 1.70 at 25° C.

The Solution when diluted in the proportion of one volume to nineteen volumes of distilled water responds to the general tests under Potassii Iodidum U. S. P. X.

Assay—Dilute 1 cc. of Solution of Potassium Iodide accurately measured, with 25 cc. of distilled water, add 65 cc. of tenth-normal silver nitrate and shake well. Now add 2 cc. of ferric ammonium sulphate T.S. and 2 cc. of nitric acid and titrate with tenth-normal potassium thiocyanate. Each cc. of tenth-normal silver nitrate consumed corresponds to 0.0166 Gm. of KI. Each cc. of Solution of Potassium Iodide corresponds to not less than 57.8 cc. and not more than 62.7 cc. of tenth-normal silver nitrate.

This assay is explained on page 1463.

Preserve the solution in amber-colored bottles.

Average dose—Metric, 0.3 cc.—Apothecaries, 5 minims.

POTASSII NITRAS. U.S. Potassium Nitrate

[**Pot. Nit.**—SALTPETRE]

Potassium Nitrate, when dried to constant weight at 100° C., contains not less than 99 per cent of KNO_3 (101.11).

Preparation—*Nitre* or *Saltpetre* is sometimes a natural product. It was formerly produced artificially in what are known as nitre beds, which are made up of earth and wood ashes, with animal and vegetable refuse; these are protected from rain by sheds. In time the ammonia produced by the decomposition of the organic matter in the mixture is oxidized, nitric acid is formed, and this unites with the potassium hydroxide in the wood ashes, and gradually forms potassium nitrate. The salt is then separated by lixiviation, filtration, evaporation, and crystallization.

Much of the potassium nitrate now on the market is prepared by the "conversion" process. Concentrated solutions of potassium chloride and sodium nitrate are brought together and the mixture evaporated with the aid of heat. Sodium chloride is peculiar in that its solubility is only very slightly changed at high temperatures. On the other hand the solubility of potassium nitrate, under the above conditions, increases to a very high degree. This means that much of the sodium chloride can be removed during the evaporation and the potassium nitrate can be obtained by its separation from the cooled mother liquor. It can then be purified by recrystallization. The reaction involved is expressed as follows:

$$\underset{\text{sodium nitrate}}{NaNO_3} + \underset{\text{potassium chloride}}{KCl} = \underset{\text{potassium nitrate}}{KNO_3} + \underset{\text{sodium chloride}}{NaCl}$$

Description and Physical Properties—Colorless, transparent, six-sided rhombic prisms, or a white, crystalline powder. It is odorless, has a saline taste, and produces a cooling sensation in the mouth. It is slightly hygroscopic in moist air.

One Gm. of Potassium Nitrate is soluble in 2.8 cc. of water, and in 620 cc. of alcohol, at 25° C.

One Gm. is soluble in 0.5 cc. of boiling water. It is soluble in glycerin.

When strongly heated, the salt melts without decomposition. At higher temperatures it evolves oxygen and is partly reduced to nitrate. When Potassium Nitrate is heated with charcoal, the mixture deflagrates.

Tests for Identity—An aqueous solution of the salt (1 in 10) responds to the reactions for potassium, page 596, and for nitrates, page 551.

Tests for Purity—An aqueous solution of Potassium Nitrate (1 in 10) is neutral to litmus paper.

An aqueous solution of Potassium Nitrate meets the requirements of the test for *heavy metals*, page 1519.

No yellow color appears when 0.1 Gm. of the dry salt is sprinkled upon 1 cc. of concentrated sulphuric acid (*chlorate*).

Assay—Dry about 0.4 Gm. of Potassium Nitrate to constant weight at 100° C., weigh accurately, dissolve it in 10 cc. of hydrochloric acid in a small porcelain dish, and evaporate the solution to dryness on a water bath. Dissolve the residue in 10 cc. of hydrochloric acid, and again evaporate to dryness on a water bath, continuing the heat until the residue, when redissolved in distilled water, is neutral to litmus paper. Transfer the residue with the aid of 25 cc. of distilled water to a flask, and proceed as directed under the assay for chlorides, page 1514, deducting from the amount of tenth-normal silver nitrate consumed the amount which would be consumed by the chlorides present in an equivalent weight of the salt originally taken, and previously determined by taking about 2 Gm. of the salt, accurately weighed, and proceeding as directed under the assay for chlorides, page 1514.

Each cc. of tenth-normal silver nitrate corresponds to 0.01011 Gm. of KNO_3.

This assay is explained on page 1463.

Preserve in well-closed containers.

N. F. Preparation—Charta Potassii Nitratis.

Uses—Potassium nitrate was formerly used as a diuretic and diaphoretic, but has largely passed out of vogue. It is used frequently in *asthma powders*, partly because of its local stimulating action on the bronchi but chiefly because of its oxidizing effect, which aids combustion. It is occasionally employed in solution as a local stimulant, similar to the chlorate, in doses of eight to twenty grains (0.5 to 1.3 Gm.). In concentrated solution it is antiseptic. It is extensively used in making gunpowder and in fertilizers.

POTASSII PERMANGANAS. U. S. Potassium Permanganate

[Pot. Permang.]

Potassium Permanganate, when dried to constant weight over sulphuric acid, contains not less than 99 per cent of $KMnO_4$ (158.03).

Great caution should be observed in handling it, as dangerous explosions are liable to occur when it is brought into contact with organic or other readily oxidizable substances, either in solution or in the dry condition.

Preparation—This salt is made by oxidizing a solution of potassium manganate with chlorine or with ozone.

When chlorine is passed into the solution a reaction takes place which is expressed as follows:

$$\underset{\text{potassium manganate}}{2K_2MnO_4} + \underset{\text{chlorine}}{Cl_2} = \underset{\text{potassium permanganate}}{K_2Mn_2O_8} + \underset{\text{potassium chloride}}{2KCl}$$

and the oxidation by ozone is expressed as follows:

$$2K_2MnO_4 + O_3 + H_2O = K_2Mn_2O_8 + O_2 + 2KOH$$
$$2K_2MnO_4 + O + H_2O = K_2Mn_2O_8 + 2KOH$$

Potassium manganate is made by heating manganese dioxide with potassium hydroxide with the aid of an oxidizing agent like potassium chlorate; the potassium hydroxide liberated by the reaction requires neutralization with an acid if all the permanganate is to be obtained, because the latter, in the presence of an excess of alkali, remains in the condition of manganate.

Description and Physical Properties—Odorless, slender, monoclinic prisms, of a dark purple color, almost opaque by transmitted light, and of a blue, metallic luster by reflected light. It is stable in the air.

One Gm. of Potassium Permanganate is soluble in 13.5 cc. of water at 25° C. One Gm. is soluble in 3.5 cc. of boiling water. It is decomposed by alcohol.

Tests for Identity—When heated, the Potassium Permanganate decrepitates, and at about 240° C. it is decomposed, yielding oxygen, potassium manganate and manganese dioxide.

An aqueous solution of the salt is of a deep violet-red color when concentrated, and of a rose color when highly diluted, and responds to the reactions for permanganates, page 706.

Assay—Dry about 0.10 Gm. of Potassium Permanganate to constant weight over sulphuric acid, weigh accurately, and dissolve it in 25 cc. of distilled water. Mix the solution with 1 cc. of

sulphuric acid and 50 cc. of tenth-normal oxalic acid, warm the mixture to about 80° C., and titrate with tenth-normal potassium permanganate. Each cc. of tenth-normal oxalic acid corresponds to 0.003161 Gm. of $KMnO_4$.

This assay is explained on page 1475.

Preserve in glass-stoppered bottles.

Uses—As a therapeutic agent Potassium Permanganate is employed as a disinfectant and deodorant; also as an antidote to morphine, strychnine, and snake poison. Formerly it was employed internally in menstrual disorders but is of little value.

It is one of the most powerful oxidizing agents known. Chemically, it is used as a volumetric test and oxidizer, for which it is admirably adapted on account of the distinctness of its color reactions, although the difficulty of keeping the solution from partial decomposition is a serious annoyance and interferes with the accuracy of the estimation. When potassium permanganate comes in contact with organic matter, it is decomposed with the liberation of oxygen; the reaction is as follows: $K_2Mn_2O_8 = 2MnO + K_2O + 5O$.

In the presence of an acid forming a soluble salt of the manganese, as sulphuric, the reaction is as follows: $K_2Mn_2O_8 + 3H_2SO_4 = 2MnSO_4 + K_2SO_4 + 3H_2O + 5O$. The MnO, in the first of these reactions, is what is deposited as a brown stain when potassium permanganate comes in contact with the skin, and the second reaction illustrates why diluted sulphuric or diluted hydrochloric acid removes the stains produced on organic tissues by permanganate, through the formation of colorless salts of the manganese. The dose is one grain (0.065 Gm.).

POTASSII CHLORIDUM. N.F. Potassium Chloride

[Pot. Chlorid.]

Potassium Chloride contains, when dried to constant weight at 100° C., not less than 99 per cent of KCl (74.56).

Preparation—This salt occurs in sea water and in many mineral springs and is also mined at Stassfurt, Germany, occurring there as *carnallite*, $KCl.MgCl_2 + 6H_2O$, and as *sylvite*, KCl. The carnallite, in aqueous solution, is treated with live steam, the two separate salts form and the less soluble salt, potassium chloride, crystallizes out as the solution cools. It may also be prepared by dissolving potassium carbonate or bicarbonate in hydrochloric acid.

Description and Physical Properties—Potassium Chloride occurs in colorless, elongated, prismatic, or cubical crystals, or as a white, granular powder; permanent in dry air. Odorless; taste saline.

One Gm. dissolves in 2.8 cc. of water at 25° C., slightly more soluble in boiling water; insoluble in alcohol.

Tests for Identity—An aqueous solution of the salt (1 in 10) is clear, and neutral to litmus.

When heated, the dry salt decrepitates. To a non-luminous flame it imparts a violet color unmasked by yellow.

An aqueous solution of the salt yields with silver nitrate T.S. a white, curdy precipitate, insoluble in nitric acid but soluble in an excess of ammonia water.

Tests for Purity—Boil 5 cc. of an aqueous solution of the salt (1 in 10) in a test tube, then add an equal volume of barium hydroxide T.S. and stopper the tube; the solution is not rendered cloudy within fifteen minutes (*calcium or magnesium*).

Dissolve 2 Gm. of the salt in 6 cc. of distilled water, add 1 cc. of chloroform, and then add, drop by drop, with constant agitation, 5 cc. of half-strength chlorine water; the chloroform does not acquire a transient violet or permanent orange color (*iodide or bromide*).

An aqueous solution of the salt meets the requirements of the test for arsenic (see page 1512).

An aqueous solution of the salt does not respond to the test for heavy metals (see page 1519).

Assay—Dissolve about 0.25 Gm. of Potassium Chloride, previously dried to constant weight at 100° C. and accurately weighed, in 25 cc. of distilled water in a 200 cc. measuring flask. Add 50 cc. of tenth-normal silver nitrate to the solution, then 5 cc. of nitric acid, afterward sufficient distilled water to make 200 cc. and mix thoroughly. Filter the mixture through a dry filter, reject the first 20 cc. of the filtrate, collect the following 100 cc. of filtrate, add to this 2 cc. of ferric ammonium sulphate T.S. and titrate with tenth-normal potassium thiocyanate, until the supernatant liquid remains reddish after it is well shaken.

Each cc. of tenth-normal silver nitrate corresponds to 0.007456 Gm. of KCl. Each Gm. of Potassium Chloride, dried to constant weight, corresponds to not less than 132.8 cc. of tenth-normal silver nitrate.

This assay is explained on page 1463.

N. F. Preparations—Liquor Hydrastinæ Compositus; Sal Kissingense Factitium; Sal Kissingense Factitium Effervescens.

Uses—It has long been used in medicine under the names *sal febrifugum* and *sal digestivum*. It has no medicinal value. It is an ingredient of Locke-Ringer Solution, of importance in the physiologic laboratories. It is chiefly used today in the preparation of other potassium salts, and in the impure form as an ingredient in fertilizer mixtures.

Average dose—15 grains (1 Gm.).

POTASSII HYPOPHOSPHIS. N. F. Potassium Hypophosphite
(U. S. P. IX)
[Pot. Hypophos.]

Potassium Hypophosphite contains, when dried to constant weight over sulphuric acid, not less than 98 per cent of KPH_2O_2 (104.16).

Caution should be observed in dispensing Potassium Hypophosphite, as an explosion is liable to occur when it is triturated or heated with nitrates, chlorates, or other oxidizing agents.

Preparation—When solutions of calcium hypophosphite and potassium carbonate are mixed, potassium hypophosphite and calcium carbonate are produced by double decomposition, thus:

$$\underset{\text{calcium hypophosphite}}{Ca(H_2PO_2)_2} + \underset{\text{potassium carbonate}}{K_2CO_3} = \underset{\text{potassium hypophosphite}}{2KH_2PO_2} + \underset{\text{calcium carbonate}}{CaCO_3}$$

The calcium carbonate is removed by filtration, and the clear solution is evaporated until a pellicle forms, after which it is constantly stirred, with continuance of the heat, until the salt granulates. The heat employed in the evaporation should be kept considerably below 100° C. for fear of explosion. If the salt is required to be pure, it should be dissolved in the granulated state, in official alcohol, and the solution evaporated and then set aside to crystallize.

Description and Physical Properties—Potassium Hypophosphite occurs as white, opaque, hexagonal plates, or crystalline masses, or as a granular powder; odorless, and having a pungent, saline taste; very deliquescent.

One Gm. of Potassium Hypophosphite dissolves in 0.6 cc. of water and in 9 cc. of alcohol at 25° C.; also in 0.4 cc. of boiling water and in 5 cc. of boiling alcohol.

Tests for Identity—An aqueous solution of the salt (1 in 20) is neutral or slightly alkaline to litmus and yields with sodium bitartrate T.S. a white, crystalline precipitate.

When heated in a dry test tube spontaneously inflammable hydrogen phosphide is evolved which burns with a bright yellow flame.

When an aqueous solution of the salt (1 in 20), acidulated with hydrochloric acid, is added, drop by drop, with agitation to an excess of mercuric chloride T.S., a white precipitate of mercurous chloride is formed. Upon the further addition of the solution of Potassium Hypophosphite, the precipitate becomes gray from reduction to metallic mercury.

Tests for Purity—A solution of 1 Gm. of the salt in about 10 cc. of distilled water requires not more than 1.5 cc. of tenth-normal hydrochloric acid for neutralization, methyl orange T.S. being used as indicator.

Heat 5 cc. of an aqueous solution of the salt (1 in 5) with 0.5 cc. of diluted hydrochloric acid in a test tube on a water bath for thirty minutes; no offensive odors are developed.

Measure 5 cc. of an aqueous solution of Potassium Hypophosphite (1 in 25) into a beaker containing 3 cc. of nitric acid diluted with about 10 cc. of distilled water, and evaporate the mixture to dryness on a water bath; the residue meets the requirements of the test for arsenic (see page 1512).

Add magnesia mixture T.S. to 10 cc. of an aqueous solution of the salt (1 in 20) made alkaline with ammonia water; it is not affected within one minute (*phosphates*).

Assay—Dissolve about 1 Gm. of Potassium Hypophosphite, dried to constant weight over sulphuric acid and accurately weighed, in 10 cc. of distilled water, add 10 cc. of nitric acid and evaporate it to dryness on a water bath. Then add 5 cc. of nitric acid and again evaporate it to dryness on a water bath. Dissolve the residue in 20 cc. of distilled water, add a drop of phenolphthalein T.S. and sufficient special potassium hydroxide T.S. (see page 545, U. S. P. IX) to produce a pink color, and then dilute it to exactly 100 cc. with distilled water. Transfer 10 cc. of this solution to a 100 cc. graduate flask, add 50 cc. of tenth-normal silver nitrate and thoroughly agitate the mixture. Gradually add reagent zinc oxide, in small portions, until the liquid is neutral to litmus paper. Then add distilled water to make 100 cc., mix thoroughly, and filter through a filter paper not previously moistened, rejecting the first 25 cc. of filtrate. Collect 50 cc. of the subsequent filtrate, add 2 cc. of nitric acid and 2 cc. of ferric ammonium sulphate T.S., and titrate with tenth-normal potassium thiocyanate to the production of a permanent red color.

Each cc. of tenth-normal silver nitrate corresponds to 0.003472 Gm. of KPH_2O_2. Each Gm. of Potassium Hypophosphite, previously dried, corresponds to not less than 282.3 cc. of tenth-normal silver nitrate.

This assay is explained on page 1464.

Preserve it in well-closed containers, in a dry place.

N. F. **Preparations**—Emulsum Olei Morrhuæ cum Hypophosphitibus; Liquor Hypophosphitum Compositus; Syrupus Hypophosphitum; Syrupus Hypophosphitum Compositus.

Uses—The official use made of potassium hypophosphite is to form one of the ingredients in the various syrups, elixirs, and solutions named above and in the production of hypophosphorous acid as a preservative in making diluted hydriodic acid. It may be given internally in the dose of eight grains (0.5 Gm.).

POTASSII SULPHAS. N. F. Potassium Sulphate

[Pot. Sulph.]

Potassium Sulphate contains, when dried to constant weight at 100° C., not less than 99 per cent of K_2SO_4 (174.26).

Preparation—This salt occurs in many mineral springs, is a by-product in many chemical processes, but its chief source is *kainite*, the double sulphate of potassium and magnesium with magnesium chloride, $K_2SO_4.MgSO_4.MgCl_2 + 5H_2O$, and *schoenite*, the double sulphate of potassium and magnesium, $K_2SO_4.2MgSO_4 + 6H_2O$, both of which are mined in the Stassfurt salt bed.

In its preparation from kainite, the ore is exposed to the air until the magnesium chloride deliquesces and runs off, the remainder is dissolved in boiling water and the less soluble potassium sulphate crystallizes first.

Description and Physical Properties—Potassium Sulphate occurs as hard, colorless, translucent, six-sided, rhombic prisms terminated by pyramids, or as a white powder; permanent in the air. Odorless; taste saline, somewhat bitter.

One Gm. dissolves in 10 cc. of water at 25° C., and in 4 cc. of boiling water; insoluble in alcohol.

Tests for Identity—When heated the crystals decrepitate. At a bright red heat the salt fuses, and at a white heat partial decomposition occurs.

An aqueous solution of the salt (1 in 20) is neutral to litmus.

A saturated aqueous solution of the salt yields a white, crystalline precipitate with an excess of sodium bitartrate T.S.

An aqueous solution of the salt (1 in 20) yields with barium chloride T.S. a heavy white precipitate, insoluble in hydrochloric acid.

Tests for Purity—Separate portions of 10 cc. of the aqueous solution of the salt (1 in 20) made slightly alkaline with ammonia, are not rendered turbid within one minute by the addition of ammonium oxalate T.S. or of sodium phosphate T.S. (*calcium or magnesium*).

An aqueous solution of Potassium Sulphate does not respond to the test for heavy metals (see page 1519).

An aqueous solution of the salt meets the requirement of the test for arsenic (see page 1512).

Assay—Dissolve about 0.6 Gm. of Potassium Sulphate, previously dried to constant weight at 100° C. and accurately weighed, in 200 cc. of distilled water, acidulate the solution with hydrochloric acid and heat it to boiling. Gradually add an excess of barium chloride T.S., and heat for thirty minutes on a water bath; collect the precipitate of barium sulphate on a filter and wash it with distilled water until silver nitrate T.S. fails to produce an opalescence in 2 cc. of the filtrate, previously acidulated with nitric acid. Dry the precipitate, ignite and weigh the residue.

Each Gm. of Potassium Sulphate corresponds to not less than 1.326 Gm. of $BaSO_4$.

This assay is explained on page 1479.

N. F. **Preparations**—Sal Carolinum Factitium; Sal Carolinum Factitium Effervescens.

Uses—Because of the hardness of the crystals it was at one time used as the diluent in Dover's Powder on the theory that the labor required to reduce the hard crystals to a fine powder would insure a uniform mixture and fine subdivision of the drug. This use has, however, been abandoned. It is used in laxative salts and extensively employed in the production of potash alum and potassium carbonate.

Average dose—15 grains (1 Gm.).

Unofficial Potassium Salts

Potassii Antimonias, $KSbO_3$
Potassium Metantimonate
: A white salt of little importance. When anhydrous it is very sparingly soluble in water but upon prolonged boiling with water it becomes hydrated, and dissolves. By further boiling it is decomposed into an acid potassium antimonate

Potassii Bisulphas, $KHSO_4$
Potassium Bisulphate
: Colorless crystals, soluble in water with an acid reaction. It is used as a flux and as a cleansing agent for platinum ware, since it is a solid substance, which when fused, behaves like strong sulphuric acid

Potassii Bisulphis, $KHSO_3$
Potassium Bisulphite
: A white crystalline powder with an odor of sulphur dioxide; soluble in water, insoluble in alcohol. It is used as an antiseptic and as a source of sulphur dioxide

Unofficial Potassium Salts—*Continued*

Potassii Chromas, K_2CrO_4 Potassium Chromate	Yellow crystals, soluble in water, insoluble in alcohol. Used as a reagent, in leather finishing, dyeing, inks and in the preparation of insoluble chromates by precipitation
Potassii Cyanidum, KCN Potassium Cyanide	White amorphous lumps or crystalline masses, having a faint bitter almond-like odor. It is extremely poisonous. It is used in medicine, in electroplating, in extracting gold and silver from their ores and, as an insecticide. Dose, $\frac{1}{16}$ to $\frac{1}{8}$ gr. (0.004 to 0.008 Gm.)
Potassii Dichromas, $K_2Cr_2O_7$ Potassium Dichromate	Orange-red, transparent crystals. They have a metallic taste. It is poisonous and is water-soluble. This salt is a well-known oxidizing agent in analytical chemistry. It is also used in medicine, in tanning, histology, bleaching, and dyeing
Potassii Ferricyanidum, $K_3Fe(CN)_6$ Potassium Ferricyanide	Commonly called *red prussiate of potash.* Bright red crystals or powder, soluble in water. Used as a reagent for ferrous salts; also used for tempering steel, as a mordant in calico printing, wool dyeing and in the production of pigments
Potassii Ferrocyanidum, $K_4Fe(CN)_6+3H_2O$ Potassium Ferrocyanide	Commonly called *yellow prussiate of potash.* Lemon-yellow crystals or powder, efflorescent on exposure to air. This salt is soluble in water but insoluble in alcohol. It is used as a reagent for the detection of ferric salts. It is also used in medicine, in tempering steel, dyeing, and in the manufacture of pigments, and of potassium ferricyanide
Potassii Hydrargyri Iodidum, K_2HgI_4 Potassium Mercuric Iodide	This is described under the unofficial salts of mercury (page 760)
Potassii Iodas, KIO_3 Potassium Iodate	A white, crystalline powder that resembles potassium chlorate in its properties. It is useful as a reagent in testing for sulphur dioxide.
Potassii Nitris, KNO_2 Potassium Nitrite	A white, deliquescent salt, very soluble in water, insoluble in alcohol. It is generally sold in fused stick form. It is used in medicine and as a source of nitrous acid, although its use is being superseded by the corresponding sodium salt
Potassii Perchloras, $KClO_4$ Potassium Perchlorate	A sparingly soluble white salt. At high temperatures it decomposes yielding potassium chloride and oxygen. It is used as a powerful oxidizing agent
Potassii Platinocyanidum, $2KCN.Pt(CN)_2.3H_2O$ Potassium Platinocyanide	Very soluble crystals, yellow by transmitted light reflecting a blue color. It is used as a reagent, giving a blue precipitate with copper sulphate
Potassii Salicylas, $KC_7H_5O_3$ Potassium Salicylate	A soluble white powder that has been almost entirely replaced by the corresponding sodium salt
Potassii Silicas, K_2SiO_3 Potassium Silicate, Soluble Glass	This salt is the counterpart of ordinary *water glass* which is the corresponding compound of sodium. It is one of the very few water-soluble silicates
Potassii Sulphidum, K_2S Potassium Sulphide	Colorless crystals, when pure, containing five molecules of water in each molecule. These crystals deliquesce in air and are decomposed by carbon dioxide with the evolution of hydrogen sulphide. It is used as a reagent, in solution
Potassii Sulphis, $K_2SO_3+2H_2O$ Potassium Sulphite	A white, somewhat deliquescent salt having a bitter saline taste. It is more soluble in cold than in hot water. Upon standing it gradually becomes oxidized to potassium sulphate
Potassii Sulphocyanas, KCNS Potassium Sulphocyanate	Colorless prisms that are deliquescent and very soluble in water, producing a decided reduction of temperature. It is used as a reagent for detecting ferric salts of iron and in volumetric solutions in quantitative analysis
Potassii Tartras $K_2C_4H_4O_6+\frac{1}{2}H_2O$ Potassium Tartrate	White, crystalline powder, easily soluble in water and in alcohol (difference from potassium acid tartrate). This salt is of no special importance

CHAPTER XLVII

THE SODIUM SALTS

Na; 23.00

Sodium is from the word "soda" which is applied to the crude sodium carbonate obtained from ashes and used for making glass. The sodium salts are generally more frequently used than those having potassium for their base, because they are relatively cheaper, and are often more soluble. The metal *Sodium* is a soft, malleable, ductile solid, which must be protected from the oxygen of the air by being constantly immersed in petroleum or naphtha. The student sometimes confuses this fact with the preserving of phosphorus, which is under water. If sodium is added to water an explosive reaction occurs, during its hydration, which might cause serious burns or injury to the eyes. It should always be handled with great caution. It is now largely and cheaply made by electrolysis.

Test for Sodium

Sodium—Sodium compounds impart an intense yellow color to a non-luminous flame.

SODII HYDROXIDUM. U.S. Sodium Hydroxide

[**Sod. Hydrox.**—Caustic Soda, Sodium Hydrate]

It contains not less than 90 per cent of NaOH (40.01). Preserve it in well-closed containers. If bottles are used as containers, they must be made of hard glass.

Sodium Hydroxide contains not less than 90 per cent of NaOH.

Caution—Great care is necessary in handling it, as it rapidly destroys organic tissues.

Preparation—Owing to the improvements in the manufacture of metallic sodium and the cheapening of the product, sodium hydroxide can be found in commerce which has been made by oxidizing the metal by bringing it in contact with water and evaporating the pure solution of sodium hydroxide.

$$\underset{\text{sodium}}{Na_2} + \underset{\text{water}}{2H_2O} = \underset{\text{sodium hydroxide}}{2NaOH} + \underset{\text{hydrogen}}{H_2}$$

It is also prepared by boiling an aqueous solution of sodium carbonate and milk of lime until the clear liquid no longer effervesces with acids, decanting, then evaporating the clear liquid, in iron dishes, to a specific gravity of 1.170, concentrating in a silver dish, and finally pouring the solution into silver molds. When the pure hydroxide is not needed, the white caustic sodium hydroxide, in sticks, made by evaporating a solution of sodium hydroxide (see Liquor Sodii Hydroxidi) and casting the fused residue into molds, is used. (See Potassii Hydroxidum, page 599.)

The reaction is expressed as follows:

$$\underset{\substack{\text{sodium}\\\text{carbonate}}}{Na_2CO_3} + \underset{\substack{\text{calcium}\\\text{hydroxide}}}{Ca(OH)_2} = \underset{\substack{\text{sodium}\\\text{hydroxide}}}{2NaOH} + \underset{\substack{\text{calcium}\\\text{carbonate}}}{CaCO_3}$$

It is now largely made by the electrolysis of a solution of sodium chloride in the presence of a porous diaphragm as explained under *Potassii Hydroxidum*, page 599, or in such a way as to prevent a secondary reaction between the chlorine and the sodium hydroxide.

Description and Physical Properties—Dry, white, or nearly white, fused masses, or sticks, hard and brittle, showing a crystalline fracture. Exposed to the air, it deliquesces, absorbs carbon dioxide, and becomes covered with a coating of carbonate.

One Gm. of Sodium Hydroxide is soluble in 0.9 cc. of water at 25° C. One Gm. is soluble in about 0.3 cc. of boiling water. It is very soluble in alcohol.

Tests for Identity—A solution of Sodium Hydroxide even when greatly diluted is strongly alkaline to litmus paper.

An aqueous solution of Sodium Hydroxide (1 in 25) responds to the reactions for sodium, page 617.

Tests for Purity—An aqueous solution of Sodium Hydroxide (1 in 20) is clear and colorless (*organic matter or insoluble impurities*), and, after being acidulated with acetic acid, it yields no precipitate on the addition of an excess of tartaric acid T.S., or upon the addition of a few drops of sodium cobaltic nitrate T.S. (*potassium*).

An aqueous solution of Sodium Hydroxide (1 in 50), slightly acidulated with hydrochloric acid, meets the requirements of the test for *heavy metals*, page 1519.

Assay—Place about 10 Gm. of Sodium Hydroxide in a glass-stoppered weighing bottle, and weigh accurately. Transfer it to a 500 cc. graduated flask, dissolve it in 250 cc. of recently boiled distilled water, and add 30 cc. of barium chloride T.S. Fill the flask to the mark with recently boiled distilled water, and thoroughly agitate the liquid. Filter it through a filter, which has not been previously moistened into a dry flask, rejecting the first 20 cc., and titrate 100 cc. of the subsequent clear filtrate with normal hydrochloric acid, using phenolphthalein T.S. as indicator. Each cc. of normal hydrochloric acid corresponds to 0.04001 Gm. of NaOH.

This assay is explained on page 1459.

Preserve in well-closed containers. If bottles are used as containers, they must be made of hard glass, and cork stoppers, if used, should be paraffined.

U. S. P. Preparations—Liquor Cresolis Compositus; Liquor Sodii Hydroxidi; Magma Magnesiæ.

N. F. Preparations—Soda cum Calce; Ferri Oxidum Saccharatum.

History—This was originally called *mineral alkali* as contrasted with potassium hydroxide which was called *vegetable alkali* and ammonium hydroxide which was called *animal alkali*. The origin of these alkalies dates from a very early period, and the alkali carbonates and hydroxides are mentioned by Dioscorides. The word *lixivium* was a Roman term applied to the lye made from wood ashes. The term alkali is of Arabic origin and was first used in the thirteenth century.

Uses—A distinct effort is being made in this country to replace potassium hydroxide and potassium salts, wherever practicable, with the corresponding sodium salt. This is because of the cheap production of sodium in this country, and the necessity of importing practically all of the potassium. For the majority of uses they are interchangeable. *Caustic soda*, as sodium hydroxide is termed commercially, is sometimes preferred to the analogous potassium salt, in the belief that it is milder and less deliquescent. It is usually less expensive than the potassium salt and is used in smaller amounts because of its smaller molecular weight, 40.01 parts of sodium hydroxide being equivalent in reaction to 56.11 parts of potassium hydroxide. It is occasionally used as a caustic but is less popular than the caustic potash.

Antidotes—(See Part XV, on Antidotes).

LIQUOR SODII HYDROXIDI. U. S. Solution of Sodium Hydroxide

[**Liq. Sod. Hydrox.**—Liquor Sodæ, Solution of Soda]

Solution of Sodium Hydroxide contains, in each 100 cc., not less than 4.5 Gm. and not more than 5.5 Gm. of NaOH (40.01).

	Metric	Alternative
Dekanormal Solution of Sodium Hydroxide	**125 cc.**	**4 fl. oz.**
Distilled Water, a sufficient quantity,		
To make	**1000 cc.**	2 pints

Mix the dekanormal solution (page 1561) with sufficient distilled water to make 1000 cc. [2 pints].

NOTE—The 125 cc. of dekanormal solution of sodium hydroxide may be replaced by 56 Gm. of sodium hydroxide, containing 90 per cent of NaOH (1 oz. av. 380 gr.).

The sodium hydroxide used in this process should be of the full strength and quality directed by the Pharmacopœia (90 per cent). Sodium hydroxide of any other strength, however, may be used, if a proportionately larger or smaller quantity is taken, the proper amount for the above formula being ascertained by dividing 5040 by the percentage of absolute sodium hydroxide contained therein.

Description and Physical Properties—A clear, colorless, odorless liquid, strongly alkaline and caustic. It readily absorbs carbon dioxide from the air.

Specific gravity: about 1.056 at 25° C.

It meets the requirements of the tests for identity and purity for an aqueous solution of sodium hydroxide under *Sodii Hydroxidum*, when suitably concentrated.

Measure exactly 20 cc. of Solution of Sodium Hydroxide into a suitable flask and titrate directly with normal hydrochloric acid, using methyl orange T.S. as indicator: it shows, in each 100 cc., not more than 5.5 Gm. of alkali, calculated as NaOH (*carbonate*).

Assay—Measure exactly 50 cc. of Solution of Sodium Hydroxide into a 250 cc. measuring flask, add 20 cc. of barium chloride T.S. and fill the flask to the mark with recently boiled distilled water. Thoroughly agitate the liquid, filter it through a filter not previously moistened, reject the first 20 cc. and titrate 100 cc. of the filtrate, representing 20 cc. of the Solution, with normal hydrochloric acid, using phenolphthalein T.S. as indicator. Each cc. of normal hydrochloric acid corresponds to 0.04001 Gm. of NaOH.

This assay is explained on page 1459.

Preserve in bottles made of hard glass and provided with rubber stoppers or with glass stoppers coated with petrolatum.

U. S. P. Preparation—Oleum Terebinthinæ Rectificatum.

Uses—Solution of sodium hydroxide is of no medicinal value although it is occasionally prescribed as a gastric antacid, in the dose of fifteen minims (1 cc.). See also solution of potassium hydroxide (page 600).

SODII ACETAS. U. S. Sodium Acetate
[Sod. Acet.]

Sodium Acetate contains not less than 59.97 per cent and not more than 62.96 per cent of $NaC_2H_3O_2$ (82.03), corresponding to not less than 99.5 per cent of the crystallized salt [$NaC_2H_3O_2.3H_2O$] (36.08).

Preparation—This salt is obtained on the large scale in the process for making acetic acid, when the crude pyroligneous acid is neutralized with sodium carbonate. For medicinal purposes it may be made conveniently by saturating acetic acid with sodium carbonate, filtering the solution, concentrating it, and obtaining the salt in crystals.

$$\underset{\text{acetic acid}}{2HC_2H_3O_2} + \underset{\text{sodium carbonate}}{Na_2CO_3} = \underset{\text{sodium acetate}}{2NaC_2H_3O_2} + \underset{\text{water}}{H_2O} + \underset{\text{carbon dioxide}}{CO_2}$$

It is sometimes granulated, and in this form it is more convenient for dispensing purposes than the usual large crystals.

Description and Physical Properties—Colorless, transparent, monoclinic prisms, or a granular crystalline powder. It is odorless, or has a faint, acetous odor. It is efflorescent in warm, dry air.

One Gm. of Sodium Acetate is soluble in 0.8 cc. of water and in 19 cc. of alcohol, at 25° C.

Tests for Identity—Heated to about 58° C., the salt begins to liquefy. At about 120° C. it becomes anhydrous; at a higher temperature it is decomposed, with the evolution of inflammable empyreumatic vapors, leaving a residue of sodium carbonate and carbon.

An aqueous solution of the salt responds to the reactions for sodium, page 617, and for acetates, page 800.

Tests for Purity—Dissolve 2 Gm. of Sodium Acetate in 20 cc. of distilled water, and add 2 drops of phenolphthalein T.S.: the pink color produced, if any, is discharged by the addition of 0.1 cc. of tenth-normal sulphuric acid (*alkalinity*).

A saturated aqueous solution of Sodium Acetate is not rendered turbid by the addition of sodium bitartrate T.S. (*potassium*).

An aqueous solution of the salt meets the requirements of the test for *heavy metals*, page 1519.

An aqueous solution of the salt meets the requirements of the test for *arsenic*, page 1512.

Assay—Proceed as directed under the assay for alkali salts of organic acids, page 1514. Each cc. of half-normal sulphuric acid corresponds to 0.04102 Gm. of $NaC_2H_3O_2$.

This assay is explained on page 1456.

Preserve in well-closed containers.

Uses—Sodium acetate is used as a diuretic. It is not deliquescent like potassium acetate. The dose is from fifteen to sixty grains (1 to 4 Gm.).

SODII BENZOAS. U. S. Sodium Benzoate
[Sod. Benz.]

Sodium Benzoate, when dried to constant weight at 110° C., contains not less than 99 per cent of $NaC_7H_5O_2$ (144.08).

Preparation—Benzoic acid is added to a hot concentrated solution of pure sodium carbonate until effervescence ceases. The solution is evaporated, cooled, and allowed to crystallize, or preferably, evaporated to dryness and granulated.

$$\underset{\text{benzoic acid}}{2HC_7H_5O_2} + \underset{\text{sodium carbonate}}{Na_2CO_3} = \underset{\text{sodium benzoate}}{2NaC_7H_5O_2} + \underset{\text{carbon dioxide}}{CO_2} + \underset{\text{water}}{H_2O}$$

The yield of granulated salt is about one and one-third times the quantity of benzoic acid used.

Description and Physical Properties—A white, odorless, amorphous granular or crystalline powder. It is stable in the air.

One Gm. of Sodium Benzoate is soluble in 1.8 cc. of water and in 61 cc. of alcohol, at 25° C. One Gm. is soluble in 1.4 cc. of boiling water.

Tests for Identity—When heated, Sodium Benzoate fuses, emitting vapors having the odor of benzoic acid, then chars, and finally leaves a residue of sodium carbonate and carbon.

It responds to the reactions for sodium, page 617, and for benzoates, page 832.

Tests for Purity—Diluted sulphuric acid added to 5 cc. of an aqueous solution of Sodium Benzoate (1 in 10) produces a voluminous white precipitate of benzoic acid.

Dissolve about 1 Gm. of Sodium Benzoate in 10 cc. of distilled water in a separatory funnel, add 10 cc. of diluted sulphuric acid, and shake out the benzoic acid with two successive 20 cc. portions of ether. Evaporate the ether solution and test for chlorinated compounds as directed under *Acidum Benzoicum*.

Dissolve 2 Gm. of Sodium Benzoate in 20 cc. of hot distilled water, and add 2 drops of phenolphthalein T.S.: the pink color produced, if any, is discharged by the addition of 0.2 cc. of tenth-normal sulphuric acid (*alkalinity*).

Acidulate 10 cc. of an aqueous solution of the salt (1 in 50) with hydrochloric acid and filter: the filtrate does not respond to the test for *heavy metals*, page 1519.

Assay—Dry Sodium Benzoate to constant weight at 110° C. and proceed as directed under the assay for alkali benzoates and salicylates, page 1514. Each cc. of half-normal sulphuric acid corresponds to 0.07204 Gm. of $NaC_7H_5O_2$.

This assay is explained on page 1457.

Preserve in well-closed containers.

U. S. P. Preparation—Mucilago Acaciæ.

Uses—Sodium benzoate has been prescribed as a remedy in rheumatism. It is also used as a urinary antiseptic in cystitis, in fifteen-grain (1 Gm.) doses. It is extensively used as a food preservative as it is the only legally authorized preservative for many classes of food products.

SODII BICARBONAS. U. S. Sodium Bicarbonate
[Sod. Bicarb.]

Sodium Bicarbonate, when dried to constant weight over sulphuric acid, contains not less than 99 per cent of $NaHCO_3$ (84.01).

Preparation—All the processes for making this important salt of sodium, with one exception, consist in the addition of carbon dioxide to sodium carbonate.

$$\underset{\text{sodium carbonate}}{Na_2CO_3} + \underset{\text{carbon dioxide}}{CO_2} + \underset{\text{water}}{H_2O} = \underset{\text{sodium bicarbonate}}{2NaHCO_3}$$

Crystallized sodium carbonate contains ten molecules of water of crystallization; sodium bicarbonate contains none, hence provision must be made for the escape of this water, which is thrown out of combination during the process of carbonating. The crystallized sodium carbonate is placed upon perforated diaphragms in chambers arranged so that the water can escape as it is liberated.

Sodium bicarbonate is more largely prepared by the ammonia-soda process, or *Solvay's*, as it is usually called. In this, carbon dioxide is passed into a solution of common salt in ammonia water, double decomposition ensues, sodium bicarbonate is precipitated, and ammonium chloride, being very soluble, remains in solution.

$$\underset{\text{sodium chloride}}{NaCl} + \underset{\text{ammonia}}{NH_3} + \underset{\text{carbon dioxide}}{CO_2} + \underset{\text{water}}{H_2O} = \underset{\text{sodium bicarbonate}}{NaHCO_3} + \underset{\text{ammonium chloride}}{NH_4Cl}$$

Formerly commercial sodium bicarbonate contained small quantities of impurities having a disagreeable alkaline taste, such as sodium carbonate, chloride, and sulphate, and ammonium salts. These are much more soluble than the bicarbonate, and are easily washed out with distilled water without serious loss of the bicarbonate. At one time it was customary for the pharmacists to purify the commercial bicarbonate, but at present, because of the enormous use of this salt in baking powder and the necessity for its being of a high degree of purity for that purpose, there is no difficulty in obtaining sodium bicarbonate of U. S. P. standard at a low cost.

Tests for Carbonates and Bicarbonates

Carbonates or bicarbonates effervesce with acids, yielding a colorless gas, which when passed into calcium hydroxide T.S. produces a white precipitate. Carbonates in solution produce a reddish-brown precipitate with mercuric chloride T.S., while bicarbonates produce a white precipitate with the same reagent. A cold aqueous solution of a carbonate is reddened by phenolphthalein T.S., while a similar solution of a bicarbonate remains unchanged or is only slightly reddened.

Description and Physical Properties—A white, opaque, odorless powder. It is stable in dry air, but slowly decomposes in moist air.

One Gm. of Sodium Bicarbonate is soluble in 10 cc. of water at 25° C. It is insoluble in alcohol.

Tests for Identity—An aqueous solution of Sodium Bicarbonate (1 in 20), when freshly prepared with cold distilled water, without shaking, is slightly alkaline to litmus paper. The alkalinity increases upon standing, agitation, or increase in temperature.

When heated above 15° C., an aqueous solution of the salt gradually loses carbon dioxide and at boiling temperature the salt is almost completely converted into normal sodium carbonate.

When heated, the salt is decomposed into sodium carbonate, water, and carbon dioxide, and at 100° C. loses about 36.5 per cent of its original weight.

An aqueous solution of the salt responds to the reactions for sodium, page 617, and for bicarbonates, see above.

Tests for Purity—Dissolve 1 Gm. of Sodium Bicarbonate in 20 cc. of distilled water at 25° C: it yields a clear, colorless solution, leaving no residue.

Heat Sodium Bicarbonate in a test tube: no odor of ammonia is evolved and moist red litmus paper is not colored blue.

Dissolve 1 Gm. of the salt without agitation in 20 cc. of distilled water at a temperature not exceeding 15° C., and add 0.2 cc. of normal hydrochloric acid and two drops of phenolphthalein T. S.: a red tint does not appear immediately (*carbonate*).

An aqueous solution of the salt (1 in 50), mixed with a slight excess of hydrochloric acid, meets the requirements of the test for *heavy metals*, page 1519.

Assay—Dry about 3 Gm. of Sodium Bicarbonate over sulphuric acid to constant weight, weigh accurately, mix it with 25 cc. of distilled water, and titrate with normal sulphuric acid, methyl orange T.S. being used as indicator. Each cc. of normal sulphuric acid corresponds to 0.08401 Gm. of $NaHCO_3$.

This assay is explained on page 1455.

Preserve in well-closed containers, in a cool place.

U. S. P. Preparations—Ferri Carbonas Saccharatus; Potassii Citras Effervescens; Pulvis Effervescens Compositus; Sodii Phosphas Effervescens.

N. F. Preparations—Elixir Catariæ et Fœniculi; Elixir Hydrastis Compositus; Glyceritum Bismuthi; Liquor Pancreatini; Liquor Sodæ et Menthæ; Liquor Sodii Boratis Compositus; Liquor Sodii Citratis; Mistura Rhei Composita; Pulvis Acetanilidi Compositus; Pulvis Pancreatini Compositus; Sal Carolinum Factitium; Sal Carolinum Factitium Effervescens; Sal Kissingense Factitium; Sal Kissingense Factitium Effervescens; Sal Lithii

Citras Effervescens; Sal Magnesii Sulphatis Effervescens; Sal Potassii Bromidi Effervescens; Sal Potassii Bromidi Effervescens Compositus; Sal Vichyanum Factitium; Sal Vichyanum Factitium Effervescens; Tabellæ Sodii Bicarbonatis.

Uses—Sodium bicarbonate is largely used as a safe gastric antacid and is extensively prescribed in many forms of nausea and digestive disorders. It is also used by hypodermic injection in the so-called "acidosis", a state of diminished alkali in the system. It is given in doses of ten to fifteen grains (0.65 to 1 Gm.). It is preferably administered in carbonic acid water, and the draught is popularly known as "extra soda". The misnomer is caused by the erroneous use of the term "soda water". Sodium bicarbonate is also widely used in fire extinguishers and in the manufacture of effervescent salts.

SODII BORAS. U. S. Sodium Borate

[**Sod. Bor.**—Borax, Sodium Tetraborate, Sodium Pyroborate]

Sodium Borate contains not less than 52.32 per cent and not more than 54.92 per cent of $Na_2B_4O_7$ (201.6), corresponding to not less than 99 per cent of the crystallized salt [$Na_2B_4O_7.10H_2O = 381.76$].

Preparation—This salt is found in immense quantities in California as a crystalline deposit at Clear Lake and near Death Valley. It is probable that this will continue to be the principal source of borax for many years to come. The process of purification consists simply of selecting the large and perfect crystals, washing them, and lixiviating the earth, which is strongly impregnated with borax, evaporating the solution, and crystallizing. It is sometimes called *biborate of sodium*. Calcium borate, or "cotton balls", also occurs in the borax deposits of California, and sodium borate is obtained by double decomposition by treating the solution of calcium borate with sodium carbonate. Borax is found native in Thibet, Persia, and other localities. It is sometimes called *tincal*. Crude boric acid, obtained from Tuscany, is fused with dried sodium carbonate, and a hot solution of the residue is crystallized in order to produce borax.

Description and Physical Properties—Colorless, odorless, transparent, monoclinic prisms, or a white powder. It is efflorescent in warm, dry air.

One Gm. of Sodium Borate is soluble in 15 cc. of water and in about 1 cc. of glycerin, at 25° C. One Gm. is soluble in 0.6 cc. of boiling water. It is insoluble in alcohol.

When heated, the salt at first loses part of its water of crystallization, then melts, and, when further heated, swells and forms a white, porous mass. At red heat, Sodium Borate loses all of its water of crystallization and fuses to a colorless, glassy mass or bead.

Tests for Identity—An aqueous solution of Sodium Borate (1 in 20) is alkaline to litmus paper.

An aqueous solution of the salt (1 in 20) responds to the reactions for sodium, page 617, and for borates, page 590.

Tests for Purity—An aqueous solution of Sodium Borate (1 in 20) does not effervesce with acids (*carbonate or bicarbonate*).

An aqueous solution of the salt (1 in 20) meets the requirements of the test for *heavy metals*, page 1519.

An aqueous solution of the salt meets the requirements of the test for *arsenic*, page 1512.

Assay—Dissolve about 5 Gm. of Sodium Borate, accurately weighed, in 100 cc. of distilled water, and titrate the solution with normal hydrochloric acid, methyl orange T.S. being used as indicator. Each cc. of normal hydrochloric acid corresponds to 0.1008 Gm. of $Na_2B_4O_7$.

This assay is explained on page 1459.

Preserve in well-closed containers.

U. S. P. Preparation—Unguentum Aquæ Rosæ.

N. F. Preparations—Liquor Aromaticus Alkalinus; Liquor Sodii Boratis Compositus; Mel Rosæ et Sodii Boratis; Mel Sodii Boratis.

Uses—Borax, as it is almost universally called, is antacid and antiseptic. It enters into many mouth washes, and is frequently applied in the form of powder to ulcers in the mouth, for which purpose it is admirably adapted,

being mildly alkaline and not very soluble. It is used enormously in the household as an ingredient in soaps, cleansers, etc. Pharmaceutically, it is frequently used in small quantity in ointments, particularly the ointment of rose water. It forms a borax soap which serves as an emulsifying agent in the preparation of the ointment. The dose is eight to twelve grains (0.5 to 0.77 Gm.).

SODII BROMIDUM. U. S. Sodium Bromide
[Sod. Brom.]

Sodium Bromide, when dried to constant weight at 100° C., contains not less than 98.5 per cent of NaBr (102.92).

Preparation—The process most used in making this salt consists in decomposing ferroso-ferric bromide by treating it with sodium carbonate. The ferroso-ferric bromide is made by acting on iron wire with bromine in the presence of water, and, after filtering the solution, adding solution of sodium carbonate. The reaction may be thus expressed:

$$\underset{\text{ferroso-ferric bromide}}{Fe_3Br_8} + \underset{\text{sodium carbonate}}{4Na_2CO_3} = \underset{\text{sodium bromide}}{8NaBr} + \underset{\text{ferroso-ferric oxide}}{Fe_3O_4} + \underset{\text{carbon dioxide}}{4CO_2}$$

Sodium bromide may also be made by a method similar to that outlined under potassium bromide (see page 602) in which bromine and sodium hydroxide are combined to form sodium bromide and bromate, the latter being afterward converted into bromide by fusion with charcoal or by first producing ammonium bromide by treating a solution of ammonia with bromine (see *Ammonii Bromidum*), and then by double decomposition with sodium carbonate, forming sodium bromide and ammonium carbonate. The solution, by careful evaporation and granulation, may be made to yield sodium bromide, while ammonium carbonate, being composed of volatile compounds, is dissipated by the amount of heat used to granulate the sodium salt.

Description and Physical Properties—Colorless, or white, odorless, cubical crystals, or a white, granular powder. The salt absorbs moisture from the air without deliquescing.

One Gm. of Sodium Bromide is soluble in 1.1 cc. of water and in 16 cc. of alcohol, at 25° C.

Tests for Identity—When heated to about 760° C., the salt fuses without decomposition and at a somewhat higher temperature it volatilizes.

An aqueous solution of the salt (1 in 10) responds to the reactions for sodium, page 617, and for bromides, page 574.

Tests for Purity—Dissolve 1 Gm. of Sodium Bromide in 10 cc. of distilled water, and add 0.1 cc. of tenth-normal sulphuric acid: no color is produced upon the subsequent addition of a drop of phenolphthalein T.S. even after boiling (*alkali*).

Add a few drops of ferric chloride T.S. and 1 cc. of chloroform to 10 cc. of an aqueous solution of the salt (1 in 20) and shake the mixture: the chloroform does not acquire a violet tint (*iodide*).

Drop 1 cc. of diluted sulphuric acid on about 1 Gm. of the powdered salt: no yellow color appears at once (*bromate*).

A 10 cc. portion of an aqueous solution of the salt (1 in 20) when acidulated with hydrochloric acid, is not rendered turbid by the addition of 1 cc. of potassium sulphate T.S. (*barium*).

A 2 Gm. portion of Sodium Bromide shows no more *sulphate* than corresponds to 0.5 cc. of fiftieth-normal sulphuric acid, page 1567.

An aqueous solution of the salt meets the requirements of the test for *heavy metals*, page 1519.

Assay—Proceed as directed under the assay for bromides, page 574, using about 0.4 Gm. of Sodium Bromide, dried to constant weight at 100° C., and accurately weighed. Each cc. of tenth-normal silver nitrate corresponds to 0.01029 Gm. of NaBr. Each Gm. of Sodium Bromide, previously dried, corresponds to not less than 95.7 cc. and not more than 98.3 cc. of tenth-normal silver nitrate.

This assay is explained on page 1462.

Preserve in well-closed containers.

See estimation of bromides under assay methods, page 1515.

N. F. Preparations—Elixir Bromidorum Quinque; Elixir Euphorbiæ Compositus; Elixir Sodii Bromidorum.

Uses—Sodium bromide is used for the same purposes as potassium bromide. The dose is fifteen to sixty grains (1 to 4 Gm.).

SODII CACODYLAS. U. S. Sodium Cacodylate

[Sod. Cacodyl.]

Sodium Cacodylate contains not less than 72 per cent and not more than 75 per cent of $Na(CH_3)_2AsO_2$ (160.02) with variable amounts of H_2O.

Preparation—Prepared by neutralizing cacodylic acid (dimethylarsenic acid) with sodium hydroxide or with sodium carbonate, concentrating the solution, and crystallizing. The acid is prepared by distilling arsenic trioxide with potassium acetate and oxidizing the distillate with mercuric oxide.

Description and Physical Properties—White prisms, or a white, granular powder. It is odorless, and deliquescent.

One Gm. of Sodium Cacodylate is soluble in about 0.5 cc. of water and in about 2.5 cc. of alcohol, at 25° C.

Tests for Identity—An aqueous solution of Sodium Cacodylate (1 in 20) is alkaline to litmus paper.

Sodium Cacodylate melts in its water of crystallization at about 60° C. and becomes anhydrous at 120° C. It burns with a bluish flame, emitting a garlic-like odor, and to a non-luminous flame it imparts an intensely yellow color.

A mixture of a few drops of an aqueous solution of the salt (1 in 100) with 2 cc. of hypophosphorous acid T.S. allowed to stand in a stoppered tube, develops the odor of cacodyl within one hour.

Tests for Purity—A solution of 2 Gm. of Sodium Cacodylate in 50 cc. of distilled water requires not more than 0.5 cc. of tenth-normal acid or 1 cc. of tenth-normal alkali to render it neutral, using 2 drops of phenolphthalein T.S. as indicator.

No turbidity is produced in 10 cc. of an aqueous solution of the salt (1 in 20) by 1 cc. of calcium chloride T.S. either in the cold or on heating (*monomethylarsenate*), or in 5 cc. of the solution by 2 cc. of magnesia mixture T.S. within one hour (*arsenate or phosphate*).
